This much is certain: if there is any definite policy being pursued in regard to the Moros, the country is not aware of it. There seems to be merely an aimless drifting along, with occasional bloody successes and now and then the report of a victory of peace. But the fighting keeps up steadily, and no one can discover that we are making any progress with the Moros. What, for instance, does it avail us to have built a wagon-road into Lake Lanao country? Any trade we may be getting out of it cannot pay for the road-making, and no settler, whether Filipino or American, will venture into that country. Unless it is to favor an occasional trader, why should we invade the Moros at all? Our tenure of the islands is uncertain, and the task of civilizing, according to our standards, or gradually exterminating them, will be a matter of years. If any one doubts this, we refer him to an article in the *Atlantic Monthly* by Major Robert L. Bullard, Twenty-eighth Infantry, the only officer who seems to have made headway with the Mindanao Moros by peaceable means.

"There is," he says, "no possibility of living in quiet with unoccupied or uncowed Moros. I preferred the method of work." He finds that by this policy government and civilization have gained upon the Moros, owing to his readiness to utilize Moro instruments and his sticking to a strictly autocratic administration. Whether his work has survived his return to the United States, he does not, and perhaps cannot, state. But here again the need of a definite policy must be apparent. In Jolo there seems to have been a pretty consistent attempt to try coercion. With what results? Gen. Wood was certain two years ago that the trouble was all over. Major Bullard says that "a kill-and-burn policy can never succeed with the Moros, can do nothing more than destroy them"; and yet even he feels it necessary to punish rigorously if a hair of an American's head is touched, in order to enforce respect for the flag and the uniform. Surely, the time has come for a final decision as to what our policy shall be—whether it shall be kill and burn or the work-programme of Major Bullard; whether we shall content ourselves with holding the coast towns and preventing slave raids on the Filipinos, or whether we must settle down to a century's job of forcing our civilization upon the Moros. In the latter case, they are at least entitled to deal with permanent, highly trained colonial officials —if such there be—instead of being subject to the whims, fancies, theories, good or bad, and ambitions of army officers relieved after every two years.

THE NEW NATURALIZATION BILL.

The bill looking to a reform in the manner of naturalizing aliens was brought before the House on Saturday. For twenty years past nearly every annual message of the President has spoken of the frauds committed against our citizenship, and asked Congress for remedial laws. In 1890 the House made an effort to do something and secured a report from its Judiciary Committee, but did no more, and in the past fifteen years has not touched the subject. In the meantime the frauds have increased. Naturalizations conferred for voting purposes immediately before elections have become more scandalously numerous; manufactories of spurious certificates of naturalization have been discovered; it has been found that the sale of certificates to aliens is an increasing traffic; perjury before the courts in naturalization proceedings has become more brazen, and the courts themselves have become more careless. Only last year the Massachusetts Legislature passed a law authorizing the holding of night sessions by the courts for naturalization purposes. At such sessions there is, of course, a minimum of publicity, and the courts can connive at improper naturalizations with small danger of detection.

During the past four years the Department of Justice has waged effective warfare against those who have committed naturalization frauds in several of the large cities, and has sent several hundred malefactors to jail; and the State Department brought the attention of Congress to the matter last winter in a forcible report. The burden of Mr. Hay's complaint was that, in performing his duty of protecting naturalized Americans when they were abroad, he was often uncertain whether the person he was protecting had been naturalized lawfully or not; and he said it was a thankless task to intervene with a foreign government in behalf of a man, and to discover, after the intervention, that he had obtained his American citizenship through fraud. Mr. Hay also showed that there was a deplorable lack of uniformity in the manner of conferring naturalization by the different courts throughout the country, notwithstanding the authority conferred upon Congress by the Constitution "to establish an uniform rule of naturalization."

The last Congress adjourned without taking action, and the President creat-

ed a Commission to study the whole question. The members were Gaillard Hunt, chief of the Passport Bureau for the State Department, Milton D. Purdy, Assistant Attorney-General for the Department of Justice, and Richard K. Campbell, law officer of the Bureau of Immigration for the Department of Commerce and Labor. When Congress met this winter, the President laid before it an exhaustive report and definite recommendations. The Commission had not gathered any additional data on the subject of frauds practised under the present laws, assuming, apparently, that the frauds were of such common knowledge that no one needed to be further enlightened concerning them; but, considering the statutes from various aspects, the Commission indicated what additions and amendments were necessary to prevent the evils which have flourished unchecked. These recommendations have in the main been incorporated in the bill now before the House.

Probably the most important feature is that which provides that the Bureau of Immigration shall be enlarged into the Bureau of Immigration and Naturalization, and shall have supervision of naturalization matters. There is no Federal supervision now, and Congress has been more diligent in seeking ways to extend its powers into fields where its jurisdiction is doubtful than in perfecting the laws on subjects in which its authority is undisputed. Up to the present time sporadic prosecutions in a few places have been the sum of Federal activity, and there has been no way by which the Federal Government could protect itself in advance against the commission of the frauds. The bill now pending provides that every application for naturalization shall be reported to the authorities at Washington in ample time to permit the Government to contest the granting of the naturalization.

We notice, however, that the House bill retains the requirement of the old law, that a declaration of intention to become a citizen shall be made two years before naturalization can be conferred, whereas the Commission recommended that the declaration of intention be abolished as useless in preventing fraudulent naturalization, and as mischievous in that it confers certain rights of citizenship upon aliens. It is a fact that in nine States—Arkansas, Indiana, Kansas, Michigan, Missouri, Nebraska, Texas, Oregon, and Wisconsin—an alien who has made the declaration of intention can vote; but it is also true that all of those States which formerly gave this privilege and which have of recent years made changes in their Constitutions, have stricken this provision out. Undoubtedly, the tendency is to restrict suffrage to citizens, and it is probable that the States which now permit foreigners to vote will amend their Constitutions in this particular as soon as they have the opportunity to do so. The Committee's bill, however, limits the life of a declaration of intention to five years, and its prolonged improper use would therefore be impossible. As there is undoubtedly a strong sentiment in favor of requiring an alien to secure naturalization step by step, the retention of the declaration of intention does not appear to be unwise. The other features of the bill are commendable, and it is noticed, as a refreshing innovation, that instead of entailing additional expenditure upon the Government, it will bring revenue into the Treasury by requiring that half the naturalization fees collected shall be a Government tax. The amount thus received will probably be twice as much as the new machinery of supervision will cost.

A UNIVERSITY DEPARTMENT OF ART.

For several years past Columbia University has had the intention of organizing a school of fine and applied arts. This project, which had long been accepted in principle, has been successively advanced by an alliance with the National Academy and by the reorganization of the school of architecture. It now gains a skeleton organization, through the alignment of the existing art resources of the University under Prof. James R. Wheeler as acting dean. This well-known classical archæologist is no novice in the work of organization. He has for years represented the American School at Athens and other archæological enterprises abroad, and has been editor of the *American Journal of Archæology*. Combining in a rare degree exact scholarship with executive ability and a wide acquaintance, he is emphatically the man for the place.

While one feels that the new school starts under excellent auspices, it can do no good and might do harm to represent this beginning as other than it is. It is, as we have noted, essentially a realignment of existing, not an immediate access of new, resources. For example, the appointment to the staff of the president of the National Academy and of the director and assistant director of the Metropolitan Museum, while it secures a most valuable advisory element, does little to provide for instruction of university grade in art history. Mr. Dielman's activities will naturally be devoted to the Academy Schools of Design, which are to become what we must regard as an extra-academic branch of the University; Sir Caspar Purdon Clarke and Dr. Edward Robinson will hardly find time to give regular university courses in their specialties. In other words, what the University gains by this forward step is rather good will and advice of considerable future value than any immediate increase in teaching force. It gives notice of its needs to its friends; it cannot as yet, except in the fields of architecture and of classical and Chinese archæology, make any serious appeal to university students of the history of art.

This makes it desirable that the new school of art should define its policy with all promptitude, pending the recruiting of its faculty. Many friends of the University fear a confusion of aims. For example, courses in the practice of sculpture, painting, engraving, and the like are excellent things, but they have no established place in a university curriculum. Columbia certainly does not mean to award the usual academic degrees for proficiency with brush or pencil. Similarly, the public lecturing on the arts which Columbia has maintained most successfully for years is an admirable work in itself. One may rejoice that this means of popular recreation and education receives the dignity of university sanction without for a moment imagining that it has anything to do with the study of art in a university. Assuming, then, that the practical schools of design will find their place in the academic order and that public lecturing will continue as a most laudable work of supererogation, one might well ask, What of the remainder? What is the scope of a university department of art?

It is, in brief, a school in which the history and theory of the arts are taught by specialists with a view to training up original investigators of the æsthetic and historical problems of the arts. In other words, it is quite as definitely an institution for training specialists as is a bacteriological or an astrophysical laboratory. It has next to nothing to do with the memory of the hand that is so necessary in the practice of the arts, and everything to do with the memory of the eye. Its primary materials are the artistic remains of all time, *in situ* or preserved in museums; its every-day working resources are photographic or other exact reproductions of these originals. Accordingly, the most fruitful university study in these branches is conducted near or actually in museums. With characteristic practicality, the French Ministry of Fine Arts has localized the real study of art history in the École du Louvre, reserving for the École des Beaux-Arts and the Sorbonne those more or less popular lectureships which are profitable to artists and amateurs. From this point of view, the presence of two members of the Metropolitan Museum staff on the Columbia faculty of the fine arts is very significant. At the Museum will naturally be centralized all the material for the study of the history of art. Such collections are a necessary part of every curator's

working equipment. In the future the Museum will probably provide precisely the materials the Columbia student of art requires; naturally the relations between the two institutions will become increasingly intimate.

In order that such relations may be profitable, however, Columbia must first recruit a university staff in art history. At present Dean Wheeler and Professor Hirt, who is an authority on Chinese art, enjoy the distinction of being about the only members of the school who are specialists in quite the university sense. This preëminence they will undoubtedly be glad to share as fast as the generous friends of the University shall provide the means. The cause makes the strongest popular appeal; for, if the primary object of the school is to produce those bat-like creatures, connoisseurs and polemics in the history of art, there will be an overflow readily convertible into those desirable by-products, taste and culture. College courses will be none the less effective as art propaganda because the lecturer is something better than a repository of vague enthusiasms; public lecturing certainly will not languish under the requirement of accuracy; our "deëducated" college graduates will be less likely to buy spurious masterpieces, old and new, if they have been counselled by professors who know artistic reality from its abounding imitations. In fact, there are few fields of special research where the relation between minute investigation and popular education may be so direct and fruitful.

These considerations lend great interest to the actual programme which Dean Wheeler and his associates will, presumably, issue in due season. At present the Columbia art department, with its combination of pedagogical, practical, and theoretical courses, bears too great a resemblance to an omnibus of the roving type—a most useful and worthy vehicle, into which, however, no wise traveller steps or pays his fare until he has received adequate information as to directions and destination. Pending such a route-card, one has the comfortable assurance that the Columbia art 'bus is in good hands.

SALARIES FOR M.P.'S.

By the large majority of 238, the House of Commons adopted, on March 7, a resolution that members of Parliament should be paid salaries. The sum of $1,500 yearly was specified as the allowance members ought to have towards "defraying the heavy expenses inseparable from their office." Similar proposals have often been made in the press and in Parliament, but no such emphatic record of opinion has before been had. It is one of the results of the great electoral upheaval which displaced so many Tory gentlemen by labor representatives. And though the Premier put his veto upon the project for the present, it seems clear that the movement will soon gather force sufficient to compel the Government to give way. We may expect, therefore, in time to see M.P.'s drawing their pay like Deputies and Congressmen.

Argue as one will that this is only an inevitable development of English democracy, it comes as a sort of disagreeable surprise. In England, we may be sure, it will be a shock to many of the best people of the country. They will see in it the glory of Parliament departing. The venerable theory has been that the Commons are simply the gentlemen of England, turning aside for a few months in the year from their ordinary pursuits and amusements to transact the nation's business. The honorable and dignified aspect of this service lay in the fact that it was both voluntary and unpaid. So sharp has been the feeling of incompatibility between a place in the Commons and a paid office that any member accepting an "office of profit" under the Crown has immediately to vacate his seat. He must then submit himself afresh to his constituents, who will say whether they wish him to go back as their representative and also as a servant of the Crown.

Then there has also been the idea, admittedly more beautiful in conception than in practice, that the House of Commons was the finest club in Europe. Englishmen have clung to this even while it was plainly vanishing. The 85 Irish Nationalists long since broke down the club convention. What sort of club courtesy could stand the strain of one-eighth of the membership rising at every meeting to jeer at the president and to denounce the board of governors as incompetent and knavish? It is the Irish, too, who have helped undermine the tradition that a member of Parliament must be a man of independent means, who would scorn the thought of a salary. Many of the Irish representatives are poor men, and their expenses have been paid—not, it is true, by the Government, but by various Home Rule organizations. By so much, this has cut into the old convention. And some Labor members, it is understood, have also accepted contributions to their support while at Westminster. So that the change has already begun. Fashion notes in the English press have remarked that the House of Commons is not nearly so well dressed as it used to be; and Tories who assert that the present House touches low-water-mark politically, point gloomily, in confirmation of their despondent view, to the unprecedented array of baggy trousers and shocking neckties.

Clothes do not make the legislator, but any indication, even an external one, of a falling off in the quality of representatives should arouse concern. What Englishmen have long contended is that the non-payment of members of the House kept out of it mere wind-bags and agitators, and thereby tended to make legislation more serious and informed. A salary, they will now say, will open the doors to empty orators and disturbers of the peace, who will be able to wheedle constituencies into returning them. Doubtless the Labor members could make a fair retort on the score of the assumed superiority of all "gentlemen" in the Commons. They could appropriate John Morley's terrible exposure of the historic blundering of the aristocracy on most of the great moral and political questions of the past hundred years. Yet every impartial man must admit that, if to make the members of Parliament salaried is to make them of coarser grain, and especially if it is to develop in England that class of legislators which is too numerous with us—those who go into public life for the money that can be made out of it—the change should be both deplored and resisted.

The great English safeguards against corruption in Parliament are, however, independent of the question of paying members. All money bills are within the control of the Government. We saw the effect of this promptly illustrated in Campbell-Bannerman's attitude last week. He refused to find the money to pay members. That is responsible government. It takes it out of the power of private members to log-roll wasteful or corrupt measures through. So long as this condition persists, the temptations to devise legislation for the pecuniary benefit of its promoters must be less in England than with us. And English politics has escaped that fountain of political corruption—the protective tariff. With no possibility of passing a customs law to put millions into the pockets of private citizens, there is no opening for that unholy system of bribery and corruption which passes with us under the name of protection. This is one of the strongest points made by English opponents of Chamberlain. Once give Parliament power to vote bounties and money-grants to special interests, Lord Rosebery argued forcibly, and its purity will be gone. Public men are by nature no better in England than in the United States, but the former country has not debauched them by throwing the great money prizes of the protective system into the hands of legislators. With that danger staved off, the English people may view with equanimity the plan to pay their members of Parliament.

TWO ELECTORAL OVERTHROWS.

In spite of Mr. Chamberlain's confident tone, the defeat of protection in Great Britain in 1906 was really far more decisive than was the overthrow

of free silver in this country ten years earlier. According to the London *Times*, the present ministerial party have in Great Britain a popular majority of more than 600,000 in a total vote of less than 5,300,000. The sound-money men in the United States in 1896 had just about the same majority as the free-traders now have in Great Britain, but the total vote polled in the United States was more than two and a half times as great as that cast over the sea. Moreover, if Mr. Bryan lost in the East, he gained west of the Missouri River. In that section of the country he carried by overwhelming majorities States which had never before given their electoral votes to any Democratic candidate for the Presidency. There was no such counter current discoverable anywhere at the recent British elections. Among the members of Parliament from England alone, the Unionists are in a minority of 211. In five counties, Kent, Sussex, Warwickshire, Shropshire, and Rutlandshire, they elected a majority of the delegation. In three others, Surrey, Hertfordshire, and Worcestershire, the representation in the present Parliament is equally divided between Unionists and Liberals. In each of the remaining 33 there is a Liberal majority, and in eleven of the 33 not a single Unionist was returned. Of the Scottish members, 10 are protectionists, 2 Unionist free-traders, 60 Liberals. Wales has not sent a single Unionist of any description to Parliament. Out of the 103 members for Ireland, only 18 are Unionists.

Mr. Chamberlain and other protectionists have pointed out that, while their party has returned a trifle less than one-fourth of the total members for Great Britain, it has polled 44 per cent. of the vote of that island. Ten years ago Mr. Bryan received 47 per cent. of the total vote, exclusive of that given to the Prohibition and Socialist candidates. He secured 39 per cent. of the electoral vote. The supporters of the late Ministry have elected but 24 per cent. of the British members of Parliament. That, relatively to votes polled, they won so much smaller a proportion of local victories than did the advocates of free silver in this country, is due to two causes. First, they polled 3 per cent. less of the popular vote; that is to say, the free-trade majority was, in proportion to the total vote polled, 6 per cent. greater than was the sound-money majority in this country in 1896. Such a difference in the relative size of the popular majority, equivalent as it would be in this country to an increase of 850,000 in plurality of one Presidential candidate over another, is always likely, under normal conditions, to make an enormous difference in the proportion of constituencies carried by the two parties to the contest.

Again, in all the South and the trans-Missouri West, Mr. Bryan was far stronger than Mr. McKinley. There is no considerable portion of Great Britain in which the same may be said for the protectionists. They carried relatively few seats because in relatively very few places were they in the majority. Their aggregate vote was large, because the conservative party in England standing for anything on any platform will always poll a great many votes. The Liberals were committed to free-trade. They were also committed to the repeal of the Education Act. They were hostile to the Licensing Act. They were pledged to a legislative reversal of the Taff Vale decision. Most of their prominent leaders had formerly been public advocates of home rule for Ireland and have never recanted their opinions. Many hundreds of thousands of voters in Great Britain dislike or distrust protection, but they dislike some one or all of these other things still more. To a greater extent than at any time before 1886, the Conservative party is socially the party of the upper classes. Disputes over the Education Act have made it even more than has been usual the party of the Church. The very provisions of its Licensing Act which are so unpopular in temperance circles, command for it the enthusiastic support of the liquor interest. In England the party of the squire, the parson, and the publican can always command many votes, no matter whether it be for protection or against it; but, standing for protection at the late election, there were comparatively few places in which it could command enough votes to win.

In Great Britain in 1900, 381 Unionists, 185 Liberals, and one Nationalist were chosen. Of the 185 seats then carried by the Liberals only four have this year returned Unionists, and in two of these the Unionists won merely because the free-trade votes were divided between Liberal and Labor candidates. On the other hand, of the 381 seats to which Unionists were returned in 1900, no fewer than 246 were lost to that party this year. The mere accidents of the election were, if anything, favorable to the Unionists, to whom the rivalries of Liberal and Labor candidates gave nine seats which they would not otherwise have won. Nine more of them were returned by the Universities and the City of London, practically all of whose voters had also voted elsewhere. Even in the matter of winning close seats they had unusual good fortune. Fourteen of their 157 members were elected by majorities below 100 each, while of the 430 Liberal and Labor seats only 15 were carried by majorities of less than 100.

In not a single county of England did the Unionists return more members in 1906 than they did in 1886, 1895, or 1900. In only one did they return more than they returned in 1892. It is true that Mr. Chamberlain showed that his hold upon Birmingham was still absolutely unshaken, but even in the Midlands as a whole the Unionists fared less well this year than they have done at any election since and including 1886. Even as compared with 1885, before Mr. Gladstone's home-rule policy had split the Liberal party, the Liberal gain in Great Britain was great and decided. In that year the Liberals carried 333 British seats. They (counting Labor members as Liberals) have this year won 427, a gain of 94. Only in Durham in the north and in Warwickshire, Worcestershire, Shropshire, and Herefordshire, in the Midlands, have the Unionists done better than the conservatives did 21 years ago. Nowhere except in the three Midland counties of Warwickshire, Worcestershire, and Shropshire have their gains been important. In 1885 those counties sent 7 Tories and 20 Liberals to Parliament. Now they are represented by 17 Unionists and 10 Liberals. Of this net Unionist gain of 10 seats, 8 are contributed by Birmingham and Aston Manor, and another is the seat for East Worcestershire, for which Mr. Austen Chamberlain sits. Indeed, wherever, as compared with 1885, the Unionists have made any marked gains, they can in most instances be traced to the influence of some local leader or magnate. Of the 333 seats for which in 1885 Liberals were returned, only 36 sent Unionists to the present Parliament, and of these 36 at least 9 are to be put down to the influence of the Chamberlains, and one, the Aylesbury division of Buckinghamshire, to that of the Rothschilds. Another like case was that of Victor Cavendish, who, elected for West Derbyshire in 1885 as a Liberal, has since sat for the same constituency as a Unionist.

Political prophecy is extra-hazardous, but it seems unlikely that the future history of protection in England will differ very greatly from that of free silver in this country. Mr. Bryan, after the election of 1896, was hailed as a peerless leader just as Mr. Chamberlain is now acclaimed. It is even possible, though not probable, that the Unionists in England will make the mistake made by the Democratic party in 1900, and go into another campaign as protectionists. Much more likely their policy will be to avail themselves of some of the divisions which are bound to manifest themselves in the large and heterogeneous minister l majority. If they do, they will seek to get the votes of some of the factions now making up that majority by taking up some new issue; and in order to win on this they will be forced to pledge themselves to let the present fiscal system of the United Kingdom alone.

JESSIE WHITE MARIO.

For forty years this name has been familiar, by its initials, to readers of the *Nation*, as that of this journal's Italian correspondent by way of eminency. Last week we published her animated account of the new Italian Ministry.

"The enclosed pages," ran her private note of February 15, "are the first that I have been able to write since I last sent a letter to the *Nation* [that is, since September, 1905]. I have been very ill, but the new hopes for Italy have wakened me a little. . . . Of course, my book on Stansfeld [the English Mazzinian Liberal] lies three-fourths finished on the shelf. This is to me a dire grief, as it tells of the pioneers who rendered possible the Liberal triumph of to-day. John Burns in the English, and Pantano in the Italian, Ministry—really, I have a Pisgah view, at the age of seventy-five, of the Promised Land."

Two days before her letter appeared in the *Nation*, her funeral procession, as the *Evening Post's* London correspondent telegraphs, "passed the Casa Guidi in Florence, which was decorated in honor of the centenary of Elizabeth Barrett Browning." The association was just, as well as striking. In his chapter on "Italy's English Sympathizers," in his 'Portraits of the Sixties,' Justin McCarthy writes:

"Another portrait properly belongs to this group. It is that of Jessie White Mario, an Englishwoman, who married an Italian and devoted herself with enthusiasm to the advocacy of the Italian cause. She had a remarkable eloquence, and became a regular lecturer on behalf of the cause. At one time she used to draw large audiences in London and in many cities and towns of Great Britain. I have a distinct recollection of some lectures I heard her deliver, and I was greatly impressed by her power of expression and her admirable elocution. She had the gift of making the tones of her voice correspond in every word and note with the feelings she desired to express, and she threw a certain poetic charm into passages which, if spoken by another, might have seemed but commonplace declamation. I had only a slight and passing acquaintance with her, but she impressed me as I have seldom been impressed by any of the women lecturers—many, indeed, in number—to whom I have listened in this country and the United States. Her career was especially characteristic of the epoch I am now endeavoring to illustrate, and she is well worthy of any tribute which can be paid to her by the presentation of her portrait in this chapter."

Her Italian husband was Alberto Mario, a well descended native of Lendinara, whom Carducci has styled "the most naturally republican of the Italians, the most artistically Italian of the republicans, whose ideal fatherland was Athens without slaves, Venice without the Ten, Florence without priests." Born in 1825, he flung himself into the militant revolutionary struggle of 1848, beginning with the Venetian campaign. Thereafter, in behalf of Italian unity, he suffered the usual experiences of persecution, imprisonment, proscription, and exile. With Mazzini's appearance in Genoa in May, 1857, to direct the disastrous expedition against Sapri, coincided Miss White's as correspondent of the London *Daily News*—and more, as active promoter of the expedition together with Mario, to whom she was or directly became engaged, so that, both having been imprisoned, they exchanged fervent letters from their respective cells. Released, and repairing to England, they were married in Portsmouth in the autumn, and Mario resumed his journalistic propaganda. At James Stansfeld's and Peter Taylor's in London they mingled with the exiled Italians—Mazzini, Saffi, Campanella—and their English supporters.

In the latter part of 1858, Signora Mario having been invited to lecture publicly in the United States on and for Italy, her husband accompanied her to this country, and himself addressed the Italian colony in New York in December, and in January, 1859. They journeyed no farther than Washington, and their natural acquaintance was with the anti-slavery circle. The outbreak of the Franco-Austrian hostilities recalled them before they could hear the first bell of our civil war, at Harper's Ferry; and they reached de-Austrianized Milan on July 25, only to be imprisoned afresh at Lagoscuro as "Austrian spies," and so conducted from jail to jail to the Swiss border, where, at Lugano, from September, 1859, to May, 1860, they had (as Carducci says) "the consolation of daily domestic intercourse with Carlo Cattaneo, the honor of Mazzini's confidences and of Cavour's persecution." This persecution drove Mario in hiding from the Canton of Ticino, and forfeited his chance to be one of Garibaldi's *Mille* in the expedition against Sicily; but he and his wife joined the second expedition, and she distinguished herself as the heroine of the ambulance corps.

We can follow Alberto Mario's career no further. He had a mind of truly Italian versatility, as his published writings show: 'Dante and the Dante Codices,' 'Our Contemporary Philosophers,' 'The Stones of New Florence,' 'Lorenzo Canozio and the Renaissance,' 'The Man in Foscolo,' 'The Red Shirt,' 'Carlo Cattaneo.' He remained true to his republican convictions and refused to enter a monarchical Parliament. He died in 1883, and now his widow took up his pen, with a like versatility, treating of Garibaldi and his Times, of Mazzini's Life and Apostolate, of Agostino Bertani, of G. Nicotera. In her *Nation* letters, as our files will show, she followed closely the political development of the peninsula, interspersing these comments with accounts of Florentine Mosaics, or Venetian Glass, or the Italian Industrial Exposition, or the opening of the St. Gothard Tunnel. Ever her thoughts were with the great idealist leaders of the Italian new birth, and she played the part of Old Mortality in editing their writings or memoirs. Among their successors her warmest attachment went out to Carducci. In her final note to us last month she wrote: "I have Mazzinian and Carduccian treasures in store for you if the spring will be kind to my heart and brain." Her two-volume Life of Bertani was issued in 1888. Last year (April 24), "after a six months' painful and tedious illness" and enforced abstention from pen and paper, her 'Life of Sir James Stansfeld, and Mazzini and the Friends of Italy in England,' though "almost finished," was "still on the shelf." A sharp relapse followed, but on May 30 she was "again to the fore." On July 12:

"I am better, but not well; have got through the heavy exams [at the Women's College in Florence] at last, and am now ordered off to the seaside at Via Reggio, where I go on the 16th. If I could hope to get my Stansfeld-Mazzini book ready by the time the Liberals 'come back again,' I would ask no more of fate. Surely, surely, we shall not return to 'protection' in old England??? If we do, then 'manhood suffrage' has proved a delusion and a snare."

To our deep regret we never met this admirable woman, an honor to her sex and to Britain's great name for ardent, world-wide philanthropy. She had a soul sensitive to all misery: our readers will recall her exposition of the horrors of the subterranean life of Naples, of the sulphur mines of Sicily. She was responsive to every proletary movement for relief from oppression or distress, though opposed to violence in the justest cause. She was ever giving of her scanty income to the poor. Her mode of living was almost ascetic. A young American couple who brought her a letter of introduction from us, were so impressed at once by her nobility and by the bareness of her surroundings that they said to each other, at the foot of the stairs on leaving, Shall we not sell our letter of credit, give her the proceeds, and return by the next steamer? On this being reported to generous hearts on this side of the water, and a sum being forwarded to her on a pretext of previous acquaintance, she accepted it—for the orphans of the Garibaldian connection.

TURNER REDISCOVERED.

LONDON, February, 1906.

The opening of a Turner Room in the Tate Gallery has made something like a sensation in London. The doors of that remote gallery are as besieged as the doors of a popular theatre, and the broughams and motors lining the roadway in front show that the sensation is sanctioned by fashion. But if the hangers-on of the correct world are flocking there because it is the correct thing to do, all the art world is going still more eagerly because there can be no question of the interest of this new Turner collection, now so suddenly displayed to the public after having been cheerfully forgotten for years.

I do not know which is the more extraordinary: that the authorities should at last admit their mistake in having overlooked these pictures, or that they should have been guilty of such carelessness in the beginning. Perhaps it is easier to make the admission during the present interregnum at the National Gallery, left for some months past without a director, when any action taken seems to be almost unofficial. I am not one of the people who think it a national crime that all the Turners owned by the nation should not have a place on the walls of one or another of the nation's galleries and museums. The generosity of Turner, it must be confessed, was just a trifle overpowering, for it will be remembered that his bequest to the country included over twenty thousand pictures and drawings, all told. To have hung every one of them, and to have kept them together as he desired, would have meant to put up a new building, or to banish the Old Masters to the cellars, where numbers of the Turners have for so long lain hidden. Tin boxes for a certain proportion of the watercolors does not strike me as an altogether criminal alternative. But it is when the boxes are looked into that there may come the realization of the want of judgment exercised

in selecting the examples to be shut up in them, and you cannot see the twenty-odd pictures now at the Tate Gallery without wondering upon what principle the finest among them were chosen to lie for years neglected in the cellars of the National Gallery, or in its offices and odd corners to which the public is not allowed to penetrate.

Two reasons have been given for the treatment they have received. One is that they were simply forgotten just as old rubbish might be forgotten in some long closed attic in one's own house; the other, that, according to the authorities, their slightness of execution and more or less wrecked condition rendered them unfit for exhibition. And one reason is no better than the other. If a case of mere forgetfulness, it is unpardonable that men appointed, and paid a large salary, to watch over the country's treasures should not have remembered the existence, and the presence on their premises, of the notable pictures of a distinguished painter. One asks, in consternation, what other fine and beautiful things may be thrust out of sight in the dust and dirt of the National cellars? And I am not sure that it might not be well to carry out in earnest a suggestion lately made in jest, and, once a year, to send the directors of the National, Tate, and Wallace collections on an official round, from the basement to the attic of their galleries, in search of lost, strayed, and forgotten masterpieces. On the other hand, it is incredible that the directors—all, I believe, artists—who have succeeded each other since the Turners were placed under their charge, should have had such a poor opinion of the merit and state of preservation of the paintings in question.

As for the pictures, they speak for themselves. They belong mostly to Turner's later period. I admit the loss would not be very serious if some were to return to the cellars. Several strike me, anyway, as sad proofs of the failing of the artist's powers; the greater number are slight and fragmentary sketches. But still, when a painter is as great as Turner (with all his faults) undeniably was, you may understand him the better sometimes for seeing how he failed. You come into closer sympathy with his methods. You realize the more clearly how he looked at things, how he set about expressing them—in a word, what he was driving at. It is true that the exhibition of studies and projects for pictures by little men who, half the time, have not the strength or knowledge to make anything of the sketch or to paint the projected picture, has been overdone of late years. But Turner was not a little man, and no one with the right feeling for art could object to these paintings, even to the least complete of them, on the score of slightness of treatment. And not only this. Curiously enough, they are in a great deal better condition than many that have been for long hanging in the Turner Room in Trafalgar Square. They are not melancholy wrecks, in which you have to imagine all the wonderful qualities Ruskin discovered in them and commanded the world to see and admire with him. The color is pure and fresh, the sun shines as it rises and sets—it has not been eclipsed by the passing of time—skies and mists are luminous. It may be that Turner's worst experiments with varnish, which these paintings seem to have escaped, were deadlier enemies to his work than the damp and squalor of his forlorn house in Queen Anne Street and the dust and darkness of the National cellars. However that may be, only the blind—or the directors of the National Gallery—could have found in the condition of the long-forgotten series an argument for their concealment.

What Turner was driving at in almost all of them, as a glance will convince you, was the expression of light. This was the problem that haunted him, that took possession of him as time went on. I have never thought he came as near its perfect solution in his later work as in a picture like the beautiful, solemn, serene "Mortlake," or others painted about the same period. No matter how devoutly and untiringly the painter studies this most difficult of all the effects in nature, when it comes to putting it down on canvas, he has necessarily to resort to convention. He cannot get rid of his materials; and there is really a formula, though of so different a kind, in the maddest dots and spots of the Pointillistes as in the restraint of Claude. The more Turner tried to emancipate himself from convention in his attempt to get nearer to nature, the less truthful seem the results he obtained. In almost every picture here, you see him facing the problem with renewed zest; almost every one you can fancy brought to the point where he felt the solution slipping away from him further than ever, and then put aside in despair (though other explanations may have been made of their unfinished state). There are canvases where he treats his subject—the sun shining through the mists on some tranquil lake, the sky aflame at sunset—as in his little water-colors. But what was possible to suggest on a few inches of paper, he could not bring to completion on a huge canvas with the same truth and force and loveliness.

None, however, is a more astonishing revelation of his ends and objects and methods than the "Interior at Petworth." I have found people roaring with laughter before it. I have heard artists raving over it as the most marvellous thing Turner ever did. For the artist catches a glimpse of the vision of light that opened before Turner; the layman sees only the chaos of crimson and scarlet and green that came of his effort to express this vision in paint—the vision of brilliant, transfiguring sunshine streaming through vast windows, into a large, spacious, sumptuously decorated room. Vague forms emerge here and there from the chaotic masses of color: a statue in a corner, a mirror or picture on the wall, a sofa against it. But these things, beautifully indicated as they are, had small value for Turner. The light drenched with color, or the color saturated with light, was all he had eyes for; and so long as there is a painter who wrestles with the same problems of light and color, so long will this "Interior at Petworth" and the series of seas and lakes and mountains be to him studies and experiments of immense interest and fascination, as they were to Turner. And the interest is probably all the greater because they remain in this experimental stage, for it is very doubtful if Turner could have carried them further.

Even the most beautiful of all, some comparatively small sketches of Yacht Racing on the Solent, you feel might have been ruined by another touch. Turner never painted anything more full of light and air and movement, nothing more graceful than the line and swing of the sails, nothing fresher than the wind-swept water. Here, apparently, he left off, not because of any failure to express what he wanted to, but because he had recorded his impression to his own satisfaction. It is curious to contrast these with the much larger, unfinished rendering of the "Thames at Waterloo Bridge," as chaotic a canvas as the "Petworth," with a huge white boat, more suggestive of the Hudson River in the old days than of the Thames, looming dimly through the fog and sending up into the heavy atmosphere a dense cloud of the most wonderfully painted smoke. The picture that comes nearest completion, or rather that is complete, is "The Evening Star," the sea, in the hour before night, under a sky from which the light has all but faded—a most delicately painted sky. There is such an endeavor to render the solemnity and peace of the hour, of the tender color and mysterious light, that I am not surprised to find the critics comparing it to a nocturne by Whistler.

Now it so happens that a nocturne by Whistler is at the present moment hanging in a neighboring room in the same gallery—"Old Battersea Bridge," recently presented to the nation, then hung abominably at the National Gallery, and now removed to the Tate, where it is treated with the consideration and respect it deserves. You leave the Turners, with their splendid, but obvious, struggles and strivings to conquer the secrets of light, and you turn to the quiet little Whistler, supreme in its mastery of these secrets, and with absolutely no trace of labor or of effort. If, in the Turner Room, your interest is in the experiments, in front of the Whistler it is in the perfect achievement of the master. But the presence on the walls of both the experiments and the achievement have given the Tate Gallery an importance it never had before, and no one who cares for art can now afford to come to London without making it a visit. N. N.

SIAM TO-DAY.

RANGOON, January 4, 1906.

Among the political and social questions which agitate the world to-day, there is none of more transcendent importance for the future of mankind than that of the capacity of the Asiatic and African races to work out their own salvation independent of foreign control. The subject has already given birth to much heated controversy, which, moreover, is probably only just beginning. We Americans have to face the matter in the acute domestic form of the negro problem in the South, and especially of the claim of the colored man to the suffrage. The question of the Philippines is fortunately a more external one, yet it is perhaps even more far-reaching in its effects on the principles which have been at the base of our whole theory of government. Great Britain has

had to encounter the demands of the new educated generation of her native subjects for a greater participation in the work of shaping the destinies of India, and this agitation looms large for the future. Even in South Africa there are the beginnings of a native movement. France will soon have to meet the same difficulties in Indo-China, Algeria, and elsewhere, while she views with concern the unsatisfactory conditions of her two old possessions, Martinique and Guadeloupe, where the blacks are dominant. In short, all the world-powers to-day are vitally interested in the ability of what we usually term the inferior races to maintain—with foreign advice if need be, but under self-government—the standard of law, order, and civilization requisite according to our modern ideas.

Such being the case, we turn eagerly for guidance to the study of what has been achieved of late years by those Asiatic and African States which have seriously attempted to put new wine into old bottles, and which have been allowed to try the experiment long enough to produce some tangible results. As might be expected, the testimony we get is conflicting, and usually it does not enable us to draw definite conclusions. There are too many elements to be considered. For instance, does the accident that the destinies of a people happened during a critical period to be shaped by a particularly efficient or inefficient despot prove anything as to their own political abilities? Modern Egypt was created by the Albanian adventurer, Mehemet Ali, and wrecked by his grandson, Ismail. Only with the revolt of Arabi do we have anything like a national movement, and that was chiefly a military one. What light do we get from this on the capacity of the Egyptians for self-government or the necessity of British occupation? Many of our other examples aid us but little more. The questions of China and of the Ottoman Empire are too vast, too confused, too complicated by disturbing influences, for us to be able as yet to draw many certain conclusions from them. In Madagascar a promising independent development was nipped in the bud by the French conquest. Korea, after an unsatisfactory but inconclusive experience, has been taken in hand by Japan. Persia is certainly not much of a success so far. Afghanistan and Morocco have hardly started on the road of Western progress. Abyssinia has for some fifteen centuries been a Christian country, though long almost cut off from intercourse with the rest of the Christian world. While this does not determine the racial possibilities of her population, nevertheless her present reawakening may almost be regarded as that of a laggard member of the sisterhood of European communities. The only Oriental non-Christian States which in our day have truly learned for themselves the lesson of European ideas and civilization are Japan and Siam.

At the present moment of their triumph, few critics would be found bold enough to deny that the Japanese have been brilliantly successful in taking over what they desired of Western civilization, in mastering the spirit as well as the letter, and in applying it to their own uses. Their success has, indeed, been so complete that it has not only given a rude shock to the complacent idea of the innate superiority of the white race; it has also inspired with vague alarms many people not otherwise unfriendly to the island empire, and it has, as all admit, introduced into world politics a new factor of the first magnitude. The transformation now going on in Siam has naturally attracted far less attention. It is a movement on a much smaller scale, with incomparably less direct influence on the world at large. Its lasting success, too, has yet to be proved, especially to those who are unacquainted with the country. None the less it is a phenomenon of much interest in itself, and, as another example of Europeanization from within, not from without, it deserves the attention of serious students. The object of this letter is not so much to attempt a sketch of what is being done in Siam to-day, as to call attention to the fact that much is being done.

Unlike Japan, Siam points to no one important date as a landmark in the story of her recent development. She has never systematically shut herself from intercourse with the outside world; therefore, she has needed no Commodore Perry to open her gates for her. Roughly speaking, we may say that her transformation began with the accession of the present king in 1866, though his father, Mongkut, was in many respects a man of liberal views. He even imported for the benefit of his children an English governess, who has written an entertaining account of her experiences at the court of Bangkok. When King Chulalongkorn came to the throne, he found himself at the head of a State, larger, it is true, than almost any European one, but with loosely defined boundaries, extending in theory well beyond the limits of actual Siamese occupation. In the outlying provinces, the authority of the central government was little more than nominal, and in the country as a whole the Siamese proper formed, as they still form, only a minority of the population, being outnumbered by the mass of Malays, Chinese, Cambodians, and tribesmen of various kinds. To-day, Siam finds herself considerably smaller than she was then, thanks to the aggressive policy of the French, which led to the unfortunate and badly-managed dispute of 1893, finally ended to her cost only a few months ago. Even in the territory left to her, she is threatened by the extraordinary Anglo-French Treaty of 1896. Without provocation, Siam was practically divided into three spheres of influence, of which only the central one was assured to her for the future as her own. The way thus seems to be left open for fresh aggression on the part of either of her powerful neighbors, without fear of hindrance from the other provided the aggression is not pushed beyond the prescribed limits. In compensation for this cool way of dealing with her, Siam can at least feel that the independence of the most important third of her territory is guaranteed. She can dispense with any but a small standing army—a large one would be purposeless; all her questions of boundary are definitely settled, and if she steers her course wisely, the influence of Great Britain and France in the spheres claimed by them may never become actual possession. It is an interesting fact in this connection that the nation which now has the largest number of vessels trading with Bangkok and is gaining ground fastest, is Germany.

Within the present borders the Siamese Government has quietly extended its jurisdiction, so the day of semi-independent chiefs in the provinces is about over. The writ of the King may not extend so far as of old, but it is much better obeyed. The Government itself has been pretty thoroughly reorganized on modern lines. To be sure, it may seem amusing to us that almost all the ministers of state are half-brothers of the sovereign, but it should be remembered that this is one of the few possible ways of utilizing any numerous royal family which otherwise tends to be cumbersome, if not worse. Here there is some field for choice, as King Chulalongkorn was one of a family of over eighty children. Accordingly, he has put many of his brothers into important posts where he has known how to utilize their talents, while he has kept them in a very wholesome dread of himself. All things considered, his ministers appear to compare not unfavorably with the average of their colleagues in other lands. Perhaps the ablest of them is Prince Damrongtse, Minister of the Interior and right-hand man of the King. He is exceptionally intelligent and well informed, has travelled much and met many people; he speaks English with perfect ease, and is a man of thoroughly progressive ideas. In the different branches of the administration a number of foreigners are employed, a preference being shown (for obvious reasons) for citizens of states from which there is nothing to be feared, such as Belgium and Denmark. For the last two years the most prominent stranger in the Siamese service has been the Hon. E. H. Strobel, who has been so successful that he has created for himself a unique position in the country. Over and above all stands the King, to whom his people owe a great deal. He is a true ruler of men, tirelessly energetic, seeing into everything, alert, broadminded, and possessed of common-sense. In 1897 he made an extended tour in Europe, and he has profited by what he saw. He knows how to make himself obeyed, and he knows how to take advice.

It is, of course, as impossible for a tourist to appreciate in a few days how much really has or has not been accomplished of late in this country as it would be to describe the results in a few lines. One can only mention a few facts obvious at the first glance or admitted to be beyond dispute. To begin with, Siam to-day is prosperous. This is shown by the increase of her revenues, of her railway receipts, and particularly of her export trade. Taxes are light. A first foreign loan has just been arranged on such favorable terms as to prove that the national credit stands high. There are already several hundred miles of railway, and the only reason why the system is not extended more rapidly is that the Government is unwilling to build on borrowed money or to hand over the work to outside (*i. e.*, foreign) capital. The telegraph and telephone have penetrated into out-of-the-way places. Public order, as far as one can learn, is excellently maintained, and there is reasonable security to life and property, except possibly in some of the remoter

districts. A code of law is being prepared which shall reconcile, as well as may be, modern scientific principles and existing national customs. Popular education is chiefly in the hands of the Buddhist clergy, and the knowledge of reading and writing is widespread, even among the lower classes; but in this there is nothing new. What is new is the introduction of Western methods, especially in higher education. There is happily no need for a large army or navy, but the soldiers one does see look pretty shipshape. Bangkok can boast of some interesting buildings (mostly temples), of shops with many kinds of European goods, an electric car service, besides two grades of public carriages, and some well-kept roads patronized by an automobile club, of which the King is an enthusiastic member. Everywhere soldiers, policemen, etc., are in Western dress, but the Siamese men of the upper class have generally adopted a good-looking mixed costume combining the European straw hat or sun hemlet, a white duck jacket, long stockings and low shoes, with the native panung, a strip of cloth, usually of some shade of blue, wound in such a way as to make baggy knickerbockers. Among the women there is still a certain amount of Oriental seclusion, but this appears to be breaking down, and on some occasions one may freely not only see, but meet, Siamese ladies of high rank.

All this makes a pretty creditable showing as the results achieved in little over a generation by a long-stationary Eastern country. The difficulties to overcome have been and still are great, not the least among them being the exterritoriality of resident foreigners, an incubus which the Japanese had such difficulty in getting rid of, and which is a much more serious evil here, where the privileged foreigners include thousands of Asiatics under English and more notably under French protection. Their privileged position continually blocks the paths of justice and improvement. Of course, in Siam, as elsewhere, all is not gold that glitters. There are deficiencies, inconsistencies, and crudities in abundance, but, when all is said and done, the progress made is remarkable. Next only to the Japanese, the Siamese may claim that they have presented the most successful instance in modern times of the independent rebirth of an Oriental people. Whatever conclusions we may draw from the fact, the example is certain to have influence in more than one part of the world.

ARCHIBALD CARY COOLIDGE.

Correspondence.

MR. REID MISREPORTED.

TO THE EDITOR OF THE NATION:

SIR: I have read with great regret your paragraph, in the issue of March 8, on my utterances or supposed utterances before the Vermont University Alumni. I say with regret, not because I do not agree absolutely and unequivocally with the sentiments which you have expressed therein, but because those sentiments were called forth presumably by the grossly inaccurate statements which the press published in reporting my talk.

I was much disturbed at the reports, at the time, but took no notice of them because, in previously attempting to correct misstatements, I have usually found that matters were not bettered. The facts are that I did not, never have, and never shall pay out one copper cent in the endeavor to secure athletes for Harvard. Such mild ideas as I once had on this subject I have wholly outgrown, and practise here no solicitation nor tolerate such practices in any form whatever. The one thing above all others that I have tried to develop at Harvard is the spirit of fair play and honesty in our contests.

Hoping that this will correct an unfortunate and wholly erroneous impression of our Harvard standards, I beg to remain, very sincerely, W. T. REID, JR.

HARVARD UNIVERSITY FOOTBALL ASSOCIATION, CAMBRIDGE, MASS., March 12, 1906.

AN INTERNATIONAL LANGUAGE.

TO THE EDITOR OF THE NATION:

SIR: Since Esperanto is now discussed so much in this country, will you allow me to call the attention of the readers of the *Nation* to a movement in favor of an international language, but which is absolutely independent of any propaganda for Esperanto?

At the scientific congresses held at Paris in 1900, the serious drawback resulting from the different tongues used by the delegates was more strongly felt than ever before. Moreover, it was evident to all that the evil could only grow worse in time. In view of the increasing number of valuable scientific contributions in Italian, Spanish, Russian, Norwegian, Swedish, Danish, Dutch, etc., it seemed impossible to limit one's self, as before, to the three languages, English, French, and German; impossible to accept one or two of the above-named languages and leave the others; impossible to recognize them all. The only solution was to try and agree upon an international language, a language which could be used on such occasions as international meetings, and by means of which also written contributions could be put within reach of co-workers who are not familiar with an author's tongue—in fact, nowadays, it is in his daily work especially that the scholar is hampered by the question of language.

Several of the international congresses in Paris decided to appoint at once some of their members to study the question. The delegates, a few months later, organized themselves under the name, "The Delegation for the Adoption of an International Language." Their aim, as expressed in a published "Declaration," is to ascertain (1) whether scholars all over the world will consider with favor the adoption of an I. L.; (2) if so, whether they will not entrust specially qualified persons with the task of selecting the I. L. (The International Association of Academies is proposed.)

The Delegation suggests that none of the national idioms be chosen (art. ii. 3). But the Königliche Akademie der Wissenschaften of Erfurt has asked leave to sign the Declaration without adhering to this special clause, thus leaving the question open altogether. The Delegation has accepted this restriction.

The *Educational Review*, edited by President Butler of Columbia, will publish shortly the text of the Declaration, together with some information as to the interest manifested toward it by European scholars in the three or four last years. Some 200 societies have given their adhesion, and among the personal supporters of the idea are men like Berthelot, the chemist; Liard, Rector of the University of Paris; Sir William Ramsay, Hugo Schuchardt, the linguist. Individual signatures, it must be said, are accepted *only* from university or college professors, and from members of scientific associations of high standing. Between 700 and 800 have already signed. Americans alone have remained utterly indifferent so far. Is it not the duty, as well as the right, of our scholars to discuss the question and to manifest their opinions? A. SCHINZ.

BRYN MAWR, PENNSYLVANIA, March 9, 1906.

P. S.—If more information is desired about the Delegation before the article referred to above is printed in the *Educational Review*, it can be obtained from Prof. Louis Couturat, Collège de France, Paris. The text of the Declaration, with subscription blank attached to it, can be had by addressing the signer of this letter.

LOWELL AND MEREDITH.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation's* excellent review of Mr. Greenslet's 'Lowell,' a remark as to the books presented by Lowell to the Harvard Library suggests an added touch in the nature of the fatal *grain de beauté* that completes the picture. On the Harvard shelves may be seen, in the plainest of ugly brown-canvas bindings, a copy of George Meredith's Poems. The title-page discloses three interesting facts: firstly, that it was presented by Meredith to Lowell, as the autograph, "with the author's compliments and respects," attests; secondly, that it was published in 1883; thirdly, that in 1885, not more than two years later, it was presented by Lowell to the Harvard Library. The inferences, if painful, are obvious.

R. M. J.

March 5, 1906.

THE STONE-CUTTER AT WORK.

TO THE EDITOR OF THE NATION:

SIR: I call the attention of philologists to the following mortuary inscription taken from a tombstone in a country graveyard in Michigan, half way between Ann Arbor and the neighboring town of Saline. It is as yet inedited:

JOHN MANN
Died
April 11, 1843
Aged
67 y'rs, 11 M's.
& 1 D'y
A weight a feather a chief a rote
A hornest man
Is the noblest work of God.

PHILOLOGUS.

Notes.

At the request of Prof. Bernhard Scuffert of Graz, Austria, representing the Royal Prussian Academy of Berlin, all institutions or individuals having any manuscripts of Wieland or letters to him are hereby earnestly urged to give notice of the fact, and thus materially further the very elaborate edition of Wieland's complete works, translations, and letters now being prepared by the Academy. A similar appeal is also made in regard to material for the great edition of Goethe proceeding from the Goethe-Schiller-Archiv in Weimar. It may be added, on official authority, that this institution was in no wise affected by the pilferings of the antiquary Bach, of which reports appeared in the American papers some weeks ago. Any information as to the above matters may be sent to Leonard L. Mackall, Johns Hopkins University, Baltimore.

Little, Brown & Co., Boston, announce a special limited edition of Petrarch's 'Triumphs,' translated by Henry Boyd, and printed at the University Press from Humanistic type expressly made for this publication, together with six plates from ancient Florentine engravings. Other spring issues will be 'The Heart of the Railroad Problem,' by Prof. Frank Parsons; 'Centralization and the Law,' by Melville M. Bigelow, Dean of the Boston University Law School, and others; 'The Fight for Canada,' by Major William Wood; 'Thunder and Lightning,' by Camille Flammarion; and 'Practical Rowing, with Scull and Sweep,' by Arthur W. Stevens.

A Corpus of new Babylonian inscriptions which have been prepared for publication by the Orientalist Stephan Langdon, is soon to be published by the Paris house of Leroux. The first volume is already finished in manuscript, and contains the inscriptions of Kings Nabopolassar and Nebuchadnezzar. The editor has not confined himself to inscriptions which were found on Babylonian soil, but embraces also those which were unearthed elsewhere, *e. g.*, such as were carried by the Kings of Persia to Susa and were recently found there by French savants.

We have received from the Massachusetts Society of *Mayflower* Descendants a sixty-page reprint of Gov. William Bradford's Letter-Book, from the Society's organ. The original MS. of this fragment has been lost, and recourse has been had to the Collections of the Massachusetts Historical Society (vol. iii., 1794—a respectable antiquity itself).

There could be no more favorable moment for a reprint of Oscar Wilde's 'Intentions' (Brentano's) than now, when, through his 'De Profundis,' that pathetic voice from the grave, he has made his peace with the world. These four essays, in an attractive edition, do in fact represent Wilde's most permanent contribution to criticism. Fantastic his utterances often are, but they are always shrewd, penetrating, suggestive—if we may be allowed to use a word that has been overworked and ought to be pensioned off. The reader who once, perhaps, read 'Pen, Pencil, and Poison' with an appreciation of its writer's talent that was half reluctant because the callousness of the sentiments expressed repelled his sympathy, should read it again with a greater indulgence and a more generous discount. Wilde's poetry was poor and imitative, but he could, when he chose, write excellent prose—too florid now and then, as he himself was too florid, but rhythmical always without being metrical, as æsthetic prose too often is. In "The Critic as Artist" he is at his best, and for that essay, at any rate, one need demand no indulgence.

To their charming series of books illustrated in color, Messrs. A. & C. Black (Macmillan) have added 'The Homes of Tennyson,' described by A. Paterson and painted by Helen Allingham. Mrs. Allingham's talent for watercolors is well known, and the twenty full-page illustrations in this volume are, we need hardly say, exquisite in every detail. The text of Mr. Paterson merely serves to hold the pictures together, and throws no fresh light on the life and character of Tennyson. The poet's homes, Farringford in the Isle of Wight and the more stately Aldworth, which he built under the lee of the moor of Blackdown, as a hiding-place from the tourists of Farringford, are still maintained as seats of the Tennyson family, escaping, so far, the fate of becoming museums. Tennyson, long before Mr. Kipling, sang of the fascination of "Sussex by the Sea"—

> "Green Sussex, fading into blue
> With one grey glimpse of sea"

—but Farringford, which he bought with the proceeds of 'Maud,' is thickest with memories of his best years. There, on his favorite down, was erected by English and Americans the great stone cross which serves as a beacon to mariners who must encounter the dangers of the Needles. Mr. Paterson's share in this book, whose value is quite unaffected by his defects—sentimentality and exaggerated adoration of Tennyson—would call for no remark had he not loaded his pages with a construction that must give pain to the sensitive reader. This is the "hanging nominative," of which even the best writer may once in a great while be guilty—we met it the other day in the works of the late Canon Ainger, himself a purist of the first water; but with Mr. Paterson it has become a habit. "Passing from right to left on the ground floor at the extreme right is one of the dining-room windows" (p. 60), is a good instance of the absurdity that may result from this sort of error. Mrs. Allingham has prefaced each one of her illustrations, which are excellently reproduced, with a few words of explanation that she always contrives to make interesting.

In 'The Way of an Indian' (Fox, Duffield & Co.), Frederic Remington has told a very effective story of the tragic clash of the Indians of the Northwest with the resistless onward movement of the white man. The career of White Otter, a Cheyenne boy, is traced from his first taste of the life of the warrior, through successful exploits against Indian foes or straggling parties of trappers and traders, down to the evil days when his bat-skin "medicine" weakens against the more potent spells of the ever rising stream of "Yellow-eyes" pouring into the plains each spring and summer from the inexhaustible caves of the East, even as the buffaloes had been wont to pour up from the mysterious caves of the South. At last, overtaken in the mountain fastnesses to which his people had been driven in search of safety, tho lodges destroyed by the flames, his young squaw dropping in the snow behind him at the touch of a deadly bullet, the spirit of his little boy filched away by the icy wind upon the bleak crags even as he held him tight in his arms, he sits down with the little frozen form across his knees and waits for the evil spirits to come from among the pine trees and take him, hoping that in the spirit-land he may find again the Cheyennes of his home and youth, walking and talking together at peace, in warm valleys. Fifteen of Mr. Remington's pictures illustrate the book, two of which are reproduced in color.

'Studies in Roman History,' by E. G. Hardy (London: Swan Sonnenschein & Co.; New York: Macmillan), is a new edition of the author's well-known work on 'Christianity and the Roman Government,' supplemented by half a dozen other essays, two of which originally appeared in the *English Historical Review*, three in the *Journal of Philology*, and one as part of an introduction to an edition of Plutarch's 'Lives of Galba and Otho.' To readers who are already acquainted with Mr. Hardy's careful and capable work, the information conveyed in the preface, that loss of eyesight has closed to him all avenues of further research except such as he may follow by the aid of the eyes of others, will bring a feeling of the deepest regret and heartfelt sympathy. For this reason the studies here republished appear practically in their original form, although the author would have wished to subject them to a thorough revision. We do not see why the supplementary essays should have been numbered consecutively with the chapters of the work on 'Christianity and the Roman Government,' as the unity of that work is thus sacrificed to the eye with no apparent gain.

The February number of the *Library Journal* contains a paper of no little interest and suggestiveness concerning the operations of the Washington County Free Library, Hagerstown, Md., by the librarian, Mary L. Titcomb. The core of the matter consists in the methods of reaching the outlying districts, and prominent among these is the Book Wagon, of which an illustration is given. From Miss Titcomb's fourth annual report it appears that "fiction is much less in demand in the country than in the city," that "the demand for the 'best seller' is unknown, and the librarian finds that the books of greatest permanent value which the wagon takes out are almost never brought back at the end of the day's work." The community which thus reaches out to the light is Southern, but not typically so, having a large proportion of inhabitants of Pennsylvania Dutch or German descent; Dunkards and Mennonites being very numerous. Since the war, Hagerstown, by the springing up of manufactures, has become the third city in Maryland.

Mr. Charles F. Lummis's first annual report of the Los Angeles Public Library since he took direction of it, is as unconventional as was to be expected. His directors have not been dazed by his proposed innovations, but have cordially seconded them. He has adopted the system of inserting in the volumes themselves "the judicial estimate of experts"

derived from leading English and American reviews. He has instituted a department of Western History Material made up of clippings from local newspapers, "condensed, classified into books, and indexed." Works in early American history, especially of the Pacific Slope, have been doubled in the past year. 'A Dictionary of Western Place-Names' is to be prepared under the auspices of the Library. Every city architect and contractor is to be furnished with lists of the Library's collection of architectural photographs. Mr. Lummis renounces the Librarians' "catalog" and other deformations; and he will modify to his needs the Dewey system of classification already established.

The Deutsche Dichter-Gedächtnis-Stiftung of Hamburg-Grossborstel, an organization recently established for the purpose of supplying the smaller libraries of the country with the best literary works in larger numbers and in good bindings, reports that in the first year of its activity it distributed among 485 public but poorly equipped libraries 18,063 volumes. These libraries are found not only in all parts of the Empire, but also in the "German Dispersion" in Russia, South America, and elsewhere. Applications for the second year have already been received to the extent of more than thirty thousand volumes. The literary and moral quality of what is sent out is carefully controlled.

In several respects the statistics of the twenty-one German universities for the present winter semester are noteworthy. The total attendance is now 47,035, by a considerable margin the greatest in the history of these institutions. The relative increase, too, as compared with the enrolment of the preceding half year, is the largest ever known, the matriculated student body having grown from 39,719 to 42,390. The woman contingent has also reached its high-water mark (1,907), of whom only 138 are matriculated and consequently candidates for examination and degree. Hence 1,769 are "Hörerinnen," a respectable figure as compared with 2,876 "Hörer." The general lesson of the new statistics seems to be that the larger universities are becoming larger and the smaller smaller. It seems not impossible that in course of time Berlin will have that preëminence in the German educational world that Paris has in France. The foreign contingent is also the greatest ever reported, being 3,555, or 8.4 per cent., as compared with 7.8 per cent. in the preceding semester. In this element the Russians occupy the front rank with 1,326, while 309 are Americans, nearly all from the United States.

—To the forthcoming Proceedings of the Massachusetts Historical Society Mr. Charles Francis Adams contributes a paper of no little curiosity and significance. It relates to his illustrious grandfather at the beginning of his career in the lower House of Congress, which was to overshadow his Presidential administration. The materials are J. Q. Adams's letters to his family, and the rough notes which he never found time to transcribe in his Diary, thus causing a regrettable lacuna (March 23-December 1, 1832). Andrew Stevenson of Virginia, Speaker of the House, between the compulsion of a decent respect for the ex-President and a Southern dread of him in the place where he eminently belonged (Foreign Affairs), ended by making him chairman of the Committee on Manufacturers, much to the veteran statesman's dismay, who had never so much as mentioned the tariff in any of his messages to Congress. His grit, however, was equal to the occasion, and he presently found himself committed to a reduction of duties contingent upon the proximate extinguishment of the national debt. This brought him into direct conflict with Henry Clay, and such was the hubbub within and without (it was the era of Nullification) that Adams foresaw an end of the Union in five years—in twenty at most. Nevertheless, the compromise bill introduced by his committee passed both House and Senate by large majorities, but was promptly declared null and void by South Carolina.

—The report, from Mr. Adams's pen, accompanying the bill stimulated Speaker Stevenson to break the force of its argument in behalf of internal improvements by publishing a private letter only two years old from ex-President Madison to the contrary. To this, Mr. Adams replied in a long letter to the *National Intelligencer*, which now forms a part of Mr. C. F. Adams's paper, and was eminently worthy to be brought to light. Meanwhile the old man eloquent had successfully resisted a move to censure him for refusing to vote on a resolution censuring another—the first of his brilliant triumphs in this line. The report, to return to it for a moment, was remarkable for meeting the current threats of dissolving the Union by asking, What would be the necessary consequence? and answering War, and suggesting, in the circumlocution of the time, "to those who deny the power of this confederated government to protect by the energy and resources of the whole nation a great and comprehensive but not universal interest [manufactures], that there is an interest [slavery] most deeply their own, protected by the Constitution and laws of the United States, and effectively protected by these alone." Let statesmen North and South consider "the condition in which that great interest would be found immediately after the separation should have been consummated." The letter to Stevenson is largely an acute discussion of the Constitutional authority "to provide for the common defence and general welfare," but it also most interestingly reviews the Louisiana purchase, which Mr. Adams approved under the above sanction, while opposing the bill enabling the President to take possession of and temporarily govern the newly acquired Territories. He believed a vote of the people of Louisiana necessary to effect annexation, together with an amendment to the Constitution. When he saw the other course condoned by the Louisianians and the American people, he regarded the Constitution as *de facto* amended, and the subsequent Florida purchase and annexation he even furthered. The protection of American industry had now one Constitutional argument the more. Congress had assumed, by loose construction, the "power of investing the President of the United States with all the despotic authority of the King of Spain," together with "the power of absolute legislation over a foreign nation, of holding in subjection a foreign people, taxing them without their consent, and fettering them into freedom"—how vivid a picture of what was repeated in the case of the Philippines! But Mr. Adams could not "allow that Mr. Jefferson, as President of the United States, but at the same time a citizen of a Southern slaveholding State," should adopt a broad and liberal construction for "one set of measures transcendently advantageous to the Southern and slaveholding interest, and then to retreat upon a narrow and niggardly construction of the same terms" to deny Congressional protection of Northern manufactures from foreign rivalry and competition.

—The Rev. Father Algué, S. J., Director of the Philippine Weather Bureau for many years, has just issued his report for January from the Central Manila Observatory. Although this month occurs in the dry season, so that little rain is expected, the unusual decrease in the rainfall this year is remarkable, placing the month among the lowest on record. For the first time since 1865, or as far back as the records of the Observatory go, Manila had no rain whatever. Samar and eastern Mindanao had a fairly good rainfall for January, as shown by the table of differences; also, southeastern Luzon and the Batanes Islands northward. The monsoon was much stronger than customary on the high seas and in the San Bernadino Strait; and the account of her experiences with winds and currents of the disabled steamer *Carlisle* makes interesting meteorological reading. In so dry a month generally the conditions were naturally not of the best for agriculture, and the drought was especially felt in the eastern portions of the islands, whose products require more water. Despite lack of rain, the mornings were very humid, and in Basilan plants were kept alive by the abundant dew. The scarcity of carabaos, however, is quite as much a menace to agriculture as drought, and a majority of towns sending reports to the Central Observatory note this lack. Injurious animals and insects seem to be few, except a moth (*Calogramma festiva*), whose larva works great destruction among all classes of liliaceous plants. Earthquakes of moderate intensity occurred in various regions on a number of days, and the Vicentini microseismograph of the Observatory recorded on the 22d important disturbances. On the 27th an earthquake of small force but long duration was felt in all the central provinces of Luzon, whose centre must have been in the western part of the island, near the Zambales range. Its characteristics furnish good confirmation of the two different types of seismic movements sometimes felt at Manila, and which seem to have some connection with volcanic centres around the active volcano Taal. Along the Zambales and Mariveles ranges a secondary centre seems to exist, one of the least dangerous for the capital.

—A successful preliminary expedition was undertaken last summer by Mr. A. Lawrence Rotch of Blue Hill Observatory, and M. L. Teisserenc de Bort, for exploring by kites the atmosphere over tropical oceans. Using the *Otaria* (a steamer equipped with an electric kite-reel) as a base, wind direction, drift of cloud, and other phenomena were studied, not only over the open sea, but above Teneriffe, at Madeira, and the

Cape Verde Islands, with particular reference to trade winds. The results point empbatically to the fact that winds blowing equatorward vary in direction between northeast and northwest. These last, generally above the northeast stratum, have a thickness from three to five thousand metres. The "anti-trades," so called, were found to be much higher, above the Cape Verde Islands being observed by a balloon at not less than 6.8 miles altitude. Their direction is southeast, south, and southwest; currents of great thickness but small density. High altitude observations at Havana and in the Antilles offer still further proof of the existence of these winds, which had been denied by Dr. Hergesell; and one of the important results of this expedition is to have confirmed the accepted view of trade winds and the long-suspected anti-trades.

—From Ferris & Leach, Philadelphia, we have a slender volume of essays, on 'Quakerism and Politics,' by President Isaac Sharpless, of Haverford College. One of these essays, dealing with the ills of Pennsylvania, appeared in the *Atlantic* four years ago, as a protest against an anonymous attribution of Pennsylvania's notorious latter-day corruption to the non-militant habit of mind engendered during the period of Quaker ascendency. Of course, Dr. Sharpless had no difficulty in refuting that charge, though, if the assailant had chosen to indict the Quakerism of his own time for failing to bear adequate testimony against existing evils, the answer would have been less obvious. The preface bears a note of pleasure that, in the recent uprising, the Friends have been represented far beyond their proportionate numbers; but doubtless he would have been happier had the name of no prominent family of Friends been identified with the side of the machine. We imagine that some changes might have been made in the book had it not gone to press before the Philadelphia revolt had taken shape and won some of its successes. Perhaps Dr. Sharpless is not quite so sure to-day that the political machine is simply the answer to the demand of the age for efficiency, and a creation against which it is idle to protest. Efficiency as an implement of "graft" and self-seeking it undoubtedly possesses; as an implement of the legitimate ends of Government, it is the greatest foe to efficiency ever encountered. In a chapter written in 1904, the author describes the condition of Pennsylvania politics as being such that one party "can elect almost any reasonably reputable man by presenting him to the public." To most observant outsiders, it would have seemed nearer the truth to say that the Republican machine at that date could elect any *un*reasonably *dis*reputable man. We shall not quarrel, however, with a book which in general gives wholesome and needful counsel to Pennsylvania Quakerism as to its political duties and responsibilities.

—Collections of Greek inscriptions until a quarter of a century ago were published in ponderous folios, with commentaries intended only for those who had been initiated in the innermost mysteries of Greek scholarship. They were not for the use of the ordinary student of the classics, and indeed thirty years ago probably not a score of copies of the old 'Corpus Inscriptionum Græcarum' existed in this country. Of late years German, French, and Belgian scholars have published admirable collections of these inscriptions in convenient form, but either with no commentary at all or with rather technical notes. An excellent volume of Greek historical inscriptions, with English introductions, has reached a second edition, but seems to be intended for the use of scholars, or at least of those who have scholars as teachers. A recent volume, however, 'Attic Inscriptions' (the second volume of Roberts's 'Greek Epigraphy,' Macmillan), edited by E. S. Roberts, Master of Caius College, Cambridge, and Ernest A. Gardner, Professor at University College, London, gives more than four hundred inscriptions, dating from the sixth century B. C. to the fourth or fifth century of our era—Decrees of the Senate and People, of Foreign States, Tribes, Demes, etc., Imperial Ordinances, Documents pertaining to finance and to ritual, Dedications of statues, Inscriptions on the seats of the Theatre of Dionysus, Sepulchral inscriptions, etc. The commentary is concise and never trivial, but it gives all necessary information in regard to technical phrases and unusual words and constructions, as well as regards matters of history and antiquities. Every teacher of Greek ought to have some knowledge of these original documents. Even the classical teachers in high schools may find such a book more helpful and stimulating for their private study than anything but the works of Homer and Xenophon. That all teachers of ancient history should read these documents is earnestly to be desired.

THE LIFE OF LORD GRANVILLE.

The Life of Granville George Leveson-Gower, Second Earl Granville, K. G. By Lord Edmond Fitzmaurice. With Portraits. Longmans, Green & Co. 1905.

During more than forty years Lord Granville stood in the front rank of English public men, filling one after another of the chief offices of state, and exerting behind the scenes an influence which many holders of great offices never obtain. Connected by family ties with several of the great Whig houses—houses which determined the course of events in England far more in those days than they do now—he was peculiarly well placed for adjusting differences and arranging combinations. Once, in 1859, he was commissioned by Queen Victoria to form an administration, and might, but for the refusal of Lord Palmerston to be subordinated to Lord John Russell and the refusal of Lord John Russell to be subordinated to Lord Palmerston, have then become Prime Minister. The life of such a statesman well deserved to be written; and Lord Edmond Fitzmaurice is in many respects excellently qualified to write it. Lord Edmond belongs by birth to one of the Whig families to which we have referred. He has had a long experience of English political life. He is not new to literature, having produced a valuable life of his ancestor, Lord Shelburne, the contemporary of Charles James Fox. And he has the special advantage of having known Lord Granville thoroughly, for he served under the latter for three years as Under Secretary, when Lord Granville was Secretary of State for Foreign Affairs in Mr. Gladstone's second Administration.

The biographer has done his work well. One difficulty which confronts every one who undertakes a political biography, an obvious and insuperable difficulty, has indeed not been overcome. It is the difficulty of relating a statesman's part in public affairs without being led on to write the whole history of the time; it is also the difficulty of making the general course of events intelligible if one deals with them only when the subject of the biography is a conspicuous actor. But although Lord Edmond's narrative cannot in parts be easily followed without going to a general history for some account of events which he could not undertake to set forth—else the biography would have grown into a history—still, he has shown much judgment in concentrating attention upon the really important periods in Lord Granville's career, and in treating these fully enough to make their significance intelligible to persons not familiar with the details of English affairs from 1841 to 1890. He writes as one who "knows the ropes" of English parliamentary life, yet he does not dilate too fully upon those details of parliamentary conflicts or intrigues which are thought so supremely important at the moment, and become so dreary when a few years have passed. He comprehends, as an ex-Under Foreign Secretary ought to do, the politics of continental Europe, though he never goes out of his way to display his knowledge. In speaking of Lord Granville himself, he does not carry that appreciation which befits a biographer into fulsome praise. Indeed, we find few judgments passed on the conduct of his hero, and could have desired to see a somewhat fuller estimate of the strength and weakness of one who figured so largely in the eyes of his contemporaries, and belonged to a type which seems to be disappearing from English politics.

Born in 1815, the year of Waterloo, Granville George Leveson-Gower was elected to the House of Commons as member for Morpeth in 1837. He had every advantage that a youth entering political life could desire, both from his connection with several of the leading noble families and as the son of an able and popular ambassador on whom an earldom had lately been bestowed. Society in London and Paris opened its arms to him, and his manner no less than his talents made him a favorite in society. He had been only a few months in Parliament when he was appointed Under Secretary of State for Foreign Affairs, Lord Palmerston being then Foreign Minister. Not long afterwards he married a German lady, daughter of the last of the male line of the great house of Dalberg, and widow of Sir Richard Acton. She had one child, and that child became Lord Acton, whose fame as a man of learning may last as long as Lord Granville's fame as a politician. Those who know Lord Acton's writings will be interested by a letter (p. 358 of vol. i.) in which Lord Granville gives a glimpse of his stepson in early manhood.

After six years spent in the House of Commons, where he had proved to be a capable and popular member, Lord Leveson (as he then was) passed by his father's death to the House of Lords as Earl Granville. He had sat there only five years when Lord John Russell, then Prime Minis-

ter, got rid of Lord Palmerston and installed Lord Granville as Foreign Secretary. This was in 1851, Lord Granville being only thirty-six years of age; and from this time onwards he sat in every Liberal Cabinet, and continued to be regarded as a man available for any office which a peer can hold. In Lord Aberdeen's Administration of 1852 he was Lord President of the Council and afterwards Chancellor of the Duchy of Lancaster; in Lord Palmerston's Administration of 1855, again Lord President. Later in his career he was again Foreign Secretary in Mr. Gladstone's first and second Administrations (1868 to 1874 and 1880 to 1885), and Colonial Secretary for two years in Mr. Gladstone's first and for six months in Mr. Gladstone's third and shortest (February to July, 1886). From 1855 till his death in 1891 he led the Liberal party in the House of Lords, except for the years 1865 to 1868, when Lord Russell, who had become Prime Minister at the end of 1865, filled that position. Thus he was always in the very centre, the midmost whirlpool, of English politics. Yet he was never, except when in 1859 he tried to form a ministry, himself a star of the first magnitude, because during the earlier part of his career he was overshadowed by Lord John Russell and Lord Palmerston, during the later part by Mr. Gladstone.

At one moment he was placed in a position of peculiar delicacy, which is worth mentioning, because the circumstances throw a ray of light into one of the dark chambers of the British Constitution. When Lord Palmerston formed an administration in 1859, the war between France and Austria was still going on, though her defeat at Solferino had disposed Austria to peace. The Queen found her views regarding Italian affairs at variance with those of Lord Palmerston, the Prime Minister, and Lord John, the Foreign Secretary. She distrusted the former, with whom she had had many passages of arms in former days, and she never liked the latter; but she both liked and trusted Lord Granville. Accordingly, she took the most unusual step of writing through the Prince Consort to Lord Granville, asking him to tell her what passed at the Cabinet. Lord Granville felt the extreme delicacy of the position, and decorously replied that it was difficult for him to comply with the Queen's request without the knowledge of the two ministers to whom constitutional usage would have required the Crown to express its wishes. However, he did relate, in profound confidence, what had taken place; the secret was kept, and no one seems to have ever heard of the incident till the letters were published in these volumes (vol. i., pp. 349-352).

When Mr. Gladstone succeeded Lord Russell as leader of the Liberal party, Lord Granville became his most uniformly trusted adviser. He had some of the qualities which the more famous and brilliant chief lacked. His judgment was less disturbed by feeling. He was perhaps a better judge of men's characters, and certainly more tactful in dealing with them. He was a stanch Liberal, but he excited less antagonism among opponents. Through Mr. Gladstone's two first Ministries (1868-1874 and 1880-1885) Lord Granville was as important a force in the Cabinet as he was conspicuous to the public from his adroit leadership in the House of Lords, where he found himself confronted by a large and constantly increasing Tory majority. When the Ministry of 1868 was formed, he had taken the Colonial Office, but on Lord Clarendon's death he was transferred to the Foreign Office (early in July, 1870) just before the breaking out of the great war between France and Germany. His conduct of the foreign relations of Britain was firm and tactful; and it was amid expressions of general confidence that he returned to the same post in Mr. Gladstone's Administration of 1880. But times had changed, and he had perhaps himself changed. He was older, and possibly less vigilant. He had a difficult Cabinet to deal with, in which there were frequent differences of opinion, constantly threatening resignations which he, as the peacemaker in ordinary, was called upon to avert. And he had a formidable opponent to reckon with in Bismarck, then at the height of his power, and spurred by the rising Colonial party in Germany into controversies with England. It was not chiefly Lord Granville's fault that, both in Egypt and in other parts of Africa, British foreign policy seemed more than once to be wavering, and once, at least, to have been palpably unsuccessful. But it was on him and on Mr. Gladstone, also almost entirely free from blame, that the discredit chiefly fell. Accordingly, it caused no surprise when, on the formation of another Liberal Administration in 1886, Mr. Gladstone allotted to Lord Granville the Colonial Office, giving the Foreign Office to a younger statesman. Lord Granville took the change with admirable temper, and remained in a no less cordial friendship than before with the oldest of his political friends. Soon afterwards his strength began to fail, and he died in 1891.

A great foreign minister he can hardly be called, because there was no single great stroke of policy attributable to him, nor did he ever mark out for the nation and for his successors any broad, strong line such as only men of profound reflection and comprehensive grasp of facts can contrive or execute. But he was adroit and tactful, specially successful where it was necessary to understand the characters and humor the foibles of individual men, and with a happy gift of saying disagreeable things in an agreeable way. It was this talent for dealing with men that made him so admirable a composer of differences between colleagues in a cabinet. Among the lessons which these two volumes enforce, there is one which, however obvious to students of the minuter details of political machinery, is apt to be forgotten by nine-tenths of those who, in reading the history of free countries like the United States and England, assume that where the will of the people is sovereign, and has full constitutional means provided to enable it to assert its authority, the characters of individuals and their personal relations become matters of small consequence. Here we see, all through Lord Granville's career, how much the march of events even in great matters—in the relations, for instance, of England, France, Germany, Austria, and Russia, in the adoption, the advocacy, the temporary failure of the policy of Home Rule for Ireland—was affected not merely by the idiosyncrasies of such men as Lord Palmerston, Lord Russell, and Mr. Gladstone himself, but by the way in which their mental peculiarities and ways of acting and speaking told upon each of the others. The same lesson might be drawn from American history in several critical epochs, such as that in which Jefferson, John Adams, and Alexander Hamilton were brought into contact with one another and with Washington.

Lord Granville was never what is called a powerful speaker. He once referred, in a characteristic phrase, to his own "slipshod oratory." He had neither the imagination nor the fire and passion needed for rising to the heights of real eloquence. But he was a dangerous antagonist in debate, for he had the art of finding out the weak points in his opponent's case; and his ready wit gave point to a retort. His mind, if not large and philosophical, was eminently reasonable and enlightened, as was proved by the educational policy which he followed when, as President of the Council, he had to hold the balance between the Church of England on the one side and the Nonconformists on the other. It was this vein of common sense, not going far beyond the average views of the average intelligent man, which won for him much of the confidence he inspired. His humor also contributed to his popularity. When Mr. Lowell lived in London as Minister from the United States, he and Lord Granville divided with one another the reputation of being the best after-dinner speaker that used the English tongue. There are many happy dicta, as well as many good stories, scattered through these volumes; but they would suffer by being detached from their context, so it is enough to say that American readers will find amusement as well instruction in this excellent biography.

LOWERY'S SPANISH SETTLEMENTS IN THE UNITED STATES.

The Spanish Settlements in the United States. By Woodbury Lowery. Putnams. 1905.

We shall begin by pointing out one of the few inconsiderable mistakes on which we might dwell, before proceeding to speak freely of Mr. Lowery's work, which is excellent and of great intrinsic value: On page 15 (note 1), the author states: "A ladino was a slave who had served over one year." The term "ladino" is nearly synonymous with "latino," and is accepted as such by the compilers of the older Spanish dictionaries, for instance, Covarrubias Orozco (1673, fol. 82). While, in Spain, the word applied to any foreigner (whether Christian, Moor or heathen) who acquired the use of the Spanish language with considerable perfection, in Spanish America "ladino" was and is used to designate chiefly those Indians who speak Spanish with approximate fluency. The word stood and stands in no direct relation whatever to the *social position* of the individual. As soon as he spoke the language of Spain with sufficient ease, any one, whether European, negro, or Indian, freeman or slave (provided Spanish was not his *native tongue*), was regarded as "ladino." When Menéndez wrote to the King concerning the negroes in the city of Santo Domingo, "most of whom are ladinos"—he meant that they spoke a rather fair Spanish. That they were "natives of the land" does not prove that they were born in the *language* of Spain, as the element of their native

African idioms still prevailed among them. We will only observe further that the quality of the index is hardly in keeping with that of the text.

Mr. Lowery has taken up his task, not only in a most dignified manner, but also with a thoroughly practical sense and with full conscientiousness of his obligation to be impartial. Even where his always well-fortified conclusions are at variance with those of his predecessors, they are presented in an impersonal manner. There is no "I believe it to be so, and it is very probably so." Our author quietly gives positive data, leaving in doubt what he cannot prove in an irrefutable manner, and courteously tolerating every dissenting opinion. He is absolutely free from pedantry, as well as from imaginative rashness. Some of his predecessors (Parkman, for instance) foreshadowed all this, but in their time access was lacking to the sources of information, the number and variety of which Mr. Lowery now places before us. The same may be said in regard to their partisanship. Could they have known more, their works, at least the works of some of them, would have shown a different spirit, for most of them were honest, sincere, and painstaking men, imbued with a desire to do historical justice. This is manifestly the way in which Mr. Lowery looks at their productions.

Spanish achievements in the New World called forth the envy and jealousy of every other nation pretending to or wishing for marine and commercial standing, which was thought to be most easily obtainable by colonization. American possessions were the dream of Portugal, France, and (though not so openly acknowledged then) of England also. The turbulent state of Europe in the beginning of the sixteenth century gave at first a legitimate pretext for encroaching upon Spanish possessions in America by open warfare; but, after peaceful relations had been established with Spain, hostilities continued to be carried on, in spite of treaties, against her commerce and her colonies. It was no longer warfare, but piracy—murder and robbery on the high sea, sacking and devastation on shore; perpetrated by individuals ostensibly disavowed, but secretly abetted, by their respective governments, in spite of truce or peace. Therefore Spain had, almost from the time of Columbus on, no peace in regard to her Western possessions. She had by night and by day to be constantly on the defensive and armed watch, whether at war or not. During the period encompassed by Mr. Lowery's investigations, France was the Power that most annoyed Spain in the manner above described. Portugal was on the decline, and England just beginning to enter the lists. It is characteristic of the latter nation that when Philip II., through his Ambassador in England, informed Queen Elizabeth of the extermination of the French colony in Florida, the Queen "expressed much pleasure at Philip's success," while at the same time English vessels and squadrons were preying openly upon Spanish fleets and Spanish ports, sometimes resorting to unspeakable cruelties. France, we repeat, in closer touch with Spain than England, was *the* nation that, in spite of treaties and diplomatic representations, persisted in harassing Spanish commerce and settlements in the most unwarrantable manner. The chief promoter of this "policy" was the Admiral of France, the famous Coligny, who, in perfect accord with the dowager Queen Catherine, fostered every enterprise destined to damage Spain in time of peace. Mr. Lowery goes into most interesting details concerning the transactions between the two governments about the question of the Indies. If we review the diplomatic history of the period as presented in this work with an abundance of testimony, we arrive at the conclusion that the only monarch who behaved logically and with dignity in these matters was Philip the Second of Spain.

Spain forbore greatly. She protested without result; the piratical attempts against her legitimate commerce with the colonies she had founded, continued unbated. Since the governments of other nations would not heed protests, but persisted in giving covert assurance to those who destroyed her fleets, sacked her ports in America, threw into the sea the crews of captured Spanish vessels, and committed untold atrocities wherever and whenever it became possible, Spain had to resort to stringent measures for the protection of her people and interests. Retaliation was not mild, of course, but not worse than the deeds of those who provoked it. The discussion of these features is conducted by the author in the most impartial manner. He fixes the blame irrespective of creed or nationality, and always endeavors to palliate, in a legitimate degree, the faults he discoverers. The picture he is compelled to draw of the intrigues going on, especially from the side of France, is a sinister one.

The conception has prevailed since the sixteenth century that the main incentive to the hostilities which the naval Powers of Europe carried on against Spain in the sixteenth century was the defence of religious liberty. Mr. Lowery tests this by his description of the three successive attempts of the French to become masters of the Florida coast and territory. Had the real object been the establishment of a Protestant community (after the manner of New England), it is scarcely probable that Catherine de Médicis would have countenanced these efforts to the extent she did, concealing the movements as carefully as possible from the Spanish Government. Neither would Catholics have been permitted to join the expeditions in any number; still less would Catholic officers have been placed in command—as, for instance, De Gourgues, who, according to the testimony, was of a Catholic family and, in all probability, a Catholic himself. These expeditions had in view the seizure of territory to which Spain held the first claim, which it had never abandoned. By occupying Florida, the French became a constant menace to the Spanish West Indies and a danger to the Spanish treasure fleets. While it is true that Spain, discouraged by repeated failures, had resolved to discontinue her efforts to colonize Florida for the moment, the fact of her having taken possession repeatedly and explored the country far inland, at various times, gave at least as much of a claim to right of possession as in the case of islands on which the English flag had been once raised, then the islands forgotten until some other nation's ships discovered them anew, when England (if the island was worth holding) would assert a right of priority. Spain had spent untold sums for and in Florida, and many lives, long previous to any French attempt. The French settlements were, therefore, justly looked upon by Philip the Second as intrusive, while at the same time they were dangerous to Spanish intercourse with the American colonies.

At this stage the central figure of the tale appears upon the scene. Pedro Menéndez de Avilés has for several centuries passed in history as a pirate against pirates, a remorseless butcher prompted to cruelty by religious zeal. Far different is the picture of him by Mr. Lowery. Menéndez appears as a man of much importance, a faithful and enthusiastic servant of his King and of his country's interests. Like other men of his stripe in other but similar enterprises, he clung to his ideas with the utmost tenacity. These ideas were, of course, largely those of his King, and in his unflinching devotion to what he regarded as the cause of colonization of the Florida peninsula he was disinterested, as the sequel proved after his death. The author of the book represents him to have been, from undeniable testimony, a man of great courage, an experienced mariner, and a colonizer of practical merits. He was a Catholic, but the great flaw in his career, that of the massacre of French prisoners, had nothing to do with his personal creed. The alleged inscription placed above their corpses, which has found credit for more than three centuries, rests, according to Mr. Lowery, on such slender testimony that it becomes more than problematical, as well as the counter-label attributed to De Gourgues.

In the course of the history of colonization, Mr. Lowery naturally touches upon the question of the Catholic missions in Florida. Most of these, during the period he deals with, terminated in martyrdom. He pays a well-merited tribute of respect to the efforts of both Dominicans and Jesuits, dwelling with greater detail upon the labors of the latter. Their education fitted them better for work among the Indians than the former, who, not in vain, wore the title of "Order of Predicants." The Jesuits also had their weak points in their intercourse with the aborigines, which the author acknowledges very frankly. The last mission Mr. Lowery touches upon is the one to Virginia in 1570, and it ended in the murder of the Jesuits who attempted it. The effort of Avilés to avenge their death was but partially successful. What the author says of the Indians rests on sound ethnological understanding. He not only describes them from good sources, ancient as well as modern, but reduces the data obtained to a fair average. He has succeeded in penetrating the nature of the aborigines to a degree highly creditable to his capacity for just criticism.

The few maps are interesting, and the portrait of Avilés a welcome addition to reproductions of early portraiture. A voluminous appendix, exceedingly important for the many difficult historical and geographical problems treated, completes the documentary material contained in the numerous footnotes. They bear witness to the conscientious manner in which Mr. Lowery has undertaken and carried out his task.

WHITNEY'S ATHARVA-VEDA COMPLETED.

Atharva-Veda Samhita. Translated, with a critical and exegetical commentary, by William Dwight Whitney, Late Professor of Sanskrit in Yale University. Revised and brought nearer to completion and edited by Charles Rockwell Lanman. (Harvard Oriental Series, Vols. vii., viii.) Cambridge, Mass.: Harvard University. 1905.

When Titian died, one of his pupils, as the story goes, finished a picture left incomplete by the master and added the legend: "Titian painted it, reverently his pupil has attempted to complete it, for the glory of God." The same reverence, and almost the same piety, attach to the attempt on the part of any pupil to carry to completion a masterpiece begun but not quite finished by the master. It is now more than a decade since Whitney's translation of one of the ancient Vedic Collections passed at his death into the hands of his former pupil, Professor Lanman, for completion and publication. It is a long time to wait for the appearance of a posthumous work. Especially is the delay fraught with danger in the case of a scientific publication, since, as in this case, in any one of the dozen years during which the manuscript remains in the editor's hands another scholar may bring out a volume that, seriously if not entirely, impairs the value of the buried treasure. That nothing of the sort has happened in the case of Whitney's translation is, one is tempted to say, an undeserved good fortune for the editor. But it was probably just this possible contingency, together with an intimate knowledge of what was doing in the little world of Sanskrit scholarship, which induced the pupil to complete, or try to complete, as he modestly puts it, the master's work on other lines than those which a more hasty and less diligent editor might have elected to pursue. Two courses were open to him: either to publish the translation at once, annotated as Whitney left it, without thorough revision, or to wait and elaborate, and in so doing to convert this tentative translation into a perpetual monument, by building under it a massive pedestal, making of the whole a permanent scientific edifice, the value of which no subsequent erection could cause to depreciate. The editor chose the latter course, and, as we think, chose wisely. The result is that in the two volumes now before us we have a lasting memorial. No translation can be definitive, but it can be made a necessary point of departure for future scholars; and to transform a partially complete work into one complete in all details, to bring it up to date in each particular, is to render it indispensable for all who afterwards labor in the same field.

In electing this method of completing and complementing the translation left by Whitney, Mr. Lanman has necessarily put much more of his own time and toil into the pious work than if he had chosen the easier course—more of himself in every way—so that, as the sacrifice was not without its compensating honor, he has well earned the right to his own place in the inscription upon this noble monument to Whitney, as one who has "revised and brought nearer to completion and edited" the work of the older scholar. So individual, indeed, is the impress of the editor, that Whitney himself would probably have disapproved of some of the features as well as some of the views introduced by the editor. On the other hand, the editor's views and additions are clearly demarcated from those of the translator by an ingenious application of L brackets, which constantly remind the reader that it is the editor who is responsible for what is contained within them. Thus no real harm is done by even a divergence of opinion, and the reader has the benefit of Mr. Lanman's own observations, not to speak of the large amount of matter actually added by him. Only in the preface of the editor and, in part, in his introduction there seems to be a certain redundancy of remarks which might better have been abated. Details in regard to pen-slips, errors of proofreading safely suppressed, even a protest against a German practice in the mechanical issue of books, seem to be, for such a work as this, somewhat otiose, though in general the editor adheres very closely to the business in hand. Strange to say, there is no suitable index. That Griffith's translation has a good index is surely no good reason for Whitney's not having a much better one. A complete topical index would have been a welcome addition, even at the cost of omitting some of the introductory matter. An interesting circumstance connected with the translation is that Roth, who was Whitney's teacher, made a selection of passages from his own (unpublished) German translation of this Veda, from which Whitney incorporated some exegetical matter into his commentary—a fact gracefully commemorated by the editor, who was a pupil both of Whitney and of Roth, in the verses (in Sanskrit and English) with which he closes his preface:

> Teacher and teacher's teacher long had wrought
> Upon these tomes of ancient Hindu lore,
> Till Death did give to one whom both had taught
> The task to finish when they were no more.

The Atharva-Veda Collection is a work containing little poetry and philosophy, much magic and bad verse. That it is nearly all in metrical form only brings into stronger relief the absence of poetry. Such philosophy as it contains is only ancillary to the art of the *mantra*-maker or Shaman, who, as in Babylon, Siberia, and elsewhere, has always been the real priest of the people. The Collection, therefore, is rich in curses, in antidotes against disease, in love-charms, in prayers for welfare, long life, and blessings, and whatever else appertains to a corrupted magic built upon older religious material. For there is no primitive magic in these so-called "Hymns," none of that magic from which religion in time differentiates itself. Atharvan magicians are not subduers of natural forces without divine assistance. They are all brought up in the odor of Brahmanic sanctity; they unite prayers with charms; they coerce, but they pray that the power may be effective. In short, as the linguistic comparison of this late Veda with the earlier Rig Veda clearly shows, the magic of the Atharvans is secondary; it is not a primitive voodoo magic, but a mixture of this with a fully developed religious sense. It is primitive only as all gross superstition is primitive, whatever be its time or place. That it contains very ancient elements is probable, but it can never be used as a general body of extremely early magical material. In the Atharva, as in the Rig, the gods are essential. The household priest, who is the Shaman of India, despite his boasts of power relies on the gods. A typical example may be seen in this charm used in a women's rite for obtaining a husband: "The creator (maker) sustains the earth, the sky, and the sun; *may the maker make for* (give to) this spinster a husband that is according to her wish." Or, in a charm for healing: "The berry and remedy, sufficient for life, *the gods prepared*." Again, against insanity: "May *all the gods* give thee again, that thou mayest be uncrazed."

But if the value of this Veda as a fund of primitive matter is easily overestimated, it is also easy unduly to depreciate what the superstition of the ages has conserved and handed down through devils and gods alike. It is therefore a collection to be used with caution, neither useless nor of extraordinary value. It is rather of unique literary value than religiously extraordinary. Probably most of its practices are already familiar to those versed in other superstitious lore; but it possesses, of course, the exceptional distinction of being the one black book of Hindu "bad magic," though as a collection it is more modern than the other religious works bearing the same general title. As literature, in the sense of fine composition, it has little or no value. Part only is popular; a large part is clearly hieratic. A discussion of these points by the editor would have proved a valuable addition to the present work. The few editorial paragraphs devoted to the Atharva from the point of view of other Vedic literature scarcely touch upon the most important question connected with the subject. It would, we think, have been eminently appropriate to a work marking an era in Vedic study had Mr. Lanman given his own opinion in regard to the place and value of the Atharva in the literary and religious life of India.

In presence of the immense amount of work accomplished in the preparation of these volumes, minute criticism, even had we space for it, would be out of place. An historical introduction and a suitable index are two non-negligible desiderata. Smaller matters are of no account compared with the important matter of publishing the translation of an extremely difficult text, made as true as possible, fortified, hymn by hymn, with an apparatus most painstakingly accurate, and prefaced by an exhaustive review of the condition of manuscripts and other critical matter—all in all, a model of what such a work should be.

The form of the two sightly octavos, the paper, print, and flexible binding, all make a fitting setting to a peculiarly interesting work—the last work of a renowned scholar, which now after many years has been thus ably edited by one who, standing in close relation with the author, seemed best prepared to carry to successful completion the master's unfinished labor. A life and bibliography, together with a fine medallion of Whitney, form part of the varied introductory matter. The cost of these volumes is quite nominal, and need deter no library, scarcely any student, from obtaining this crowning effort of Whitney's philological genius. We congratulate the learned edi-

tor upon reaching the end of his useful and arduous undertaking. It was a great task to assume; it was made harder by reason of the enlarged scope and conscientious particularity with which it was executed; but the task has been accomplished in a manner worthy of Whitney, and than that no higher meed of praise can be bestowed.

Old France in the New World: Quebec in the Seventeenth Century. By James Douglas, LL.D. Cleveland: The Burrows Brothers Co. 1905.

Despite all that has been written on Quebec, Dr. Douglas manages to give us a fresh, unhackneyed and characteristic volume. From such a book (for example) as Sir Gilbert Parker's, it differs *toto cœlo*. It is neither an abridgment of Parkman, nor the description by an antiquarian of buildings and fortifications. The elements which enter into it are a sound, first-hand knowledge of the chief sources, an intimate acquaintance with local topography, and a selective talent of unusual fineness. We have long wished to see the history of Quebec treated by one who should know how to bring out alike its connection with France, its place in the life of the whole colony, and its purely social aspects. Dr. Douglas has embodied all these things in his narrative and assigned to them their due proportion.

The battle of Marathon does not owe its importance to the number of combatants engaged. Neither does the interest which attaches to Quebec in the seventeenth century depend upon vastness of numbers, wealth, or intellectual preëminence. Mr. L. O. David, in his recent 'Laurier et son Temps,' styles Arthabaska (where the Premier of Canada passed several years of his life) an intellectual centre of the first order. Dr. Douglas, we imagine, would hardly prefer this claim on behalf of Quebec, at the period with which he deals. Indeed, he is careful in both his text and appendix to point out how meagre were the resources of the capital during its heroic age. In 1620, twelve years after the establishment of the colony, the population was 60; in 1663, it was 800; in 1698, the population of all New France amounted only to 15,355. As for such of the more pretentious buildings as the Church and the Jesuit College, it can only be said in the words of Charlevoix to the Duchesse de Lesdiguières that their beauty depended solely upon the contrast between them and the huts by which they were surrounded. The manor houses of the seigneurial régime in Canada bore little resemblance to the châteaux of Touraine, and the Quebec of Frontenac owed its chief dignity to a magnificent situation.

What really invests Quebec with historic charm is neither the beauty of its edifices nor its direct contribution to the higher culture of the New World. On the purely picturesque side, Dr. Douglas goes to the heart of the matter when he says that, through the establishment of a modified feudalism,

"an impressive antiquity was stamped on New France, and Quebec as the seat of government became an epitome of the Middle Ages, where the Governor as representative of the King, the Seigneur Dominant, held his court and received the homage of his seigneurs in person or by deputy, and where the priests ruled over the conduct and consciences of men as though Luther and Calvin had never resisted the authority of the Church in Europe. For more than another century [*i. e.*, after 1634], the Governor of Canada remained an anomaly on the American continent, and Quebec an anachronism; as picturesque in its religious, social, and official life as in its natural situation."

Matthew Arnold doubtless has something of this sort in mind when he made his invidious comparison between Quebec and Chicago; but we should be giving the reader an imperfect idea of Dr. Douglas's book if we let it be understood that the main motive is to be found in a fondness for romantic associations. His successive chapters are studies of special topics, each of which has an organic connection with the rest. Thus, one after another in coherent sequence, the main features of colonial life are described and discussed—the leading explorations, the question of Church and State, the commercial system, the rivalry of religious orders, the clash of French and English, the social stratification of the settlers. Throughout the whole book we have been impressed by the large amount of general information which Dr. Douglas brings into line with his account of Canadian transactions; contemporary movements in Europe, for example, being much more frequently drawn upon for analogies and suggestions than they are in most monographs on New France or New England.

Our last word of appreciation is claimed by the illustrations. These not only are drawn from authentic sources rather than from works of the modern fancy, but are both varied in scope and admirably selected. Those which illustrate topographical points by the aid of photographs and prints we have found especially interesting. The first and larger title of the volume seems to promise that the same field may yield us still further fruits of Dr. Douglas's leisure. Such an inference, we trust, will not prove incorrect. Meanwhile, the public demand has necessitated a second edition of the 'Quebec.'

Essays and Addresses on Economic Questions, with Introductory Notes. By the Right Honorable Viscount Goschen. London: Arnold; New York: Longmans. 1905.

In making accessible to all students the essays and public addresses here gathered under one cover, Lord Goschen has rendered a distinct service to economic study. Some of the papers, indeed, could be found readily enough by persons who had access to the files of the *Edinburgh Review*; but others, printed only in fugitive form, were difficult to procure, while all were worthy of preservation in convenient dress as part of every economist's working library. Moreover, the value of the original discussions is greatly enhanced by the introductory and supplementary notes, in which the distinguished author explains the circumstances under which each paper was written, or comments upon the subsequent march of events in the fields he had surveyed.

The first two papers, "Seven Per Cent." and "Two Per Cent.," deal with the striking conditions of the British money market in 1864 and 1867. In the former year an extraordinary mania for company promotion had tied up vast amounts of capital in speculative enterprises, many of them organized for the purpose of lending money to foreign borrowers. Under such demands the rate of interest had risen to an average level of 7 per cent. for the year, and the City began to clamor for relief. As usual, the speculators contended that the trouble lay in the lack of elasticity in the banking system established by the Act of 1844, and they clamored for "freedom of banking." We wish that Mr. Goschen's diagnosis of the financial situation in London in 1864 could be read by every New York banker of 1906 who has been shrieking for Congress to come to the aid of our speculators before it is too late. Mr. Goschen pointed out that the high rate of interest was the inevitable result of the unprecedented demand for capital in joint-stock enterprises, both at home and abroad, and that the situation could not be relieved safely by the issue of paper money. The issue of additional banknotes would but encourage speculation, and the old trouble would recur when, as must needs be the case, the issues had come to an end. To complaints of inelasticity in the circulating medium, he replied: "The circulation is not limited. It is at least as unlimited as the supply of gold in the world. And to say that trade must be brought to a standstill if fresh *notes* are not issued, is to confess that fresh supplies of gold can no longer be had. But if this is the case, it is the strongest reason for not issuing those notes, which profess to represent gold." Seven-per-cent. interest, although somewhat disagreeable, had been, in reality, the only available brake upon speculation. The panic of 1866 finally put an end to the building of card-houses, and a period of depression followed. In 1867, when the second paper was written, business enterprise had been paralyzed, and the accumulation of idle capital had reduced the rate of discount to 2 per cent. This furnished Mr. Goschen with both a text and a favorable opportunity to review instructively the financial operations of the previous year.

The third paper, an address on "Our Cash Reserves and Central Stock of Gold," was delivered two months after the Baring failure in 1890, and at a time when the author was Chancellor of the Exchequer. Looking beyond the immediate issues of the hour, Mr. Goschen argued that one of the main difficulties with the situation was that the effective banking reserves of England had been allowed to fall to a dangerously low level. He computed that, excluding the Bank of England, the reserves were, in proportion to liabilities, considerably smaller than they had been in 1879, and showed that some banks were accustomed to reckon "cash on call" as a part of their reserves. Such a situation he declared to be unsatisfactory, inasmuch as it led the City to "rely simply upon the aid which the Bank of England can give in a crisis, and to take no thought how to meet the difficulties which might arise, except by such action as the Bank of England may possibly take, with the Government, as they think, behind it." Moreover, he showed that the growth of other banking institutions had made the Bank of England a smaller factor in the money-market than it had been in former times,

so that, as its responsibilities increased, its power to deal with emergencies had probably declined. In a supplementary note, Mr. Goschen discusses the efforts made since 1891 to improve the situation, and expresses the belief that "a most distinct improvement has taken place in the policy of the great majority of banks as regards their cash reserves"—a conclusion that would be more reassuring if it were possible to estimate the extent to which bank statements are affected by "window-dressing."

Best known of all the papers in this volume is the fourth essay, on "The Depreciation of Silver," originally published in 1876. As chairman of the Parliamentary Committee appointed in that year, Mr. Goschen had ample opportunity for studying the silver question, and his views were widely quoted in the "battle of the standards" waged during the next twenty years. The fifth paper, on "The Conditions and Prospects of Trade," presents a careful review of the condition of British commerce in about 1885, and emphasizes the importance of developing commercial relations with the colonies. In his prefatory note Mr. Goschen points out that, "in a modest way," he was then acting as "a missionary of Empire." The sixth paper, on "The Increase of Moderate Incomes," endeavors to elicit from the income-tax returns some conclusions concerning the manner in which wealth is being distributed; and the materials gathered tend to support the proposition that there has been a considerable growth of moderate incomes at the same time that the proportion of large incomes has tended to remain stationary. And this, it is remarked, has occurred under "the steady working of economic laws" and "under a system of commercial and industrial freedom."

Of the three concluding papers, those dealing with "Laissez-faire" and "Ethics and Economics" carry the author further into general theoretical questions than most of his other essays, while the last, on "Insurance: Voluntary or Compulsory," compels him to deal with fundamental questions of social policy. In all of them he shows that firm grasp both of facts and of principles that has characterized his economic writing. The modest preface of the present volume states that the author does not claim to write from the point of view "of a trained and scientific economist," but rather from that of a "man of business" interested in the practical application of his subjects. But, however seriously intended, this disclaimer will hardly be accepted at its face value by the reader who is able to follow Mr. Goschen in his masterly analyses of complicated economic phenomena, and observes how constantly he returns to underlying principles. In fact, our author's readers will probably agree that it would augur well for the future of the science if all "scientific" economists had Mr. Goschen's powers of careful analysis, judicious inference, and perspicuous statement.

The Philosophy of Religion. By George Trumbull Ladd. 2 vols. Charles Scribner's Sons. 1905.

The main title, 'Philosophy of Religion' (in itself an unhappy expression), hardly suggests the scope of this work; the subtitle describes it as "a critical and speculative treatise of man's religious experience and development in the light of modern science and reflective thinking." It includes an elaborate statement of man's religious beliefs and practices from the earliest known times to the present, an estimate and a comparison of the great religions, a discussion of the various forms of theistic and anti-theistic belief, of revelation and inspiration, the future of religion, and the future of the individual and the race. The description of religious phenomena is, with a few exceptions, accurate (the chapter on the differentiation of religions is especially good), and the argument is conducted in an attractively calm and candid way, with fair presentation of considerations pro and con, full statement of difficulties, and careful estimation of evidence. Throughout the book there are suggestive remarks. The great extent of the field traversed, and the author's anxiety to make his positions clear, lead to a good deal of repetition. The points on which he lays most stress are the unity of the world, human free selfhood, and the testimony of history to man's religious nature and to the presence among men of the Absolute Spirit.

An undue amount of space appears to be given to the review of early religious phenomena. Religious experience, Dr. Ladd rightly holds, furnishes the material for the establishment of a rational basis of religion. But he himself sees that much of the early material must be rejected; history furnishes as good authority for belief in ghosts as for belief in God. The standard is the experience of the best-disciplined and most spiritual minds; the critic of to-day recognizes only what he regards as rational, and values ancient thought only so far as it agrees with his own—and he himself may be set aside by a future generation. Dr. Ladd is alive to the constantly shifting nature of religious thought, but, with all his care, he does not avoid the mistake of undertaking to characterize some particular religion as a unity (i., 128 ff.). The word "Christianity," for example, means nothing unless the particular period had in mind is given. Every religion, it is true, inherits something from its immediate predecessor, and this latter from what preceded it, and so on back to the beginning; but this process does not justify one in identifying a great modern religion with its savage ancestor. The habit of personifying a religion, and speaking of it as if it possesed a spirit and an energy of its own, is unfortunate, because it tends to blind the eyes to the fact that a religion is simply the expression of the religious ideas of its founder or of the people who profess it. The Yahweh cult of the early Hebrews had little or nothing in common with that of the prophets, and Louis XIV. as little in common with the Sermon on the Mount. The capacity of development and adjustment to new conditions, often ascribed to this or that religion (by Dr. Ladd to Christianity especially), is really the capacity of a given community or race; the Sikhs of India, for example, have reached by their own efforts or instincts a theistic position substantially identical with that of the cultivated Christian world of to-day.

Professor Ladd's main purpose is to define and demonstrate the rational basis of religion. His choice of the word "philosophy" involves an appeal to human reason, and rationality is emphasized throughout the work; the assumption of opposition between reason and religion he calls (i. 307) "the deadliest of all heresies"; he sharply opposes Kant's "schismatic and divisive view of human reason," which "has begot a sort of antithesis between intellect and reason" (i. 304). And yet he is unable to accept in full the supremacy of reason. The investigation of religion, he thinks, must be conducted with "limited reliance" on human reason (i. 24, 37, 40; ii, 71)—the "*non-rational* (which is by no means the same thing as the *contrary to reason*) has its part to play in shaping this [religious] experience" (i. 305). As examples of phenomena that do not admit of a perfect mental representation in the terms of man's rational life he goes on to cite "the beliefs, the sentiments, and the practices of religion." Why, he asks, do we believe in the reality of that which corresponds to our highest ideals? why do we admire and worship it? Now it is true that the impulse to worship the ideal, conceived of as an ethically perfect person, is, in a sense, irrational; such impulses or instincts lie at the foundation of life and are inexplicable by us; so far as they are concerned, religious thought and feeling does not differ from all other thought and feeling. The fundamental question is that of the reality of ideals, which are the product of reason dealing with the material furnished by experience. Dr. Ladd holds that ideals have ontological validity. Against the view that they are mere ideas he protests "in the name not only of history and psychology, of art, ethics, and religion, but also of science and philosophy as well" (ii. 567 f.). The "ontological consciousness" he makes the basis of the belief in God and individual immortality. This question involves the whole of philosophy, and cannot be discussed here. But it is to be observed that the phenomena adduced by Dr. Ladd are not to be thought of as lying outside the sphere of reason, for it is reason that constructs ideals and decides on the validity of the data of the "ontological consciousness." His whole argument, in fact, is conducted with the purpose of showing that religion is justified by reason; his patient investigation of the significance for the life of man here and hereafter of the great mass of facts he has collected, is a tribute to reason.

The philosophic basis of the discussion is given by Dr. Ladd in previous writings, of which the present work may be regarded as a continuation.

The Life of Molière. By Henry M. Trollope. E. P. Dutton & Co. 1905.

To undertake the story of Molière's life and works in an octavo of five hundred and sixty pages is proof of capacity for patient toil, which Mr. Henry M. Trollope thus shares with Anthony of laborious fame. Relying chiefly on French authorities, this work is a full and elaborate compilation of facts, whether important or trivial, which the Moliéristes have vied with Shaksperians in amassing about their subject for subsequent generations to sift. Mr. Trollope's sieve is no fine one. "Facts," he says (p. 79), "may, then, possibly bring a great man closer to our eyes and help to show us what he was like"; but the wished-for effect calls for something more than

"judicious handling," under which literal treatment a vigorous character and personality are too easily lost for want of the biographical artist's hand and eye.

This is, indeed, the first objection to be urged; in this 'Life' Molière does not live. We could picture an account of him, shorn of a full third of the details in this book, and yet presenting the busy, bustling actor-manager and playwright in the thick of work or pleasure, without the slightest sacrifice of proportion or of biographical dignity, and equally without risk of running into the facility of the mere *causerie*. The very Introduction, of some forty pages, which seeks to convey the dramatic and histrionic setting of the time, is a generously padded expansion of the history of pre-Molièrean comedy in France, to which justice has long been done in a dozen familiar treatises. And from the body of the work we may cite instances in which the carefully tabulated facts are accompanied by a disconcerting undecisiveness in their interpretation. Thus, the authorship of the anonymous publication, 'La Fameuse Comédienne' (1688), which bespattered the name of Molière's widow, remains a mystery; but among conjectures the biographer might well lay more stress on the points brought out by Larroumet, and but lately revived in Mr. H. Noel Williams's 'Queens of the French Stage,' in support of the belief that professional spite had much to do with the actual wording of the libel. Singularly enough, most commentators take such publications seriously, not perceiving that they are, in a sense, the analogues of slanderous modern journalism (p. 109). On page 141, explanation is offered of the name of *Mascarille*, used in more than one of the comedies; it is surely obvious that the *Marquis de Mascarille* of the "Précieuses" is a satirical title, under which Cathos and Madelon, through their silly snobbishness, fail to detect the valet. Mr. Trollope says: "There is a Marquis de Mascarille in his *Précieuses Ridicules*, a comedy of a very different kind from the *Étourdi;* but to suppose that the actor wore a mask in that part would be absurd"! It would, indeed.

This last quotation illustrates the method which has succeeded in swelling the volume. Page after page expands trifles, dilates on the self-evident, amplifies truisms, or digresses into side-issues. The place for such a remark as the following is not in an introduction to Molière's acting, but in an elementary text-book, or in some new stanza from Monsieur de la Palisse: "Acting is seeming to be, but it wants large and often high qualifications" (p. 266).

Contrasting acceptably with such excerpts as the above may be found a number of pages helpful in explaining the spirit and cast of some of the comedies, whose peculiar conditions are not usually so accurately rendered by English critics of Molière because of their omitting to study local or temporal customs determining fundamentals of character-treatment. Mr. Trollope points out clearly (p. 164) that a plausible theory concerning "Les Précieuses Ridicules" holds that the satirist had in view not so much the social leaders of Paris, whose chastening influence on the language he could hardly deny, but their would-be-imitators among the pretentious bourgeoisie. And the discussion of "Tartufe," drawn from French studies, elucidates the position and rôle of the *domestic* director of conscience—the type of spiritual family manager; an "institution" not readily comprehensible without detailed reference to ecclesiastical conditions in France at that time (pp. 355-360). Such examinations illustrate the generally trustworthy accuracy of Mr. Trollope in rendering for English readers the results of French scholarship. His own endeavors at independent judgments are by no means so felicitous. If we turn to chapter viii., which rehearses the now unstimulating comparison and contrast between Shakspere and Molière, we discover that the point of departure is unassailable: "Everybody has not the same ideas about comedy, and everybody will not think about Molière's plays in the same way, for men's humors and their sympathies are often widely different" (p. 175). *Passons au déluge*—to use a quotation as familiar, and at least as apposite, as any in this volume. We can nevertheless feel gratified that the attitude here taken is the polar opposite of the patronizing spirit, which led such critics as Coleridge and Hazlitt to a state of naïve wonderment that any Frenchman could show deep-reaching humor over the weaknesses of his fellow-worms; for Mr. Trollope's bulky work has been executed in a disposition of reverence for the sad-eyed one who extended the sympathetic scope of comedy in treating his own countrymen as eternal types of humankind.

NATURE AND HEALTH
By EDWARD CURTIS, M.D.
313 pp. $1.25 net, by mail, $1.37.
Informal advice on the care of the body and the home by a well-known physician.
"A capital popular treatise on hygiene. . . . He knows his subject thoroughly, and how to make it clear to the general reader. A great variety of important topics are touched upon; in every instance the exposition is plain, concise, and as thorough as possible under the circumstances. . . . A thoroughly moderate spirit. . . . Deserves to be widely circulated. . . . Full of excellent advice."

CAROLINA LEE

The Nation.

NEW YORK, THURSDAY, MARCH 22, 1906.

The Week.

Secretary Taft's decision—for it is manifestly his and not the President's—that no appointment to the Supreme Court need be made till there is a vacancy, leaves him free to go on with his important public business at least till October. Various motives have doubtless actuated him. The man who rapped Engineer Wallace over the knuckles so smartly for taking his hand from the Government plough, could not with good grace throw over his unfinished Philippine and Panama labors. Mr. Taft's desire to get his present work into better shape before dropping it is clearly in line with public duty. But that political considerations lurk behind, is obvious. He has been considered a strong Presidential candidate, if not by himself too seriously, at any rate by many friends. They do not want to see a possible President spoiled to make a judge. Hence the Secretary's declination to go to the Supreme Court for the present must be held to have "big politics" in it.

Try as the President may to expel politics from the railway-rate bill it is always coming back. Senator Tillman made it plain on Thursday that his aim will be to render the President's bill so radical that the Republicans cannot support it. In that way Tillman would make capital for his party, and possibly furnish it with a rallying cry. He went frankly over to the view that this railway bill is but a part of the coming and concentrated attack upon "the great accumulation of wealth in the hands of the few," before which "the honest patriot stands appalled." Naturally, the Republican Senators are a good deal staggered by this sort of endorsement of the President's measure, and are casting about more anxiously than ever for some form of amendment to make the bill "safe," and to unite their party behind it. It is said that Knox and Dolliver—representing the conservative and the extremist wings of the party—are nearly agreed upon an amendment providing for judicial review, with suspension, of any rates made by the Interstate Commerce Commission. This, the Democrats will of course declare, "emasculates" the law, and then party lines will be drawn again, and the present "era of good feeling," or mixed feelings, closed.

Senator Bailey's argument on Monday went to the heart of the matter. The Hepburn bill—clumsily, it is true, and without sufficient precision — contemplates "suspension" by the courts of any litigated rate made by the Commission, pending a final judicial decision. The President has assented to this plan. But Mr. Bailey contends, and Senator Rayner agrees with him, that this "suspension" must be got out of the bill if it is to be a really drastic measure. Yet, as Senator Clapp and Senator Culberson have admitted, any court of equity would grant a preliminary injunction against a Commission-made rate which the railroads might assert to be confiscatory, and of which the enforcement would cause them irreparable injury. Exactly, says Mr. Bailey; therefore let us take away equity jurisdiction in all such cases. This, of course, raises the new Constitutional question whether Congress has power to do anything of the kind. To that point Senator Bailey directed himself. It seems clear that the whole law is certain to be contested in the Supreme Court. It is also clear that party lines are reforming in the Senate, and that the Democrats are manœuvring to get into a position where they can assert that the President and the Republicans have surrendered to the railroads, and have agreed to a bill which is not worth the paper it is written on.

The Connecticut Senators who refuse to vote for the Philippine tariff bill can plead that, if they do not exhibit sweet reasonableness, they at any rate show a quality which their party has hitherto held in far higher esteem—unswerving devotion to extreme protection. True, a number of Connecticut Republicans who do not approve the policy of hanging the monkey-wrench on the safety-valve, protest that the Senators "misrepresent the overwhelming Republican sentiment in Connecticut" and "frustrate President Roosevelt's policy of a square deal for the Filipinos." The protestants labor under a serious delusion. The question is not as to the overwhelming sentiment of the Republicans of Connecticut, but as to the overwhelming demand of the tobacco-growers of that State. Senator Brandegee declares that he intends to stand by the tobacco-growers; and doubtless he is well advised. A protected interest will put up its good money for campaign expenses and fight tooth and nail for its own, while the huge majority of the party will rest content with a vague feeling of dissent, and proceed to vote the straight ticket. Thus it is that the alert beneficiaries of the tariff hold the Republican leaders by the throat. Ten men with money, energy, and without scruples, can wield more power through a political machine than ten thousand amiably disposed but inert advocates of the square deal. The attitude of the Connecticut Senators is fresh proof that the quickest way for Republicans to reform the tariff is to vote for Democrats.

President Roosevelt continued his good work on behalf of consular reform by his speech in the White House on March 14; and his admission that we have had much difficulty with our consuls in China was particularly apropos, in view of present conditions in that country. A bad or inefficient or tactless consul can do an immense amount of harm to our national prestige, particularly in such a country as China. It is, as the President points out, far cheaper to pay high salaries for good men, since a second-class man can so easily do a first-rate amount of harm. On the details of the reformed service, the President was open-minded, insisting only on some way of weeding out the incapable and superannuated officials at the top. Whether this can be properly arranged without the establishment of some kind of retiring pension, would have to be determined after a trial of the new system. The point is that our growing foreign trade demands the most careful and intelligent representatives abroad, with a life career before them, and with prospects of advancement to the diplomatic service if they merit it. The Washington convention is a most encouraging sign that the business man is waking up to the sheer stupidity of our present policy, and the only question is how long it will take him to make the average Congressman or Senator realize that it is better to vote for a change and relinquish the petty patronage he now gets out of consular appointments.

The business men who protested against a rigorous Chinese exclusion, at last week's hearing before the House Committee on Foreign Relations, frankly based their arguments on commercial expediency. The boycott, they maintain, has not yet affected the Asiatic trade as a whole, but its continuance or extension would limit for the United States an ever-growing business in the "greatest unexploited market of the world." This is an argument suited to a commercialized government. The average Congressman generally has a great respect for indignant merchants who are losing a foreign market. The Asiatic Association speaks with much authority, and it declares that what is now demanded is to define the excluded class of Chinamen and to let all others enter freely after presentation of certificates from American consuls. Undoubtedly,

Burlingame Public Li...

this would do much to soothe the injured feelings of the Chinese, but, in our opinion, so long as there is exclusion of any class there is bound to be irritation, since the Chinese must inevitably fail to see any good reason why their laborers should be barred out when those of Russia and Bohemia are freely admitted. Moreover, while the Administration itself is guilty of such execrable taste as it showed recently in permitting its dispatch to Manila of troops for expected service in China to become public, we must be prepared for great bitterness and hostility towards Americans throughout the Chinese Empire.

Representative Shackleford's furious attack upon "Czar" Cannon on Friday for arbitrary use of the power of "recognition" really has little point. Everybody knows that, under the practice which now has come to have the force of law, and with the consent of the House, the general control of public business has been more and more put into the hands of the Speaker. He is very much the American analogue of the English Premier, who decides and announces what bills shall be, and what shall not be, taken up by the House of Commons. Mr. Shackleford has been in Congress only about six years. If his service dated back to Speaker Carlisle's time, he would have remembered that even a Democrat in the chair, though professing as humbly as Mr. Cannon to be but "the servant of the House," could in reality set up quietly as its master. Mr. Carlisle's Speakership is, indeed noted in Miss Follett's 'The Speaker of the House of Representatives,' as one that "made a decided advance even on this [Blaine's] arbitrary use of the privilege" of refusing to allow legislation to be called up which the Speaker opposes. For years Mr. Carlisle declined to allow the Blair Educational bill, which passed the Senate three times, to be considered in the House. In 1887, when urged by a clear majority of the House to permit a tobacco-tax bill to be taken up, he replied in writing that he did not think it would be "proper." So our Czars have been long growing.

That Americans prefer to live in perpetual Presidential elections, is proved again by the rising eagerness of discussion about the nominees of 1908. Judge Parker revived once more on Friday, in his address in North Carolina, the suggestion that Southern Democrats step boldly forward and present a candidate of their own. He declared, what is undoubtedly true, that the South has several men in public life who, by character and attainments, are well fitted for the Presidency. But these very men are the first to perceive that the time has not yet come to look for a President in the South. Senator Bailey, for example, who is now one of the most respected members of the Senate, and who has frequently had the empty compliment of being "named" for the Presidency, is clear-headed enough to see that the thing is impossible. He has said that years must yet pass before a Southerner as Presidential nominee will be thinkable. This does not mean that sectional prejudice should be encouraged, or that any section of the country ought to be put under a ban; it is simply to look the hard facts of politics full in the face. So long as the chief object of parties in nominating Presidents is not to pay a tribute to worthy persons, but to succeed in the election, the argument from "availability" will remain very much what it is. At present, it is dead against Judge Parker's proposal—which was, perhaps, intended only as a graceful way of acknowledging hospitality. The South will have to wait. A border State—say, Missouri—may furnish a candidate, but not as yet a State further South.

One gathers from Bourke Cockran's intolerable deal of sack in the Tammany resolutions of Monday, that Hearst is not going to be allowed to buy Tammany support. The inference which the cynical will draw is that somebody else has bid higher. Who it is, time will be expected to reveal. That Tammany, as such, has any political convictions which cannot be altered while you wait—except the conviction that all the city plunder is its by divine right—no one seriously pretends. Hence its solemn erection of itself into the great bulwark against Socialism is enough to make a broken-down and dispirited artillery horse laugh. There were, of course, gleams of sound sense in what Mr. Cockran said. On the question of municipal ownership, he appears to have argued powerfully against the views which he himself propounded, in the name of Tammany, when he went to Albany a few weeks ago to outbid Hearst. With every appreciation of Mr. Cockran's natural flow of eloquence and easy simulation of the loftiest statesmanship, we must remind him that a certain amount of political steadiness is required to give an orator real weight. Wanting that, people will be apt to say of his rhetoric that it has the contortions of the sibyl without her inspiration.

If the opposition to the insurance bills had not practically collapsed before Andrew Hamilton spoke out, his attack upon the trustees of the New York Life would have determined most of the legislators to vote for the reforms. The speeches at the hearings showed clearly enough that the objections came mainly from officers who did not want their power curtailed, from agents who were naturally reluctant to see their inordinate profits reduced, and from financial cliques that wished to keep their hold on the treasure-chest. Some of the arguments were singularly indifferent to the rights of the most deeply interested party, the policyholder. Then, too, the insurance people weakened their case by such wholesale assaults on the bill as that of Paul Morton. The upshot is that the bill will probably be amended in some minor details; that the section regarding agents' commissions will be made rather more liberal; and that the requirement as to surplus may be made less rigid. All the principles recommended by the Armstrong committee are likely to be embodied in the new law.

It may be that Judge Cowing, in sentencing a member of the Housesmiths' Union on Friday to a year in the penitentiary, was creating a new "martyr" to the cause of labor. But this particular act of violence, like the strike of which it was an incident, was of a sort on which sympathy would be absolutely wasted. Edward Lynch was one of the men who set upon a watchman at the American Can Company's factory. It was a cowardly attack in that the unionists were three to one. And why were "scabs" on duty at all? Not because the union men were on strike for any grievance of their own—not even because they unselfishly took up the grievance of other workmen whom their employer was oppressing somewhere else. No, the demand of the strikers was the discharge of twenty-five non-union men on a job which *another firm* was doing in McKeesport, Pa.! Not one of the pleas usually offered in palliation of union violence can be entered here. Yet, in the course of the Post & McCord dispute, according to the firm's affidavit, sixty-five non-union workmen have been assaulted by strikers, and dynamite has been used five times to destroy the results of "scab" labor. "We must have order," said Judge Cowing in pronouncing sentence, "and we can have it only by observance of the law."

Maine city elections no longer indicate the drift of general opinion, but merely what is thought of the State's prohibition law. A majority of the municipalities that have just chosen new officers have been captured by the Democrats, including Augusta, which since 1893 has been consistently Republican. Bangor reëlected a Democratic mayor, and Rockland, the home of Gov. Cobb, who has stood for the rigid enforcement of the anti-liquor law, changed over for the first time in its history. Last December, Portland and Westbrook "revolted" against Republican control. Instead, however, of taking these results as a warning to the dominant party, the observers of public sentiment in Maine go no further than to say that the

State is bound to come to a form of local option resembling that in force in Vermont. In most cases the successful Democratic candidates waged their campaign on the single issue of enforcing the "Sturgis law." In Augusta, for example, Col. Frederick W. Plaisted was chosen mayor, as the Kennebec *Journal* points out, simply and solely because of his denunciations of the policy that actually meant closed saloons. It was in that city that Gov. Cobb's deputies had done particularly effective work, and it was there that it was most clearly brought out that Maine is exceedingly restless under rigid enforcement of prohibition.

In establishing a $1,000 saloon license Chicago has followed the practice of most large cities in this country; but she has been fortunate in the privilege of taking this action for herself and not having to depend upon a State Legislature to make the change. The increased revenue will permit the employment of a large number of additional policemen, and this phase of the question has been brought prominently forward in the rather protracted campaign for the increased license. While Chicago has usually found herself capable of evolving within herself policies and arguments alike, in this case the contrast of conditions at home with those elsewhere has been one of the often-repeated arguments. New York has a saloon to every 400 inhabitants, Chicago one to 243, while the ratios of policemen are one to 500 and one to 703 inhabitants, respectively. In January and February Chicago had 22 murders, 840 burglaries, and 216 robberies, to only 18 murders, 400 burglaries, and 20 robberies in New York.

A trades (or, better) study-union in the navy is a unique manifestation of the all-prevailing tendency to combine. The Secretary of the Navy deliberately charges that the Annapolis midshipmen have conspired in true labor-union style to keep down the level of scholarship at the Academy. Just as a union looks askance upon the man whose superior intelligence and ability makes him a greater producer than his neighbor, so the cadets pledged themselves not to do better than a fixed average in their studies. The honor man and the "grind" were both proscribed, and doubtless described as "scab" middies. The suggestion will delight the souls of Harry B. Smith and other creators of comic-opera librettos; but it is not without its practical suggestions. After graduation, for instance, our cadets might have a gentleman's agreement not to stay on watch more than three hours at a spell, except for double pay for overtime. They might also decide to fix the percentage of proficiency in engine-room service at, say, 50 per cent., thus reducing the now altogether inordinate length of cruises and increasing the periods of navy-yard service and the enjoyment of family life. The enlisted men, too, might then organize. A strike at the outbreak of war, for instance, for extra pay and plenty of it, would be as successful as a strike of municipally employed motormen and conductors five days before a mayoralty election. Indeed, the Annapolis idea is an altogether delightful one, and capable of such infinite ramifications that Congress ought really to extend its thanks to our midshipmen, hazers not excluded.

Canada has never shown much enthusiasm for Mr. Chamberlain's schemes of Imperial Federation, and two recent Ministerial utterances display strikingly the general desire for administrative and fiscal independence. Prime Minister Laurier, speaking at Ottawa recently, handled the proposals for Imperial tariffs quite frankly. Let Canada and England each seek her own good in tariff matters. Perhaps treaties of commerce were possible; uniform tariffs emphatically were not. But in any case it was not reciprocity treaties that upheld the Empire. It was Sir Wilfrid's firm conviction that the Empire could be maintained "on one condition only, and that condition is that every component part of the British Empire should be left to do the best it can for itself." Something like a practical application of this principle has since been made by Sir Frederick Borden, Minister of Militia. Speaking after a lecturer who had advocated Canadian contributions to the support of the Imperial navy, the Canadian War Minister called attention to the fact that no colony would willingly tax itself for a fund over the spending of which it had no control. He further said that, under the Monroe Doctrine, which he accepted as a fact without approving it as an article of international law, Canada virtually commanded the protection of the United States navy as against all European nations. He saw no profit, then, in the Dominion bearing the burden either of its own navy, or of the Imperial navy in part. If these two speeches may be regarded as representative; as we believe they may, Mr. Chamberlain's arguments have fallen flat in Canada. The Dominion is willing to dispense with a formal Imperial federation for precisely those business considerations which Mr. Chamberlain advances as his strongest plea for Imperial reciprocity.

The free-trade resolution passed in the House of Commons on March 13, by an overwhelming majority, effected its aim of displaying the cleft in the Unionist minority. Eight Unionist members voted with the Government, while twenty-five avoided voting, and only ninety-eight opposed the resolution. Evidently, adversity has not made the free-food and protectionist Unionists contented bedfellows. The division follows shortly after Mr. Balfour's resumption of the party leadership, as if to emphasize the fact that his conversion to Chamberlainism has not served as an example to the free traders of the Opposition. In a recent address Mr. Chamberlain pointed out the utility of division of counsels in a minority party, proposing to organize the protectionists into a separate group, acting independently in all tariff matters. The above vote shows that the way is clear for the trial of that interesting experiment. As for the status of Chamberlainism generally, until it gains something like the unanimous assent of the Unionist party it need hardly be taken as an imminent danger.

A recent British bluebook on vagrancy practically condemns the workhouse system because it fails to distinguish between professional tramps and unwilling vagrants. The method of giving food and lodging for manual work, or none at all, is defective because it dismisses the criminal wanderer without punishment and the pauper vagrant without relief. The report also emphasizes the futility of mere imprisonment either as a deterrent to vagrancy or as a punishment for refusing to do prison labor. It is the judgment of the commission that "forced labor" has ceased to exist except in name. It is further pointed out that the present habit of estimating the tramp population by night lodgings furnished is wholly worthless. In this manner a single active man or woman beating a way through the island may appear as a couple of hundred wards of the State. The remedies suggested are the transfer of jurisdiction from the several localities to the counties; measures to keep the records of vagrants who have undergone sentence and to identify such on the road; finally, the revival of actual "hard labor" in "colonies" to which chronic vagrants may be condemned for not less than six months nor more than three years. The remedy need not necessarily be an expensive one, for Switzerland actually manages to squeeze a small profit out of the compulsory labor of her "vagrom men." In America the problem is complicated by the presence of varying State jurisdictions and by the absence of a centralized police; but here also the establishment of an organized work punishment for incorrigible tramps would presumably be better than merely passing them on, while it might exceptionally result in an actual work cure for the individual vagrant.

AFTER EXPOSURE, WHAT?

There is a growing feeling that we are approaching the limit of mere exposure of official and corporate misdoing. It is clear, at any rate, that we should distinguish sharply between legislative investigation made in view of definite evils and as a basis for definite remedies, and the flood of rather loose accusation that runs unceasingly through the daily and periodical press, spreading dark suspicion abroad without suggesting remedies. In other phrase one should not fail to know Hughesism from Lawsonism. They are as different as light and darkness.

The characteristic of Lawsonism, which prevails in a score of tinctures and dilutions, is its turbulence. It proposes to make the public "sit up." The idea of reforming is quite subordinate to that of making a stir, arousing a passion, and creating a hatred. We take it that hatred is always an unfortunate emotional habit. One cannot see red and yet practise sweet reasonableness. To visualize the United States Senate as so many upas trees walking, brings us no nearer the reform of that body. It is profitable to recall that Senators, and even the presidents of life-insurance companies and the promoters of Trusts, are fellow-mortals, and that the humblest of us bear in our bosoms the seeds of their defalcations. More practically, we shall restrain the harmful activities of these capitalists, not by representing them as so many dragons and hoping for a St. George to ride in, but by thorough and dispassionate investigation of the grounds of their arrogant pretensions and of their portentous gains. Nobody has shown more strikingly than Mr. Hughes himself in the course of numerous cross-examinations that the advantage is with him who keeps a cool head. That is a collective as well as an individual advantage, and those who, with no concrete programme of reforms, are stirring up a vague sense of the rottenness of the present order, are doing but an ill service.

There is no more clearly established principle of psychology than that intense emotion is an evil unless it is expressed in some appropriate action. To compassionate the needy only lands you in barren sentimentalism, unless your hand goes down into your pocket. Similarly, to execrate the capitalist merely keeps one in a sullen and hopeless fume, unless one perceives that the injustice is remediable and that voice or vote may aid thereto. It is the most serious defect of Mr. Roosevelt's agitation for rate regulation and control of industrial combinations that he has approached the subject with slight previous reflection upon ways and means, and that he has concentrated his efforts upon empty, if spectacular, prosecution of corporations, while the very practical recourse of exemplary pursuit of persons lay neglected at his hand.

The surest way to make men live contentedly in what they have been taught to regard as the worst possible world, is to preach the doctrine of total depravity detached from that of salvation. Human nature revolts at any prolonged chronicle of irremediable woe, and today those readers whose bellies are overfilled with the Lawsonian east wind either have sunk into that beatific coma which continued emotionalism induces, or are crying for better provender. "Show us an illegal corporation the harmful business of which has been not only conspicuously exposed but arrested; produce a lawless rebater in prisoner's stripes"—these are the gages of sincerity very properly asked of an Administration professedly consumed by indignation against the Trusts.

In the scientific as well as in the political sphere the mere heaping up of uninterrupted data is a very doubtful good, even when these bare observations are honestly and accurately made. The sheer mass of accumulated statistics discourages generalization. To obtain the best results, the search for general principles should follow pretty closly the accumulation of particular observations. It has been said, and justly, that if three-quarters of the German doctoral dissertations, which are largely devoted to statistics, were swept away, the world of science would be rid of an encumbrance. Similarly, the mere dissemination of vague data of malfeasance, unrelated to the practical work of the courts and legislatures, may produce in the long run, and after a certain barren irritation, an actual deadening of the public conscience.

Does not, in fine, the gist of the whole movement lie in the honest enforcement of such law as we have, and in prompt legislation where the old legal mesh is too wide to catch the representatives of the new financial slipperiness? All else is vanity. To wrench the superlatives of the English language merely to produce a general atmosphere of suspicion is, granted that the suspicion may be justified, a very questionable public service. It must be expected that a generation of former "word-painters" should exploit the profitable art of "exposure" as far as the market will bear; it is probable that State commissions and Government departments will for a time sally forth lightheartedly to "bust" the Trusts, leaving at home their best weapon, the vigorous application of old law to evils only quantitatively new; but the reaction is bound to come. We shall be on a better basis when the public asks of both amateur and professional exposers, not only, "How rotten are things?" but also, "How are you going to freshen them up?"

THE NEW HIGHER LAW.

Andrew Hamilton has performed a public service by his brief and forcible exposition of his theory of the higher law. His phrase is an old one; the idea which underlies it is still older. Readers of the Bible know that the "law of the Most High" transcends all man-made statutes. Readers of history are familiar with appeals from the lower to the higher law—appeals which have overturned thrones and disrupted empires. John Hampden thus appealed when he refused to pay twenty shillings ship-money because that payment would have made him a slave. Those devoted men who helped the fugitive negroes from the South made a similar appeal to eternal justice. The validity of such resistance to the established order is what William H. Seward had in mind when he uttered that famous sentence: "There is a higher law than the Constitution."

In the light of these inspiring precedents, it is worth while to examine somewhat narrowly Hamilton's *apologia*. We are not deeply concerned over his statement that for every dollar he drew from the New York Life he gave a voucher. That is a point over which lawyers and accountants may wrangle. Whatever their decision, the moral aspect of the case remains unchanged. These facts are indisputable. The activity of insurance lobbies at Albany, Trenton, Harrisburg, and other State capitals has for years been notorious. "The insurance interests are opposing this bill; the insurance interests favor that measure," have been commonplaces in all newspaper reports of legislative proceedings. If the trustees of the insurance companies were unaware that large sums were being paid to a lobby, they were children in regard to matters, connected with their own business, on which the general public was fairly well informed. They must have known that a corruption fund was pouring from their treasury in a steady stream; that vouchers and requisitions for it were, in one form or another, following the usual course; and that somebody was spending hundreds of thousands in bribing legislators. If the trustees and salaried auditors were unfamiliar with the details of these nefarious transactions, it was only because they deliberately closed their eyes.

Hamilton, however, solemnly declares that the responsible managers of the New York Life cannot avail themselves of even this flimsy pretext of nominal innocence. "The executive officers, one and all," he cried, "were conscious of what the purpose was and what the expense was. When I look around and see their faces before me, I challenge contradiction." "The men who would not know me now would come and pat me on the back and say, 'You did it.'"

"When they say they didn't know what was going on, it excites my laughter and derision." It also excites the laughter and derision of heaven and earth.

These eminent respectables who openly approved of, or tacitly consented to, Hamilton's operations, clearly enough acted on the principle which he lays down with such precision:

> "The insurance world to-day is the greatest financial proposition in the United States, and, as great affairs always do, it commands a higher law. In defending its rights and its property, you cannot stop to kick every cur that comes along and barks; and if you could sweep them out in other, perhaps mysterious, but honest ways, you are defending and asserting the higher law, which great enterprises have a right to command."

That is, these huge corporations are a sort of all-wise and unscrupulous Providence. Like God himself, they move in a mysterious way their wonders to perform. The ends which they have in view are above and beyond those of ordinary fallible mortals. John Smith, who is worth only $100,000, pays $500 to one or two scalawags in order to buy off a strike bill aimed at his private interests. John Smith is obviously a contemptible scoundrel, who, for the sake of a few dollars, would debauch a commonwealth and poison the very fountains of honor. The New York Life, the Mutual, and the Equitable, which reckon their assets by billions, pay $500,000 to scores of lawmakers in order to buy off strike bills. The insurance companies have, as we all see, risen to the realm of the higher law.

Of course, these "protectors of widows and orphans" plead—to use Hamilton's own phrase—that "Andrew Hamilton was defending the New York Life and the insurance interests generally throughout the United States on behalf of the principles which the officers of the insurance companies believed to be necessary for their success and for the benefit of the policyholders." "The benefit of the policyholders" is a term which we now easily understand—thanks to the relentless questions of Charles E. Hughes and the opposition of Paul Morton and others to some of the most salutary proposals for insurance reform.

Pretty words cannot conceal the ugly deed. Not only insurance companies, but our public and semi-public corporations generally, have coolly assumed that they are amenable to a higher law than that which binds the rest of us puny beings. Hamilton has described the very things which our mighty and reckless captains of industry have been thinking and doing—and has done it with a naïveté which is as exquisite as convincing. His anger is directed not at the system of which he was a part, but at the men who have failed to stand by it, the poltroons who have shifted to his shoulders and those of the late John A. McCall the blame of his "honest" and "necessary" enterprises. He has played the game according to the rules, but they have stacked the cards and "welched" on their bets. He echoes the wail of anguish from Godwin's hero, "If fidelity and honor be banished from thieves, where shall they find refuge upon the face of the earth?"

We lately overheard one well-dressed man say to his neighbor, "Why is it that everybody is getting down on corporations?" Hamilton's railing accusation is a complete answer. Sane men are not "down on corporations," but they tremble for the results of these displays of unrestrained and wicked power. In the work which Hamilton undertook in obedience to the "higher law," in his passionate outburst against the confederates who have thrown him to the wolves in order to save their own skins—sane men recognize the operation of a principle which is fatal to democracy.

REFERRED TO THE CONSUMER.

A "campaign of education," no matter what its subject, means a considerable addition to our mail-bag, and some of the more recent of these accessions have been uncommonly well worth running over. Some one has said that the pure-food bill would mean not a restriction of the people's diet, but the appearance on the grocer's shelves of a large number of articles never heard of before. It is just these articles which, after long years of masquerading as something they are not, now respectfully ask a hearing in their proper persons.

Until the past year, we may say, the attitude of the food-manufacturing interests might be fairly represented about as follows: "The public is full of the most unreasonable prejudices in regard to its diet. We know that such and such preservatives and coloring matters are innocent, but this same stupid public believes them injurious. We know that glucose is not only harmless, bu better than other sweetenings for many purposes, but the public will not have it so. We must deceive to a certain extent if we are to carry on at all a business which is entirely legitimate. People who are not capable of deciding justly what is bad for them and what is good, have no claim on the information. But the time will soon come when the men who have taken this attitude are to be forced to bring their claims before this very tribunal, which, with all its prejudices and panics, has a rather notable habit of being right in the long run.

The chief amendments that were made by the House Committee to the Heyburn bill were some that concerned the rights of so-called "blended" or "rectified" liquors. These are products which have hitherto been sold in competition with so-called "straight" whiskeys. No one ever saw a liquor advertisement which called attention to the fact that the product offered was anything but "straight." Such a concoction as Dr. Wiley produced the other day while the House Committee waited, is shuddered at by people who often enough have unwittingly swallowed much the same thing.

We have recently received a highly interesting pamphlet devoted to the proposition that any beverage which is made to taste like whiskey, *is* whiskey to all intents and purposes, and is entitled to the name. The finest "old rye," the writer submits, was unfit to drink when it dripped from the still, and gained its color and flavor only from storage in a charred oak barrel. If charred oak, why not burnt sugar and prune juice? Also, whiskey manufactured in the orthodox way may contain more noxious compounds than that which is frankly made from cologne spirits and flavoring matters. The Committee of Fifty, even, reported that there was no great difference in wholesomeness. If the two products look the same, taste the same, and are equally wholesome, why not take the one which is cheapest? That is the argument briefly put.

The makers and users of chemical preservatives have the same story to tell. At worst it is better to be poisoned by preservatives than by ptomaines, they say, and, as a matter of fact, the acids which have had so much notoriety lately never hurt a child. "An honest examination of the virtues of salicylic acid will show any unbiassed persons that, so far from being injurious to old people, in the majority of instances it could only be a benefit to them, even if administered in very much larger doses than are ever taken in food." This is the doctrine of Dr. R. G. Eccles in a recent monograph on 'Food Preservatives.' The same author undertakes to show that the minimum doses of salicylic or boracic acids are much larger than those prescribed by medical authorities for the characteristic acids of lemons, grapes, and vinegar, so that if the former are dangerous in diluted form, the latter must be far more so. We are already getting this and similar arguments in leaflets intended for wide popular distribution.

It is not our present concern to express an opinion about any of this reasoning, but it is a clear gain for the consumer to hear both sides and have a chance to make up his own mind. Probably the careful man will refer the whole subject to his family physician and act according to his advice. The careless will buy what is cheap and take his chances. The decision is exactly like that which every one has to make regarding the use of tobacco or alcohol. We hardly expect in our time to see any whiskey dealer boasting of the superfine quality of the aniline dyes used to color his wares, nor the canner making the label which indicates the preservative he

uses any larger, say, than the colored picture on the can. Whether the American palate will ever prefer glucose to honey or maple syrup, is indeed an open question. But if the pure-food agitation has done nothing but bring forth these public arguments and start people thinking a little for themselves, it would have been worth while. In fact, it will do more.

PASSING-RICH SCHOOL TEACHERS.

The bulky report which a committee of the National Educational Association, appointed in 1903, has made on the subject of "Salaries, Tenure, and Pensions of Public School Teachers in the United States," is, as its preface states, "not susceptible of satisfactory summarization." Its chief value is as a store of facts, almost brutally specific in statement, and useful for the discussion of school affairs in particular cities rather than for general arguments about the state of our educational systems.

The schools of this country are roughly divided for purposes of study into three groups: city schools, schools in small towns and villages—8,000 population being the dividing line—and ungraded rural schools. Each of these groups embraces something like a third of the total school population. What the tables of this report picture is a descending series from the respectable salaries paid in a few large cities down to a point where so little money is offered that teachers actually cannot be obtained even in communities where the cost of living is lowest. In only four out of forty-eight of the principal cities of this country was the minimum teacher's salary equal to the earnings of street and sewer laborers working fifty weeks in the year, while in the rural schools the committee found instances of salaries so preposterously low that it is hard to decide whether to call them shocking or ridiculous. Orneville, Me., paid $118 for an eighteen weeks' session, Peru, Me., $138 for twenty-eight weeks, or at the rate of $4.93 per week. In Frontier County, Neb., $75 was paid for twelve weeks; in Elkhorn, Ore., $90 for twelve weeks; while some of the Southern States, desperately cramped for school money as they are, pay many salaries still lower, Georgia's minimum of $10 per month for negro teachers marking low water.

With these as the horrible examples, we may extract from the report figures which will carry the comparison up to the largest cities:

AVERAGE SCHOOL SALARIES.

ELEMENTARY SCHOOLS.

No.	Cities Population.	Principals.	Teachers.	Both.
87.	8,000- 10,000.....	$633	$446	$464
110.	10,000- 15,000.....	680	456	482
60.	15,000- 20,000.....	733	486	515
74.	20,000- 30,000.....	794	479	516
58.	30,000- 50,000.....	922	517	558
38.	50,000- 100,000.....	1,075	572	619
20.	100,000- 200,000.....	1,087	603	648
16.	200,000-1,000,000.....	1,455	677	732
3.	Over 1,000,000.....	2,282	906	967

HIGH SCHOOLS.

87.	8,000- 10,000.....	$1,174	$650	$721
110.	10,000- 15,000.....	1,317	709	787
60.	15,000- 20,000.....	1,464	799	869
74.	20,000- 30,000.....	1,691	798	877
58.	30,000- 50,000.....	1,682	850	912
38.	50,000- 100,000.....	2,248	981	1,051
20.	100,000- 200,000.....	2,418	1,044	1,096
16.	200,000-1,000,000.....	2,685	1,230	1,287
3.	Over 1,000,000.....	3,663	1,615	1,676

The best of these groups do not show what could fairly be called princely remuneration, yet it is certain that the method of averages states the case too favorably. Those few cities which have adopted a more or less generous policy bring up the averages unduly. Thus, while the average salary of elementary school teachers is $1,161 for men and $650 for women, the omission of the four cities of New York, Chicago, Philadelphia, and Boston from the computation brings the average down to $653 for men and $556 for women. As one of the Moseley Commission remarked, American school boards prefer first-rate women to second-rate men, and the largest class concerned in this investigation is that of women teachers in elementary schools. These compose 74 per cent. of the total; and though the average salary, as above stated, is $650, more than nine-tenths of these teachers—reckoning now the cities alone—receive less than that. In the three university cities of Rochester, Syracuse, and New Haven, minimum teachers' salaries were found to be only $300, and in Baltimore, the sixth city of the country, $348.

The large proportion which school expenses bear to the total of local expenditures, is perhaps the chief obstacle to their readjustment on a more enlightened basis. One-fifth of the running expenses of New York city's government, for instance, is for schools, and all but a small fraction is in the salary list. If the payroll of any other department were as large in proportion, there would be a public scandal, and, while the analogy is absolutely false, it is not unnatural that the largest item of the budget should in many places have been deemed a proper subject for retrenchment. The Educational Association report points out the tendency toward creating special funds available for teachers' salaries and nothing else. There are three stages, it says, in the progress toward living salaries for teachers. First comes the raising of particular salaries by special resolution, next the fixed schedule with regular increases with length of service; finally, the "protecting such schedules of salaries against relapse owing to other public demands, which may seem to those who, at the moment, may have the disposition of the community funds, to be of more pressing necessity than the payment of good remuneration to teachers." The fixing of salaries in this city's schools by act of the Legislature and the provision of money for them by a special fixed levy on all taxable property, has often been denounced as a violation of the home-rule principle, but has unquestionably been one of the chief reasons why New York stands so far ahead of all other American cities in such a comparison as is made here.

AN IRISH NOVEL.

DUBLIN, February, 1906.

At present I can think of no abler novel in which Irish character and Irish affairs are treated than 'The Seething Pot," which appeared a few months ago and was noticed in the *Nation*. The author is the Rev. James O. Hannay, an Episcopal clergyman of Westport. He writes under the pseudonym of George A. Birmingham. He lately delivered lectures to mixed audiences in Dublin—one on "Irish Novelists," the other on the "Gaelic League," of which he is an enthusiastic member. He charmed us all by his viva-voce utterances, as he had previously done by his writing. He now gives us another novel, 'Hyacinth' (London: Edward Arnold). I purchased a copy, and scarcely laid it down before I had finished it. In caustic portrayal of characters and of society, where there is so much that is abnormal as there is in Ireland, these novels are unmatched. In both, the hero is more or less of a *Hamlet*, the burthen of whose cry is:

"The time is out of joint: O cursed spite,
That ever I was born to set it right!"

In both he retires hopeless from the conflict. All through, there is evinced a surprising knowledge of Irish affairs, and a keen, yet withal tender and pitying, appreciation of our virtues and shortcomings.

Hyacinth Connealy was born some twenty-five years ago in a remote fishing village in the west of Ireland. His father was a dreamy, unpractical clergyman in charge of a small Protestant congregation. His mother died when he was but two years old, and he was brought up by an old crone, consorting with the fishermen and their children. The time came when

"Mr. Connealy awoke to the idea that he must educate his son. He began, naturally enough, with Irish, for it was Irish and not English that Hyacinth spoke fluently. Afterwards the English alphabet followed, though not for the sake of reading books, for, except the Bible and the Prayer-Book, Hyacinth was taught to read no English books. He learned Latin after a fashion, not with nice attention to complexities of syntax, but as a language meant to be used, read, and even spoken now and then to Father Moran."

This Father Moran is a charming old priest, who figures upon several occasions in the narrative. The father and son kept house in a sort of fashion together, gradually abandoning the better rooms to neglect and decay, and living in the kitchen.

"Latin and Greek books . . . took their places among the diminishing array of plates and cups on the kitchen dresser. . . . When room was required on the table for plates, the books and papers were swept to one side. A pile of potatoes, and the pan, with bacon or perhaps a fish still frizzling on it, was set in the place left vacant."

The boy, clad in homespun, goes up to Trinity College to pursue a course of theological study. He is understood and tak-

en up by Dr. Henry, divinity professor. Reared in an Irish Nationalist atmosphere, he is astonished, on attending a students' prayer-meeting, to find himself face to face with Irish Protestant Jingoism of the most pronounced type. According to the leading clergyman, "the Boers were a psalm-singing but hypocritical nation, addicted to slave-driving. England, on the other hand, was the pioneer of civilization, and the nursing mother of missionary enterprise. It was therefore clear that all good Christians ought to pray for the success of the British arms." The heartfelt practical enthusiasm of the minority for England in the war is graphically described; and, contrasted with the verbal though empty sympathy of the mass of the nation for the Boers, will bring the blush of shame to the cheeks of many self-respecting Irish leaders. Hyacinth cannot conceal his pro-Boer opinions, is boycotted by his fellow-students, and is thrown for sympathy into outside Gaelic League and Nationalist circles. A leading figure in these circles is Maud Gonne (thinly veiled under the name of Miss Goold. who for so many years occupied a prominent place in Separatist circles here). We are now plunged into the vortex of the Irish question:

"Ever since Pitt and Castlereagh perpetrated their Act of Union, two political parties have struggled together in Ireland. . . . The Protestant party has hitherto been guided and led by the gentry. It has been steadily loyal to England. . . . It has not come well out of the struggle of the nineteenth century. Its Church has been disestablished, its privileges and powers abolished, and the last remnants of its property are being filched from it. . . . The Roman Catholic party has been led by the ecclesiastics. . . . The leaders of this party enter upon the twentieth century in sight of their promised land. If the bishops can secure the continuance of English Government for the next half-century, Ireland will have become the Church's property."

There is concealed under these exaggerated phrases profound truth. Ireland will under any conditions continue Catholic. The "Unionists" are playing the game of Ultramontanism; the Nationalists, of liberal Catholicism, such as is being developed on the Continent and abroad where the people have effective political power.

"Outside both parties there have always been a few men united by no ties of policy or religion, unless, as perhaps we may, we call patriotism a kind of religion. Other lands have been loved sincerely, devotedly, passionately, as mothers, wives, and mistresses are loved. Ireland alone has been loved religiously, as men are taught to love God or the Saints. Her lovers have called themselves Catholic or Protestant; such distinctions have not mattered to these men."

Hyacinth becomes involved in differences between Miss Goold's and the Parliamentary party led by Mr. O'Rourke. (If by this gentleman is meant Mr. Redmond, it is an absurd and unworthy caricature, and a blot on the book.) He is compelled to give up a theological career and to return home. His father's reception of him is pathetic in the extreme. The old man dies suddenly, and Hyacinth is thrown upon the world. Dr. Henry, by letter, urges him to qualify for a curacy in England, where he would soon grow out of the enormity of his political opinions, and where meanwhile they would not be understood. Father Moran entreats him to purchase a fishing-boat, and settle down quietly among his old friends. Miss Goold offers him a post in a small force she has recruited to join the Boers. He decides on the latter course, goes up to Dublin and throws most of his small capital into the cause. He is soon disgusted with the motives and characters of the men among whom he finds himself. Through a somewhat unnatural chance he finds employment as salesman for Mr. Quinn, a woollen manufacturer in the west of Ireland. He there finds a calm retreat for some years. The well-ordered life of his employer's family and of that of a neighboring clergyman, Canon Beecher, is in refreshing contrast to his early home and to the showy, grimy surroundings of his Nationalist friends in Dublin. We, of course, know what is likely to occur when we learn that the Canon has daughters.

The Nemesis of the Irish out-of-jointness follows him. Mr. Quinn manufactures none but genuine Irish tweeds and friezes, for the encouragement of which, and of Irish manufactures of all kinds, the cry is loud on all sides. Those who make most noise and even obtain representative positions as encouragers of home manufactures, secretly favor English goods. Mr. Quinn's business declines. A finishing touch to it is put by a community of nuns who start a woollen factory, and are enabled to undersell him by the wretched wages they pay their workpeople, and the subventions which, through political influence, they are able to obtain from the Government. Mr. Quinn removes to Dublin.

Hyacinth has become engaged to Marion Beecher. Two possible means of livelihood present themselves—work on the *Croppy* newspaper under Miss Goold, or a curacy in England offered by Dr. Henry. He is about to accept the former, for which a necessary qualification is to "hate England and the Empire and everything English, from Parliament to the police-barrack," when in a private interview Canon Beecher impresses him with the incompatibility of such views with any real belief in Christ or His doctrines. The Canon conquers. "As for me," says Hyacinth, "if I have been forced to make a great betrayal [of my political principles], if I am to live hereafter very basely—and I think I am—at least I have not cut myself off from the opportunity of loving Him [Christ]." He weds Marion, obtains the curacy, and settles in England. "He accepted his new duties and performed them without any feeling of enthusiasm, and, after a little while, without any definite hope of doing any good. He got no further in understanding the people he had to deal with, and was aware that even those of them who came most frequently into contact with him, regarded him as a stranger."

The concluding pages of the book are not more cheering or definite as to the future of the principal characters than are those of 'The Seething Pot.' They leave Hyacinth and his wife "disheveled, dirty, and tired" in Dublin after a night's passage from England, on a short holiday to Ireland. Father Moran is met by chance, and we are given no clue as to whether or not Hyacinth follows out his suggestion that he should occupy his father's old cure, vacant in his native village.

The defect in these charming novels—as in 'The Real Charlotte,' 'The Recollections of an R. M.,' and other brilliant books that of late years have appeared relating to Ireland—is that they are almost purely critical, dissolvent of hope. Their influence upon us in Ireland, tending as they do to show up our faults and weaknesses, and to tone down the acerbity of our differences, is doubtless upon the whole beneficial. But we are not a free people. We are governed largely through the prejudices of outsiders. The tendency of such writings as these is to strengthen their conception of us as naturally unreasonable, inconsequent, unstable, incapable of self-guidance and self-control, who must, out of kindness, be kept in leading-strings. There could not be a more mistaken estimate. We are the children of circumstances. Such altered, as they might be without injury to ourselves or others, life here, public and private, would flow on much as it does in other countries—no better, no worse. Enough of the naturally sweet and reasonable influences of public life run to waste here, and too often to evil, in any one year, sufficient under normal conditions to render happy any country of like population and of like natural capabilities to ours. These are hours of hope, not for bewildering, however brilliant, criticism. They are solemn hours, in which the inmost spirit of thoughtful Irishmen is best voiced by such utterances as Stephen Gwynn's beautiful monody of "Waiting":

"Is this, O Lord, Thy promised dawn,"

etc., which has lately been contributed to the press.

D. B.

LECONTE DE LISLE.

PARIS, March 1, 1906.

Leconte de Lisle is one of the representatives of the modern poetic school of France. He was long the head of those who called themselves the Parnassians; his 'Poèmes Antiques' marked in the history of our modern literature a date, a revolution, almost as important as, fifty years before, had been marked by the 'Génie du Christianisme.' Chateaubriand's work was the beginning of what has been called the Romantic era, that became so illustrious under the reign of Lamartine and of Victor Hugo. The 'Poèmes Antiques' of Leconte de Lisle were in distinct contradiction of the traditions and teachings of the Romantic school. The Romantic poets, Lamartine, Victor Hugo, Alfred de Vigny, were essentially lyrical; the beauty of Victor Hugo's dramas does not lie in the dramatic developments, which are often feeble if not improbable and almost absurd, but in the magnificent lyrical parts, which can be detached and admired by themselves. The splendor of the scenery, the costumes, the talent of the actor, are but an envelope of the lyrical beauty.

Leconte de Lisle was the creator of the purely æsthetic school of Hellenism. There is no place in his work for lyrical development, for subjective emotions of any sort. The poet becomes a mere witness of nature; you can read his whole work without knowing anything of him. "The influence of Leconte de Lisle," writes

M. Brunetière, "has been considerable, as it was particularly exercised on rare disciples, on the chosen disciples, who suffice in everything to maintain and propagate the teachings of a master." He was more than sixty years old when he took his seat at the French Academy in the chair of Victor Hugo (who had invariably given him his solitary vote at all preceding elections); but from the age of twenty he had been the uncontested master of a school of young disciples. He seems to have had a natural gift for leading minds, and his disciples' devotion to him was absolute. M. Coppée, a brother poet, wrote in 1894: "Towards 1866, my comrades and myself used to go every Saturday evening to the house of Leconte de Lisle as believers go to Mecca."

A volume has recently appeared, written by M. Marius Ary Leblond, which gives a complete biography of Leconte de Lisle. It is interesting to enter into the details of the life of one who was so careful in his works to avoid the most distant allusion to himself. His muse was impersonal; she lived apart from the troubles, emotions, and passions of the time. The Parnassian school professed a sort of contempt and almost horror for the passionate Romantic school. The life of Leconte de Lisle, as now told to us, shows a curious contrast between the man and his poetic production. He was born in 1818 at Saint-Paul de la Réunion (called Bourbon at the time). He left the island for France at a very early age, but returned to it at the age of ten, and remained there till 1837. His first impressions were derived from the sea and from the tropical scenery. He spent his youth at Dinan in Brittany, and at Rennes, where he began to study law; but he was not attracted by this severe discipline, and turned to literature. He wrote much verse; he wrote also literary criticism for a provincial review, edited at Rennes, and gave his opinion on the writers of the time, not only in France, but also in England. The titles of some of his articles are worth noticing: "Strophes to Lamennais," "Literary Sketches," "Hoffmann and Fantastic Satire," "Sheridan and Comic Art in England"; "André Chénier and Lyrical Poetry at the End of the Eighteenth Century." He often wrote under a pseudonym. His judgment of Lamartine is rather severe:

> "I at last decided to read 'Jocelyn'; I confess that the reading has not been without difficulty. . . . There are charming passages in it, magnificent pages of elevated poetry. The picture of the night, in the Eagle's Grotto, is truly sublime, and one encounters parts exquisite in sentiment; but you must confess, also, that there are long passages which much weaken this charming and incorrect work."

His admiration for Victor Hugo was entire, at the time; he calls him the "regenerating genius." He styles Théophile Gautier, the eccentric autbor of 'Fortunio' and of the 'Comedy of Death,' a witty "literary lion." His definition of a literary lion is: a writer "qui fait de l'art pour l'art"; and this might afterwards have been applied to himself. Balzac surprises him by his fecundity: "The present time abounds in enigmas of all sorts, as is easily conceivable, for nothing is quite stable yet in politics or in literature; but if there is a problem of which the solution is next to impossible, it is the exhaustless fecundity of M. de Balzac." Madame Sand has his entire praise and admiration; he speaks with enthusiasm of Indiana, of Geneviève, those "frank angels," those "charming and frail flowers," of Lélia, "a sublime spirit, a ray of her genius." She seduced him by her intense love of nature; her heroines are well forgotten, but her descriptions are still readable. He was very republican in sentiment, and so was Madame Sand; this community of political aspirations was another tie between them.

In these early essays we find not only literary judgments: Leconte de Lisle gives also his philosophical and social views. He wrote for a Catholic review, and could not well disagree with its religious tendencies; but he showed that he considered Christianity a system of morals, a philosophical creation. These independent views, however, were only in germ in his early writings. The review in which they appeared did not live more than a year; it ceased to appear in March, 1841. Leconte de Lisle returned to his law studies. In 1843 he left Nantes in a sailing vessel for the Isle of Bourbou. He became for a time a lawyer, but felt very solitary, and applied himself to philosophical and social studies. He began to read the *Démocratie Pacifique*, a paper founded by Victor Considérant, and became imbued with the ideas of the socialist school of the *Phalanstère*. He entered into correspondence with some of the writers for that paper, and, returning to Paris in 1845, himself became one of its contributors. At the same time, he gave sundry poems to a Fourierite paper, *La Phalange*, which have not been republished.

After the Revolution of 1848, he took a prominent part in the abolition of slavery in the French colonies. His father suppressed the small allowance which he sent him, and he was obliged to give lessons in Greek and Latin, and to make translations. He was sent as a delegate of the Provisional Government to Brittany, but had not much success in trying to reconcile tbe Bretons to the new Government. "You can hardly imagine," he writes from Dinan, "the state of stolidity, ignorance, natural brutality, of this unfortunate Brittany. . . . It is as clear as day that the Revolution will be cheated; the Assembly will be composed of bourgeois and of royalists. . . . How stupid the people is!" The poet adds: "This does not hinder me from living on intellectual heights, in the calm, in tbe serene contemplation of divine forms. There is a great tumult at the base of my brain, but its higher part knows nothing of casual happenings." Leconte de Lisle paints himself exactly in this phrase: he does not profit much by what he calls casual happenings. His *milieu* is the revolutionary world of 1848. During the terrible insurrection of June, 1848, writes Madame Dornis (a lady who saw much of him in the latter part of his life), he was observed on the barricades in company with Paul de Flotte! The two friends carried powder to the insurgents; they fought. One day Leconte de Lisle was arrested in a little street of the Faubourg St.-Germain; he had powder in his pockets, and was put in prison. "For forty-eight hours, the longest of my life," he said, "I remained in prison; but they had left me my books, and I continued to translate Homer."

After the *coup d'état* of Louis Bonaparte he became thoroughly disgusted with politics: "I cannot express the anger which burns my heart at witnessing, in my impotence, this murder of the Republic which was the sacred dream of our life. . . . The popular masses are stupid; the Counter-Revolution is in power. France is dishonored in Europe, and we have no more blood in our veins." After the fall of the Empire there appeared a volume of 'Papiers Secrets et Correspondance du Second Empire' in which was a note, showing that Napoleon III. had paid Leconte de Lisle a pension of 3,600 francs since the month of July, 1864. The poet's friends were much disconcerted. The pension had been obtained through the influence of Madame Cornu, a personal friend of the Emperor. This revelation made a great noise at the time. Leconte de Lisle wrote to a friend: "A fatal necessity obliged me to accept the offer made me, for my allowance from the Isle of Bourbon was not paid, and I had to take charge of my mother. I had to choose between the life and the death of my people. I sacrificed myself." The Republic was generous and maintained the pension, adding to it the post of Librarian of the Senate. Leconte de Lisle was elected a member of the French Academy on the 31st of March, 1887, at the age of sixty-nine years, and died in 1894.

M. Leblond's volume is a perpetual apotheosis of Leconte de Lisle; its interest lies chiefly in the facts and dates it contains. It would give but an imperfect idea of the poet to those who had not read his works; but it may take its place among the numerous articles and reviews which have had Leconte de Lisle for their subject. The translations of the great Greek and Latin poets by Leconte de Lisle can be highly commended for their admirable exactitude; and his two volumes, 'Poèmes Barbares,' 'Poèmes Antiques,' have pages which will always be remembered.

Correspondence.

A NEW SOCIETY WANTED.

To the Editor of The Nation:

Sir: The late ghastly disaster on the Denver and Rio Grande Railroad, after many not much smaller ones on other American roads, "must give us pause." Other evils in the United States have been remedied by movements which began with the starting of a society for that sole end—for instance, slavery. It is my ambition to start an American Association for Putting an End to Railroad Wrecks. Tbey are a disgrace to the United States, being more frequent and more deadly here than in any other country in the world. Tbe reasons for the frequency of these horrors are well known: one is the public's preference for speed over its own safety; tbe other is the preference of the railroad managers for big profits over tbe safety of crews and of passengers. The sparse population in the South and West prevents such precautions as double tracks which make head-on collisions impossible, and many other contrivances nearly as expensive as the double

track; but slower travel would easily make up for the lack of them. In more densely settled parts of the country all the precautions that are taken by British, French, and German roads could be easily introduced, but the railroad management finds it cheaper to pay damages occasionally for the loss of life and limb than to prevent such loss. There is a simple remedy for this: the law should impose such heavy liability for the loss of life, for mutilation or sufferings, caused by clearly proved neglect (and a collision is always the result of neglect), as to make a disaster like the late one near Denver equal to the bankruptcy of the road.

The work of a society for stopping railroad wrecks should thus have a double aspect: first, to educate the travelling public into a preference for safety over speed; second, to strive for such legislation, both State and Congressional, as will force the railroad managements to put freedom from disaster above the desire for heavy receipts and big dividends.

My name is not too unknown and obscure to figure in originating a great movement like this: any one can find it in 'Who's Who' and some other national biographies. What I propose is this: Let those who, like myself, feel the importance of such a movement and who read these lines, either in the *Nation* or in any of the newspapers or periodicals that may copy them, give me by letter or postal card their names, with occupation and post-office address; and as soon as one hundred names are received I shall have them printed and forward the lists to all those sending their names—that is, to the founders of the new society, so that they may agree on a place of meeting and a plan of organization.

Louisville is among the greater cities of the United States nearest to the centre of population, and might do very well for the first place in which to meet for organization.

Very respectfully,

LEWIS N. DEMBITZ.

LOUISVILLE, March 18, 1906.

POOR RICHARD'S POETRY.

TO THE EDITOR OF THE NATION:

SIR: The verses which served to enliven the pages of 'Poor Richard's Almanack' (1733-1758) were collected and edited, in 1890, by Paul Leicester Ford. On the title-page they are called "Poems of Benjamin Franklin." In the introduction the editor quotes Franklin's own statement, "I need not tell thee that many of them are of my own making," and adds that he has "been able to identify but one or two pieces as from other pens." Perhaps some of your readers may be interested in a longer list of the great man's borrowings.

The verses for June, July, and August, 1733, are clipped from Dryden's translation of Virgil's first Georgic. The lines for May, "My love and I for kisses play'd," were written by William Strode (1602-1645). They are quoted in Ashton's 'Humour, Wit and Satire of the Seventeenth Century,' from 'Witts Recreations,' London, 1640. So are half of Poor Richard's verses for May, 1734. The couplet for December, 1734, "Is't not enough," etc., is from Young's 'Love of Fame,' Sat. v.

The introductory verses for 1736, "Presumptuous man," etc., and the verses for March, are from Pope's 'Essay on Man.'

The lines for February, 1737, and for November, 1738, appear in a volume of 'Miscellaneous Poems by Several Hands,' published by D. Lewis, London, 1726. The epigram for May, 1737, is from William Walsh.

The lines for April, 1738, 'The Old Gentry,' are adapted from Prior's poem of the same title.

The lines for June, 1739, 'On his late Deafness,' are conveyed from Swift's 'Complaint on his own Deafness.'

For 1740, nine pieces of verse (76 lines in all) are clipped from Gay's 'Fables.'

For 1741, five pieces are taken from Gay's 'Fables,' and three from Swift's 'Strephon and Chloe.'

In 1743, the February verses are Prior's 'Democritus and Heraclitus.'

In 1744, the twenty lines entitled 'The Country Man' are Pope's 'Ode on Solitude.' The June verses are taken from Pope's 'Essay on Criticism,' the lines for August from Pope's 'January and May.' The April and July verses are from Thomson's 'Summer.'

For 1745, five pieces are clipped from Pope's 'Essay on Man,' and one from Pope's 'Moral Essays.' The ten lines for June are from Lyttelton, 'An Epistle to Mr. Pope' (from Rome, 1730). The lines for July are from Armstrong's 'Art of Preserving Health,' Bk. iii.

In 1746, ten pieces (a total of 76 lines) are taken from Young's 'Love of Fame.' In 1747 eight pieces, and in 1750 six more, are taken from the same poem. (It was in his preface for 1747 that Franklin stated that many of these verses were his own.)

In 1751, the April and June verses are adapted from Gay's 'Trivia.'

In 1752, all the verses for the year, 'On Public Spirit,' are taken from Richard Savage, 'Of Public Spirit in regard to Public Works.' Some of the lines are changed to fit local conditions.

There are a good many other poems, especially in the later issues of the Almanack, which are probably not original. Perhaps some one who has special knowledge of eighteenth-century literature will help to identify them, and throw some further light upon Franklin's course of reading. In some cases one finds a very familiar sentiment or situation, without being able to say just who is responsible for its present form. For example, the verses for October, 1742, and May, 1743, come, through some channel, from Horace, Odes, ii. 10 and iv. 7. The simile for October, 1734, seems to come from Horace, Ars Poet., 304, and the epigram for November, 1734, from Martial, i. 38. The situation set forth for June, 1734, is the subject of the first story in 'L'Élite des Contes du Sieur d'Ouville,' and the story for March, 1741, is merrily told in Montaigne, 'Essais,' ii. 32.

WILFRED P. MUSTARD.

HAVERFORD COLLEGE, March 17, 1906.

LOWELL AND MEREDITH.

TO THE EDITOR OF THE NATION:

SIR: A correspondent in the last *Nation* calls attention to the fact that Mr. Lowell gave to the Harvard University Library in 1885 a copy of George Meredith's Poems which the author had given him but two years before.

In answer to this it is only fair to notice that in 1885, when Mr. Lowell came home from Europe after an absence of eight years, his own house was leased, and he did not occupy it again for a considerable time. It seems but natural, then, that, in providing for the accumulations of those eight years, he should decide to give the books to the Harvard Library for use and safekeeping; and it should not be considered a test of his estimate of them, as your correspondent intimates, that he should so dispose even of authors' gifts.

E. L.

CAMBRIDGE, MASS., March 18, 1906.

Notes.

'A History of Architecture,' in three volumes, by Russell Sturgis, is announced by the Baker & Taylor Co., volume one being set down to appear in the autumn, and the others at short intervals. Each will contain nearly 500 illustrations in half-tone and line, with select plates by the carbon-gravure process.

McClure, Phillips & Co. have nearly ready 'The Meaning of Good,' by G. Lowes Dickinson.

'Consumption: Its Relation to Man and his Civilization,' by John Bessner Huber, M.D., is in the press of J. B. Lippincott Co.

The spring announcements of George W. Jacobs & Co., Philadelphia, include a 'Life of Frederick Douglass,' by Booker Washington; 'The Battles of Labor,' by Carroll D. Wright, ex-United States Commissioner of Labor; 'The Literary History of Philadelphia,' by Ellis P. Oberholtzer; and 'The Rambles of an Idler,' by Dr. Charles C. Abbott.

A 'Russian Reader,' from the French of Profs. Paul Boyer and N. Speranski, by Samuel N. Harper, is just issuing from the University of Chicago Press.

Antiquarians will be interested in a forthcoming book, on 'The Ancient Crosses and Holy Wells of Lancashire,' by Henry Taylor, F.S.A. (Manchester: Sherratt & Hughes). In order to accomplish his task thoroughly, he has not only devoted much time to personal investigation of the localities, but has made a minute study of the ordnance maps and of numerous documents bearing on the history of the district from the invasion of the Northmen to the dissolution of the monasteries, and indeed to the days when the municipal authorities triumphed over the monks, and when the Jacobin market-cross, the successor of others on the same site, became the centre of commercial prosperity. Attention will be drawn to the numerous natural fastnesses—*e. g.*, the rock in Manchester at the junction of the Irk and the Irwell—seized upon for purposes of defence not merely in the Stone, Iron, and Bronze Ages, but in Roman and post-Roman times. There will also be notes on the pre-Reformation churches and monastic institutions and the superstitions of the county. The illustrations, one hundred and forty in number, will include maps to a large scale of the six Lancashire hundreds (Leyland, Blackburn, West Derby, Amounderness, Lonsdale, and Salford), showing the course of the rivers, the strongholds, the position of

the crosses, etc. The edition will be limited to two hundred and fifty-five copies.

The death of Miss Susan B. Anthony is announced as we turn the pages of a new edition of Mill's 'Subjection of Women' (Longmans), edited by Dr. Stanton Coit, who avowedly offers it as a revived weapon for the British Women's Suffrage Movement. Working women having begun to be drawn into the agitation, Dr. Coit has made his volume inexpensive, and has prefixed the argument in outline, which any reader may be glad to avail himself of. At the end the editor reviews the disabilities of women in Mill's day and at the present, with the conclusion that there has been relatively little change. His other remarks are eminently restrained and judicious.

We noticed with approval last autumn A. Harold Unwin's 'Future Forest Trees; or, The Importance of the German Experiments in the Introduction of North American Trees'—British experiments as well. A. Wessels Company are now introducing this not bulky work to the American market.

Five years ago we reviewed M. Victor Bérard's 'L'Angleterre et l'Impérialisme,' and it is a proper tribute to the solid character of this work, well supplied with official documents, that an Englishman now translates it, viz., H. W. Foskett, M. A., Oxon., under the title, 'British Imperialism and Commercial Supremacy.' It is very handsomely brought out by Messrs. Longman. In spite of the recent general election, this must be thought a timely anti-Chamberlain tract (300 pages octavo).

A famous Puritan tract, Nathaniel Ward's 'The Simple Cobler of Agawam,' has been fitly added as No. 14 to the Publications of the Ipswich (Mass.) Historical Society. The edition followed is the fourth London, of 1647, and the title-page and some other portions are reproduced in facsimile, while the text is a literal transcript in antique fashion. This is followed by some account of the eminent author, and a summary of the pedantic farrago, in which religious intolerance and political independence jostle each other. Ipswich men have not a monopoly of interest in this local product, and every public library should seek to obtain a copy.

Dodd, Mead & Co. publish a volume of papers and addresses by Dr. Daniel C. Gilman, about one-third of which deal with the founding and early years of the Johns Hopkins University and give the volume its title, 'The Launching of a University.' The chapters of this portion of the book appeared in large part as contributions to *Scribner's* and the *Century*, two or three years ago, and received some notice in these columns at the time. The remainder is devoted to educational addresses delivered on various occasions, such as the Yale Bi-Centennial, the dedication of the Princeton Library building in 1898, and the inauguration of President Wheeler of the University of California. A fine picture of Dr. Gilman, dated 1905, forms the frontispiece, and indicates a mind and physique still good for years of profitable endeavor.

In addition to Professor Harrison's outline 'History of Greece,' which formed the opening volume of the "Story of the Nations" series, Messrs. Putnam concluded that the subject merited a more detailed treatment. The work was accordingly put into the hands of Dr. E. S. Shuckburgh, and the first of his two volumes has just appeared, covering the time from the coming of the Hellenes—not definitely dated, of course—down to the death of Augustus. In accordance with better ideas of relative importance, the emphasis is thrown upon political, intellectual, and artistic development rather than the vicissitudes of military operations.

From the Macmillan Co. we have a volume of 'Lectures on the Early History of the Kingship,' by J. G. Frazer, D.C.L. The theory of the evolution of kingship out of the primitive institution of magic, as developed in these lectures, will appear, we are told, as part of the author's well-known 'Golden Bough,' a third edition of which is promised for the near future. As Mr. Frazer's studies in this subject are there to be set forth in fuller form, it seems best to defer elucidation or criticism until the additional material shall be at hand.

We receive from Lemcke & Buechner a copy of Otto Jespersen's 'Growth and Structure of the English Language' (Leipzig: B. G. Teubner), which we have lately characterized as a very suggestive and stimulating little book. We hope the author may yet achieve the companion volume contemplated on page 246, discussing "how one form of English came to be taken as standard in reference to dialects," "all the problems connected with that pseudo-historical and anti-educational abomination, the English spelling," "provincialisms, cockneyisms, and vulgarisms," "Pidgin-English and Negro-English," etc.

Mr. James Schouler's 'Law of the Domestic Relations' (Boston: Little, Brown & Co.) is an abridgment of the author's well-known larger work upon this subject, and "makes use, besides, of the lecture notes used by him for twenty years or more as a law-school professor." It cites over twenty-five hundred cases, and will be found a convenient manual for students. A companion volume, by the same author, on the 'Law of Bailments,' is also issued by the same house. This, too, is based on the author's larger work. Special prominence is given to the topics of Pledge and Carriers.

The opening chapter of Dr. Victor Tourneur's 'Histoire des Études Celtiques' is introductory, dealing with the history of the Celtic races, their languages, ancient and modern, the sources of their literature, and the Pan-Celtic movement. In the remaining two hundred pages this author discusses the state of learning in Ireland and Wales from the earliest times to the present day, the work of Gaelic, Manx, Cornish, and Breton scholars, etc. There are also chapters on current theories as to the Celts and their languages, on Celtic philology, and on the teaching of Celtic. The book may be had on application to the author, at 98 Rue Defacqz, Saint-Gilles, Bruxelles, Belgium.

How many years ago would a "Finding List of Music" have seemed a surprising novelty in a public library's apparatus? Not many. Such a list comes to us from the Worcester (Mass.) Free Public Library, and fills with the index nearly 100 pages. Its shortcomings, of course, are those of the collection to which it furnishes a key, but they do not seriously impair its utility in any other library.

Lemcke & Buechner send us parts 29-40 of the new (third) edition of 'Meyer's Geographischer Hand-Atlas,' of whose commendable qualities we have spoken from time to time. These parts are occupied solely with the index; so here is one more convenient and copious little gazetteer of names, handy for reference without regard to the maps on which it is based.

The weight of illustration in the March number of the *Harvard Graduates' Magazine* is given to the enlarged Harvard Club building in this city, along with an account of the celebration at the opening last December. But there is a pleasant innovation in two portraits of Continental lecturers contributing to the international exchange now firmly established—one of Wilhelm Ostwald, the other of Anatole le Braz. Of interest also is a plan of the college grounds and vicinity, with red coloring for buildings erected within twenty years. The Radcliffe College group is here very conspicuous, as it is to the eye of every visitor to Cambridge.

Now that the cessation of war allows the Japanese Government a free hand in Korea, the lawless and irresponsible subjects of the Mikado are seeking cover, while the forces of order are being rapidly organized for efficiency. The *Seul Press Weekly* tells of sixty-nine unemployed Japanese summoned to give account of themselves. Twenty-nine were ordered to leave the country at once, and the others received their first warning to get to work. The Japanese military administration under Gen. Hasegawa ceased on January 31, and the Marquis Ito, with his staff and subordinates, began civil government. In all places where there were consuls, Japanese, and in all others Korean, police authority will prevail. A Japanese customs cruiser and a commission for the codification of the laws are actively at work. The opportunities of unprincipled low-class Japanese for spoliation of the native peasantry are likely to be greatly curtailed. On the 25th of January, at the American Hospital for Women, in Seul, the first native Korean trained nurses were graduated. They received not only their certificates, but, as is eminently proper in the land which has a unique language and etiquette of headgear, their caps. Under the inspection of the former chief of police in Nagasaki, the Korean prisons are receiving attention and reform. The one-garment and one-meal-a-day system, with no beds, and the detention of prisoners without trial—some of them for ten years—is to give way to the Japanese system, which of late years has been reorganized after the models in Elmira and Concord and the best examples in Europe.

The near-Eastern question was the subject of a characteristic speech by Mr. Bryce at a dinner given in his honor in London, February 23, at which were present the ministers of Greece, Bulgaria, and Servia, and a member of the French Senate. He began by decrying the narrow view that the duty of a great nation was confined to the protection of its own interests. He was brought up to think that it was one of the first duties of a British citizen to be interested in the cause of liberty and human-

ity elsewhere. While he could not approve a war from the mere hope of ameliorating conditions in a foreign country, he held that a government, provided it was the sentiment and will of the people, should exert its power and influence on behalf of humanity and justice, and he believed that the British, French, and Italian peoples were willing that their Governments should act so now. The regeneration of the East would be effected, in his opinion, by the erection of the nations in the Turkish Empire into states, and, from the capacity shown by these peoples and their powerful individuality, he hoped that each nation would produce some new and distinctive type of civilization proper to its peculiar character and gifts. It would be a happy consummation, a cheering result to follow after so many centuries of misery, and it would be an honor and glory to the free peoples of Italy, France, and England if they could be associated with that work.

Prof. Ulrich Wilcken, easily the leading German papyrus authority, fills forty pages in the January issue of *Hermes* with the particulars of a surprising and valuable find he has made. He put together forty pieces, large and small, of a papyrus making a document twenty-three centimetres long by eighteen centimetres wide. The language of the writing is Greek, and the skill of the investigator has succeeded in finding in it a fragment of a hitherto unknown source for the history of the Second Punic War, and that, too, a source of the first quality, namely, the work known as the 'Deeds of Hannibal,' composed by Sosylos, the war companion, secretary, and language teacher of the great Carthaginian general. This fragment belongs to the papyri collection of the University of Würzburg, having been bought for this collection by Dr. Prym, the professor of mathematics in that institution. The Munich *Allgemeine Zeitung* says we may believe Wilcken when he avers that it was hard for him "librum non scribere" on his discovery.

The tenth International Congress of Geologists has been called to convene in the city of Mexico on the 6th of September, 1906. Sr. José G. Aquilera will be the chairman, and Sr. Eziquael Ordony the general secretary. The official programme announces a number of excursions in connection with the convention, as also the four leading topics to be discussed. Applications are to be addressed to the general secretary; membership tickets cost $4.

—A correspondent writes us from Florence under date of March 7:

"*La Nazione* of yesterday had little on its first page except long and appreciative notices of two remarkable Englishwomen, Elizabeth Barrett Browning, the centenary of whose birth it was, and Jessie White Mario, who had died the day before, and whose body was to be carried in the afternoon to the crematory at Trespiano. At four o'clock a crowd stood in front of the house where she had lived, No. 125 Via Romana, and half an hour later a hearse, completely covered with flowers—callas, orchids, an immense wreath of violets, roses, lilies-of-the-valley—gifts from Signora Mario's pupils in the Istituto di Magistero Femminile, where she had been a teacher, from the city of Florence, and from various societies and friends, moved slowly down the narrow street, followed first by the hundred schoolgirls who had sent red and white roses and green palms to symbolize Italy. Behind them walked a group of distinguished men, and the procession was closed by Garibaldian and workingmen's societies carrying banners. It went from the Via Romana into the Via Maggio, where the tablet that marks Casa Guidi had been wreathed with flowers by order of the mayor in honor of Elizabeth Browning, and the English and Italian flags hung side by side; then across the Arno, by the Ponte Santa Trinità, to the Porta San Gallo on the other side of the city. There it stopped, and Prof. Pasquale Villari and Professor Eccher spoke words of farewell. Professor Villari said: 'She had only one ideal, only one affection: the love of Italy, and the worship of those who lived and died for our country. . . . In 1859 and afterwards, she was on all of Garibaldi's battlefields, caring for the wounded, whom she collected together under the enemy's fire. She always showed so much courage that Garibaldi decorated her with military honors. When the battles were over, when Garibaldi retired to Caprera, she began to write the lives of the Italian patriots. . . . All these works cost her much labor, and gave her little or no money. Her only object, and her only reward, were the glory and honor of Italy, which she loved and admired above every other nation, and for which alone she wished to live and die. . . . Her place is among the saints and heroes of our Revolution, and her epitaph may well be: "She lived and died for Italy and for duty."' *Il Nuovo Giornale*, a new daily paper of much promise, says: 'She is followed by the loving thoughts and gratitude of the younger generation of Italy, for whom she hoped, fought, and suffered so much. *Fieramosca's* notice ends with: 'The reverent salute of every Italian is paid to her sacred memory; and the gratitude of all those who feel the love of country and admire while living and mourn when dead the noble, brave Englishwoman, heroically faithful to Italy.' *La Vita* (Rome) and *Il Corriere* have appreciative personal reminiscences."

—The 'History of All Nations' (Philadelphia: Lea), to which some time ago we devoted a long article, has advanced from its tenth to its fourteenth volume. Chronologically, the tract thus covered extends from the beginning of the Reformation to the middle of the eighteenth century—the outbreak of theological disturbance forming the subject of Vol. XI; the religious wars, of Vol. XII; Louis XIV. and his era, of Vol. XIII; and the balance of power, of Vol. XIV. The author to whom we are indebted for all four volumes, is Dr. Martin Philippson, a thoroughly competent authority so far as statement of essential facts is concerned, and a more enlivening writer than some of his predecessors in the same series. For the Lutheran period and the era of the Thirty Years' War, the illustrations seem particularly good, while as we advance farther and farther into modern times the narrative becomes sufficiently detailed to embrace topics which lie outside the beaten path of political epitome. A good deal of the material here employed has been drawn from the author's previous works, but not in a slavish way nor in such wise as to catch the notice of any one save the professional student. Those who are already familiar with the views which Dr. Philippson holds regarding the agencies of the Catholic Reaction, will be interested to see whether, in a series designed for popular use, he will employ a colorless style of statement or give free vent to his private opinions. Actually, he has followed the latter course, as may be seen from his account of the Jesuits. "'Loyola cared less,' said his secretary, Father Polanco, 'for natural goodness than for firmness of character and aptness for affairs, in those who wished to join this Society; for he was of opinion that men not qualified for public affairs were not suited to the work of our Society.' Piety evidently was of slight value in what concerned the temporal interests of the Company. In an official document, Polanco, in the name of his General, requires of the novice 'good natural endowments and capacity, either for science or for external good works'; he wants young men of fine appearance, of an agreeable exterior, 'as our mode of life and our relation to our neighbours demand.' Not a word about genuine piety as a condition for those who ask to join the Company. Intelligence, worldly wisdom and a fair exterior are what Loyola requires." We quote this passage simply to show how Dr. Philippson approaches one of the most controverted subjects in an era which bristles with acute theological disputes. He certainly has not sought to mask the nature of his convictions, but, as the foregoing excerpt will show, he makes a point of giving the grounds for his judgment in any given case. Of the volumes in this series which are still to appear, several have been written by American historians like the late John Fiske and Professor Andrews.

—We had just read in E. W. Prevost's 'Supplement to the Glossary of the Dialect of Cumberland' (H. Frowde), among the "similes current in the county," "Drunk as a potter (the last stage of drunkenness)," when a New York daily paper reported the potters of Trenton, N. J., to be the special objects of temperance reform at the present moment. "Drunk as a hatter" is current on the eastern border of the same State. "Blewd," by the way, is Cumberland for slewed. In old farmhouses the ground floor consisted of "the kitchen, into which the front door opened, and the *parlor*, formerly called the Bower, also opening into the kitchen, and both facing the south. The parlor was the room in which the master and mistress slept." If, now, we turn to a recent work of Mr. Waters's on colonial Ipswich (Mass.), we read (p. 23): "There were but two rooms on the main floor, the 'hall' and the parlor, and entrance to them was made from an entry in the middle of the house. The 'hall' of the old Puritan house was the 'kitchen' of the next century. . . . It was the living-room." The parlor was the "fine-room" or spare bedroom, but sometimes it was the sleeping-place of the owner. In 1646, Joseph Morse willed "the bed and all the bedding he lyeth on, standing in the parlor." Sitting or reception room it was not, on either side of the Atlantic.

—The Glossary affords the usual instruction in country customs, many as obsolete as gross. Nearly extinct is the indigenous Greyhound Fox, whose existence is mentioned by Bewick. Perhaps the most unexpected meaning for a familiar expression is shown in "horse sense," signifying acquisitiveness. Some French influences are remarked in the dialect, and the want of the genitive in *s* is at least parallel to a grave defect in French as compared with English. The word "ask" is seldom if ever used; one is "bidden out" or "speered for." And "throw" is similarly avoided. "'At' (that) replaces who, which, whom. Final *gh* is apt to be pronounced *f*, and so dough, is sounded "duff." *H* is variously aspirated, in and out of place. "'Bessy, boll me a hegg.' 'Father, you should have said an egg.' 'Then gang and boll me two neggs.'"

K "was formerly pronounced at the commencement of words like knit, knap, and knot." A grammar of the dialect is contributed by S. Dickson Brown, a member of the Philological Society. This connection should have saved him, at page 10, from going counter to the Society's new English (Oxford) Dictionary, when explaining the idiom "I had rather." He is still in the bog of "I would [I'ld] rather."

—The twelfth part of the "Anecdota Oxoniensia, Mediæval and Modern Series," contains an edition and translation by Professor Kuno Meyer of the "Cáin Adamnáin," an early Irish treatise on the law of Adamnan. The document is of much interest, both to the Celtic grammarian and to the student of early Irish institutions. It belongs to that class of texts, now known to be numerous, which, though preserved in mediæval or even in modern manuscripts, are proved by their language to have been written in the Old Irish period. In this instance the two existing manuscripts date from the fifteenth and seventeenth centuries, respectively, and are both ultimately derived from a lost Book of Raphoe of uncertain age. The composition of the treatise itself, however, is probably to be assigned to the ninth century. The linguistic difficulties, which are usually considerable in the texts thus preserved, have been adequately dealt with by the experienced editor in his notes and glossary. Dr. Meyer has also done a good deal for the historical elucidation of the material, though he has been compelled by illness to abandon for the present his purpose of writing a systematic introduction on this phase of the subject. It is earnestly to be hoped that he may soon be able to resume the task. The treatise as it stands is clearly a mixture of historical and legendary elements, and an analysis of the underlying documents would make an interesting contribution to an important period of Irish ecclesiastical history. It will be remembered that the Law of Adamnan (best known, perhaps, as the "Lex Innocentium") was promulgated during the time of controversy about Roman and Celtic usages in the Irish Church.

HALDANE'S DESCARTES.

Descartes: His Life and Times. By Elizabeth S. Haldane. E P. Dutton & Co. 8vo, pp. xxviii., 398.

The facts which render Descartes interesting to us of to-day, may be summarized under three heads. First, modern philosophists are substantially unanimous in reckoning him as the founder of modern philosophy. Secondly, some of those who are most competent to judge of such a matter, tell us that his vast influence in philosophy is closely connected with the fact that, in an age of great mathematicians, he was either the second or nearly of that rank. That is, he cannot be compared with Fermat, but his power was not far from that of Desargues. He was particularly helpful in mathematics, for it was he who gave analytical geometry to the public, went far toward settling the signs of algebra, and gave a useful rule about algebraic equations.

The third class of facts which stimulate our curiosity concerning Descartes consists of sundry characteristics of the man which seem almost inexplicably at odds with the first two. It is staggering to common sense to find metaphysicians ranking Descartes so very high, and yet denying almost everything that he pronounced to be mathematically evident. What he plumes himself upon most and almost exclusively is his institution, for inquiry into any subject, of a method which, as he maintains, perforce must absolutely exclude all danger of falling into error; and yet almost every scientific proposition to the truth of which this method led him, and which, because it so resulted, he insists is as certain as that twice two is four, is now seen to be wildly false. Such is his notion that "the brutes" have no feeling, and may be vivisected as unconcernedly as one would saw through a log; that a vacuum is unthinkable, and that consequently our universe must be unlimited; that the movements of the planets are determined by vortices or whirls in the ether; that light is a material substance, resistance to the translation of which determines the law of refraction; that colliding bodies must behave in a way in which the fact is that no bodies really do. One is further surprised to find that so great a man seemed unable to see any merit in the work of Galileo, and was so disgusted with his denials of Scripture truth that he took no interest in his work; that he could see no mark of genius in the discovery by the boy Blaise Pascal of that hexagram from which all the properties common to conic sections can be deduced; and that he even affected to look down upon the works of Fermat, of Vieta, and of Desargues.

The most surprising thing of all, however, in a mind of such unquestionable power and greatness, is that Descartes seems to have been continually engaged, and that very successfully, in deceiving himself. Thus, he plainly regarded himself as the only philosopher worthy of that name that ever lived; and yet it seems impossible that, after eight years in perhaps the most admirable Jesuit college there ever was, he should not have been perfectly aware that his famous *Je pense, donc je suis* was taken entire out of St. Augustine's 'De Civitate Dei,' or 'De Anima,' or 'De Quantitate Animæ,' for its substance, as the form of the 'Discours de la Méthode' and of the 'Meditationes' is imitated from the 'Confessiones'; nor that he should have been totally unconscious of how far he availed himself of the results of Galileo, of Thomas Harriotts, and others whom he ignores. It would seem that at two different times he persuaded himself that he had made an absolutely clean sweep from his own mind of every vestige of belief in everything; for we cannot think that the inconsistent narratives in the 'Discours' and in the 'Meditationes' refer to the same occasion. And yet each time his definite purpose—as he would have hotly maintained it to be, had it been questioned, and as he distinctly states in the dedication of the 'Meditationes'—was to put certan predesignate propositions of theology beyond question. As long as this universal and absolute doubt lasted (for he apparently had no doubt at all that in a month or two, at the most, it would be over), he decided that it would certainly be best for him to continue in all respects to conduct himself as if he retained his old belief; as if it were possible for a man for days to keep up, without fail, a line of conduct about all things without the slightest belief in the advantage of such conduct—always, for example. using the tongs to stir his fire, instead of his fingers, though he had utterly dismissed all belief that fire would burn his fingers. One of the provisional rules that he adopted for his guidance during his period of doubt was that he should firmly and resolutely adhere in his conduct to the effect of each and every item of his former beliefs, no matter how utterly improbable it might be shown to be, so long as it was not mathematically demonstrated to be false! Verily, had he included among his doubts a very strong doubt whether he really was doubting the while, his state of mind would have been less childish. The last part of his life was devoted to the study of physiology and medicine, entirely without books, as was his wont, with no view to any publication, but simply to prolong his own life. Yet he died of pneumonia at fifty-four, probably in consequence of his obstinate opposition to the physician whom he had called in.

Such are the facts that excite our curiosity about Descartes. We want to know, first of all, better than anybody has yet told us, what the particular character of his mathematical genius was; and then, what relation there was between his mathematical thought and his philosophy. We want to know what all our hand-books of the history of philosophy, except Hoefding's, leave very mysterious (and even that does not sufficiently explain), wherein and whereby he is the founder of all modern philosophy. We want as detailed a picture as possible of the wilful and irrational element of the man, or of whatever else it may have been that seems such, together with all that seems wise and practical; and after the facts have been given, we want to see them treated by scientific psychology, so that we may gain a comprehension of the make-up of this extraordinary intellect. We want to know with the utmost minuteness about the education of the boy and of the man.

On the other hand, there are facts which restrict our curiosity, or give it special directions. Descartes took not the slightest interest either in scientific politics or in the political and ecclesiastical movements of his times, excepting so far as they might have a bearing upon his own security, peace, and dignity, and, further, excepting a lively interest in some sieges and perhaps other military operations. Consequently, Miss Haldane's chapters on the general history of his "times," however interesting in themselves (and really they tell us nothing that we have not often read before), connect themselves only in their most general outlines with Descartes. He was a bachelor, and a thorough one. After he had devoted himself to philosophy he lived in more than seclusion, changing his domicile every few months from one Dutch town or village to another, and giving as his address some place sufficiently distant from where he really lived, whence letters could be forwarded to him. He used to lie abed till noon, doing his thinking. The rest of the day he spent in writing and in amusing himself in his solitary fashion, often doubtless at the

gaming-table. He took care always to have one good correspondent in Paris, for scientific and other correspondence, another at Leyden for business, and so on. The only ones in whom we are quite assured that he took a real personal interest were two royal ladies. This known, we do not particularly care in what precise order of succession he made his different abodes.

The narrative of the events of his life was told in two volumes with all-sufficient accuracy by the industrious Adrien Baillet in 1691, from information assiduously collected by an Abbé Legrand (or perhaps only later an abbé; but he must not be confounded with Père Antoine Le Grand, called the "abbreviator of Descartes" on account of his still useful 'Institutio Philosophiæ'). Baillet was not an elegant writer, but he knew, by great experience, how to write an accurate and useful book; he had all the information about Descartes that anybody can have now (barring a few minutiæ), and much besides. The volume of Blackwood's admirable "Philosophical Classics" that is devoted to Descartes is from the pen of Professor Mahaffy. We need not say that it is a very useful book, nor that it leaves much to be desired, were it only owing to its smallness. The latter must still more apply to Edward Caird's article in the 'Encyclopædia Britannica.' It becomes clear enough, then, what was wanted in the way of an English volume on Descartes. We should have preferred something like a reproduction (abridged, if necessary) of Baillet, with annotations, and with three long appendices, one of which should explain Descartes as a mathematician, another what he did for philosophy, and a third the man himself. Of these four desiderata, Miss Haldane sufficiently supplies the first, although she omits some facts with the apparent purpose of avoiding what would be unfavorable to Descartes, such as the details of his behavior in his last illness. She evidently knows nothing of mathematics or its history—even referring to Desargues, who carried projective geometry to wonderful heights, as one "whose work in life was to make inventions which might prove of practical value to artisans and mechanical workers," and whom "we may judge to have been a popular writer and adapter rather than purely a man of science." Had she taken the trouble to refer to Moritz Cantor's work or any other modern history of mathematics, that bit of silly stuff would have been spared. Of philosophical comment there is more than enough; but it is not of the right kind, being neither critical nor elucidative of the historical position of Descartes, and simply consists in telling her readers, as if they were three-year-old tots, what they "of course" believe. Moreover, it is written from the standpoint of the vaguest and weakest variety of Hegelianism. However, the reader can skip all those parts, and probably will. The reviewer had not this happy privilege.

The nature and character of the man are insufficiently considered. We should like to have been told more of the studies at the Jesuit College of La Flèche, or, in default of that information, of the best Jesuit instruction of the time. In particular, we should like to know how much Descartes would be likely to hear there about St. Augustine and the 'De Civitate Dei.' The 'Correspondance' of Descartes, as now so ably edited in the new edition of his works by Adam and Tannery, would supply material for the exercise of a great power of psychological analysis. Instead of anything of that sort, we find only insipid, vacillating, inconsistent reflections, such as the most superficial reader would make for himself. The style of the book is easy and unperiodical; a little too much so, perhaps. Superfluous words are not avoided. We venture to guess that the phrase "later on," for an adverbial *later*, may occur, on the average, once in five pages, in the chapters where there is any occasion for it. At any rate, one tires of it. The index is sufficient. We might have picked the author up about many points; but we have endeavored to avoid fault-finding that would not touch the essential merits or demerits of the work.

IBSEN'S LETTERS.

Letters of Henrik Ibsen. Translated by John Nilsen Laurvik and Mary Morison. New York: Fox, Duffield & Co. 1905.

There are men who put so much of themselves into their letters that these remain their best biography. They are usually little affected by their surroundings, and ask only to be let alone that they may develop what is in them. Such a one was Ibsen. He realized from the first that in Norway he had small chance of being left to himself, and so he avoided his native land. Once well out of it, his career was unaffected by his setting, and he could have written just as well in London as in Rome or Dresden or Munich. He hated correspondence, but, like many persons who profess this distaste, he wrote a great many letters, and, as they appear in the present collection, they are a perfectly sufficient account of his life.

He was born at Skien in 1828, of a family once prosperous, but then reduced to poverty. The break with his parents dates almost from his fourteenth year, when he went to Grimstad to become an apothecary's apprentice, and shocked the respectable citizens by his comic verses and caricatures. From the first he hated every symptom of orthodoxy or social prejudice. His people were both conventional and orthodox, and at the age of twenty, when he went to Christiania, Ibsen severed his connection with them, convinced, as he told Brandes in more than one letter, that the only important thing is to save one's self, to develop one's talent, and to escape from those who could only condemn or misunderstand. It was more than forty years before he revisited Skien; his parents, who died in the seventies, he never saw again. Except for a few months of study in Christiania in 1850-51, there is no trace of any formal education. In the latter year Ibsen went to Bergen as stage-manager of a theatre. There he met and married Susanna Thoresen, whom nearly twenty years later he describes as having "exactly the character desiderated by a man of mind—she is illogical, but has a strong poetic instinct, a broad, liberal mind, and an almost violent antipathy to all petty considerations."

From 1857-64 Ibsen was again in Christiania as "artistic director" of the Norwegian Theatre, a position which barely provided him with the means to support himself and his wife and child. Those years of hardship were soon over. Norway may not provide an atmosphere favorable to the unconventional genius, but she makes it easy for him to live elsewhere. The first Government grant was awarded to Ibsen in 1862—the sum of £27 for the expenses of a summer tour to collect the songs and legends of Norway—and about the same amount in the following year for the same purpose. The book that was to have been the fruit of these journeys never appeared. In 1863 he was given a travelling-grant of £90. His debts, which amounted to about £112, were paid by his friends in Christiania, and he left Norway, which in the next twenty-seven years he was to revisit only twice, and then with reluctance and misgivings. What made this long exile possible was a life pension of £90 granted by the Norwegian Storthing in 1866. But until his writings began to pay, as they soon did under the auspices of his Danish publisher, it was the generosity of his Norwegian friends that supplemented the Government grants and enabled him to live in comfort in Rome. In spite, therefore, of Ibsen's dislike and disdain of Norwegian narrowness and parochialism, constantly expressed in these letters, Norway has no reason to be ashamed of her treatment of her iconoclastic son. In 1872 he writes of the "mean behavior" of the Government in refusing to increase this annuity. Ibsen never visited England, where, in the early seventies, the most sympathetic of all his critics, Mr. Gosse, had introduced his plays to the readers of the *Spectator*, in which appeared, in 1872, the first English article on Ibsen. Of the Scandinavian countries he always looked to Denmark as the place "where one is least trammelled by existing prejudices," and it was a Dane, George Brandes, who, almost from the beginning, ranged himself on Ibsen's side and interpreted him to the public. The best letters in this collection are those to Brandes, which have already been published separately in the *Revue de Paris*, in a French translation.

Before he left Norway, Ibsen had published several plays, including "Catilina" (1850), "The Feast at Solhaug" (1856), "Lady Inger of Östraat" (1857), "The Vikings at Helgeland" (1858), "Love's Comedy" (1863). In Rome he at once began his drama on Julian. But what really possessed his thought at this time was the subject of "Brand," which suddenly came into his mind "in strong and clear outlines" one day in 1865 when he strolled into St. Peter's. While he wrote it, he felt "indescribably happy, with the exaltation of a Crusader."

"If I were asked to tell you," he wrote in that year to Björnson, "what has been the chief result of my stay abroad, I should say that it consisted in my having driven out of myself the æstheticism which had a great power over me—an isolated æstheticism with a claim to independent existence. . . . I am now sufficiently serious to be very severe with myself. An æsthete in Copenhagen once said to me: 'Christ is really the most interesting phenomenon in the world's history.' The æsthete enjoyed him as the glutton does the sight of an oyster. I have always been too strong to become a creature of that type; but what the intellectual asses might have made of me if they had had me all to themselves, I know not."

'Peer Gynt' was published in 1867. Ibsen was greatly annoyed by a Danish review which refused to treat it as poetry and classed it as polemical journalism. To this Ibsen replied: "My book *is* poetry; and if it is not, then it will be. The conception of poetry in our country, in Norway, shall be made to conform to the book." That is characteristic of his perfect self-confidence, which never admitted a criticism, never confessed to external influences. If he passed through the usual agonies of the creative genius, we have no trace of the struggle in these letters. In 1873 he had finished his two plays on the Emperor Julian, into which he put "a part of my own spiritual life." His ignorance of Greek was a serious hindrance to the true understanding of one whose own writings are accessible only in the original. In using the other sources for Julian's life and the period, he could not find out whether Eunapius wrote Latin or Greek, accepting finally the assurance of a friend that this Greek sophist was a Latin author. Meanwhile, he had transferred his home from Rome to Dresden. But Munich, where he spent some years in the seventies and eighties, was, he declared in 1879, his "own spiritual home." In 1879 the "Doll's House" was written at Rome and Amalfi, "Ghosts" at Sorrento in 1881. In 1880 Ibsen gives an interesting explanation of the alternative ending of the "Doll's House." He had heard that the play was likely to be adapted, and was threatened with a happier ending. "In order to prevent such a possibility, I sent a draft of an altered last scene, according to which *Nora* does not leave the house, but is forcibly led by *Helmer* to the door of the children's bedroom; a short dialogue takes place, *Nora* sinks down at the door, and the curtain falls. . . . Those who make use of the altered scene do so entirely against my wish." It was with reference to the storm raised by "Ghosts" that he said bitter things about majorities and the Liberals:

"The minority is always right, that minority which leads the van and pushes on to points which the majority has not yet reached. When I think how slow and heavy and dull the general intelligence is at home, a deep despondency comes over me, and it often seems to me that I might just as well end my literary activity at once. . . . . Liberty is the first and highest condition for me. At home they do not trouble much about liberty, but only about liberties—a few more or a few less, according to the standpoint of their party. . . . A fighter in the intellectual vanguard can never collect a majority round him. . . . At the point where I stood when I wrote each of my books, there now stands a tolerably compact crowd, but I myself am no longer there; I am elsewhere; farther ahead, I hope."

That the minority is right was "my fundamental principle in every field and domain." As to the Liberals, he wrote to Brandes, "They are Freedom's worst enemies—freedom of thought and spirit thrives best under absolutism; this was shown in France, afterwards in Germany, and now we see it in Russia."

In 1891 Ibsen left Germany and settled in Norway, exposing himself "to the cold, uncomprehending eyes of Christiania"; but in 1897 he writes to Brandes that in Norway "all the channels of intelligence are blocked," and plans to make a home for himself near the Sound, "between Copenhagen and Elsinore, on some free, open spot. . . . Up here by the fjords is my native land. But—but—but! Where am I to find my home land?" In 1900, however, the date of the last letter, he is still at Christiania, writing an open letter to a Dutch paper which had accused him of sympathizing with England in the Boer war. His convictions, as he again asserts, were on the side of England as the nation that had done most for the civilization of South Africa.

The publication of these letters will give all English readers of Ibsen a chance to correct their previous ideas of the man and his works. How necessary such correction is one can measure by reading again Mr. Shaw's 'Quintessence of Ibsenism,' with its carefully presented picture of Ibsen's philosophy, and its almost complete lack of interest in Ibsen as a poet and imaginative writer. Mr. W. L. Courtney, when he wrote his 'Idea of Tragedy' in 1900, would certainly have modified his remarks on Ibsen if he had read the Letters. He said in that essay (p. 117) that "'Brand' and 'Love's Comedy' are especially overshadowed by the thoughts of the Danish Kirkegaard," whose influence "evaporated later." Twice, however, Ibsen states in the Letters that he "has read little of Kirkegaard and understood less." On page 125 Mr. Courtney says that, after producing "Ghosts" and finding derision where he had looked for sympathy, "he shook the dust off his feet against his native country and lived abroad." The truth is, that "Ghosts" appeared in 1881, and, as Ibsen had not been in Norway since 1874, and then only for a brief visit, he had not had much opportunity to acquire the dust of his native land. Take up any criticism of Ibsen's plays and you will find the same sort of misconception. Perhaps the most unfair criticism that we have seen is that of Mr. Pinero, who described the Grand Hotel of Christiania with Ibsen coming "to sit on a particular chair in a particular window, his mug of beer upon the window-sill, to watch the world—his world of native Norwegian townsmen and touring foreigners. . . . I felt grateful that the tragic idea (in Greece and England) had developed in a larger atmosphere than the smoking-room of a Norwegian hotel." What Mr. Pinero should have seen was an old man of seventy, who, after forty years' exile and dramatic production surrounded by influences as little Scandinavian as he could manage to make them, had come home to spend his last years, and was finding Norway and its tourists extremely uncongenial to the "tragic idea."

Ibsen is not a good letter-writer. He always wrote under compulsion, took a complete holiday from correspondence during the composition of a drama, and wasted no words. The entertaining letter-writer must waste many words, display a gift for lively description, anecdote, and epigram, and, above all, be human, showing us his weaknesses—a sight that always endears. Ibsen's readers will find little of all this. He took himself seriously as he took his plays—an attitude fatal to the charm of the epistolary manner. But he is a man who will inevitably be misunderstood by most of his biographers. Each literary critic will see in his plays the peculiar principles of social philosophy that he may wish to find. The Letters, though they were seldom written to set the critics right, and though the references to the plays are usually business-like when they are not vituperative of Norwegian narrowness, are still bound to warn off the too ingenious critic, and they show us the man as he was, not quite a poet, no dreamer, but a hard-headed, practical man, born with a hatred of every restraint that fettered the individual in the name of society, and endowed with an extraordinary talent for character-drawing and the technique of the drama. Every play is mentioned here except the last, "When We Dead Awaken" (1900), to which there seems to be an allusion on page 453. The Introduction, of 45 pages, is useful, and the footnotes are quite sufficient to explain the allusions. The index is a weak point, since it refers only to the persons to whom the letters were addressed. It should at least have included the plays.

The translation is very smooth and readable, but un-Ibsenish, as is particularly noticeable in the first half of the work. In Letter No. 38, page 131, every paragraph and almost every sentence begin with "I," whereas in the original but a single sentence so opens, "Jeg er i ordets virkelige betydning bedrövet" (I am, in the true sense of the word, grieved), but here the translation reads: "It grieves me, truly grieves me." Hence the impression conveyed that Ibsen is a sad egotist, whereas from the Norwegian the case is exactly the opposite. Elsewhere the translators do not seem to have truly caught the meaning of their text. Thus (p. 61): "On the Ancient Ballad and its Influence on the Art of Poetry." Now the "art of poetry" is not in question at all, but art poetry, *i. e.*, poetry cultivated as a fine art, in contradistinction to popular poetry. At page 66, dramatic art is said to be "a unification of all these other forms of art." What Ibsen says is, that it is "the unity of all these forms of art" (with reference to the Hegelian philosophy). Such misconceptions, wherever the original requires some knowledge beyond the most elementary, in order to be understood, are quite common.

While the proofreading is on the whole satisfactory, certain mistakes should not have occurred in a book of this kind. Thus (p. 97, note), Christi*ana* (for Christi*ania*); (p. 97), *De* Nygifte for *De* Nygifte (p. 111, note), the Danish poet, Carsten Hauch (1790-1872), published in 1876 (read 1866); (p. 449), read 1896 for 1898 as the date of the letter to Brandes; (p. 118, note), Swedish and Norwegian *Ambassador* in Paris—such a person has never existed, but *ministers* there have been; (p. 122), Swedish Aftenblad, for Aftonblad. On page 431, Mr. Shaw's book is called 'The Quintessence of Ibsen'—read "Ibsenism."

MONOD'S MICHELET.

Jules Michelet: Études sur sa Vie et ses Œuvres. Avec des fragments Inédits. Par Gabriel Monod. Paris: Hachette & Cie. 1905.

We are indebted to the editor of the *Revue Historique* for an illuminating book on the conceptions of Michelet as they affected his private life. This is not the first time that M. Monod has shown an interest in the works and career of the brilliant writer whose character he now seeks to il-

lustrate and expound. As early as 1876 he published, in the second volume of the *Revue Historique*, a series of passages from Michelet's lectures on the Roman Emperors; the article on Michelet in the 'Grande Encyclopédie' is from his pen; in 1904 he contributed to the *Deutsche Revue* an article entitled "Michelet und Deutschland"; while, more recently still, passing from husband to wife, he has edited, with an introduction and notes, Mme. Michelet's 'Les Chats.' Finally, he has become, by an indirect process, Michelet's literary executor. So long as Mme. Michelet lived there could be no other exponent than herself of one whose life she had shared in the fullest sense for twenty-five years. The twenty-five years of her widowhood (1874-1899) were wholly occupied in the publication of her husband's posthumous works, either in their original form or with clever additions of her own. A few weeks before her death, she placed in M. Monod's hands a great quantity of unpublished manuscripts, multifarious in aspect and quality, but containing among them much that is important for the due appreciation of Michelet's ideals and attainments.

Entering upon his duties in the spirit of an interpreter rather than of an annalist, M. Monod gives us seven admirable essays, bound together in one series, along with copious excerpts from Michelet's journal and correspondence. The bulk of the volume centres in the historian's activities during the period 1839-1851, though incidents of earlier and later life come into view from time to time. The narrative of events is, however, a mere thread upon which to hang that record of thoughts and emotions which furnishes the vital interest of the book. Few, we imagine, even of Michelet's most enthusiastic readers are familiar with the fact that, in addition to his multitudinous publications, he has left a journal, scrupulously kept day by day through forty years of unresting effort in the fields of history, literature, and democratic propaganda. M. Monod, in announcing his intention to publish still further papers, says that Michelet the man quite equals in interest Michelet the writer. With this remark we are inclined to agree. Michelet felt that he had written about himself with more sincerity than is revealed in Rousseau's 'Confessions'; and perhaps no one ever had a closer eye upon the operation of his own mind and feelings.

During the early part of his manhood Michelet often alludes to himself as one marked out for solitude. A professor at the Collège de France, who was surrounded by a band of enthusiastic students and possessed of admiring friends in every class from the royal family to the lower ranks of the bourgeoisie, need not have been a recluse if only he had cared to take part in the ordinary occupations of society. Michelet, from the time when he left the École Normale down to the moment when he began his attack upon the Jesuits, did command the general admiration to which we have just alluded. Even the clericals had not begun to suspect him, for he had been preserved by depth of historical sympathy from attacking the ages of faith so long as in his 'History of France' he was still dealing with them. Only on passing from the Middle Ages to the Renaissance did he reveal to the world the degree of his separation from Catholicism. Yet during the years 1838-1841, when outwardly his life seemed to be most prosperous and his position most assured, he was suffering the keenest agonies of soul from the sense of his spiritual loneliness.

By temperament most men are disciples either of the laughing or of the weeping philosopher. Those who can find unction in Leopardi or 'Vathek' or the 'City of Dreadful Night,' are likely to find congenial occupation in the anatomy of melancholy, whether it be Michelet's or their own. Even for people of different mood there may be some interest in seeking to distinguish between what is morbid and what normal among the manifestations of introspective grief. Michelet took his depression of spirits very seriously, not only recording in his journal the varieties of such woe as he experienced, but actually publishing a volume entitled "Amertumes,' wherein may be found a series of his reflections during the four years that followed the death of his first wife. Pauline Michelet had some good qualities, but did not possess either the intellectual power or the moral dignity which could have commanded her husband's thorough respect. Her death, however, not unnaturally filled him with searchings of heart and with vain regrets for his sins of omission. Always meditating upon the paradoxes of the universe, his own affliction made them seem the more intolerably oppressive. "Why," he asks, a little less than two months after his wife's death, "does the thought of God bring with it so little consolation? It is because the Christian God is a judge of the soul: it shall survive, but only to suffer! The God of Pantheism gives repose, but only through absorption."

Grief at his wife's death may be held to account for much, but in fact Michelet was so highly strung that he always stood on the verge of a spiritual or physical crisis. His intense energy worked itself off to a considerable extent in the labors of scholarship and literary composition. But even then there remained a strong erotic disposition which was sure at frequent intervals to cause him anguish. Within a year from Pauline's death he is assailed by what M. Monod styles "la tentation mauvaise de chercher une consolation dans un semblant de vie conjugale, sans la communauté de sentiment, de pensées, et de devoirs qui font la dignité et la beauté du mariage." As a result of this agitation Michelet finds it difficult to be grateful. When he wishes to bless and render thanks, the words stick in his throat. Marriage, he feels, is impossible, while on the other hand, "ces demi-mariages sont scabreux, pleins de chances." He seems particularly impressed by what Mme. Quinet has urged in seeking to dissuade him from an irregular connection. "What would happen if she should love you?" This, comments Michelet, would indeed be a danger.

The most important fact in Michelet's life during the years 1839-1842 was his friendship with Mme. Dumesnil. If, as there is good reason to suppose, the period was a decisive one in his life, no single incident bulks more largely in it than this. Michelet made the acquaintance of Mme. Dumesnil through her son Alfred, who was among his most eager disciples. She was slight, frail, and not beautiful, but possessed of great charm and sweetness. M. Monod points out that students of Michelet's career have sometimes attributed to Mme. Dumesnil a kind of influence upon the historian's ideas which she did not exercise. He did not, it is clear, owe to her his emancipation from the formulas of the Roman Church. Numerous writings show that he had gone beyond the limits of orthodox Christianity long before he met her. Far from being his leader on the path of rationalism, she was considerably the more conservative of the two. As for her influence upon him, it was purely moral and sentimental, platonic in character, and to Michelet a source of the highest inspiration. They met for the first time in May, 1840, and she died almost exactly two years later, but the second twelve months of their friendship was undoubtedly one of the happiest periods in Michelet's life. It has been said of Lewes that, after his marriage with George Eliot, he could at times speak patiently of Christianity. Without bringing this particular illustration into the analogy, Mme. Dumesnil may be said to have had the same mellowing effect upon the mood of Michelet. Her death was a fresh laceration, though it left behind a chain of more exalting memories than could have been drawn from his life with Pauline.

We have touched upon simply a few of the salient incidents which affected Michelet's development during a critical period. Between 1839 and 1842 his fame as a lecturer, scholar, and writer had not yet been marred by the rancors of controversy. By 1841 some suspicion perhaps had been aroused among the clericals. Otherwise the Parisian world admired and lauded him, nor had the clericals come to see in him an irreconcilable antagonist. With the aid of the passages which M. Monod now publishes from his journal, we can see how the trend of his thought was setting toward internationalism and the propagation of the democratic ideal. It was impossible for him to live without exercising his fertile and fiery imagination. Having lost his hold upon religious dogma, there remained the gospel of humanitarianism, and that whole body of aspirations which became to him, no less than to Quinet and Mazzini, living realities. During the last thirty years of his life he fought on behalf of his cause with all the ardor of an impassioned nature, upholding reason, justice, and mercy, condemning superstition and despotism. By the close of 1843 he had passed through the worst years of his life, had fought his doubts and gathered strength, had grappled with evil at the bottom of the pit, and, by so grappling, had prepared himself for the missionary work that lay before him. Taken by themselves, many of the passages which M. Monod cites may seem morbid, diffuse, and ineffective; but Michelet, whatever his limitations, was neither weak nor insincere, and the record of his strivings with doubt, sorrow, and contrition will be for many by no means destitute of edification.

As a contribution to our knowledge of both Michelet's thought and nature, M. Monod's chapter entitled "Yves-Jean-Lazare Michelet" is the most striking essay in the volume. In it are described the beginnings of the historian's second mar-

riage, and the emotions which were awakened in him by the birth and death of his son Yves. The whole episode is too long to discuss here, but the portion of Michelet's journal given on pages 283-290 is a very remarkable document, which should be read by all who open the book at all. Among the five remaining papers, the two most striking are those entitled "Michelet et l'Italie" and "Michelet et George Sand." For Italy, Michelet cherished the deepest reverence and affection. Virgil was the chosen author of his youth, and Vico of his early manhood. To Italy he turned when he needed physical resuscitation, and not even Mrs. Browning longed more ardently to see the triumph of the national cause. M. Monod's essay on his relations with George Sand brings out one fact almost amusingly. These two writers, who at first sight have so much in common, were quite content to admire each other at a distance. Michelet, in the preface to 'L'Amour,' styles George Sand "the greatest writer of the nineteenth century," while she, at the close of her 'Histoire de ma Vie,' styles him "a guide of generations yet to come." Both had been fed on Rousseau, both believed in intellectual emancipation and social democracy. Unfortunately, they differed so completely over the question of the wife and the family that both thought it wiser to keep at arm's length. In M. Monod's words, Michelet "trouvait que George Sand rabaissait la famille, et George Sand trouvait que Michelet rabaissait la femme."

For a variety of reasons we have endeavored to give this volume some prominence. Michelet was a man of vast historical erudition, who, quite apart from his learning, occupies a secure place in French literature by virtue of his imaginative insight. Again, his whole life was conditioned by the mutual reaction of a strong intelligence upon a high-strung, mobile, and somewhat sensuous disposition. Finally, it is extremely interesting to observe the attitude towards him of a modern historian, who, like M. Monod, has received the discipline of a science unknown in Michelet's youth and apparently antagonistic to Michelet's method of historiography. These essays, when supplemented by others that are promised in the introduction, will not only acquit M. Monod of his duties as literary executor, but will constitute an extremely valuable body of criticism. In the case of the present volume, excerpts from Michelet's journal occupy considerably more space than is represented by editorial comment. At the same time the gloss is hardly less serviceable than the text.

Astronomy in the Old Testament. By G. Schiaparelli. Oxford: Clarendon Press; New York: H. Frowde. 1905. Small 8vo, pp. 178.

This book, originally written in Italian, has been turned into very good English under the author's own supervision. He is observer at the Milan Observatory, seventy years old; his fame rests mainly on his discovery of what he calls the "canals" on Mars, and has been spread among American readers through Percival Lowell's late book, which discusses the appearance of the reddish planet. He follows the higher critics as to the ages of the Biblical books and as to the layers of which the Pentateuch is built up. He gives the ancient Hebrews very little credit for observation and thought, but believes that their work towards a higher morality and purer religion makes up for such shortcomings, and their freedom from astrologic superstitions for their ignorance of astronomy.

His astronomy takes a very wide range, sweeping into its compass earth and sea and the abysses below, rain and rivers; days, months, and years; weeks of days and of years; Sabbaths, Sabbatic years, Jubilees, and all the Mosaic laws incident to these. He remarks on the absurdity of identifying Ezekiel's Rosh, Meshech, and Tubel with Russia, Moscow, and Tobolsk—a remark rather befitting a geography than an astronomy of the Old Testament. As he lives in Catholic Italy, his Old Testament embraces Sirach, Maccabees, Judith, and other apocrypha. He is well versed in Biblical Hebrew; he knows some Aramaic, Arabic, and Assyrian; the Mishnah and Talmud he quotes only at second hand.

Schiaparelli treats first of the *firmament*, preferring this rendering of *raqiá* in the text to the *expansion* of modern interpreters. The lower heaven was rigid and transparent; above this was the heaven of heavens bearing the sun, moon, and stars, flexible as a curtain. The earth, a vast plain, extending below to a great depth, so as to embrace the mighty abyss, also Sheol, the abode of the departed, was hung (see Job xxvi.) over nothing. This view is illustrated by a rude drawing (p. 38). Schiaparelli charges the Hebrew writers, on the strength of such passages as Isaiah lv. 10, with not knowing that watery vapors rise from the sea, become clouds, and return to the sea through streams and rivers; and holds that with the exception perhaps of the more learned author of Job, they imagined rain, hail and snow to come from beyond the firmament and that the sea communicated with the sources of rivers only under ground.

No sane man could hold such a belief. In Palestine many streams run dry every summer; the autumn rains fill their beds. Lebanon is high enough for those at its crest to look down upon clouds. And fog (Heb. *qitor*) is only a cloud that reaches the ground. A child can see that every cloud floats below the blue sky. Israel lived closely east of the sea; it saw the west wind bringing rain, the east wind dust and heat (see quotations on p. 35). The Bible almost begins with telling us: A vapor arose from the earth to irrigate the face of the garden. The plural noun *nesiim*, meaning watery vapors, but literally "lifted ones," occurs in Jeremiah, Psalms, Proverbs. Thus, Psalm cxxxv. teaches that *nesiim* are brought from the end of the earth, and by lightnings are turned into rain; which is correct to this day. In Psalm cxlviii. 8, fire and hail, snow and fog, are named among the phenomena of earth.

If other passages speak of rain, snow, and hail as if they came through the firmament, and of the sea as if it communicated with the river sources under ground, it is not because some writers are wiser or more learned than others, but because in some passages the writer uses poetic language, elsewhere the words of sober truth. The verse, Isaiah lv. 10, carefully read with attention to its tenses, proves the very contrary of Schiaparelli's inference: the prophet knows that water ascends towards heaven, for "the snow and rain cometh down from heaven and does not return thither, *but when it has* irrigated the earth." The "host of heaven," when referred to in the later reigns of the kingdoms of Judah and Israel, seems to our author to mean those of the planets that received an idolatrous worship; such as Helel (Lucifer) named in Isaiah xiv. 12, and *Kiyun* or *Kaivan* (Saturn) mentioned in Amos (v, 12). He is not positive about *Gad* (Isaiah lvx. 11) standing for Jupiter. He does not claim that the ancient Jews knew nothing of Mercury and Mars (p. 49, n. 5), but he feels sure that the recurrence of the Seven was not based on the number of the so-called seven planets of the Greeks and Romans.

The following passages contain the names of fixed stars or constellations: "Those burning incense to . . . sun and moon and mazzaloth; (2 Kings xxiii. 5): "The stars of heaven and their *Kesils*" (Isaiah xiii. 10); "The maker of *Kimah* and *Kesil*" (Amos v. 8); "He who made *Ash*, *Kesil*, and *Kimah* and the Chambers of the South" (Job ix. 9); "From the Chamber cometh whirlwind and from *Mezarim* cold" (Job xxxvii. 9); "Canst thou tie the (?) delights of *Kimah*, or loosen the bands of *Kesil*? bring out *Mazzaroth* at its time, or lead 'Ayish with her children?" (Job xxxviii. 31, 32). On *Kesil* = Orion and *Kimah* = Pleiades, Schiaparelli agrees with other Hebraists. He rejects the Great Bear as the rendering for *'Ash* or *'Ayish*; following the Talmud (Berakoth 58b), he identifies "*'Ayish* with her children" with the *Hyades;* he shrewdly derives *Mezarim* from *mizrch* (winnowing-shovel), something like our dipper; hence the two Bears, both in Job's days near the pole. In the Chamber or Chambers of the South Schiaparelli sees Canopus or bright stars in the Southern Cross, then visible in Palestine. But if visible, how were they in Chambers? More probably star-groups were meant, too southerly to be seen in Palestine, but told of by travellers in the far South. He takes *Mazzaloth* and *Mazzaroth* without sufficient reason to be identical, and applies both as plurals to the two offices of Venus as morning and as evening star, though the former is found in the Mishnah as the only name for the constellations of the Zodiac. Now, when and why did the word *Mazzal* change its meaning between its use in the Book of Kings and its use in the Mishnah?

When our author comes to the division of the days, he shows that the later word *sha'ah*, hour, does not occur in the Hebrew of the Old Testament, and in Aramaic only in the sense of "moment." But if hours were known by that name in Syria in very ancient times, as he admits, they could not be unknown to Israel, considering the close relations between Damascus, Samaria, and Jerusalem. These hours, he says (p. 101), were "seasonable," *i. e.*, each one-twelfth of the period between sunrise and sundown, longer in summer than in winter; such is also the Jewish tradition.

The book, with all its discursiveness, or rather by reason of it, is quite entertaining.

American Diplomacy: Its Spirit and Achievements. By John Bassett Moore. Harpers. 1905.

Professor Moore's volume embodies, with some revision and amplification, a series of articles which appeared originally in *Harper's Magazine*. A new chapter on Fisheries Questions has been added.

"The primary object of the work is to give, not a chronological narrative of international transactions, but rather an exposition of the principles by which they were guided, in order that the distinctive purposes of American diplomacy may be understood and its meaning and influence appreciated. Nothing could be more erroneous than the supposition that the United States has, as the result of certain changes in its habits, suddenly become, within the past few years, a 'world-power.' The United States has in reality always been, in the fullest and highest sense, a world-power; and the record of its achievements in the promulgation and spread of liberal and humane doctrines is one in which no American need hesitate to own a patriotic pride."

We have found the book entertaining as a non-chronological narrative, but less valuable as an exposition of principles. Indeed, as an expounder of principles the author writes in altogether too patriotic a vein to be weighty. Nobody disputes that the United States has played a leading part in advancing the causes of the freedom of the ocean, neutrality, arbitration, expatriation, and extradition; but we, like other countries, have been involved in disputes in which we not only did nothing to advance these causes, but have seemed for the time to be doing our very best to thwart the advance of our own principles. During the whole of the civil war, for instance, we did our best for the rights of belligerents as against neutrals, and in the *Trent* case, if we could have carried our point, we should have established the right of a belligerent to stop a neutral vessel on a neutral voyage and take away passengers as prisoners, on the ground that they were ambassadors sent by the other belligerent to the Government of the neutral. Having wholly failed to establish any right to do so, we yielded the point and surrendered the prisoners, while Mr. Seward took advantage, in the correspondence, of our old opposition to the right of search to maintain that this was a triumph of American principles. But this is what is known as putting a good face on a bad situation. Throughout the controversy we were on the side of belligerent rights, and we yielded virtually to a threat of war. So, later, when we undertook to establish an American theory of continuous voyages, it was certainly not an advancement of our pretensions as champions of neutral rights.

The truth is, that no country consistently maintains the true principles of international law, any more than individuals consistently maintain the principles of justice and right. Under the influence of self-interest we have attacked the freedom of the seas in the Bering Sea arbitration, and in the boundary dispute between Venezuela and Great Britain we abused the principles of arbitration. In our exclusion and penalization of the Chinese we have flown in the face of all our professions of liberality on the subject of expatriation.

All this may be said without detracting from what Mr. Moore extols as our "advancement of the principle of legality" (p. 252). The principle of law has, indeed, lain at the foundation of the American diplomacy of Washington, Jefferson, Madison, Monroe, John Quincy Adams, Webster, Seward, Fish, and Bayard—that is, we have been preëminnetly the nation which has insisted that diplomacy shall be supported by the recognized principles of the *jus gentium*. We have insisted on the legal responsibility of states. But that has not prevented our abandoning the paths of law in several instances (*e. g.*, the erection of the Republic of Panama, as to which Mr. Moore has little to say), or our resort to an elastic principle of national policy, in the Monroe Doctrine, to justify whatever we feel it for our interest to do in relation to our immediate neighbors. The development of the Monroe Doctrine is not by any means a development of the principle of legality, or of the law of nations.

In short, we think Mr. Moore's book is altogether too patriotic, and in this respect we have found it disappointing. Patriotism is an excellent thing in its place, and prescribed to all diplomats and advocates of their country's interest in any contention or polemic proceeding. But in that forum of exposition in which Grotius and Vattel and Wheaton and Kent are known as leaders, patriotism is less a panoply than a handicap. What those great men taught was that international law was of no country; and it was by studiously laboring to forget country and self that they so wonderfully advanced that great principle of legality to which we all, when at our best, try to do reverence.

International law, as we know it, is the growth of hardly more than a century. The reason why the United States was, during that period, the leader in its development, was that it was the great pacific world-power. The freedom of the seas, neutrality, arbitration, expatriation, and extradition are all bound up with the cause of peace and non-interference. Engaged in war, in annexation, in colonial expansion, or in the business of protectorates, it is capable of re-developing on American soil the early *jus belli* in all its ferocity and disregard of pacific interests. All this can be illustrated by an expounder of our true principles from our own history; but the picture would present glaring contrasts, and would not be so agreeable to our self-love as Mr. Moore's.

It is difficult to make anything connected with international law popular reading; but the author has come nearer to doing so than any one we can recall. His account of the beginnings of American diplomacy is entertaining, while that of the difficulties encountered by our Government in dealing with the question of diplomatic costume is amusing. With his main point, that the United States has been for a long period a world-power, and that its diplomacy for the most part has rested on a coherent body of principles which was not invented yesterday, we are entirely at one.

Supplementary Papers of the American School of Classical Studies in Rome. Vol. I., pp. iv, 220. 4°. 18 plates, plus 75 text illustrations. Macmillan. 1905.

The publication of this volume is a very gratifying indication of the growth of the American School in Rome, intellectually as well as in numbers. Its papers have thus far been published in the *American Journal of Archæology*, which, however, has not been able to afford space for all that have been offered and officially recommended. Some contributions from members of the School have therefore appeared elsewhere, and others have perforce been held up, if not *nonum in annum*, at least till their freshness has somewhat evaporated. This new method of publication in separate volumes is intended to supplement rather than to supersede that in the *Journal*, and will also provide a proper format for papers that call for more copious illustration than the plan of the *Journal* can admit.

The initial volume contains work of eight contributors, of whom two are officers of the American School, and a third, Mr. Ashby, the well-known vice-director of the British School in Rome, who has again shown his kindness to American students by collaborating with one of them, Mr. Pfeiffer, in valuable topographical surveys and descriptions of the sites of Carsioli, and of "La Cività" near Artena (about ten miles north of Norba).

The technical student who is interested in the dry study of brick-stamps and the historical evidence to be deduced from them, will welcome the detailed and classified analysis, with full tables and plates, of the stamped bricks and tiles recovered from the portion of the wall of Aurelian, near the Porta S. Giovanni, which collapsed in 1902. The total number of stamps and marks collected was 832, ranging, so far as dates could be ascertained, from the first century of our era to the time of Theodoric. The largest single group (309) was of the reign of Hadrian, and, of these, 145 were of the single year 123. The next largest group (49) was of the reign of Severus and Caracalla. These statistics appear to accord with what has heretofore been known about the relative activity in building during various reigns. It is not to be concluded, however, that all this material from earlier buildings was appropriated by Aurelian, for this stretch of wall shows signs of several later repairings. A considerable number of the stamps examined are not to be found in the 'Corpus.' The writers of the paper, Messrs. Pfeiffer, Van Buren, and Armstrong, are to be congratulated on a very thorough and important piece of work.

Dr. Mahler, in an interesting article, essays to prove that the "Aphrodite of Arles" is a copy of the spinning Aphrodite of Praxiteles (the *catagusa* of Plin., *N. H.* i. 19. 2); Mr. Morey subjects the Christian sarcophagus in S. Maria Antiqua to a careful and convincing examination, in which he controverts a number of Marucchi's flighty observations; and Mr. Cross describes as "a new variant of the 'Sappho' type" a head in the Art Museum at Worcester, about the genuine antiquity of which some expert doubt has been expressed. The study of palæography in the School is represented by the publication, by Mr. Van Buren, of new collations of a part of codd. S and A of Columella.

The praise deserved by the rest of the volume can hardly be extended to the last paper in it, which is a record of superficial, and for the most part not new, observations in Turkestan, expressed in a very ill-

formed style, and marked by most curious bits of reasoning.

The Life of Sir Henry Vane, the Younger. With a History of the Events of his Time. By William W. Ireland. London: Eveleigh Nash; Edinburgh: Oliver & Boyd. 1905. 8vo, pp. viii., 571.

Dr. Ireland is no novice in authorship. He has appeared before the public with a personal account of the siege of Delhi, a novel, a treatise on Psychical Medicine, and other works. But in this venture into the historical field he has produced a very singular book. One may readily admit that it shows extensive knowledge of the events and characters of the Stuart period; that its style is always lively and readable, and sometimes forcible; and that the career of his hero is set forth in a narrative of events, most of them familiar, some not so well known, and all intelligently combined. Yet it can hardly be esteemed a valuable contribution to the historic literature of an age which is in imminent danger of being overwritten. In one octavo volume of moderate thickness we are to have a life of Vane and a history of the events of his time. This last half of the title may mean anything, from a work as bulky as Gardiner's to the summary of a school-book. Dr. Ireland's limits require a severe process of selection, yet he includes much that is almost offensively superfluous. We have an introduction on the growth of popular principles in England that is thoroughly commonplace; we have a detailed description of Edgehill, with which Vane had no more to do than Pym or Hyde. Other capital events, which had little bearing on Vane's career, are introduced apparently for no purpose but to impeach in one way or another what the author considers the excessive current estimate of Cromwell. Dr. Ireland's words in his preface are worth quoting:

"I have, avoiding controversies, tried to make the facts cry out. My own views have been formed upon a study of original documents. Later histories and commentaries thereon I have not read, or only looked at after my pages were composed, in order to see if they have cited any authorities not already consulted by me."

He admits, however, his obligations to Foster and Bisset for help and guidance; he might have extended the list, but his method of avoiding controversy is to dogmatize on some of the most vexed questions of history as if there never were two opinions about them. This preference for "facts" is quite in accordance with current historical taste. There is a general call for historians to give us facts, and not opinions or "settings." Some persons will not read Macaulay because he draws inferences from facts to motives. Now this would be very well if facts, as Dr. Ireland says, "cried out." But they do not, or if they do, it is like Orator Puff, with two voices. To him they cry that Strafford was a renegade tyrant, and Laud a malignant bigot; perhaps that is the correct estimate. But Professor Gardiner, who surely knows the facts, hears them "cry" with a very different tale of these men. Vane himself is to his biographer faultless; any criticisms which adhere to any of his contemporaries roll off of him as from a rock. Undoubtedly, as far as personal probity and purity, freedom from low ambition, and elevation in some great matters beyond his time go to make up character, he deserves unqualified praise. Yet his warmest admirers can scarcely deny that in some critical moments, when for such a noble soul to have secured the confidence of his fellow-citizens, and with it the just control of their affairs, would have been well, Vane, after fair trial, failed to keep that confidence and control. In early youth, his governorship of Massachusetts proved an utter failure, and gave indications of something very like moral cowardice; in advanced manhood, the successive failures of Richard and of the officers found him and his Republican colleagues of the Rump endlessly dreaming and debating of ideal commonwealths which the age neither understood nor desired. It is true of Vane, even more than of Milton, that his "soul was like a star and dwelt apart"; but stars give no heat, and their light is of value only to photograph themselves. In plainer words, Vane, with all his breadth of conception, failed when it came to sympathetic action. He abhorred persecution; yet he was most exclusive when it came to coöperation. He could not work with Winthrop, nor yet with Cromwell; but Winthrop was as saintly as himself, and so were Milton and Hale, whose services Cromwell easily secured.

But all these and further grounds of criticism might be pardoned in Dr. Ireland, if it were not for the extraordinary carelessness in the handling of his words and sentences. It would be impossible in this review to point out all the faults of type, faults of phraseology, faults of grammar that disfigure these pages. A single rapid reading has shown no less than sixty in four hundred and forty pages; pure misprints like ingenously (p. 56), relecting for reflecting (p. 251), *saluto* (in an Italian note) for *salute*, and in proper names Codrington for Coddington (p. 83), and, by way of climax, John Wilton for John Milton (p. 437). Certain proper names are now right and again wrong. Prynne's 'Histrio-Mastix' becomes 'Histro-Matrix' (p. 109), which name, if it means anything, means the source of the Danube. In quoting the title-page of the recent life of Archibald, Marquess of Argyll, his name is printed "Marquess of Montrose" (p. 273). There are such expressions as plausible entertainment (p. 46), meaning, apparently, cordial reception; acting inadvisably (p. 72); under the majority of Louis XIV., meaning after (p. 359).

The history is by no means immaculate. James I.'s reign is called twenty-four years instead of twenty-two (p. 9), the judges in the ship-money case are stated as eight to four, instead of seven to five (p. 100). The National Covenant is called the Solemn League and Covenant (p. 29), though they are distinguished later. The petition for the abolition of episcopacy is assigned to "five years after the assembly of Parliament" (p. 159), meaning five weeks after the assembling; the Second Folio of Shakspere is dated 1630 for 1632 (p. 301); De Witt is made Pensionary of the States, instead of Holland (p. 329); and the Cavalier Parliament of 1661 is given nineteen years instead of eighteen (p. 427). Nor does this exhaust the list of blunders.

To conclude with a word of praise: there is a most excellent note on page 317, showing how wantonly Carlyle criticises Burnet.

The Negro and the Nation: A History of American Slavery and Enfranchisement. By George S. Merriam. Henry Holt & Co. 1906.

After a careful reading of Mr. Merriam's volume, we are obliged to say that it falls painfully short of fulfilling the expectations legitimately aroused by its title. It does not approach the degree of completeness which severe condensation might accomplish, even within the limit of its four hundred pages, nor is it to be followed safely either in its statements of facts or in its estimates of men and events. Rather than a genuine history of the negro in his relation to the nation, it is a volume of sketchy comment on American politics and public men, with preponderant reference to the negro, though the reader will occasionally pass over many pages without detecting the preponderance. Ordinarily such comment would not call for very close examination, but when it is put forward as a serious historical treatment of one of the most important phases of American national life, it is at once necessary to raise the question whether the comment is based on careful and comprehensive study. As an example of Mr. Merriam's lack of care in statements of fact, we may take his assertion (p. 76) that, "as the last act of Tyler's administration, Texas was declared a State." The facts were, that Congress, right at the close of its session, took action making possible the annexation of Texas with its own consent; that Tyler hastily dispatched a messenger to secure that consent, which was given by the Texan Congress in June and ratified by a convention in July, and that Texas was finally erected into a State of the Union by joint resolution of the two Houses near the close of the following December, about ten months after Tyler had retired to private life.

Even more than by mistakes of this type, the book is marred by its constant failure to give a clear, complete, and connected account of any of the important events connected with the development of its declared subject. There is much, for instance, about the Reconstruction measures of Congress, but one looks in vain for any adequate information as to the full scope of a single one of them. There is something about the Freedmen's Bureau, but one must go elsewhere to learn the real scope of its work, either in its intent or in its actual practice. There are, of course, frequent references to the American Anti-Slavery Society and the successive movements for abolition or restriction of slavery through new party organizations, but of none of these movements can even a fairly complete outline sketch be derived from this volume. The truth is, as we have already intimated, that the author has given simply a volume of sketchy comment, with the result that much of it is unintelligible to anyone who has not already had a wide reading in the political history of the country. To one who has had such reading, we do not see that there is much in the volume of serious value, despite the fact that its general attitude towards the great

problems involved in the presence of the negro, past, present, and future, is correct.

As to the position of the American Anti-Slavery Society, under the leadership of Garrison, Mr. Merriam is hopelessly unable to give an account consistent with the facts. Because so much that attended the abolition of slavery, when it came, was contrary to the principles which Garrison had persistently proclaimed, he cannot see that the Garrisonian movement had any very vital relation to the outcome. Garrison saw clearly the need of a great moral work, and felt upon his own soul the burden of duty to do his part in performing it. He saw the value of an organization earnestly and definitely devoted to that line of work, and therefore used all his influence to hold the American Anti-Slavery Society steadily free from all complications which were calculated to subordinate the moral phase of the issue. If history has demonstrated anything on that point it is that the cause of abolition, and of the negro ever since, would have benefited by more, rather than less, of distinctively moral work. Mr. Garrison was not intolerant of those who strove to do something for the cause in some other way. He took the Free Soil movement of 1848 as a cheering sign of the times, proving that an effective impression had been made upon public opinion, and he did not hesitate to lift up his voice in support of the Government during the war, even before Lincoln had arrived at the point of the Emancipation Proclamation, as, for instance, in his Cooper Institute speech of January, 1862. Moreover, when his own eldest son enlisted in the war, as officer of a regiment of colored troops, he wrote: "You will bear me witness that I have not laid a straw in your way to prevent your acting up to your own highest convictions of duty, for nothing would be gained, but much lost, to have you violate these." There should be no serious difficulty in understanding his fundamental position. He wanted all to face the great fact of human slavery from the standpoint of moral duty, and he regarded it as his mission to rouse the sense of moral duty and set it upon the highest possible level. If he had been turned aside into any other channel, another might have risen up to do his work; but, whether by him or by another, freedom to the slave would never have come until that work was done.

In writing of 'Uncle Tom's Cabin' Mr. Merriam quotes with approval the words of Judge Tourgee, "Scratch one of Mrs. Stowe's negroes, and you will find a white man." Yet perhaps one may find in these words the suggestion of a truth not altogether uncomplimentary to the insight of Mrs. Stowe. If we were to scratch beneath the surface of any negro, in 'Uncle Tom's Cabin' or out of it, we might find a soul more difficult to differentiate from that of the white man than is ordinarily supposed. To realize, with Mr. Higginson, that the negro is "intensely human" is possibly of more value under present conditions than success in differentiating him carefully from any other human species.

Salve Venetia: Gleanings from Venetian History. By Francis Marion Crawford. Two volumes. Macmillan. 1905.

It is unusually hard to give a just account of these volumes, for they are neither history nor romance, but a blend of both. If we judge them as history, their value is small; as romance, they are entertaining. They are such studies as the historical novelist would work up to give verisimilitude of background and local color to his story. Mr. Crawford has long proved his right to be called a born story-teller, but we are not aware that any one of the hundreds of persons in his novels has attained to more than a transient celebrity. However it may be with his fiction, there can be no doubt that he lacks the two essentials—historic sense and the power to trace historic continuity—without which no man has ever written good history.

For Mr. Crawford, Venetian history is a series of episodes, with very slight interdependence, but abounding in picturesque or romantic externals. He sees surfaces, not character; he has a skill for melodrama, not for the tragic. And so his book gives one hardly an idea of the real greatness of the Venetians, but it tells over again, in agreeable fashion, the old stories from the old unhistoric point of view. A writer with these limitations naturally pitches upon the last centuries of decadence—those centuries which no more explain how Venice came to play a great part in the world than a description of the sensuality and effeminacy of the age of Majorian and Romulus Augustulus explains how the Roman Republic became mistress of the ancient world. During the first half of her existence Venice won and preserved her independence by an adroitness which has had no parallel. She escaped from actual subjection to either the Eastern or the Western Empire; she eluded the efforts of her tyrant neighbors on the mainland to subdue her; she rejected the encroachments of the Roman Curia. In these great lines of policy lies the real dramatic interest of her growth; but a reader who depended solely on Mr. Crawford would scarcely understand their importance. In the later history, no figure stands out so conspicuously as Sarpi, and no Venetian achievement equals the resistance, led by him, to the Catholic reaction. When we say that Mr. Crawford devotes less than two pages to Sarpi, we sufficiently indicate why he cannot be regarded as an historian. The fact that he is a Roman Catholic accounts, perhaps, for his failure to do justice to what was one of Venezia's most precious contributions to civilization—her strict separation of Church and State.

Equally when it comes to details, we discover in Mr. Crawford a fatal lack of the historic sense. To cite but a single instance, he describes the treatment of criminals and prisoners so as to leave the impression that the Venetians were particularly cruel. The truth is, that for many centuries they were in advance of their neighbors in humanity. The true historian, instead of expatiating on the horrors of strangling and drowning, as if these were peculiar to Venice, would inquire what was going on contemporaneously in other countries. This criticism may be applied throughout to Mr. Crawford's chapters on manners, customs, and institutions. They are often packed with many unimpeachable details, they are always entertaining, but they lack the indispensable historic sense. We can but regret that, thanks to the popularity of Mr. Crawford, the old half-truths about Venice, the misconceptions and exaggerations which the best recent historians have been working to dispel, should gain a new lease of life. Instead of a great, sagacious, stanch, and sober nation, the stage is filled again with the *bravi* and *sbirri*, the courtesans and gamblers and decadent nobles, who have so long done service in novels and operas. The reason is of course obvious; there exists almost endless material for the last three centuries of the Republic's decline—material, moreover, in which the novelist of manners and gossip delights. We can believe that were Mr. Crawford to take up seventeenth-century England (which may Clio forfend!) he would deal very sketchily with Cromwell and Puritanism, but come out strong on Charles the Second's court and mistresses.

The illustrations of these volumes are, to the present reviewer at least, a great disappointment. They consist of two sorts. The first are reductions from sepia wash or charcoal drawings, and seem to be views of Doré's "Inferno" rather than of the incomparably bright Venice. Some, less fuliginous than others, would fairly represent the murky atmosphere of London or Chicago. A medium less adapted to Venice could not be found. The second sort of illustrations are of the nibbed and scratchy draughtsmanship which some architects' apprentices think artistic. The result is that one must strain hard to discover values and to disentangle the perspective. The drawing of Ponte Canonica (ii., 356), for instance, leaves one in doubt as to what is gondola, what bridge, what water, and so on. Nobody could possibly recognize the botch (ii., 145) of Tintoretto's house; and so we might proceed to point out the inadequacy of scores of these illustrations. Besides their false method of draughtsmanship, they frequently give an altogether false idea of proportion, making what are low bridges or narrow *fondamenta* look huge and high and broad. When fine half-tones of photographs are readily procurable, it does not seem likely that this faddish style of illustration will be tolerated much longer.

The Evolution of an English Town: Being the story of the ancient town of Pickering in Yorkshire from prehistoric times up to the year of our Lord 1905. By Gordon Home. London: J. M. Dent & Co.; New York: E. P. Dutton. 1905.

A very beautiful specimen of book-making is presented in this volume. Its title, however, is misleading. It is not the story of the unfolding of the political life of a civic community, but rather a curious mélange of geological and antiquarian lore connected with Pickering and its environs. Mr. Home, not content with Stow's semi-mythical story of the founding of the town in 270 B. C., proceeds to recount its history "in an infinitely earlier period." The geological remains dating from the palæolithic and preglacial periods are first described, and thereafter the slender thread of the early local history is spun

around the remains of Roman roads and camps.

The Forest and the Vale of Pickering have left but an attenuated impress on the Saxon period (A. D. 418-1066). The nave of the present church dates from Norman times, and, together with other quaint bits of architecture and scenery, furnishes the subject-matter for many of the beautiful pen-and-ink drawings and the photogravures with which the book is replete. The first notes of real human interest begin with the local legends of the Tudor period, and are of decided worth to the student of witchcraft, folklore, and magic. The death-blow to this mass of ignorant superstition dates from Wesley and the Methodist revival. Of curious significance to the social historian is the survival of the practice cited from Calvert "of compelling girls who had misconducted themselves to stand in the church for three successive Sundays"—a custom which continued in Pickering up through the first quarter of the nineteenth century (p. 212). Calvert also describes the local clergy in 1824 as "in the main but a despert reckless lot."

The book concludes with chapters on the scenery and zoölogy of the Forest and the Vale. So sumptuous a product of the printer's art may well subserve the pride of the local historian. It will also appeal to the lover of fine illustrations. But it should have been entitled 'The Topography and Antiquities of Pickering.'

The Nation.

NEW YORK, THURSDAY, MARCH 29, 1906.

The Week.

The Statehood bill, as it passed the House and was reported to the Senate, may as well be considered a dead measure. If any State is admitted at all, it will be Oklahoma-Indian Territory; yet the whole bill may die in conference. Whether or not it is true, as reported, that Speaker Cannon has an explicit agreement to yield in the end to the Senate amendments, there are many grounds for predicting such an outcome. The House itself, barely held in line on Thursday, when the vote was taken to send the bill to conference, could not be kept from adopting a conference report favorable to Oklahoma alone. And, finally, the country at large, which has displayed in former years only the most languid interest in the whole Statehood question, has evinced a strong and unmistakable sentiment for admitting one Territory now and letting the others wait. No one has put the case more pithily than Representative Bede. "We are looking for a quarrel with the Senate," he said. "Let us quarrel with it when the Senate is wrong and we are right. Let us not quarrel with the Senate when we are wrong and it is right."

When Senator Lodge votes against fortifications in the Philippine Islands, on the ground that on our evacuating them we shall need only a fortified harbor or two, all Americans who oppose the retention of the Philippines may well take heart. For Senator Lodge is one of those to whom the mailed fist is everything. He would have big fleets, fine armies, and awe-inspiring forts. True, he no longer twists the British lion's tail, as was once his regular habit. But, like President Roosevelt, he has a grave suspicion that there are several European Governments which are as much tempted by the amount of wealth in our New York safety-vaults as the pickpocket is attracted by a carelessly displayed purse. If, therefore, Mr. Lodge were as certain as he once was that in the Philippines we have the jewel-lands of Asia, he would not haggle over a mere $600,000 to protect them from the envious German or Japanese. But even Senators, it seems, are getting tired of squandering money on the islands from which the country gets nothing. Politically, the Philippines are nothing but a plague, and the obstinate refusal of the natives to settle down and submit to peaceful subjugation is getting on the nerves of even a Lodge. Over this and other signs of a recovery from the madness of 1898 and 1899 all true patriots may rejoice.

When is Congress in "that calm, judicial frame of mind so necessary to the preparation of a tariff act"? Never. Sereno E. Payne, chairman of the Ways and Means Committee of the House, kindly but firmly tells Representative S W. McCall of Massachusetts that the subject cannot be considered, "so near the coming Congressional elections." The intellects of our statesmen are too much perturbed. Yet after election a movement for revision of the tariff is, as experience has abundantly shown, still more inopportune; for then Congressmen are more excited than ever. The artists of the country unanimously demand the abolition of the duty on art. They do not know, as Mr. Payne does, that the mere mention of paintings, engravings, and statuary throws our Representatives into convulsions, destroys their "judicial frame of mind," and renders them unfit for their exalted calling. Our manufacturers are opposed to a high tariff on alcohol; but "alcohol" is a word at which the stoutest blanch and tremble. Any right-minded Representative would rather suffer himself from chronic alcoholism than see the nation suffer from free alcohol in the arts. Mr. McCall and his Massachusetts friends are clamoring for free hides. The very phrase is more ominous than the primal eldest curse. It spells "disaster politically and commercially." No Congressman can listen to it and live. Let us therefore do nothing to upset Mr. Payne's philosophic calm as he views either the tariff or the coming election.

The Northern California Indian Association has issued an appeal for public support of a bill for the relief of the Indians of that State. C. E. Kelsey, secretary of the Association, who was made a special agent of the Government to investigate reports of destitution, has gone to Washington to lay before the Senate Committee on Indian Affairs the truth about the 10,000 tribesmen who are in distress. The plain fact is that the California Indians have been "marooned" on small reservations which are arid and of no present value. The case of the Campos in the southern end of the State is typical. This little remnant finds itself desert-bound and utterly unable to dig a living out of the sand. Last year the Government went so far as to provide for the Campos a white field matron, with an Indian assistant—a needed salving of a tribal sore, but a measure that should be supplemented by the removal of the whole band to another location. Mr. Kelsey and his associates will recommend the purchase of small arable allotments for the California Indians, in order to provide work for the adults who are willing to become self-supporting. The long, shameful history of the looting of the native tribes of the Pacific slope should be closed. Either the Government should adopt a vigorous policy of assistance, or make no further pretence of paternalistic care.

Attorney-General Moody's ridicule of the beef packers who had protested against Commissioner Garfield's use of alleged confidential communications, aroused applause in a Chicago courtroom, but hardly covered the point at issue. He represents corporate offenders of all sorts hastening to Washington for confession and absolution, if immunity from prosecution may be secured by unbosoming one's self to a Government official. The fancy is mirth-provoking, but the packers' case finds a certain weight in the ambiguous functions of the Department of Commerce and Labor. It is one thing to confess to an officer of the law; such action is equivalent to surrender at discretion. It is quite another thing to talk freely with an engaging person who is apparently concerned merely with the disinterested compilation of industrial statistics for the use of sociologists, reformers, and similar innocuous students. Nobody will believe that Commissioner Garfield would intentionally abuse the confidence of the worst Trust that ever converted a pig into food products. On the other hand, even corporations under Government scrutiny have their rights, and it is only fair that their officers should know just what consequences a frank talk at the Department of Commerce and Labor may involve. When the scope and function of this Department is more definitely understood, it is not likely that either the Secretary or any of his aides will have to sit many hours a day in the confessional.

The decision of the Federal Court in Chicago that the indicted packers are entitled to immunity, but that the indicted corporations must stand trial, lends a certain color to President Roosevelt's theory as to responsibility for misdeeds of a corporation—the theory which he applied in the case of Paul Morton. The Chicago decision, however, lets off the individual packers because the evidence against them was obtained by the Department of Commerce and Labor, on the understanding that it was not to be used in prosecutions. Judge Humphrey's opinion, if sustained by the Supreme Court, will

absolutely divorce the Department of Commerce and Labor from the Department of Justice. The facts obtained by Mr. Garfield may serve as a guide in framing new laws, but not as a weapon for the enforcement of old ones. The distinction is one which is not merely legal, but highly desirable. The Department of Commerce and Labor has not yet clearly proved its usefulness; but recent events show that, were it to become a mere bureau of the Department of Justice, it could make little or no headway. People who have been attacking the packers, privately as well as publicly, will not overlook the fact that they have escaped on a technicality. Their case has yet to be tried on its merits.

The Lacey bill, which provides for game refuges within the Federal forest reserves, will be favorably reported to the House, and deserves the serious attention of Congress. The plan is to set apart certain areas within which the killing of game—birds or fish—will be illegal. It is only by some such provision that the game supply of the country can be maintained. Otherwise recreation with rod or gun would very soon be restricted to members of the rapidly increasing sporting clubs. Unless there are forest asylums where the wild creatures may escape the annual slaughter, shooting in this country will soon be a matter of killing each autumn, *more Britannico*, the chicks and cubs that have been bred for that purpose the previous spring. Others than sportsmen are interested in the matter. Nature-lovers may well hail a measure that establishes a permanent "truce of God" for harried dumb creatures, and preserves a few portions of wild America in their original undesecrated seclusion.

The present session of the New York Legislature has seen such an extraordinary number of bills designed to remove or modify the restrictions of the civil-service law that the phenomenon deserves notice. The merit system of this State is established by the Constitution itself; it is so fortified by public opinion that the spoilsmen no longer attempt direct attacks. They have become sappers and miners, and, in the form of "exemption" bills, carry their tunnels against weak spots in the wall, ready to break through when the sentries happen to doze. The preference already given to civil-war veterans in respect to appointments and removals is the starting-point for most of these indirect attacks. It is proposed to extend the same privileges to veterans of all our other wars, recent or remote, to every soldier who has been in a skirmish, to every one who has been a soldier at all, volunteer or regular, whether there was fighting to be done or not, and to national guardsmen. Finally, as a crowning absurdity, volunteer firemen come up to ask for preferential treatment. The man behind the nozzle ranks himself with the man behind the gun. It is one of the curious features of certain of these bills that they are not for the sole benefit of classes likely to be politically useful. Some are so drawn that, as the Civil Service Reform Association points out, veterans of various classes could rush in from other States and receive the benefit—a form of carpet-bagging which the old soldiers at home would not be likely to appreciate. They include the regular, whose service in the field is an incident of his fixed calling, with the volunteer who went to the front, supposedly, from sheer patriotism, and is the peculiar care of the statesman. In fact, the logical end of legislation of this kind is not so much to aid the old soldier of the State as to make its civil machinery unworkable.

The Armstrong Insurance Committee has wisely decided to press at once the bill providing for the election of new trustees by policyholders. The proposed act postpones to November 15 next the elections of all mutual companies with a New York State charter. Four companies are affected—the Mutual Life, the Mutual Reserve, the New York Life, and the Security Mutual of Binghamton. The bill before the Legislature provides that, on November 15, "the terms of office of all the directors of said corporations respectively shall expire, anything to the contrary in the charter or by-laws thereof notwithstanding." It makes full and adequate arrangement for the nomination of independent candidates, requires the management to send out these independent ballots along with the "administration ticket," and allows no policyholder's proxy to be counted unless executed within two months of the election date. The importance of this last proviso lies in the fact that it renders invalid, for the November vote, both the proxies collected by Thomas W. Lawson and those lately solicited by the New York Life's own management. While legislating out of office all the existing trustees of these four companies, the bill lays no embargo whatever on their reëlection. If the majority of the policyholders, in any of these four companies, wish to return the present management to power next November, the opportunity is theirs. If they wish to reëlect some of the old trustees and drop others from the list, there is nothing to prevent them. Undoubtedly, the first sequel to the enactment of this bill would be the formation of policyholders' committees to name opposition tickets. It hardly need be added that their nominations, which must be made three months before the 15th of November, will be scrutinized and discussed as thoroughly as the management's ticket.

Even if "Federal control" of life insurance were feasible, it would be evident that the Armstrong committee has stolen President Roosevelt's thunder. To try a totally different experiment at the very moment when New York State's plan was on the eve of being tested, would be of itself absurd. But the thoroughness with which Mr. Roosevelt's scheme is disposed of by the House Judiciary Committee, practically removes it from the field of discussion. The President remarked, in his annual message last December, that "Congress has already recognized that interstate insurance may be a proper subject for Federal legislation"; his ground for this statement being that the Bureau of Corporations is allowed to inquire and publish information about insurance companies. The Chairman of the Judiciary Committee now rejoins:

> "Let it be said kindly, and not offensively, that it is a monstrous doctrine, subversive of our dual system of government, to even suggest, after the distribution of these great powers between the Federal Government and the States, that the Federal Government, created by the States, can take from the States the power they have always enjoyed and expressly reserved to them by the Constitution exclusive in the States."

Sound Constitutional reasoning this, especially when backed, as it is in Mr. Jenkins's report, by the Supreme Court's repeated declaration that insurance is not commerce and that Congress cannot impair the police power of the States. Much of the hazy reasoning lately prevalent in this matter resulted from a fancied analogy between Federal control of insurance companies and Federal charters for national banks. There is really no analogy, the national banking system having been created to serve the Government's fiscal purposes, and having been endowed with special powers in note circulation, which were denied to State banks through imposition of a Federal tax.

We will pass over the somewhat comic aspect of Mr. Jerome's excited protests against excitement. What are the facts? The Grand Jury asked instruction from Judge O'Sullivan on a point of law. Did the diversion of insurance funds to politicians constitute larceny? Before the judge was heard from, the District Attorney filed a brief arguing that no convictions could be had, because "felonious intent" could not be proved. Mr. Jerome asserted that no reputable lawyer in this city would disagree with him. But immediately the very judge of the court disagreed. Judge O'Sullivan instructed the Grand Jury that the facts alleged would constitute larceny, and that it was for them to judge of the in-

tent. Now we submit that, on this basis of fact, all Mr. Jerome's objections and alternative offers were beside the point, and that his public duty was straightway to urge indictments under the law as laid down by the court. His argument from terrible consequences had nothing to do with the case. He says that, if Judge O'Sullivan's law is sound, then Mr. Perkins committed a felony and Messrs. Bliss and Cortelyou were receivers of stolen goods. But if that is the law, why should he object to applying it? It is of the highest public importance that this issue be tried out; and the regular way to do it is by indictment and prosecution. If Mr. Jerome felt that his declared opinion would disable him from trying the cases, he could assign his ablest assistant, as he did in the trial of Nan Patterson. In her case the District Attorney did not proceed on the assumption that he must be absolutely certain of having evidence to convict before seeking indictment. Mr. Jerome, however, has chosen to go his own gait and has sought warrants from a police-court justice. Well, we shall in that way undoubtedly get the decision of the highest court of the State upon the law of larceny. Meanwhile, we suppose there is no reason why the Grand Jury should not composedly proceed by way of orderly indictment.

In all the discussion of railroad rebating, the shipper has been invariably described as the helpless victim of corporate oppression. His modest business beginnings are snuffed out by some tool of the Trusts who has smuggled himself into a railroad staff; his humble produce is taxed as caprice or malice dictates; his profits evaporate into freight tolls. Recent testimony taken by the Interstate Commerce Commission presents the shipper in a less pitiful aspect. He habitually mislabels freights to get the advantage of a lower classification; he plays railroad against railroad until he finds one that will agree to accept his lace window-curtains as "stamped tinware," or will engage to underweigh all his shipments. In fact, the shipper reveals to the hardened railroad man unmistakable traces of the cloven hoof and forked tail. We are unwilling to be umpire in the matter of making an award for diabolism between these contestants. In particular, no layman would willingly enter the labyrinth of freight classification—a subject which admits all possibilities of jugglery on the part of him who charges and him who pays. But the recent investigations at least show that it sits ill on many a shipper to cry harrow upon the railroads, and that Government ownership or just and even application of freight rates would be quite as unwelcome to many a private man of affairs as to the very monsters of the corporate deeps.

The memorial of the American Federation of Labor, which was the occasion of the sound admonition by Mr. Roosevelt and Speaker Cannon, ended in these terms:

> "Labor now appeals to you, and we trust that it may not be in vain. But if, perchance, you may not heed us, we shall appeal to the conscience and the support of our fellow-citizens."

Evidently, the good advice received at Washington was taken amiss, for the Federation announces that it will enter politics and organize an independent Labor party. The step is momentous. For years President Gompers has opposed meddling with politics, whether as an organization or through alliance with any of the Socialist parties. But he now gives his voice for the literal fulfilment of the warning conveyed in the "bill of complaint." On the whole, one may welcome this decision of Federation. In itself a new labor faction will tend only to perplex the political situation, affording confusing opportunities of rivalry or alliance with the Socialist groups; but, to go into politics will at least compel the representatives of trade-unionism to formulate their demands and to measure them on the scale of political possibility. To sit in Congress for a session would be no mean education for a labor leader; it would tend to reconcile him to certain inevitable administrative and economic conditions which now get scant consideration in labor circles. In any case, neither Mr. Roosevelt nor Speaker Cannon need tremble in his official chair because President Gompers has taken an appeal to the people. There are many indications that the people are thoroughly wearied of the extravagant pretensions of the unionist oligarchy. From the tribunal of average good sense, unionism in its latest phase is by no means likely to obtain a favorable verdict.

In Ohio a law has been passed imposing severe penalties upon "hazing." Any one acquainted with college life is aware of the difficulty in convincing juries of genuine criminality in hazing, except in such cases as would evidently warrant action under existing criminal law. Hence the Ohio legislation is not likely to prove effective as such; but it is significant of an irritated state of public feeling toward current manifestations of "college life." No country has been so ready to lavish its wealth upon higher institutions of learning as our own. The people tax themselves freely for great State universities, tens of thousands contribute of their little store to be duplicated by the rich in the interests of denominational colleges, and still larger numbers make heroic sacrifices that their own sons and daughters may have the advantages thus rendered possible. Most of these classes feel that there is something radically wrong when the college is continually before the public with a notoriety based upon the trivial, the lawless, the criminally reckless, or at best the merely subordinate, and not the things for which it was created to stand. But there is a defect in home training which constitutes contributory negligence.

Hustling the Hapsburgs is the latest recreation of an ever-active Administration. Ambassador Francis was confirmed as *persona grata* before Ambassador Storer's recall was formally notified to the Austrian Foreign Office. We hope Mr. Roosevelt will have no patience with the plea of doddering Continental diplomacy for its obsolete and foolish conventions. If we are ever going to teach the Old World that a wink is as good as a word, or better, Vienna is the place to begin. There the mossback tradition of Metternich still persists in the face of a telephonic age. Bless you, they don't even read the New York papers on the Ballhaus-Platz. How can they expect to know when an Ambassador has been recalled? What can you do with people like that, except plump a new Ambassador upon them and make them "sit up"? We are heartily glad that this effete chancellery is at last getting its lesson in the new diplomacy.

Gen. Kuropatkin's analysis of the cause of the Russian collapse in Mantchuria results in the not very startling statement that a rotten bureaucratic system was at the root of the disaster. This will account, in a way, for the notorious shortage of supplies and appropriate artillery early in the war; it explains rather less directly the general ignorance and lack of initiative among the Russian officers. The former commander-in-chief declares that promotion by favoritism or by routine, irrespective of merit, had driven many of the best officers out of the army. In this avowal there is a lesson for a nation that still keeps its army in politics, and regulates promotion more or less by political and personal influences. Into the deeper causes of the Mantchurian fiasco Gen. Kuropatkin, so far as the cable reports him, did not enter. Evidently these are to be found in general social conditions in Russia. The officers of the army are drawn from an aristocracy at once ignorant and dissipated, who bring to the very exacting duties of command no better qualifications than a certain good fellowship and personal courage. Gen. Kuropatkin's valedictory order thus becomes, perhaps unconsciously, a potent argument for opening the military career to talent, regardless of social rank, and for hastening the liberalizing of the Russian Government.

LABOR'S IMPOSSIBLE DEMANDS.

ORGANIZED LABOR: Call at the White House or the Speaker's Room, and you will hear of something to your advantage.

No such advertisement appeared in any Washington paper on March 21, so far as we can discover, but what happened would have justified its insertion. Various officials of the Federation of Labor saw the President and the Speaker of the House and got some of the most refreshingly straight and wholesome talk they have listened to for many a day. They will not profit by it as much as they should, but the country stands to gain by the frank words of Mr. Roosevelt and Speaker Cannon. For a long time there has been a growing, we will not say arrogance, but obtuseness, in the demands of trades unions, and it is well that they should be squarely met.

We do not say that labor leaders are without a grievance against politicians. The latter have flattered and fooled organized Labor to the top of its bent. Promises impossible of fulfilment have been made. Votes have been sought and, perhaps, obtained on what amounts to false pretences. It is not to be wondered at, then, if those who have been taken in by the hopes held out of creating a labor millennium by legislation, should descend resentfully upon the legislators with a demand for an explanation. In particular, we think that the professed guardians of labor have a just complaint against the Republican party. It has undertaken to enact laws of which the declared intent was to make American workingmen a specially favored class. It has professed to keep their wages high by a protective tariff. It has favored an eight-hour day in Government employ. Yet when it came to be a question of doing a great piece of national work at Panama on strictly business principles, both the tariff and the eight-hour day were thrown over. There is, no doubt, a deep inconsistency here. If it is right that our laws, as the tariff-makers pretend, should give special privileges to laboring men, we ought not to draw back just because the money cost threatens to be too great. This makes it look as if the Government were willing that the private consumer should be made to sweat by the tariff and by labor exactions, though it will not itself tolerate them. This is highly illogical, from the labor point of view, and so also is the refusal of the Republican party to "protect" American workmen effectually by excluding competing immigrants.

But the moment that Mr. Gompers and the others screwed their courage to the sticking-point, put their demands down in black and white, and took them in person to the responsible officers of the Government, all the world could see upon what untenable ground they stand. In effect, these great enemies of monopoly wish to perfect a monopoly of their own. They desire to be exempt from the ordinary processes of the courts—processes which, as the President showed, they are the first to invoke against employers of labor. These haters of privilege covet the most intolerable of all privileges for themselves. Many of them foreign-born, or the children of immigrants, they would cut off from others the opportunities which they themselves have enjoyed. Complaining that they suffer from discrimination, they would discriminate ruthlessly against the Chinese. Throughout, their programme is one of thoroughgoing exclusion and monopoly. The Standard Oil Company never did anything more cruel and remorseless in crushing a rival than these representatives of organized labor stand ready to do in the case of laborers from abroad or outside the unions.

For the great plainness of speech which the President used, we must all thank him. And the Speaker was not far behind. With a free use of the vernacular which the labor delegates must have appreciated, he told them that they were not "the whole shooting-match." There are the workmen to be considered who have refused to wear the shackles of unionism. There is the large interest of the country as a whole to be consulted. Labor as a "class" is as unknown to our laws and the spirit of our institutions as are doctors as a class or mine-owners or clergymen or millionaires. This is the point which the President brought out with salutary emphasis. To ask exemption from the general law of the land, to demand a special status of any kind, is to seek something un-American, revolting to the sense of fair play, destructive of the only equality we know. We hope he will keep the same principles out of the scabbard, and lay about with them as vigorously when ship-subsidy hunters come to see him and when the protected manufacturers raise their wails; but, at all events, he did one good day's work. The ring of sincerity in his indignation at the pretensions of his labor visitors was unmistakable; and the flat-footed way in which he told them what he would and would not do, without a single politician's shuffle or juggling with words, was worth a ton of abstract discourses about the square deal.

This labor descent upon Washington goes to swell that mounting wave of Socialism which, under one name and another, is, as Professor MacDonald said at Providence last week, threatening to break upon us. There is no occasion to be hysterical about it. We shall doubtless see many excesses, but most of them will effect their own cure. Politicians will play their little games. Already the Hearst papers are rushing in to say how differently *he* would have received the dear workingmen. But things will settle themselves in the end if our responsible citizenship steadies itself to fight for even-handed justice for all, with the abolition of every special privilege. We must, however, give our political truths their full scope and bearing. We cannot deny favors to laboring men as a class while continuing favors to manufacturers as a class. In a word, if we wish to attack the socialistic tendencies of the day in their great source and provocation, we are bound to do all that we can to get rid of the protective tariff.

THE SENATE AS A FOUNT OF KNOWLEDGE.

Senator Lodge uttered a timely and much needed word on Thursday. The country has been getting very anxious of late over the possibility that what Senator Spooner correctly calls a "whirlwind of abuse charged with wickedness and folly," might seriously disturb the Senate in the calm and high-minded performance of its Constitutional duties. Senator Lodge has allayed all fears. Referring to the criticisms of the Senate, "penny-a-line" and other, he said that that body would continue to perform its duty regardless of them. Both the Senate and the Executive, he asserted without fear of denial, "could take care of their own fortunes." We are not so sure about Mr. Roosevelt, but we think every candid man will agree that the members of the Senate do take extremely good care of their fortunes. Men like Senators Aldrich, Elkins, Clark, Alger, and Proctor, to mention only a few, have displayed what we may be pardoned for calling a marked aptitude in this direction.

One great cause of some of the popular misconceptions of the Senate is the limited circulation of the *Congressional Record*. The public depends too much upon brief and mangled dispatches from Washington, which often emphasize merely a sensational happening and give no conception whatever of the mingled pathos and bathos, wisdom, humor, sarcasm, the keen, incisive, self-contained yet self-assured methods of dealing with public affairs which mark the Senate in its treatment of our legislative problems. People may write us if they wish about the need of more and better public schools. We for our part should be content with things as they are if we could but place a copy of the *Congressional Record* in the hands of every man and woman in this fair land. Were this done, correspondence schools and universities by extension might fade away. Not only would the most instructive printed matter in the world be placed in the hands of the toiling plain people, but they would refuse to patronize the ten-cent monthlies, and the power of these publications to misrepresent the Senate would be a thing of the past.

Take, for instance, the Senate debate on March 20 on the great question whether the Philippines should or should not be fortified. It shows the Senate at its best, dignified, bent on knowledge, ready to regard the question from every point of view with scholarly thoroughness. The first matter to be settled was whether Subig Bay or Manila should be fortified; Senator Perkins favoring the latter, Senators Lodge and Bacon Subig Bay. Quite naturally, the drydock Dewey played an important part in the discussion. We append a brilliant extract from the debate, which speaks for itself:

"Mr. Perkins—As to the harbor of Subig Bay, there is notbing now tbere.
"Mr. Lodge—The Dewey dry dock will be there.
"Mr. Perkins—The dock is not yet there.
"Mr. Lodge—Well, we bope it will get there.
"Mr. Perkins—We all hope so. If it had bcen built in San Francisco it would have been there by this time.
"Mr. Spooner—Wbere was that dry dock built?
"Mr. Perkins—At a port on the Atlantic Coast—Pbiladelphia.
"Mr. Spooner—It seems to be a pretty plain case, as the Senator puts it, that the public interest would have been much better subserved by the construction of that dock in California; and I ask why was it not constructed there?
"Mr. Perkins—If I had had my way, it would have been; but unfortunately my friend from Massachusetts bad more influence than I.
"Mr. Lodge—I did not even know where it was built.
"Mr. Perkins—The Senator spoke of the dock.
"Mr. Lodge—I asked the Senator where the dock was built, and be said it was built at League Island, Pbiladelphia. I merely suggested, in speaking of American labor, tbat there were American laborers on the Atlantic Coast.
"Mr. Perkins—I spoke of the tolls for going tbrougb tbe Suez Canal.
"Mr. Lodge—What bearing that has on Subig Bay I do not know.
"Mr. Perkins—The Senator said the dry dock was to go to Subig Bay, as I understood.
"Mr. Lodge—It is not yet there, but we hope it will be there.
"Mr. Frye—When is it supposed it will reach there?
"Mr. Perkins—I see it stated this morning that it is supposed it will reacb there by Christmas. At the rate of progress it has been making I tbink it will be long after Christmas before it reaches there."

This, we submit, presents the Senate in its most characteristic mood, and our position is not changed by the fact that the Dewey was built at Sparrows Point, Maryland. Homer must nod sometimes.

But our next quotation from this masterly debate shows why we want the *Congressional Record* in the hands of the young:

"Mr. Perkins—When the dock reaches there, we have automobile topedoes, we have submarine mines and submarine boats, and we can easily protect that dock with very much less expense than it would be to build fortifications for which we have had no particular plan as yet presented to us. When I was a boy in Maine, when I went with the lumbermen into the woods to get out timber, in the first place we cut down the trees, then ran the chalk line to see what it would square up, and then they would hew to the line. If you were building a fence or a house, vou would first make a plan, so as to know what that fence or house was to be constructed of and what it would cost you before you expended any amount of money upon it."

Rarely have we seen so much sound practical sense and valuable information crowded into one paragraph and stated so attractively. But this process of education did not end here. The island of Batan figures next:

"Mr. Perkins—I should like to call the attention of the Senator to the chart of Manila Bay.
"Mr. Lodge—I have not been there, but I am fairly familiar with the chart.
"Mr. Perkins—I should also like to call the attention of the Senator from Massachusetts to Batan Island.
"Mr. Lodge—I know where that is, too.
"Mr. Perkins—I am sure we did wisely in purcbasing those mines.
"Mr. Lodge—Yes, but suppose we find an iron mine and it is wise to secure it; is it tben to be argued that we must move the naval station over to tbe iron mine? The naval station is military. It is not merely to be near a coal mine. The object is the military value, and tbe military value of Subig Bay is admitted by every expert whose opinion is worth anything."

We are sure that nothing so useful as this could be heard in the same time in either Reichstag or Parliament, and it gains rather than loses by its marked resemblance to passages from 'Alice in Wonderland.' But while Alice had difficulty in always finding out just what play was the proper one to come next, the Senate is in no danger of being deprived of accurate information:

"Mr. Lodge—I do not think it will be necessary, if we have a strong base at Subig Bay, to enter on very extensive fortifications in Manila Harbor.
"Mr. Beveridge—It is only seventy miles away.
"Mr. Lodge—It is only seventy miles away, and Manila is such a large bay that the way to protect Manila is witb a fleet. The fleet tbat holds Subig Bay is master of Manila.
"Mr. Perkins—There is no question about that. The only trouble is, it is seventy miles from the place we want to fortify.
"Mr. Burrows—Will tbe Senator allow me to correct bim—that is, if the Secretary of War knows anything about it, and I tbink he does, because he has spent considerable time in the islands? He says it is only thirty-five.
"Mr. Perkins—That must be overland.
"Mr. Lodge—Does the Senator mean to say it is a shorter distance by land than by water?"

There was much more of this discussion—pages and pages and pages of it—and every remark shows with what utter disregard of time and labor the people's interests were safeguarded. As our readers know, the upshot of the inquiry was that no fortifications whatever were voted. After such a demonstration of the capacity and usefulness of the Senate, one would think the whirlwind of abuse might stop for at least one issue of the "ten-centers."

A TEST OF ORTHODOXY.

In the coming trial of the Rev. Algernon S. Crapsey of Rochester for heresy, the Episcopal Church must answer a grave and far-reaching question: What are the limits of orthodoxy?

The issue is presented clearly. Dr. Crapsey accepts fully and proclaims boldly the teachings of modern science and the logical implications of those teachings. He rejects, for example, the miraculous:

"Natural forces are now known to be unchangeable in their nature and uniform in their operation. Tbey know nothing of man and care nothing for his wishes; the only way he can profit by them is by obeying them; if he puts bimself under tbeir guidance, they will help him; if he gets in their way, they will destroy him."

On this assumption of the immutability of natural law, Dr. Crapsey denies the dogmas of the virgin birth and the divinity of Christ as those dogmas are commonly understood:

"If we are told of a certain being in human form, born of a human motber, expressing consciousness in human speech, living a human life and dying a buman death, we naturally predicate of such a one a human fatherhood as well as a human motherhood; for universal experience bears witness to the fact that every one who is the child of a human mother is also the child of a human father. To overcome this presupposition, which is established by universal experience, would require testimony of overwbelming force. The burden of proof lies with tbose who deny, not with those who assert, the validity of universal experience to establish a given fact."

This reasoning, we need hardly remind our readers, follows closely the classic argument of Hume's essay, "Of Miracles." "There must," said the eighteenth-century philosopher, "be an uniform experience against every miraculous event, otherwise the event would not merit that appellation. And as an uniform experience amounts to a proof, there is here a direct and full proof, from the nature of the fact, against the existence of any miracle; nor can such a proof be destroyed or the miracle rendered credible but by an opposite proof which is superior." Hume concludes, therefore, "that no testimony is sufficient to establish a miracle, unless the testimony be of such a kind that its falsehood would be more miraculous than the fact which it endeavors to establish."

Dr. Crapsey, however, unlike some earlier disbelievers in miracles, feels that his faith in the essentials of Christianity is strengthened rather than weakened. He is not disturbed because "the Bible is not a miraculous book, which orthodoxy claims it to be"; or because "Jesus, the son of Joseph, no longer stands apart from the common destiny of man in life and death." On the contrary, the Rochester clergyman finds cause for fresh hope and courage in the fact that Christ "is in all things like as we are—born as we are born, dying as we die; and both in life and death is in the keeping of that same divine power, that heavenly fatherhood, which delivers us from the womb and carries us down to the grave." To Dr. Crapsey the change in view is a source, not of alarm, but of relief:

"We are no longer compelled to look upon tbe scientific movement as irreligious, hut we are able to see in it a new and greater religion, a religion based not upon

the sporadic miracle, but upon the eternal law. We are no longer compelled to look for our God in some obscure event of the past; we have but to lift up our eyes to see him in the outgoings of the evening and morning, in all the days of our pilgrimage."

Without quibbling or equivocation, Dr. Crapsey stands, doctrinally, exactly where many Unitarians and others of the unorthodox stand, and have been standing for several generations. In this situation three paths lie before him. The easiest and perhaps the simplest is to follow certain predecessors over to Unitarianism. He may feel, however, that the Episcopal Church, with its formularies, its compact and efficient organization, and its history and traditions, offers him personally greater opportunities for usefulness—provided it will tolerate his beliefs.

If he remains an Episcopalian, he still has two ways to choose from. At the close of the general convention of 1904 the House of Bishops issued a pastoral letter, saying: "If one finds, whatever his office or place in the Church, that he has lost his hold upon the fundamental verities, then in the name of common honesty let him be silent or withdraw." In the name of common honesty, Dr. Crapsey declares, he will not be guilty of that cowardly hypocrisy of silence which the bishops urge. This position the *Church Standard* commends as "absolutely just." By refusing to withdraw, he purposes to test the attitude of the Church. As a writer in the *Sun* puts it, Dr. Crapsey feels that he still holds to the fundamental verities. Under such circumstances, "the plain duty of a religious teacher" is to "throw upon his Church the responsibility of proclaiming before the world the limits of its toleration and defining the precise doctrines excluded from further inquiry or modification."

Dr. Crapsey has the support of a large number of the more liberal clergy and laymen. His case was in the minds of many who signed the circular letter printed in the *Evening Post* of January 30. Among the subscribers to that document were Dean George Hodges and several professors of the Episcopal Theological School of Cambridge, and the Revs. Loring W. Batten, Percy Stickney Grant, and John P. Peters of this city. They assert that the "historical validity" of details of New Testament narrative "must ultimately be determined in the court of trained research." George Foster Peabody, another of the signers, has written a public letter in which he says that a decision against Dr. Crapsey might "make it impossible for sincere and earnest young men in college and seminary to contemplate taking the ordination vows." He looks forward to the possibility, "within reasonable time," of "a revisal of the language now in use in the Episcopal Church." If Dr. Crapsey's heresies are accepted as orthodoxy, a revision of the Apostles' Creed as well as the Nicene would logically follow. The doctrines set forth in these formulas of faith would no longer be binding; and the language could no longer be interpreted in the natural sense. They would be literally creeds outworn.

ASPECTS OF COMPARATIVE LITERATURE.

The appointment of a professor of comparative literature at Harvard, after the chair had remained vacant for several years, is a matter of more than academic interest. The new incumbent, Professor Schofield, is preëminently a mediævalist. He has published numerous ingenious studies in the field of legend and folklore. After the fashion of his master, the lamented Gaston Paris, he traces the affiliations of legends and stories through all the versions in what may be called the culture tongues to their crudest variant in the remotest *patois*. Such study deals chiefly with matter that is not literature at all in any but a loose sense. It is primarily an investigation of the interrelations of the stock subjects of mediæval story-tellers — a branch of historical science. It deals mostly with the least important manifestation of the mediæval spirit, and regards as literature any document whatever that affords a clue to the history of a legend. Such studies are of an engrossing sort, and require that extraordinarily discursive reading and retentive memory which Professor Schofield exemplifies so well. Occasionally, work of this kind assumes a form that may itself fairly be called literature. This was the case with Gaston Paris, and is with M. Bédier; they are almost the only mediævalists possessed by the comparative idea who themselves have contributed to modern letters.

We have no intention of denying to the literature of the Middle Age a certain place in humane letters. Yet, if one excepts Dante, Petrarch, Boccaccio, and Chaucer, there is scarcely a mediæval text between the First Crusade and the fall of Constantinople a knowledge of which is in any sense indispensable to culture. The sinking of the rest would lose us much interesting reading, and would efface in the period prior to the true Middle Ages a fascinating legendary world; it would, however, leave no very important tract of the human spirit uninterpreted. Whatever criticism of life there is in mediæval literature as a whole is vague and casual. Its form is relatively monotonous and inexpressive. The great emotions it professes to invoke, it seldom realizes with any poignancy. Except in a few lyrics, the structural sense of the Middle Ages is weak and faulty, in singular contradistinction to the architectonic character of its social order and its actual achievement in monumental building.

In fine, no student who has not wholly lost his sense of literary proportion approaches a mediæval writer with the reverence appropriate to the great masters. No reader of Virgil has anything very serious to do with Chrétien de Troyes or Benoît de Ste.-Maure. Indeed, most writers of the twelfth and thirteenth centuries had a very correct apprehension that they fell not only far below the Virgilian, but also measurably beneath the Ovidian standard. For this reason it would be matter of regret if Harvard were to restrict "comparative literature" to instruction in what is literature at all only in the slighter and less significant sense. The authorities at Cambridge cannot, of course, hope to develop an adequate department of comparative literature along any such narrow lines.

In any case, there is a growing dissent from the purely philological view. To an expanding school of students, best represented, perhaps, by the late Joseph Texte, comparative literature deals primarily with humane letters and with the direct or reciprocal influences of literary cultures. Texte, for example, thoroughly traced Rousseauism from its mixed French and English origins to its effects upon all the nations of Europe. At Columbia, Professor Woodberry founded courses in comparative literature which embraced particularly the literary internationalism of the Renaissance. His pupils have published comprehensive treatises on such topics as Renaissance criticism and the influence of the Spanish upon the English drama. Professor Saintsbury's portentously big and learned 'History of Criticism' is an attempt to trace the entire history of European taste in literature. Such studies have the obvious advantage of bringing the investigator into close contact with great literature. No one can have studied minutely the history of any literary influence since the Renaissance without covering a considerable portion of the field of humane letters. Furthermore, the implications of such study force one to travel the main routes of human intelligence from Grecian times to our own. No one can deny the utility of such studies for our university students. They should produce men of wide and sympathetic culture—ideal incumbents of our college chairs of literature.

It is evident that one may have threshed out the quiddity of a score of mediæval legends without having come into stimulating contact with the literature that to-day counts for culture. A personality like that of the late Francis J. Child, combining the widest reading and appreciation with minute specialization on material seldom literary, must of necessity be rare. No one will understand us as depreciating such investigations as resulted in the 'English

and Scottish Popular Ballads.' They furnish an admirable example of industry, insight, and method for all scholars; they open up to popular appreciation a *genre* of peculiar freshness and charm. Yet the drying-up effect upon most men of these minutely historical and extra-literary studies is well known. We cannot produce really educated teachers of any literature by confining the studies of their best years to what is barely literature at all.

RICHTER AND GERMAN LIBERALISM.

The death a few days ago of Eugen Richter, the last of the great German Liberal leaders who were directly inspired by the ideals of 1848 and 1849, calls fresh attention to the way in which the Liberals in that country have been ground between the upper stone of Imperialism and the nether stone of Socialism. Richter himself was truly a magnificent Parliamentary figure, both in ability and in personality. His great friend and co-worker, Ludwig Bamberger, was one of the exiles from Germany after the Revolution of 1849; Richter was too young to be active at that time. But the spirit which animated Kinkel, Kapp, Von Unruh, our own Carl Schurz, and a host of others, was Richter's as well. To his ideals he added extraordinary powers as an orator and as a statesman. Absolutely fearless, he was known as the most successful Parliamentary antagonist Bismarck ever had. As Bebel is to-day, so Richter was denounced by the great Chancellor as a *Reichsfeind*, "an enemy of the Empire," and in return he criticised, scored, badgered, and fairly drew blood from Bismarck until the latter frequently lost his temper completely.

Bamberger and Richter alike never experienced any sea changes in their Liberal, or, as they were better known, Radical opinions. Both were ardent Free Traders and followers of the Manchester school; they were Bismarck's sharpest critics in all matters financial. They championed the freedom of the individual with an earnestness which never failed to tell. They and their immediate following were thoroughgoing anti-Imperialists in that they believed the nation's first duty to be at home. But far more interesting to them than over-sea ventures were the freedom of opinion of the press and the individual in Germany, and the social progress of the masses. Others might rejoice over the beginnings of a colonial policy, which Richter lived to see a costly and terrible failure; he and his colleagues were far more concerned with Bismarck's creation of a powerful centralized government, ruling less by the consent of the governed than by the might of its police power, to which the "man of blood and iron" resorted so readily. A leader in the trades-union movements, Richter knew nothing of caste, and so he naturally became one of the chief combatants of the anti-Semite agitation. But he had the keenest eye for illicit privileges of any kind, whether those of the military autocrat or of the protectionist or the selfish agrarian.

To every cause he brought extraordinary knowledge, what the London *Times* calls "a Gladstonian faculty of making figures live and speak," and an inexhaustible power of laborious research and study. Idealists as he and his associates were, they were none the less practical men. Bamberger once wrote that their Opposition was "not that of the beer philosopher of Berlin and Frankfort, who demands that the Outs bring him the very stars in heaven—from which he would certainly run away if they did fall to earth." The Liberal Opposition, he declared, "took part in the living world, where things were actually going on, and developed itself and the common weal by copious draughts of pure, fresh air and unceasing labor." Neither he nor Richter believed that the way to the millennium was marked "Socialism." Karl Marx and Lasalle were their warm personal friends, but political enemies. Richter himself studied, years ago, some of the problems which many Americans are now approaching as if they had never been heard of before in any other clime, at any other time; and he rejected the solutions offered by the Social-Democracy. Attack him as they would, his opponents, whether repressionists or revolutionaries, found him ever on the alert and an invincible antagonist, if only because of his unfailing good humor and cheerfulness, and because his owr character was so spotless, his integrity beyond all question.

Yet it was Richter's fate to see the Liberal movement, once so powerful, shrink into insignificance. Perhaps it would have been wiser if he and his comrades had opposed with greater vigor the latter-day manifestations of Imperialism. They failed, as some of their successors do to-day, to see how militarism menaces Liberalism. And so the Social-Democrats took from them a powerful weapon, which Bebel still wields with enormous advantage. Had Bismarck had even a slight sympathy with Liberal ideals, the tremendous growth of the Social-Democracy which swamped Liberalism would at least have been postponed, if not prevented. The social and political reforms for which the Liberals contended would have made the proletariat far less ready to accept the doctrines of communism. Denied them, its members have in despair thrown themselves into the arms of the revolutionists, whose ranks contain to-day greater leaders than are left to the Liberals.

But he would be pessimistic, indeed, who should say that the golden age of German Liberalism has gone for all time. The astounding triumph of the corresponding party in England is an example of the speed with which political revolutions may occur. There are already signs of an approaching Liberal reunion in Germany. Ever since the elections of 1903, efforts have been made to bring together the two Liberal groups and the *Volkspartei* of South Germany with considerable success, conferences having brought out the fact that a common programme was not impossible of adoption. In Bavaria and Baden, too, there has been much progress, particularly in the latter State, where the National Liberals have been really democratized. On the 17th of February a general assembly at Frankfort adopted a basic programme upon which all Liberals can unite. At this convention there was displayed a praiseworthy readiness to overlook minor differences. Of course, this affects only a small portion of the Liberals, but it may be fairly heralded as a promising beginning of Liberal rehabilitation.

THE SURRENDER TO SOCIALISM.

LONDON, March 9, 1906.

On the second of March the Education (Provision of Meals) Bill passed through its second reading in the House of Commons. It passed without a division. One member of Parliament alone ventured to offer any vigorous opposition. Yet the bill is no ordinary measure. It imposes a new and heavy burden of a strictly incalculable amount on the overtaxed ratepayer. It in reality extends the area of poor relief. It protects parents who in truth derive aid from the rates from the disability of pauperism. Virtual paupers will be able to vote for the man whom they find most inclined to increase the benefits which they are to receive from the state; a man, under the bill, may be a voter who calmly leaves to the public the cost of supporting his children. With the details of the bill I do not care to trouble your readers; my object is to insist upon the light thrown by the reception of this hazardous measure upon the characteristics of a modern House of Commons.

The first and most marked feature of the debate of Friday last is the extraordinary levity with which the present House of Commons accepts a proposal which, whether good or bad, amounts in principle to a social revolution. If there be one English institution which more than another ought to be touched or modified with only the greatest care and circumspection, it is the Poor Law. Our system of poor relief affects not only the wages, but also the moral tone of the whole body of wage-earners. It is admittedly the weak point in our social arrangements. Not much more than seventy years have passed since ill-considered distribution of public alms pauperized the poor whom it was meant to relieve, and well-nigh brought the country to ruin. The so-called new Poor Law was the salvation of England. The man who relaxes the Poor Law is proceeding along a path of which the perils are known; he at least

may be expected to step slowly and with the utmost discretion, to proceed gravely and even sadly. This, however, is not the spirit in which a House of Commons, fresh with the vigor of a new election, passes a bill which gives an extension to poor relief that might have astounded even the bigoted opponents of the Reform of 1834.

The House of Commons is supposed to be in a special sense the guardian of the taxpayers' money, but the House has accepted the novel principle that the nation must feed children who attend elementary schools, without making even an effort to ascertain the cost of the experiment. One member suggests, apparently with reason, that it involves an expenditure of from twelve to fifteen millions a year. He is interrupted with shouts of "No! No!" but no one gives even an approximate estimate of the expense involved in a change which commands popular support. The general tone of the House certainly is that, somehow or other, the schoolchildren must be adequately fed by the nation if their parents will not undertake to feed them. The arguments used in favor of a scheme which, conceal the matter as you will, must in many cases relieve neglectful parents from the performance of one of their most obvious duties, are singularly feeble. One member tells us that "the youth of the nation are the trustees of prosperity"; that you cannot teach a starving child, and that in his opinion free meals are no more demoralizing than free education. Mr. Birrell is a member of the Government and a man of talent. He meets the most obvious objections with witticisms that we are told raised laughter. When he announces that man "was born of a woman and not of the Local Government Board," he rouses "loud laughter." He thinks, or asserts, "that there is not much use in saying that this question [of providing food for school children] was part of a larger question," because "everything is part of a larger question." To the objection that the proposal he supports may involve future perils, he has the easy reply that he is "quite content" to leave posterity to deal with a great many other questions that might arise. *Après moi le déluge*, the silly maxim of a worthless king, seems to be the wisdom of our modern democrat.

Nor does the lack of serious argument alone show the levity of the House. One speaker after another betrayed a suspicion that the bill before them might bring considerable evils upon the nation. Yet even critics dealt with it in a very gingerly manner; their attitude is for the most part summed up by the words of a member who said that he was not "altogether in accord with the bill before the House, but he did not wish to say very much in the way of criticism." One man, it is true, Mr. Harold Cox, spoke out his mind boldly; he moved "that it is undesirable to proceed further with the measure, which would diminish the responsibility of the parents for the maintenance of their children, and would tend to lower the wages of the poorer classes." He spoke, and spoke well; but this effort of plain-spokenness sheds a curious light on the temper of the House. Not a single member seconded Mr. Cox's amendment; it fell to the ground without a division, and Mr. Burns, as a member of the Cabinet, pledged the Government to see that the bill should get through this session. The bill was not a Government measure, but it is now accepted by the Ministry.

If the levity of the House of Commons is noteworthy, the sentiment of the House, which no doubt to a great extent (though to what exact extent no one knows) represents the feeling of the nation, is also deserving of attention. There can be no real doubt that the Provision of Meals Bill, taken together with plans for the relief of the unemployed and the promises held out of the provision at some indefinite period of old-age pensions at the expense of the State, is an unmistakable sign of the prevalence of beliefs or feelings which certainly savor of Socialism. Whoever has noted the growth of opinion during the last twenty or thirty years, must feel that the prevalence of ideas absolutely opposed to the beliefs which constituted the Liberalism or Radicalism of fifty years ago, is no sudden revolution, but rather the outcome of causes the slow but constant working of which in England may be traced back through the history of a generation. The virtues no less than the defects of an Englishman of to-day make him look with something like favor on socialistic experiments—as long, at any rate, as they do not actively interfere with his own comfort. His humanity urges him to relieve physical suffering, he perceives keenly the evils and pains resulting from poverty, he is in reality much more sympathetic than were Englishmen (say) at the beginning of the nineteenth century. He has, on the other hand, no firm belief in or grasp of political or economical principles; he has grown up in a country where the power of the State is constantly on the increase; he has ceased to feel enthusiastic about self-help. Indolence no less than humanity suggests to him that he can perform his duty to his poorer neighbors by voting that their wants shall be met by money supplied by rates or taxes, *i. e.*, at the expense of the State. The wage-earners themselves, though, according to all the evidence that can be obtained, better off than were the workingmen of (say) 1850, feel the contrast between poverty and riches more acutely than did their parents. Add to this, that they too have become accustomed to receive help either directly or indirectly from the State, and have imbibed a sort of natural Socialism. Then, too, the growth of the feeling in favor of State help has coincided in England with the development of democracy. As I have already pointed out in other letters, the creation of the Labor Party is the most important political fact of the day. It is the manifest sign of a changed spirit. In so far, then, as members of Parliament honestly lean to socialistic ideas, they represent a sentiment of which account must be taken; and if a disinterested thinker may hold that in this matter members of Parliament share the failings no less than the virtues of the times, he can hardly blame the representatives of the people if they sincerely represent the sentiment of the day.

Unfortunately, the ready acceptance of a bill open to much criticism is a symptom of two of the worst diseases which undermine parliamentary life—cowardice and party spirit. It clearly betrays the cowardice which attacks men who, though they may be in private life persons of vigor and honesty, feel that their success in public life depends upon humoring the weaknesses of the constituents to whom they owe their seats. The unanimity with which the House of Commons assented to a bill of dubious expediency is of itself ominous. No man of sense can believe that there were not many members of Parliament who distrusted a measure which they hesitated to criticise and were determined not to oppose. Why could Mr. Cox find no seconder? The answer lies ready to hand; it is to be found in the existence of the Labor Party. But lack of courage was here connected with the fatal influence of partisanship. Personal selfishness is less influential than party spirit. A politician who might risk his own seat is not willing to injure his party. No Conservative will, if he can avoid it, do or say anything which might seem to show that the Tories care less for the children of the poor than do Radicals. No Radical is prepared to oppose a popular measure, even though grounded on false principles, if his action may give currency to the idea that the Tories are the real friends of the people.

We may read in that most interesting 'Memoir of Henry Sidgwick' that about twenty-one years ago he listened to a debate in the House of Commons on the Medical Relief Bill, the aim of which was to provide at the public expense medical relief to a workingman in sickness without imposing upon him the disabilities of pauperism. Sidgwick was no economical doctrinaire, but he saw at once the bad side of all legislation that aims at diminishing the discredit which a man incurs by living on public charity. The practical philanthropists were, in 1885, opposed to the Medical Relief Bill. "They have," writes Sidgwick, "been trying hard for fifteen years to teach the poor thrift, and now the moral weight of the Legislature is to be thrown into the other scale as far as medical relief is concerned." A day or two after the debate which he had heard, Sidgwick notices that the Liberal Opposition had extended instead of diminishing the effect of the bill introduced by the Conservative Government of the day. The Ministry meant to provide only medicine for workingmen struck with illness. The Liberal Opposition insisted that a wage-earner when ill should receive not only medicine, but food at the expense of the State. The Liberals saw an opportunity of proving that Short was the friend of the people after all, and not Codlin. The result was, that a sick man could receive outdoor relief paid for by the Poor Rate, and yet retain the Parliamentary franchise of which the law deprives a pauper. It needed far less than Henry Sidgwick's acumen to see that the time was fast approaching "when all paupers out of the workhouse would be enfranchised in the unseemly competition for popularity." His language exactly applies to the events of to-day. The unseemly competition for popularity is becoming more and more active. A Government supported by a gigantic majority bows the knee to the Labor Party. The men who make up the majority are themselves the slaves at once of fear and of party spirit. The weak Opposition is, naturally enough, neither bolder nor more honest than a strong Ministry. The House of Commons

has surrendered to Socialism. The interests of the country are being sacrificed to the unseemly competition for popularity.

AN OBSERVER.

Correspondence.

NIETZSCHE'S WORKS IN ENGLISH.

TO THE EDITOR OF THE NATION:

SIR: If it is not too late to return to the questions of an endowed press and the publication of Nietzsche's works in English (dealt with in a leading article on January 18, and in a letter on behalf of the Macmillan Company on February 21), I might perhaps be allowed to add a few words with regard to the matter, especially as I have had something to do with the introduction of Nietzsche to the English-speaking world from the very first.

It is certainly a very great loss—a far greater loss than the lack of half a dozen average universities and a hundred Carnegie libraries—that Nietzsche's highly original works, which throw an entirely new light on morals and the philosophy of history, should not be readily accessible to all thinking minds in English-speaking countries. No doubt the cold reception which Nietzsche has met with in England and America has been in some degree owing to the unfavorable auspices under which his books have been presented to the public, but it is partly, also, owing to the character of the Anglo-Saxon peoples, who are less ripe for the best thought than the French. The fact that most of Nietzsche's voluminous writings are already accessible to French readers, and are eagerly purchased by them, confirms the truth of Nietzsche's estimate of France as the home of the highest culture, where people are most receptive of new modes of thought. It is unfortunate that many important Continental works never become accessible to English readers, owing to the unremunerative terms for good literature which obtain in the utilitarian and materialistic Anglo-Saxon race, whose great prophet is still the shallow and shortsighted Adam Smith of 'Wealth of Nations' fame, whose doctrines Carlyle and Ruskin so vigorously combated.

How are we to remedy the evil? Especially by introducing a sounder philosophy, which, by its far-reaching influence, is really the most practical of all matters. It is far more than a mere publishers' question. It has been a far more serious matter to those of us who, acting on arrangements made under Messrs. Henry and the Macmillans, through their editor, Dr. Tille, have prepared very careful translations of about half a dozen more volumes of Nietzsche's works, which we have not got published owing to the discontinuance of the issue of the works, and Messrs. Henry being obliged to give up business owing to their losses. The publication of a book of selections ('Nietzsche as Critic, Philosopher,' etc.) has been equally unfortunate and unremunerative, owing to the bankruptcy of Mr. Grant Richards. To be sure, the English issue of Nietzsche's works has not been too well managed, and the printing of the books in Germany after a final revision at the Nietzsche Archiv (where imperfect English was too often substituted when an alteration was made) has no doubt been prejudicial to the undertaking. These evils, however, will be avoided in future.

Mr. Williams, on behalf of the Macmillan Company, suggests that the public should help the cause by purchasing the works already published. Perhaps I might be permitted to suggest something more. The question of the difficulty of issuing Nietzsche's works in English was raised to illustrate the evils resulting from the lack of an endowed press. Why, then, should not steps be taken to remedy the evil in this particular case? To be sure, there are endowments for the purpose of publishing valuable works which cannot be profitably produced otherwise—*e. g.*, the Clarendon Press and the Royal Society of Literature; but neither the one nor the other will have anything to do with Nietzsche. His originality frightens the narrow-minded delegates and trustees who have the management of these institutions; and instead of helping, they only tantalize those who are in advance of them in the foremost files of time. Nietzsche's works, however are now sufficiently recognized as most worthy of publication. Here is a sufficiently long list of eminent men who vouch for their importance: S. Alexander, M.A., Professor of Philosophy, University of Manchester; William Archer, Esq.; S. H. Butcher, LL.D., Emeritus-Professor of Greek, Edinburgh University; H. Havelock Ellis, Esq.; Edward Garnett, Esq.; the Rev. John Glasse, D.D.; Edmund Gosse, LL.D., Librarian to the House of Lords; W. S. M'Cormick, LL.D., Secretary to the Carnegie Trust; W. Romaine Paterson, Esq. (Benjamin Swift); J. G. Robertson, Ph.D., Professor of German Lauguage and Literature, London University; G. Bernard Shaw, Esq.; and Arthur Symons, Esq. Let those who have the inclination and ability contribute to help the cause, and we shall soon have Nietzsche's principal works accessible in satisfactory English translations. In any case, we shall succeed in our aim in one way or another; but we shall do so sooner and better if we get the assistance we deserve, either with the coöperation of the Macmillan Company and Mr. Fisher Unwin, or without it. Mr. Unwin has shown great indifference about the matter, and is disinclined to take the next volume which should be published, namely, 'Beyond Good and Evil,' translated by Miss Zimmern: to substitute another volume for it would be doing a great injustice to Miss Zimmern, since none of her translations of Nietzsche have yet appeared after the lapse of a decade.

It does not, however, seem to be the function of those who prepare good books to endow publishers, especially if they be indifferent. If publishers themselves cannot provide the required endowment for good books, it seems best to adopt the plan suggested by Mr. Bernard Shaw, namely, to publish the works ourselves. Owing to the causes above mentioned, we now hesitate to appeal further to the public for funds with which to subsidize publishers. We will gladly coöperate with publishers, however, if they will meet us with reasonable terms; but, in any case, we are now going to help ourselves. A thoroughly revised edition of Part I. of Nietzsche's 'Zarathustra,' with introduction, summary, and explanatory notes, will soon be issued; it is, in fact, the first authorized translation of 'Zarathustra,' being authorized before the arrangements with Messrs. Henry and the Macmillans took place, when only Dr. W. A. Haussmann and myself were interested in translating Nietzsche.

By all means, however, let the public act on the suggestion of the Macmillan Company, and purchase Nietzsche's works from them; they are most valuable books, in spite of some imperfections in the translations. Their value is attested by the fact that the greatest English author and dramatist, Mr. Bernard Shaw, read the MS. of the book of Nietzsche extracts with approval, and afterwards carried it himself to the publisher's office, where he recommended that it should be issued.

Yours obediently,

THOMAS COMMON.

8 WHITEHOUSE TERRACE, CORSTORPHINE, SCOTLAND, March 17, 1906.

NEW LIGHT ON AMERICAN HISTORY.

TO THE EDITOR OF THE NATION:

SIR: The ligneous English mind is not unique in its abnegation of reason when dealing with American subjects. My son, a student in a leading Continental university, writes me that a professor there, in a recent conversation, asserted to him in good faith that the decision to use English instead of German as the national language of the United States was carried by only one vote! He had seen this statement, so he said, in an historical work; unfortunately, he did not give his authority, nor the date of this remarkable transaction, whether before or after the adoption of the Constitution, or whether in convention or by joint vote of Congress. One would be curious to know whether the vote was taken by yea and nay, or *ja* and *nein*, and what method of coercion was to be imposed upon the minority; and if the Congressional debates would have been carried on and military orders issued in German, in case of another decision.

Whether some confused notion of the debates over teaching German in the public schools was floating in the professor's head, can only be guessed; perhaps his mind had been unhinged by reading the editorials on American affairs in the old *Saturday Review*, where statements not much less extraordinary were plentiful.

Truly yours, NEMUS.

RAILWAY ACCIDENTS IN AMERICA.

TO THE EDITOR OF THE NATION:

SIR: Mr. Lewis N. Dembitz's eloquent utterance in your issue of March 22, relative to the curse of railway accidents in the United States and the need of organized action on the part of the public to diminish their frequency, ought to elicit a loud response. It is a national disgrace that while the rest of the world is travelling in comparative safety, we Americans should be treated to a succession of unspeakable horrors, for which the railways and the travelling public, in its senseless eagerness for rapid locomotion (as Mr. Dembitz rightly says), are jointly responsible. The nature of the evil is rendered all the more appalling when we consider the ratio of accidents to the total number of

passengers carried in the region west of the Mississippi, as compared with that in the eastern half of the country. The insecurity of travel on the Western roads is nothing short of monstrous. It is a shame that the double-tracking of the railways does not proceed faster in the face of the frequent head-on collisions.

Mr. Dembitz's scheme for the formation of an American association for putting an end to railway wrecks ought to meet with a wide welcome. Perhaps it will be found practicable to extend the scope of the association so as to include the problem of the protection of the lives and limbs of trainmen. How long are we to face complacently the spectacle of a million railway employees killed and maimed in the course of a single generation? This is what our statistics gives us.

Yours truly. L. H.

New York, March 25, 1906.

To the Editor of The Nation:

Sir: Amen! ought every patriotic American to say on hearing of Mr. Dembitz's suggestion in the *Nation* for the prevention of railroad horrors in this country. There is not a civilized Government on the face of the globe, outside of the United States, that would tolerate for a week such conditions as exist unchallenged on many American railroads from year to year. I know of one Western railroad whose average of derailments is three for every two days; and when the disaster occurs, the directors of such railroads shrug their shoulders and speak of the "acts of Providence."

To realize the enormity of our national culpability in this matter, it is necessary to know the facts concerning European railroads and to have an idea of what Europeans think of the management of ours. Let me quote a few figures. It will scarcely be believed that, in the whole of last year, only six passengers lost their lives on all English railroads from causes not due to personal carelessness. The number in the preceding year was twenty-five. These figures are taken from 'Whitaker's Almanac' for 1906. For the railways of the German Empire in the decade from 1891 to 1901, the number of passengers killed each year through accidents not due to personal carelessness was as follows: 8, 2, 4, 6, 8, 2, 25, 1, 2, 29. These figures are taken from Meyer's 'Konversations-Lexikon' (article *Eisenbahnunfälle*). Comment is unnecessary. Gustav Pollak.

New York, March 25, 1906.

Notes.

The Syndics of the Cambridge (Eng.) University Press have arranged for a comprehensive 'History of English Literature,' in scale and plan comparable to the 'Cambridge Modern History.' Twelve royal octavo volumes of 400 pages each will be required for the period extending from Beowulf to the end of the Victorian Age. The editors are Dr. A. W. Ward, master of Peterhouse, and Mr. A. R. Waller.

We read in the *Athenæum* that Mr. Fisher Unwin will publish the story of Signora Mario's life and work, which was arranged for some years ago and is sufficiently completed.

A French translation of Prof. A. V. Dicey's 'Law and Opinion' has just finished printing, and will shortly appear.

Cardinal Rampolla, Secretary of State to the late Pope, has, since his retirement, devoted his leisure to historical studies, and has completed a hagiographico-historical work entitled 'Santa Melania e i suoi tempi.' The volume contains, in addition to a biography of this saint, detailed studies of Rome and life in that city during the fifth Christian century. The work is very comprehensive, and, according to the Vatican correspondent of the *Corriere della Sera*, a well-known French writer is already engaged in the preparation of an abridged edition for popular reading.

The interesting announcement is made that Fox, Duffield & Co. of this city have absorbed the Chicago publishing house of Herbert S. Stone & Co.

Among the spring announcements of the Johns Hopkins Press are 'The Finances of American Trade Unions,' by Aaron M. Takolski; 'The Apprentice and American Trade Unions,' by James M. Motley; 'Labor Federations in the United States,' by William Kirk; 'Trade Agreements in the United States,' by Frederick W. Hilbert, and 'Diplomatic Relations of the United States and Russia,' by John C. Hildt.

An 'Anthology of French Poetry, from the Time of Froissart to the Beginning of the Present Century,' compiled by Frederick Lawton, and 'Days with Walt Whitman,' by Edward Carpenter, are in the press of Macmillan Company.

James Pott & Co. will bring out next month 'Robert Louis Stevenson,' by G. K. Chesterton; 'The Foundations of the Republic,' two addresses by Edward Everett Hale; and 'A Sicilian Marriage,' by Douglas Sladen.

'Paul et Virginie,' in the French text of the original edition and with the illustrations recut, will form one of the Riverside Press luxurious limited editions of the present season, along with a new selection of 'Songs and Sonnets by Thomas Bailey Aldrich.'

That philanthropic yearbook, 'Burdett's Hospital and Charities,' comes to us punctually for 1906 (London: The Scientific Press). It is, as we have annually had occasion to remark, a mine of statistical information, a directory world-wide in its scope; and regularly it discusses most intelligently and helpfully the larger problems of its theme. The preface this year offers the idea of a Hospital City. Dr. Goldwater of New York, in chapter iii., succinctly describes hospital conditions in the United States.

Another recurring repository, equally without a rival, N. W. Ayer & Son's 'American Newspaper Annual' (Philadelphia), makes its prompt appearance for the present year. In its lists, census and gazetteer statistics, and maps, as well as the vigilant care to insure accuracy, it leaves nothing to be desired. Porto Rico and the Philippine Islands are included.

Major William Wood's animated and authoritative narrative of 'The Fight for Canada' was reviewed at length in these columns about a year and a half ago, from the English edition of Constable. Meanwhile the work has attained, on both sides of the water, to five editions, and that which we now receive from Little, Brown & Co., Boston, is marked "Definitive." If so, it is a very pretty ending, in bold type, with maps, portraits, and a bibliography.

About the same time, too, we noticed, but more briefly, Pierre Leroy-Beaulieu's 'Les États-Unis au XXe Siècle,' of which an authorized translation has just been made by H. Addington Bruce and published by Funk & Wagnalls Co. The work is largely statistical, and is attractively displayed.

One may infer the defects of Albert M. Hyamson's miniature 'Dictionary of Artists and Art Terms' (London: Routledge; New York: Dutton) by such a definition as "Baroque: Ornamentation in bad taste"; and by the omission of such terms as impast, patina, eclectic (in its specific Italian usage), dry point, and aquatint. Fresco painting is described as "Painting with mineral and earthy pigments on stucco"; silver point and sanguine are ignored. The book seems as badly done as possible in so brief a compass.

It would be easy to linger over Dr. J. McKeen Cattell's 'American Men of Science: A Biographical Dictionary' (New York: The Science Press). It is an attractive small quarto of 364 pages, in double columns, and is derived from sources which enable a popular writer like Dr. William Eleroy Curtis to figure here as a scientist. He owes the fact to his membership in certain learned societies, whose members have been bodily taken over without invidious discriminations. Those who live near the rose thus claim a place in the garden of roses. The biographies are compact, and have all been submitted for revision to the respective subjects, male and female. Dr. Cattell thus professes to give "a fairly complete survey of the scientific activity of [the United States] at a given period." He does more: he stars a thousand names as the leaders in American science, and he has chosen this group for future scientific study. We have observed but a single omission of moment (one proper to figure among the Thousand), and this may have come about through no fault of the editor. There is an appended necrology of our men of science who died 1903-05. This company has now been joined by Professor Langley.

In this connection we may mention a 'Bibliography of the Life and Works of Simon Newcomb,' compiled by R. C. Archibald, M.A., Ph.D., and reprinted (as it comes to us) from the Transactions of the Royal Society of Canada. It is accompanied by an excellent portrait. One cannot but be struck by the recorded range of this savant's interests as revealed in his writings.

'Structural and Field Geology' is the title of a recent work by Prof. James Gelkie of Edinburgh (New York: Van Nostrand), illustrated with many plates and figures, and intended for "students of pure and applied science." Its chief headings are: Rock-forming Minerals and Rocks, Rock Structures, Eruptive Rocks, Ore Formations, Geological Surveying, Economic Problems, Soils, and Surface Features. The different chapters seem of unequal value, some being much more elaborated than others. The student who is competent to utilize the explanations of ore formations in his field work can hardly be in need of the elementary suggestions given in the pages on field

equipment. One who can appreciate the considerable detail of the chapters on minerals and rocks, should have more information regarding the field problems of glacial deposits. References to American examples are not infrequent, but the bulk of the illustrations are from Great Britain, where the book will naturally be more useful to the student than with us.

Two useful summaries of South African geology made their appearance last year as if in connection with the visit of the British Association to the South African colonies. One, entitled 'The Geology of South Africa,' is by Messrs. Hatch and Corstorphine (Macmillan), and gives a general survey of all the southern colonies; the other, 'An Introduction to the Geology of Cape Colony,' is by Mr. A. W. Rogers (Longmans), and is limited to the colony of which the author is the official geologist. Both books are well prepared and well illustrated. The geological maps in particular serve as ready guides to the contents of the text. The manual by Hatch and Corstorphine gives an excellent account of the ancient rocks of the interior highland, among which the gold-bearing formations of the Rand are of especial interest; that by Rogers tells with more detail of the folded mountain ranges along the southern border of the continent. Both volumes give good summaries of the Dwyka glacial formation, of Permian date, and of extraordinary origin inasmuch as the ice sheet by which it was spread out accumulated in latitude 25° or 26° and moved southward, from the region of the equator towards the region of the pole.

Matthew Arnold used to tell a story of a naïve parson who, desiring to show an intelligent interest, asked Wordsworth whether he had written anything besides his 'Guide to the Lakes.' The anecdote illustrates the popularity of this essay, which has been edited this year by Mr. de Sélincourt (Henry Frowde). The reprint of 1906 represents the fifth edition of 1835, Wordsworth's final text of a work that originally appeared as an Introduction to 'Select Views in Cumberland,' by "a Mr. Wilkinson, a clergyman," published in 1810. Wordsworth soon disentangled his own from Mr. Wilkinson's ponderous work. He desired to "give a model of the manner in which topographical descriptions ought to be executed"; and when he republished the essay in 1820, with the Duddon Sonnets, he intended it to illustrate the poems. This is a guide-book that can never become antiquated, partly because it contains much autobiography interesting to Wordsworthians, partly because of its admirable prose style and a sympathy and intimacy with the Lake country which Ruskin himself never surpassed. The present reprint is got up in a most attractive little volume, light in the hand, furnished with a map and useful notes; and, as far as the beauties of scenery are concerned, apart from the question of the trains and hotels of to-day, is the best possible companion of the Lake tourist.

Those admirers of Jane Austen for whom no detail of the circumstances of her life can be superfluous, will find matter of interest in J. C. and E. C. Hubback's 'Jane Austen and her Sailor Brothers' (John Lane). They were both captains in the British navy during the Napoleonic period, and the extracts from their logs and letters here presented, though of no particular importance, give occasional glimpses of conditions at the time of the great war that are not without interest. The authors attempt to draw a parallel between some passages in Jane Austen's novels and the actual experiences of her brothers at sea.

Under the title of 'Bibliography of Printing in America,' Mr. George T. Watkins has compiled a list of about 400 titles of "books, pamphlets, and some articles in magazines relating to the history of printing in the New World." The latter term is used advisedly, as Mr. Watkins's list includes many interesting and unfamiliar Spanish titles on Mexican and South American printing. Several works relating to the history and bibliography of the press in the Philippines are also included. Useful notes are appended to many of the entries. While the list makes no pretension to absolute completeness, it is of considerable value; and Mr. Watkins—who, by the way, is a printer in the office of the Boston *Globe*—deserves hearty praise for his undertaking. Three hundred copies are printed and may be had of the compiler, whose address (20 Fenno Street, Roxbury, Mass.) we are glad to give.

Tryon County, New York, had long been under the sway of Sir William Johnson when the Revolution encouraged an element of opposition. The 'Minutes of the Committee of Safety,' with an introduction by J. Howard Hanson and notes by Samuel L. Frey, tell the story of this opposition in 1774-1775. Johnson was not the most feared by these "good people," but his allies, the Indians, whom he countenanced and to whom he supplied ammunition. To prevent an outbreak, appeal was made to Johnson, but the son, Guy Johnson, is charged with making "malevolent insinuations to the Indians of our American cause." So the committee had direct communications with the Indians, organized a militia, harassed the Tories, sat as a court of justice, and sent delegates to the Provincial Congress. The Johnsons were irreconcilable, and remained loyal to the King, eventually losing their estates and influence. The Indians were hostile, and, as was proved later, could inflict terrible suffering on the community. The record ends abruptly, some pages being lost; and many of the papers issuing from the committee were not spread upon the minutes, but were merely mentioned. Such as it is, this fragment presents a very good picture of conditions in the country at that time, and the notes and illustrations add to its value. The manner of printing is excellent. Dodd, Mead & Co. are the publishers.

One of the most successful French novels of recent years is Pierre de Coulevain's 'Ève Victorieuse.' It is an exceptionally clever piece of work, and of special interest to American readers in that the author (or rather authoress, for Coulevain is a nom de plume), has chosen a New Yorker for her heroine. Although occasionally open to criticism when she deals with such details of American life as Colonial Dames and Harvard athletics, yet in the broader questions, and especially in her attempt at a comparative psychology of her French, Italian, and American characters, she shows much real observation. The American heroine and the cause of virtue come out equally triumphant in the end.

The French side of the thorny question which the diplomats are trying to solve at Algeciras is presented to the public by M. Victor Bérard in 'L'Affaire Marocaine' (Paris: Colin). The author is as dispassionate as might be expected under the circumstances, and places before the reader numerous extracts from the recently published official dispatches. The point at issue between Germany and France is too well known to require restatement here, but it may be remarked that the author brings out in a very interesting manner the uncertainty of the policy of France towards Morocco of recent years, and leaves the reader somewhat skeptical as to whether its latest form would, if sanctioned by the Conference, be consistently adhered to. This latest form represents undoubtedly the least objectionable method of securing a colonial empire—the policy of peaceful penetration. The book reveals no diplomatic secrets and throws no new light on the causes of Germany's course of action. It further leaves French policy as open as heretofore to the initial reproach of not having made sufficient allowance for Germany's forward policy of commercial expansion and for the international character of the accord on Morocco established by the Conference of Madrid in 1880.

Morocco is the subject of the leading article in the *National Geographic Magazine* for March. Mr. Ion Perdicaris, after a brief sketch of its history and inhabitants, gives an entertaining account of his capture in 1904 by the insurgent chief Raisuli. This man, through a natural dignity and grace, attracted and interested him so much that he characterizes him as the most gentle and kindly of brigands imaginable, and adds that he was idolized by his wild tribesmen. The only reference to the present conference at Algeciras and the events which led up to it, is the remark that it may be the prelude to the closing act in the drama of Moorish independence. The reproductions of photographs of Tangier and the natives are numerous and excellent. Dr. Alexander Graham Bell's plea for the adoption of the metric system, made before the Committee on Coinage, Weights and Measures, contains a practical argument in its favor from his experience in his own laboratory. In carrying on his experiments with man-lifting kites, the calculations proved to be so laborious that he found it simpler to translate the proposed measurements into metrical terms, and then work out the solution on the metrical plan. No change was required in the machinery and tools employed, but a set of metrical weights and measures was procured to which the workmen readily accustomed themselves, and he says that they liked the new system.

The definitive arrangements for the celebration, in both Leyden and Amsterdam, of the tercentenary of the birth of Rembrandt van Rijn, as set forth in letters and missives in Dutch and English, look to permanent as well as temporary memorials. The house in the Jews' Broad Street in Amsterdam has been purchased by the municipality. It will be restored, and, as far as possible, refurnished in conformity with its internal conditions during the life of

Saskia, and of the time between the painting of "The Anatomy Lesson" and the "Night Watch." No alterations will be made on the front of the building without the sanction of the Remhrandt Society of Amsterdam. Two editions of the Bible, or rather of those parts of the Scriptures which were especially illustrated by Remhrandt's pencil, needle, or hrush, and containing two hundred pictures, of a size and form to allow an almost full-size reproduction of the "Hundred Guilders Print," will he prepared. The text, in hoth the States-General Dutch version and the Latin Vulgate, will be compiled hy Dr. Hofstede De Groot and published by Scheltema & Holtema of Amsterdam. Of necessity, these editions will be high priced. Rembrandt's biography in outline (pp. 160), written by the Dutch artist Jan Veth, and illustrated, will he Issued at a moderate price. Besides this threefoid commemoration, one tahlet will he placed on the walls of the house in the Rosengracht where Remhrandt died, and another on his tomb in the Wester Kerk. There will he a *soirée artistique* at the Amsterdam Theatre on Monday, July 16, and the pictured walls of the Rijks Museum will be illuminated hy searchlight. In harmony with the copious medallic history of the Netherlands, a medal will he struck in remembrance of the Remhrandt Day of July 15, 1906, on which day, also, the formal opening of the Remhrandt Annex to the Rijks, or National, Museum will take place. By recommendation of the Queen, the "Night Watch" will he placed in a spacious, imposing, hut plainly decorated room, calling to mind hy character and tone the "Doelens" and "Governors" rooms of Rembrandt's time, and thus in harmony with the picture, so that the visitor may "be given the opportunity of devoting his whole attention to the painting, without the chance of heing distracted from its contemplation hy disturbing factors." In the same annex the picture of the "Syndics of the Cloth Hall," and in another some of the masterpieces of Remhrandt worthy of the place of honor, will he hung.

An important informal convention recently met at the call of the Prussian Cultus Minister in Berlin, for the purpose of suggesting to the Government the proper steps to be taken in the reorganization of the secondary schools for girls. It may prove a counterpart to the famous confcrence of 1900, which resulted in placing the scientific preparatory schools for boys on a level with the classical in admitting the graduates to the universities. The recent conference consisted of both male and female representatives in ahout equal parts. The universities and the church as well as the schools were represented. As a result of these deliberations, it was decided to recommend to the Government a new type of higher schools for girls, namely, the girls' lyceum, Mädchenlyceum, which is to he followed by a higher school called the Mädchenoberlyceum. The former is to cover ten years, and its course is substantially to be that of a Latin *Real*-school, and will accordingly give prominence to the natural sciences and to mathematics. The higher grade is to cover a four years' course, and to have for its special ohject preparation for the university, so that a full fourteen years' course for girls is to lead up to the latter. These proposals met the approval of such men as Professors Harnack and Seeberg and the leading court preacher, Dryander. It is expected, says the *Alte Glaube* of Leipzig, that the Government will in suhstance adopt these far-reaching innovations.

Ex-President Cleveland's sixty-ninth birthday, just past, has heen commemorated by Mr. Jacques Reich in an etched portrait on the large scale of the series of American statesmen which this artist has now for several years steadily produced, and in a manner to challenge comparison with the best. In the present instance, the Cleveland of the print is a somewhat younger man than the one entering on his seventieth year. All the substantial qualities, however, of the well-known face and head—the weight, the seriousness, the conscientiousness—are here caught with great verisimilitude, and the portrait must appeal to Mr. Cleveland's admirers, as it is said to give satisfaction to himself, evidenced by his signing a small number of proofs. In point of technique, it maintains the etcher's high level. Mr. Reich's address is No. 2 West Fourteenth Street, New York.

—The town of Lincoln, Mass., an early patchwork derived from the territory of Concord, Lexington, and Weston, and all whose streams flow outward, somehow drew in population against the current, and is now one of Boston's most charming suhurbs. On April 23, 1904, it celebrated the 150th anniversary of its incorporation, and the proceedings have just heen generously puhlished in a beautifully illustrated volume. Mr. Charles Francis Adams, a recent townsman, supplied the oration, "A Milestone Planted," much of it along the lines of his latest Weymouth address, hut conspicuously original in an elaborate review of prehistoric glacial conditions, which had shaped not only the face of the land, hut the roads, the huilding sites, and the common life of the future population. Mr. Adams might have remarked further on the adaptability of all highly glaciated and morainic regions for suhurhan villas. After the huilding of the Fitchhurg Railroad the town succumbed to Western competition in all its staple products except timher, hut maintained itself hy truck farming. "As compared with a century ago, . . . Lincoln is more populous, more temperate, and more moral." In March, 1904, the town-meeting unanimously "directed its clerk to cast one ballot for the order prohibiting during the year all sales of spirits within Lincoln's limits." Mr. Adams finds its town government typically "in a shape approaching perfection," whereas the decay of that form had been among his motives for quitting Quincy. The appended letters and plain speeches read or spoken at the succeeding hanquet justify this view. Mr. Adams professed to be addressing posterity, and we venture to suggest that he has unconsciously planted a milestone in a matter of speech—we mean in his uncertain use of *shall* and *will*. Will any of the town celehrants of 1954 or 2004 remark this in rereading his oration? We very much douht.

—As many of our readers know, Professor Oman of Oxford is editing a coöperative history of England in six volumes, and we now bring together for hrief notice the two most recent contrihutions to this series (Putnams). In 'England under the Normans and Angevins,' Mr. H. W. C. Davis of Balliol College covers the period which lies hetween the Battle of Hastings and the death of Henry III. In 'England under the Tudors,' Mr. Arthur D. Innes employs a title which explains itself without special definition of dates. Both works represent a valiant endeavor to coördinate the chief results of intensive research without disclosing the painfulness of the process whereby those results have been gained. For purposes of lucid statement it is always well to invest one's subject with a certain unity, and Mr. Davis seeks to focus his volume at a given point by dwelling on the inventive and experimental features of his era as contrasted with the spirit of consolidation which marked the age of the three Edwards. But, behind all the creative efforts of the two centuries in question, one essential fact may he discerned. "It is not," says Mr. Davis, "a duel between two races, as Thierry asks us to helieve. It is much rather a struggle of native against foreign ambitions and ideas; a struggle of which the influence is apparent in every class and almost every individual." Alike to Crown, Baronage, Church, and People, opposing ideals present themselves during the twelfth and thirteenth centuries—forces of nearly equal strength fighting for the control of great institutions. The Crown, divided hetween continental ambitions and its desire to build up an empire of the British Isles, co-exists with a Baronage which hesitates between the rival policies of personal or collective aggrandizement, and a Church which is sometimes national and sometimes papal in its aspirations. Upon these warring tendencies of the early Angevin age Mr. Davis lays stress, hut without failing to show how hy 1272 all of the main issues had heen provisionally settled. "The policy of the Church and Baronage is stereotyped; De Montfort has given a close and consistent form to the aspirations of the masses; the Crown has reluctantly accepted an insular policy and the idea of a limited prerogative. And, as a result, England has entered upon the truly English phase of her development." From such hare generalities as the foregoing the reader may be enabled to form some preliminary idea of the way in which Mr. Davis approaches the main problems of English politics during the Norman and early Angevin periods. We must supplement a statement necessarily concise by saying that neither social nor economic history is excluded from the author's survey, while space is even found for the leading facts in the progress of culture. Mr. Davis is an excellent writer, and keeps at all points in touch with first-hand authorities.

—Mr. Innes's hook is to a large extent the record of the lay spirit at work in transforming the educational system, the religious institutions, and the national activities of England during the era of Renaissance and Reformation. To be sure, the leading ministers of the Crown during the first forty years of the Tudor period were ecclesiastics, but, from the fall of Wolsey forward, the personnel of the official class undergoes a profound change. "The Cromwells," says Mr. Innes, "the Seymours, Dudleys, and Pagets, the Cecils and Wal-

singhams and Bacons, the Russells, Sidneys, Ralelghs and Careys, were of stocks that had hardly been heard of in Plantagenet times outside of their own localities." Amid the Erastian impulses of that day, the political reign of the great prelates passed away, and even in the Church itself the Act of Supremacy restricted the range of their practical powers. "The political influence of the Church," says Mr. Innes, "was reduced to comparative insignificance by the treatment of the whole hierarchy as if it were a branch and a rather subordinate branch of the civil administration; by the appropriation of its wealth to secular purposes, to the enrichment of individuals and of the royal treasury; and by the suppression of the monastic orders." The rise of lay lawyers through the dwindling of the ecclesiastical courts is a further sign of the times, while still another is the failure of the clergy in England to produce political leaders of real eminence. The whole Erastian motive, indeed, is developed in Mr. Innes's hands with much effect. At the same time he has formed a very different opinion of Thomas Cromwell from that which has recently been reached by Dr. Van Dyke. "Unpitying he lived, unpitied he died. Regardless of justice he had struck down each obstacle in the way of his policy; regardless of justice, he was in turn struck down. By his own standards he was judged; his end was the end he had compassed for More and Fisher. History has no more perfect example of Nemesis."

—Apart from his treatment of the theme to which we have alluded above, we have found in Mr. Innes's character sketches the most interesting feature of his volume. For this kind of writing he evidently has a fondness, and few of his leading personages are dismissed with an adjective or a phrase. Among all the people of the sixteenth century, Mary Tudor furnishes him with the most pathetic spectacle. "Royally courageous, loyal and straightforward; to her personal enemies almost magnanimous; to the poor and afflicted, pitiful; loving her country passionately; she was blind to the forces at work in the world, obsessed with the idea of one supreme duty, and she set herself, as she deemed, to do battle with Antichrist by the only methods she knew, though they were alien to her natural disposition, facing hatred and obloquy. She whose life was one long martyrdom, for conscience' sake offered up a whole holocaust of martyrs; she who thirsted for love, died clothed with a nation's hate. Where in all history is a tragedy more piteous than that of Mary Tudor?" It may appear invidious to institute a comparison between two books each of which is admirable in design and workmanship, but, while Mr. Innes's volume is quite adequate to the purposes of the series, we have found it somewhat less carefully wrought than Mr. Davis's account of English life under the Normans and Angevins.

—The uninitiated will not realize the amount of special and valuable information contained in Anna R. Sheldon's 'Pistoia' (Brentano's). Not only is it one of the very best guide-books we have ever seen, but it is also eminently readable. Indeed, it would be difficult to praise it too highly; and it is just because it is so exceedingly good that we are tempted to indicate what we consider the one weak point of the book. If only a few more pages were devoted to the history of the town—half a dozen, written in the proper spirit, would suffice—this little volume would be as welcome in the study as it undoubtedly will be in the pocket of the tourist. As it stands, the stay-at-home reader is given no key which may enable him to unlock Pistoia's heart, while the ordinary tourist will hardly even suspect what a wonderful history Pistoia has. He will not be put upon inquiry; and he may imagine that when he has read the history of Florence, he has read that of Pistoia too—a notion not likely to be dissipated by the extensive use which Miss Sheldon has made of F. A. Hyett's 'Florence: Her History and Art.' Mr. Hyett is the only authority quoted by her in her meagre historical sketch (pages 16-19); on pages 52-53 she drags in a long paragraph from his work, almost *à propos de bottes*, touching the office of *Podestà* in Florence, while the only actual mistake which we have found in the whole book seems to be drawn from the same source. On page 17 we are told that the Florentine *carroccio* "first appears" in the war of 1228; and Mr. Hyett is quoted. Now, in the 'Gesta Florentinorum' of Sanzanome we find mention made of the *carroccio* as early as 1170 ("victorioso preeunte carroccio"), and again, at the siege of Montalto, in 1207. Of course, the matter is one of no importance. In a book dealing with Pistoia, we do not want to read about the Florentine *podestà* or the Florentine *carroccio*. Will not Miss Sheldon excise such superfluities, and, in a second edition, tell us something which concerns us more nearly? What of the two marble arms on the tower above the fortress of Carmignano, with hands which *faceano le fiche a Firenze?* What of the taking and retaking of Serravalle (the name alone is eloquent)? What of those old feuds between the Panciatichi and the Cancellieri, which wasted not only all Pistoia, but also the *contado* and the *montagna?* So competent an Italian scholar as Miss Sheldon is, could tell us of these things if she would. For the rest, the book is well illustrated and adequately indexed. It is charmingly bound in flexible leather, and will fit comfortably into any pocket.

—The seventeenth volume of the 'Annales du Musée Guimet' (Paris: Ernest Leroux) contains five lectures delivered at the Musée Guimet by Émile Guimet on "The Vocal Statue of Memnon," "The Recent Archæological Discoveries in Egypt," "The Museums of Greece," "The Antiquities of Syria and Palestine," and "The Chinese Drama." The sub-title, "Bibliothèque de Vulgarisation," indicates that these lectures are intended to interest the general public rather than specialists, and this fact may account for the somewhat overdone humor of the first lecture, in which the origin of the name Memnon, applied to the statue of Amenophis III. at Thebes, the explanation of the sound emitted by the statue when the warmth of the day succeeded to the chill of the night, and the growth of the cult of the statue in Roman times, are cleverly worked up for the amusement of a popular audience. The second lecture deals chiefly with the discoveries made by M. Amélineau at Abydos, which relate to very early times, and those of M. Gayet at Antinoë, among which the most interesting are, perhaps, the remains of silks and other stuffs, with elaborate and beautiful patterns woven in them, which belong to Byzantine or Sassanide times. The intermediate periods are, however, not altogether neglected. This lecture, like the two that follow it, was illustrated with stereopticon slides, which are catalogued, with brief explanations and a few illustrations. The lecture on the museums of Greece is a rather superficial description of the remains of ancient art to be seen in various parts of the kingdom of Hellas, with especial attention to Delphi, because that site was excavated by Frenchmen. The comparison of the work done at Delphi with that performed by the Germans at Olympia is made, with some slight disregard for the facts, to appeal to the prejudices of a French audience. The greater part of the fourth lecture is devoted to the antiquities of Asia Minor, especially Ephesus, Miletus, Priene, Pergamon, and Tralles, followed by a comparatively brief treatment of Jerusalem and Baalbek. The second, third, and fourth lectures are published from a stenographer's copy. This accounts for some peculiar mistakes, especially in proper names, such as Eberday and Wielberg for Heberdey and Wilberg. In general, the author seems to be more familiar with Egyptian than with Greek matters. The fifth lecture is perhaps the most interesting part of the book, as it gives a brief sketch of the development of the drama in China, with copious extracts from some of the curious plays of the thirteenth century. On the whole, the volume, though not important, may be recommended to those who wish to be amused, and at the same time to acquire a little superficial information on the subjects treated.

HOLMAN HUNT'S AUTOBIOGRAPHY.—I.

Pre-Raphaelitism and the Pre-Raphaelite Brotherhood. By W. Holman Hunt, O.M., D.C.L. With 40 Photogravure plates and other illustrations. The Macmillan Co. 1905.

Those who read through to the end the two ample volumes containing the life of Holman Hunt and the history of the Pre-Raphaelite Brotherhood, will not be inclined to regard art as a "light and irresponsible pursuit"—an idea very generally prevalent, we are told, in latter eighteenth-century days, and even early in the nineteenth century among people who knew but little of artists or of the years of hard work and strenuous endeavor which go to their making; for they were not then as sought after in general society as now. Holman Hunt had unusual difficulties to overcome in order to obtain the necessary training in his early years. His parents, while recognizing his strong natural bent towards art, had the greatest objection to his following a career which seemed both unremunerative and fraught with perils and uncertainties. His was a constant struggle with difficulties of every kind. His varied experiences accordingly offered superabundant material for a good book, and his narrative, although quite unnecessarily diffuse, is not devoid at times of a saving sense

of humor. It is natural enough that an aged man gifted with a wonderful memory should believe that all he can tell of the past is worth hearing; and we are bound to admit that the limitation of what is really significant in biography is rarely understood. Nor should we look for this self-restraint from a man as singularly endowed with self-esteem as our present autobiographer. But what much interferes with the value of the work and the pleasure of the reader is, that Holman Hunt, from the moment he treats of the formation of the Pre-Raphaelite Brotherhood, is entirely preoccupied with a contention and a grievance, which, like the grain of mustard seed mentioned in Scripture, takes quite surprising proportions, for one can never remain unconscious of the bitterness it occasions in his memories of fellow-workers. A contention may occupy a column in a newspaper, or at most be allowed to ventilate itself in a magazine article or a pamphlet, but it is quite unseemly—almost indecent—to find it bristling up continually through two lengthy and handsomely illustrated volumes.

Hunt was born in 1827. When about four years old, his home being then in the suburbs, he began to show a decided inclination for drawing, spending the intervals of noisy play in copying with a pencil any pictures he happened to see, or in representing what he knew or imagined. The child was taken on special occasions to his father's warehouse in Dyer's Court, Aldermanbury, to see the Lord Mayor's show, Bartholomew Fair, or other sights, and was often allowed to accompany the porter, who, with a knot on his head, carried a formidable pile of goods around according to approved custom. When only seven, he went with his father to the studio of an artist who was painting a landscape for him, besides being at work on a large canvas representing the burning of the Houses of Parliament. The boy was so fascinated by the process of oil painting that he begged to be allowed to remain and look on while the artist painted. This was permitted if he liked to stand on the stairs and watch through a little window they opened for the occasion. He stood in rapt attention till dark, watching the flame being spread around the buildings on the canvas, and hailing joyfully the grinding of fresh vermilion and chrome by the painter in preparation for fresh outbursts of fire. Great was his surprise when the artist turned from this exciting work to partake with his children of a substantial meal of tea and bread and butter prepared by his wife. This was the boy's first experience of studio life, with its frequent changes from the ideal to the stern realities of life; it left a pleasing remembrance in his mind, and, when questioned by his father at the age of twelve as to the profession he meant to follow, the boy declared he was determined to become a painter.

This decided intention was a great disappointment, though nothing was said at the time; but Holman Hunt soon learned from his mother that he was to leave school and begin work in a warehouse in the city. This meant no leisure for drawing, inasmuch as the distributing of invoices for goods took up eleven hours a day, and ensured promotion to a desk only after two years' work. In desperation at this outlook, hearing of a vacant post as copying clerk to an estate agent, the boy applied for it, and, having shown himself capable, was engaged on trial. Mr. Hunt was surprised at his son's having taken this independent step, but, after an interview with Mr. James, his employer, consented to the engagement. This proved a piece of good luck for young Hunt's artistic proclivities, for Mr. James was himself a lover of art, and when he by chance discovered his young assistant's talent for drawing, he revealed his own proficiency in painting landscapes in oil, and invited him to make use of his materials, which he subsequently ceded to him, teaching him how to buy crude pigments, grind and mix them with oil, and put them into bladders for use. Soon after, he was permitted to practise drawing at a mechanics' institute in the evenings, and was taken one Sunday by his father to see John Varley, the professor of watercolor landscape and "Zodiacal Physiognomy," who received the young art aspirant with encouraging cordiality, lending him drawings to copy, and his book on the occult laws, and expressing the hope that he might become as great an artist as his former pupil of the same name (William Hunt, the watercolor painter).

After this encouragement from Varley young Hunt was allowed to spend his salary on weekly lessons from a city portrait painter named Rogers, from whom he acquired a boldness of execution and other habits he had much trouble later on in eradicating. Mr. James, when he retired from business of his own accord, sought to persuade Hunt's father to allow his son to become a painter, but his efforts in this direction succeeded only in obtaining for the boy a few weeks of liberty. The first use he put his spare time to was to visit the National Gallery to see the famous works of old masters about which he had read. His account of his first visit is astonishing; he tells how he passed by the masterpieces of Italian art, anxiously searching for noteworthy pictures, and he had to be led up to them by the custodian; even then the "Bacchus and Ariadne" of Titian failed to excite his enthusiasm. But to suit the taste of the dilettante of that time, when bright coloring was disliked, the dealers had given the old masters a brown coating with tobacco decoction and other washes. When they were cleaned six years later and appeared in their pristine richness of color, the newspapers raised the outcry that they had been ruined.

His father, again excited by his objection to the career of an artist, sought to place Holman in a strict house of business, but he settled the matter for himself and entered the London agency of Richard Cobden's Manchester business. In this office unexpected opportunities in favor of art soon became manifest. His room-mate was a pattern designer. This turned his attention to ornamental design, with the conviction of its being essential in artistic education. He continued his evening lessons with the portrait painter, and on Sundays in the summer time he tried to paint landscapes from nature; but his attempts to produce color as he saw it were not successful. When he showed them to his master, he was told that nature required to be treated *in a key*, and that no one with a true eye for color would paint ivy green and grass greener as it appears. Constable was mentioned as a wrong-headed person who had done this and failed, and an example of Mr. Rogers's own work was shown him in which, according to the favorite convention, green was turned into soft yellows and rich browns, the result being very unlike anything seen in nature. Four monotonous years passed thus of daily routine in the office when, during the absence of his master, Hunt, having but little to do, invited an old Jewess, who sold oranges in warehouse offices, to sit for him. She did so willingly, bargaining for a copy of her portrait, and although the sittings were brief and often interrupted, the likeness was soon recognizable. It was pinned up on the wall to dry when his master returned. He was much struck by the portrait of old Hannah with the basket on her head and the oranges in her hand, as she appeared in life. He rushed out to call in friends to see the work, which was much admired and talked of, so that its fame reached the ears of the elder Hunt, whose displeasure seems to have been great when he learned its authorship. He complained to his son's employers of their not giving him sufficient work, and threatened to place him elsewhere if his time was not filled. Holman Hunt very justly felt that his only chance of success as an artist would be lost if he delayed any longer, by giving way to parental authority. While acknowledging the risk, he openly declared his intention of studying art seriously, and taking his life into his own hands. He gave up his place in the office, and took a room in the city, in which to paint the portraits which had been commissioned him on the strength of old Hannah's likeness. He also began to draw from the antique in the British Museum, and sent in drawings for a probationership at the Royal Academy schools.

LEE'S SHAKSPERE FACSIMILES.

Shakespeare's Poems and Pericles. Collotype Facsimile Reproduction, with Introductions by Sydney Lee. Oxford: Clarendon Press; New York: H. Frowde. 1905.

Among the many eminent services which Mr. Sydney Lee has performed in the cause of Shaksperean scholarship, it is questionable whether any will be rewarded with higher appreciation than the present volume. Regarded merely as a specimen of typography, the book is one of rare beauty—a real delight to the eye. The facsimiles are executed with the utmost fidelity, and the student who possesses them is in a position to form as accurate a judgment on all questions that require an exact knowledge of the texts as if he had the practically inaccessible original editions before him. Accordingly, to say nothing of those who love a beautiful book for its own sake, the work forms an addition to the resources of the textual critic and the student of Shakspere's language which will be henceforth indispensable.

In regard to the critical introductions which accompany each of the facsimiles, it is evident that no one living was so well qualified to supply these as Mr. Lee; for in the matters that concern the practical side of authorship, the relations of writers

to publishers, and generally the eondltions under which the works of authors (more particularly Shakspere) found thelr way to the press in the latter years of the sixteenth century and the early years of the seventeenth, Mr. Lee had already performed a service whieh is analogous to that of Mr. Fleay in the history of the Elizabethan stage, although his industry is eontrolled by an infinitely sounder judgment. Whether we accept or not Mr. Lee's main contention with respect to the problem of the Sonnets, unquestionably among the beuefits which the world owes to his devotion to that subject is the light which he has shed on just such conditions as we have mentioned above. The preparation of his admirable introduction to the Clarendon Press facsimile reproduction of the First Folio edition of Shakspere's Plays, to which the present work forms a supplenent (eompleting the facsimile reproduction of the original editions of all of Shakspere's weiks), led him still further into studies of this nature, not to mention those which are more strictly bibliographlcal, so that he approached the task whieh is represented by this volume with an unequalled mastery of the practical side of his subjeet, as well as of tbat other side wbich more immediately concerns the eritic and historian of literature.

Considering more closely the results of Mr. Lee's investigations presented in this volume, we are struck, first of all, with bis extremely interesting discussion of the sources of "Veuus and Adonis." It is rather remarkable that so promising a theme should have received so little atteution from the dispeusers of subjects for dissertations iu the universities of Germany and Ameriea. Mr. Lee, however, has brought to the discussion a kuowledge of the literature of the sixteenth century in the different European countries which no mere apprentice in scholarsblp could be expected to command, so that it is, on the whole, fortunate, perhaps, that the study of "Venus and Adouis" in this important aspect has been comparatively neglected in those quarters. Our editor has traced the treatment of the legend in literature from the Greek poets of Sicily down to Shakspere's poem. It is especially his object, however, to investigate in the fullest manner the various versions of the story—Italian, French, English, and even Spanish—in the literature of the Renaissance, since it was in the atmosphere of these versions that Shakspere's "Venus and Adonis" came into existence. Mr. Lee, as it seems to us, has accomplished this very happily, for even where one may differ with him as to Shakspere's dependence on earlier works, as in the ease of the Italian poems of Dolce and Tarchagnota, the parallels have undoubtedly a very great interest. Probably no student of Shakspere wbo has read the passages in ancient literature which deal with this legend, has failed to be struek with the fundamental difference in tne conceptiou of the relations of Venus and Adonis as compared with that with which Sbakspere has made us so familiar. Neither the Greek poets nor Ovid give any ground for supposing that Adonis does not return the love of Venus; and the same is true of most of the treatments of the theme in the literature of the early sixteenth century. On the other hand, from the first it would appear that the beautiful youth was not so much the slave of love as to surrender everything for the sake of this passion, and he tears himself from the arms of the Queen of Love to give bimself up to the fatal delights of the chase. This feature of the story seems to have formed the starting-point of the conception of the coyness of Adonis, which, through the influence of Shakspere's poem, has practically eclipsed the original conception; and the lover who, in the beginniug, is simply not wholly the slave of passion, becomes in the course of the development of the legeud positively averse to the embraces of the goddess. It was evidently this germ of piquancy which, so to speak, made the fortunes of the story in modern times, much in the same way that the infidelity of Cressida had made the fortunes of another famous story in the Middle Ages. Practically every work of fiction put forth, whether in verse or prose, offered a story of love requited, but here was au opportunity for a novel kind of interest without any sacrifice in the exhibition of passion—nay, with a situation which called for an even more intense exhibition of passion.

The new development of the story appears dimly before Shakspere in two lyrics of Robert Greene—more pronouncedly in the second of these, the exquisite appeal of Venus in "Never Too Late" (1590) with the refrain, "N'oserez-vous, mon bel, mon bel, N'oserez-vous, mon bel ami"; and again in Marlowe's "Hero and Leander" (published in 1598 after Marlowe's death, but earlier in composition than Shakspere's poem), where, as Mr. Lee says, in his translation of Musæus, the poet "went out of his obvious path in order to bring Adonis's coldness into signal relief." It seems to us that, even after Mr. Lee's discussion, however, there is room for an effort to trace more precisely the growth of the conception of the coldness of Adonis in European literature before Shakspere's "Venus and Adonis." That conception evidently existed, although imperfectly developed, before Shakspere took up his pen, but it is not elear from Mr. Lee's introduction exactly when it first appeared. The employment of the motive by Marino, who surely did not know Shakspere, proves the existence of an independent Italian tradition to that effect. We would suggest in tbis connection that it would be also worth while taking into aecount the treatment of the subject in the paintings of the Renaissance—witness the well-known picture by Titiau in the National Gallery, which antedates the publication of some of the Italian poems cited by Mr. Lee—only one would encounter here the difficulty, perhaps, of deciding whether the gesture of the goddess in detaining the beautiful youtb was due to an effort to overeome his amorous reluctance, or simply to hold him baek from the fatal boar-hunt. In Shakspere, however, at auy rate, there is no hesitation in the conception. It is the coyness of Adonis that eonstitutes the sole *motif* of his poem. In explanation of the boldness with which this conception is here developed, Mr. Lee makes the suggestion of certain extraneous influences which seem to have determined Shakspere in his treatment of the theme. This is the most notable part, perhaps, of Mr. Lee's introduction to "Venus and Adonis" and, it appears to us, must compel general acceptance. As Mr. Lee points out, Ovid's "Metamorphoses," whieh Shakspere undoubtedly used as a source of his poem (probably ln its original form as well as in Golding's translation), contained not only the story of Venus and Adonis, in which the latter is "mildly responsive to Venus's embraces," but another story in which a beautiful nymph makes vehement suit to a reluctant youth—the story of Salmacis and Hermaphroditus; to say nothing of the account of the Calydonian boar-hunt, wbich, as Mr. Lee' makes evident by parallels, obviously furnished hints (through Golding's translation) for the boar-hunt in Shakspere's poem. But the influence of Ovid's "Metamorphoses" as a source of "Venus and Adonis," curiously enough, reached Shakspere through still another channel, viz., the "Glaucus and Scilla" (1589) of Tbomas Lodge. The story of this poem came likewise from Ovid, but it had been radically changed by Lodge, and, in the form in which he presents it, bears a strong resemblance to the tale of Salmacis and Hermaphroditus. This poem, which is written ln the same metre as "Venus and Adonis," must be reckoned indisputably among the works wbich influenced Sbakspere. Finally, in the consideration of this question we should not forget the influence (which, of course, escapes determination) of oral discussion of such subjects which must have taken place in the literary circle to which Shakspere belonged.

Mr. Lee's introduction to "The Rape of Lucrece" is not so fruitful of novel results as his introduction to "Venus and Adonis." In the twenty-second volume of *Anglia*, Dr. Wilhelm Ewig had already treated with great thoroughuess, along with other questions pertaining to "The Rape of Lucrece," the sources of the poem. For instance, the interesting connection of "Lucrece" with Daniel's "Complaint of Rosamond"—which seems to have suggested to Shakspere even the use of the seven-line stanza in which this poem, unlike the "Venus and Adonis," is composed—is fully dealt with there. Mr. Lee, however, gives us a complete review of the treatment of this famous story in European literature down to the publication of "Lucrece," remarking that Shakspere's poem, generally speaking, has a closer affinity with Ovid's version (in the "Fasti") than with that of any other predecessor. "Like Ovid, Shakspere delights in pictorial imagery, and occasionally in 'Lucrece' he appears to borrow Ovid's own illustrations." It is interesting to observe that Mr. Lee rejects the idea that Shakspere knew Livy's version of the legend merely through Painter's "Palace of Pleasure," and gives reasons for assuming a knowledge of the original on the part of the poet. Here, as in his discussion of the earlier poem, our editor has collected many parallels in phrase, imagery and sentiment between Shakspere's work and works of his contemporaries; and if in some cases any actual dependence of the one on the other may strike the reader as accidental or fanciful—especially in the case of certain conceits which any poet might easily have lighted upon in the time of the Renaissance, when conceit-hunting was the most habitual occupation of the whole fraternity of poets—still, the results of such investigation were well worth recording.

Next to the introductions to Shakspere's two great narrative poems—or even perhaps before these—the division of Mr. Lee's work which will attract most immediately the attention of the reader is that which deals with the question of the Sonnets. It is with this branch of Shakspere's production that the editor's name is most indissolubly connected, and it is to the study of these poems that he has made the most original and valuable contributions. Mr. Lee had already threshed out the problems of the Sonnets, from his well-known point of view, so thoroughly in his 'Life of Shakspere,' and more indirectly in his 'Elizabethan Sonnets,' that there remained little for him to do but to reproduce the arguments of these earlier publications. To be sure, he has limited himself in this place mainly to the bibliographical history of the Sonnets and the problems involved in the circumstances of their publication. Nevertheless, partly by the aid of Professor McClumpha's articles on the subject, it seems to us that he has here established better than has been done elsewhere the fact that the great majority of Shakspere's Sonnets belong to the earliest period of his production—say, before 1597. Mr. Lee has also given in this volume additional details in regard to the men who were concerned in one way or another with the publication of the Sonnets. With respect to the famous dedication which Thorpe (for whom the Sonnets were published) prefixed to the collection, Mr. Lee adds new examples of "beget" in the sense of 'procure,' and, what is perhaps of even more interest, a parallel instance where the procurer of a collection of poems, 'Belvedere, or the Garden of the Muses' (1600), is addressed in a dedicatory sonnet in the name of the publisher as

"First causer and collectour of these floures."

It will be readily granted that Shakspere had nothing to do with the publication of the Sonnets, and so was not responsible for the language of the dedication; but, after all, "beget" with the signification of 'procure' was evidently rare, and, even in the case of some of the examples cited by Mr. Lee, its common meaning of 'generate,' though in figurative use, suits the passages just as well. The natural interpretation of Thorpe's words, as it appears to us, is that he knew by report who was the young man of the Sonnets, and so dedicated the collection to that person. It seems too much to assume of the impudence even of a piratical publisher like Thorpe that he should have been wishing "eternitie" (*i. e.*, of fame) to some man of obscure station in life, who, indeed, if our editor's theory be correct, is most likely to have been a mere literary scavenger. On the general question of the relative proportion of convention and personal history which underlie the Sonnets, no one can deny that Mr. Lee by his investigations has shown that the latter element is restricted to a degree that had been suspected by only a few since the revival of interest in these poems about the end of the eighteenth century. It seems to us, however, we confess, that he has not yet quite succeeded in driving the "dark lady" (as a living personality) from the field.

The sections on "The Passionate Pilgrim" and "Pericles, Prince of Tyre" demand no especial comment, but the same high level of scholarship is maintained in these parts of the volume as elsewhere. It is a pity, however, that, in his discussion of the "Pericles," Mr. Lee should make no mention of what is unquestionably the ablest book that has been written concerning the legend on which this play is based—namely, Klebs's 'Die Erzählung von Apollonius aus Tyrus' (1899); a work of a very different order of scholarship from the bibliographical compilation which is actually cited by Mr. Lee.

In conclusion we will say that not the least valuable feature of the present work is the census of extant copies of the early editions, which forms a part of the introduction to each of the poems or collection of poems here reproduced in facsimile. Each exemplar is described in detail and its history given, where practicable. And here it is interesting to observe how many of these precious volumes have taken part in the great movement which we once heard a German speaker describe as the "Bücherwanderung nach Amerika." Copies even of the first editions of most of these works have found their way to libraries in this division of what Carlyle has called the realm of King Shakspere; and of the two works which constitute exceptions—namely, "Venus and Adonis" and the mainly spurious "Passionate Pilgrim"—it may be remarked that in the case of the former even in England only one copy of the *editio princeps* survives, and in the case of the latter only two.

Canada as It Is. By John Foster Fraser. Cassell & Co. 1905.

Mr. Fraser's keynote may be assumed from the opening paragraphs to be one of disparagement:

"I have chosen the title, 'Canada as It Is,' for three reasons. Firstly, because the popular idea about the great Dominion is that it is a region clasped most of the year in ice and frost, which it is not; secondly, because the Canadians themselves, by means of Government pamphlets and subsidized lecturers, would like the world to believe it the most delightful land to live in, which it isn't; and, thirdly, because Canada has just emerged from its adolescence as a nation, has reached lusty manhood, and has become conscious of the great rôle it may play in the history of commerce."

"The chief asset in the Canadian's character is glorious enthusiasm and belief in himself and his country. Britons are predisposed to take a pessimistic view of things. The Canadian revels in optimism. He lives in a whirl of it. He is always comparing himself to John Bull, to his own satisfaction and the detriment of John. He welcomes with open arms—and his hospitality is warm and unstinted—anybody from the 'old country,' yet he is unable to conceive how any one can pass through the Dominion without being in constant ecstasy."

These paragraphs were probably written when the author first landed in Little Canada, and before he had breathed the exhilarating air and been inspired by the enthusiasm of the Greater Canada which is being so rapidly created west of the Great Lakes. These are to Old Canada what the Alleghenies were to the original Thirteen States. The Maritime Provinces are left out of Mr. Fraser's estimate altogether; but Quebec, with its antiquities, religious, social and architectural, and its peculiar racial contrasts (for they are not antitheses); and Montreal, with its growing commerce and arrogant self-importance; Ottawa, the political capital, with its governing classes and its quarrelling legislators, inflated with as much bombastic pride as though they controlled the destinies of and made laws for sixty millions instead of six millions of people; and Toronto, with its exclusively English population, tinctured by Yankeeism—are elements Mr. Fraser tries to arrange into equations from which he has deduced certain definite solutions. The conclusion is not very distinct, and the impressions were apparently not altogether pleasant.

In the paragraph quoted, he speaks of Canada as having attained to manhood. That it has not yet done, though it is rapidly growing to man's estate; but, like a healthy, well-grown youth, it feels its strength and frets under the trammels which forbid it the privileges of full manhood. It occupies and resents the nominally subordinate position of a colony, but is glad enough to enjoy the prestige of being a part of the British Empire, and to take shelter under the ægis of British protection. It submits to arbitration methods, as in defining the Alaska boundary; and yet, like a passionate, spoiled child, it howls over the award which does not give it all it cries for. These little traits (incident to immaturity among other communities than those north of the St. Lawrence) impress a stranger rather offensively; but, as our author's experience proves, there is a freer spirit abroad in the West, where, however, fewer prejudices and perhaps, therefore, fewer restraining safeguards against extremes in thought and action may act as countervailing advantages.

The Canadian West in these respects is but a faint reflection of our own, for the riotous license of the Texan cowboy has never infected the more staid cattle rancher of Calgary, and law and order have always been introduced into even such remote gold camps as Dawson, in the Klondike, at as rapid a pace as the gold hunter maintained in his headlong rush for the precious metal. Farming has always been as much ahead of mining in far-western Canada as the prairie is in extent wider than the Rocky Mountains, on the forty-ninth parallel. The development of Canada has therefore been less romantic, but also slower than our own. Nor would its present growth be as rapid as it is, were it not that Canada has still millions and millions of acres to give away, while well-nigh all fertile land south of the line has passed from under the control of our own Government. As long as land was procurable under the Homestead Act in our temperate zone, few farmers were tempted to accept it in Canada, though given away with a charming, bracing climate, where the temperature occasionally dropped to fifty degrees below zero, and where early August frosts jeoparded two out of every three wheat crops. But just as the operation of civilized man in our own arid region has extended the line of rainfall for hundreds of miles to the west and south, the cause being the disturbance of the atmosphere by our railroad trains, or the influence of the vegetation which he has raised by artificial irrigation, or some other unexplained agency, so in Manitoba

and other parts of the Canadian Northwest, by like influences and the drainage of the swamps, the severity of the climate has been notably mitigated, and fewer crops are lost by early frost than were damaged ten years ago. As a result, the immigration into Canada, mainly into the western provinces, has increased from 23,895 in 1900 to 130,331 in 1904, of which 45,229 were from this country, for the American farmer must follow his habit of improving his farm, selling it at a high figure, and occupying another piece of waste land, even though it carry him across the border.

Thanks to these causes the Canadian West shipped, as the harvest of 1905, 90,000 bushels of wheat, and every interest in the Dominion responds, as it does here, to the prosperity of the farmer. Above all, railroad building has received such an impetus that three new transcontinental lines are either under construction or under contract, intended to open up the Northwest almost to the headwaters of the Mackenzie River, and to traverse the vast forests lying between the Height of Land north of the St. Lawrence and the Great Lakes, and Hudson Bay. Thither, as neither the rainfall nor the scenery will be interfered with by the ruthless axe of the wood-pulp maker, it is to be hoped that he will transfer his mills and his political methods from the Adirondacks and our own rapidly vanishing forests. What natural wealth is hidden in these bleak regions, in the unexplored peninsula of Labrador, and in the two million square miles of dreary country north of the Manitoba, Saskatchewan and Alberta prairies we may calculate from the discoveries made in the Klondike and Alaska, which were supposed until lately to yield only salmon and seals.

Looking at "Canada as it is," we see it to consist of a country of 3,745,000 square miles, much of it within the Arctic circle, inhabited by less than 6,000,000 people. of whom 70 per cent. are congregated on the banks of the St. Lawrence and Lakes Ontario, Erie, and Huron. There is, therefore, breathing space, as the density is only 1.7 per square mile. But they are a fairly prosperous people, producing from their farms, fisheries and industries, $185 per head. They have expended above $100,000,000 on canals, and maintain 20,000 miles of paying railroads—or about the same mileage per head of population as ourselves.

But Canada as it will, or may, be is whatever one wishes to believe, and the Canadians have some reason to believe what they wish. The Trans-Canada, the Canadian Northern (the Mackenzie-Mann Railroad), and the Grand Trunk Pacific are being built across the continent to Hamilton Inlet, the point of delimitation on the Pacific Coast between ourselves and Canada. These transcontinental railroads are expected to open up a wheat area as large as our own, inasmuch as there is now confirmation of the earlier statements that a temperate climate and fertile land extend along the eastern foot of the Rocky Mountains for nearly 1,000 miles north of the international boundary. On the banks of the great Mackenzie River, which is open to navigation for almost as many summer months as the port of Duluth, oil is said to flow as freely as from the Baku wells; lead and other minerals crop out abundantly on its banks, and Hearn has told us of the native copper on his Copper River; so that imagination can run riot over what the 2,000,000 miles of unexplored territory may produce. Much of this is set forth attractively in Mr. Fraser's little book.

The Truth about the Tsar, and the Present State of Russia. By Carl Joubert. London: Everleigh Nash; Philadelphia: J. B. Lippincott Co. 1905.

In our notice of 'Russia As It Really Is,' by Mr. Joubert, we had occasion to point out the author's "popular" style and reckless inaccuracies, bred, in part, of overconfidence, in part of neglect to verify quotations and statements of "facts." The present volume, which forms a sort of sequel to the one just mentioned, is characterized by like qualities. Evidently, they meet the approval of publishers and public, as this is the third edition. Its appearance is somewhat belated, as it contains several prophecies regarding the state of affairs after the war between Russia and Japan shall have been concluded. But as it contains much besides the interest of comparing prophecy with fulfilment (or, rather, in the present case, with non-fulfilment), which is likely to impress the non-critical or the badly informed reader, it may properly be treated as current literature rather than a dead issue.

The late author (for the bearer of the pseudonym "Carl Joubert" has just passed away) sets out with the assumption that his previous volumes were criticised because they were too much in advance of public opinion. He then says: "My predictions have been realized. The Autocrat's massacre of unarmed, peaceful Christians by hired Moslems on January 23 ended the armistice between the people and the Romanoffs." This is nothing short of amazing, but has its value in that it furnishes, at the start, an excellent example of the author's method. As the Preface from which we extract it is dated "February, 1905," the occasion alluded to can be none other than the one popularly known as "bloody Sunday," when the troops fired upon the processions of striking workmen in front of the Winter Palace and elsewhere in St. Petersburg. The Tartars and Moslems, in general, dodge military service by devices perfectly well understood, so that the proportion of them in the army is very small. The author probably refers to the Kazaks, many of whom belong to the sect of Old Ritualists in the Eastern Catholic Church.

Another typical instance of misinterpreted facts occurs in a paragraph about Alexander III. After saying that he swore like a "strugovtchik" (the Russian word is correct, for once), which would have been equally forcible had its English equivalent, "bargee" (employed immediately afterward), been used, we are told: "His courage was not equal to his bad manners. It was two years before he would trust himself to face the ordeal of coronation, dreading the fate of his father if he ventured out of his palace of Gatschina." One feels inclined to ask Mr. Joubert, Why was there any delay in crowning the present King of England? The explanation is deplorably prosaic in both cases. A gorgeous ceremonial, with its innumerable and complicated details, robes, and the rest, requires time for preparation. Before Alexander III. was crowned, the vast State rooms in the Kremlin palace, as well as the extensive private apartments, were rehung and refurnished, the cloth of gold and silver and brocades being woven for the occasion, as they were for the elaborately embroidered mantles, thrones, and so forth. It may not be amiss to remark, also, that Alexander III. was in the habit of driving about his capital daily, in open equipages, with the unostentation and freedom of a private person—not escorted by troops like Queen Victoria or the President of the French Republic.

When our author pays his respects to the Emperor Nicholas II. on the score of cowardice, he asserts that, during that sovereign's visit to France, "twice a day he received absolution from his chaplain. . . . A Pope of the Orthodox Church used to lick his left eye twice a day as a preventative [*sic*] against the machinations of the Nihilists." The first statement displays a lamentable ignorance in matters of the Church concerning which Mr. Joubert has made numerous remarkable assertions with an air of supreme authority. Absolution is given only after confession, immediately preceding the reception of the communion, which cannot possibly be taken more than once a day, even by an ordained priest. As for statement No. 2, we can only say that our author's facetious informant must have been thoroughly satisfied with the test of credulity thus applied. Equally unreliable is the assertion that the Greek Church teaches the peasant: "As great as God is in heaven, so great is our Tsar on earth." In this connection it may be remarked that, as religious freedom has been granted since the publication of this volume, most of the comments on that subject have lost whatever force they may have originally possessed; notably, the prediction that, given religious freedom, "the Greek Church throughout all Russia would be powerless." The State Church has cordially welcomed religious freedom for other sects, and desires reforms in its own affairs, with the confident expectation that these new conditions will strengthen its hold upon the affections of its members by conviction, while permitting the discontented to depart and remove with them elements of discord.

The reiterated and positive assertion that the Emperor would never accept any draft of a Constitution has been falsefied by events, and falls into the discredited category along with those on religion. As to the fitness for self-government on the part of the Russian people, Mr. Joubert is, undoubtedly, right in holding that, "with all their ignorance and fatalism, the Russian moujiks are as well fitted for self-government as some of the inhabitants of New York State, or Pennsylvania, or as the lynch-law element of the Southern States." This, although intrinsically not very high praise, at least puts the case clearly. Equally true are the sentences which follow, and a little local application might be respectfully suggested to the author:

"All that the people of Russia ask is that the rest of the world should mind their own business, and abstain from interference with the internal affairs of Russia. They have neither asked nor received any benefits from foreigners, and they have no intention of meddling in their affairs. The

development of their own country and the amelioration of their own people will keep them fully occupied for many years to come."

Later on he says: "I may be told that it is no business of mine then I make it my business:" on the ground that he has been "a tramp" for many years in Russia.

As our author indulges in fewer Russian words than in his former volume his errors are fewer; but he seems to have acquired an inveterate habit of wedding plural adjectives or pronouns to nouns in the singular number, and "anglisky podletz" means "English scoundrel," not (as rendered) "carrion." Why he persists in confusing readers by calling the Dowager Empress Marie Feodorovna "Marie Dagmar"—she discarded the "Dagmar" forever on her reception into the Russian Church before her marriage—and Tsarskoe Selo "Natsarskoe Selo," is a puzzle, unless it be explicable by that general inaccuracy of mind to which we have repeatedly referred, instanced by "Il Trouhadour" as the title of a well-known opera. His fine tribute to the ineradicable home-love of Russians is thoroughly merited, and his firm faith in Russia's future is assuredly well founded. Whether his vision of the flag of the United States of Russia flying over the Kremlin (practically, the only one of his prophecies which has not come utterly to naught within the book's little life-span of a year) is well founded, remains to be seen.

Edward MacDowell. By Lawrence Gilman. John Lane.

Fuller accounts of MacDowell's life than that contained in Mr. Gilman's volume have been printed in the *Century Magazine* and the London *Musical Times*; but as his volume comprises only seventy-seven pages, he probably felt that he could not spare more than a dozen for biographic details that do not help to throw light on the character of the composer's works. Edward MacDowell has often been called "the American Grieg," and it is an odd coincidence (as well as a fact that does throw light on his works) that America's most original composer, like Norway's, had a paternal great-grandfather who was a Scotchman. The American's paternal great-grandmother, on the other hand, was born in Ireland. His mother, Frances M. Knapp, was a young American woman of English antecedents, and his father was born in America. From him he inherited the Celtic qualities of his genius, concerning which Mr. Gilman has much to say:

"It is the heroic Gaelic world that MacDowell has made to live again in his music: that miraculous world of stupendous passions and aspirations, of hards and heroes and sublime adventure—the world of Cuchullin the unconquerable, and Laeg, and Queen Meave; of Naesi, and Deirdré the Beautiful, and Fergus, and Connla the Harper, and those kindred figures, lovely or greatly tragical, that are like no other figures in the world's mythologies."

Notwithstanding the Celtic note in much of his music, MacDowell is undoubtedly the most distinctively American of all our composers. The subtle problem as to wherein his Americanism lies, Mr. Gilman does not try to solve; he does, however, protest against the notion that an "American" art must necessarily be evolved from negro and Indian melodies. Concerning the "Indian Suite," in which songs of the Iroquois and Iowa Indians are used as themes, he says:

"Although MacDowell in this suite has admittedly derived his basic material from the North American aborigines, he has never, so far as I am aware, claimed that his impressive and noble score constitutes, for that reason, a representatively national utterance. He realizes, doubtless, that territorial propinquity is quite a different thing from racial affinity; and that a musical art derived from either Indian or Ethiopian sources can be 'American' only in a partial and quite unimportant sense."

To Mr. Gilman, MacDowell is the saviour and representative of the romantic spirit in music at a time when men like Richard Strauss, Debussy, D'Indy, Elgar, Loeffler are exhibiting other impulses and tendencies. With these "new men"—whom our author also admires, while others regard them with the same horror as they do the "new women"—MacDowell has nothing in common. His supple, broad, fresh, spontaneous melody contrasts strikingly with the "hesitant melodic contours," the "unceasing avoidance of definite patterns" in the works of the men just named. Nor does he indulge in the "intricate exfoliations" which give so peculiar a flavor to the harmonic schemes of the "new men." "It is in the novel disposition of familiar material, rather than in the discovery and exposition of new elements, that MacDowell's emphatic individuality consists," the author informs us. "Whether it is a more signal achievement to create a new speech through the imaginative readjustment of established locutions than to evolve it from fresh and unworked elements, is open to debate." This point seems well taken, but it loses some of its value when we bear in mind that the "fresh and unworked elements" in the compositions of the "new men" consist chiefly in making a sport of cacophony for its own sake, and in deliberately violating all the moral laws and conventions of music.

The least satisfactory of Mr. Gilman's chapters is that on the songs, the most satisfactory that on the sonatas. Grieg once compared the typical critic to a wet poodle who comes into the parlor and selects the best piece of furniture to lie down on. One cannot help thinking of this on reading the author's remarks on "Menie," one of the most wonderful songs ever composed in America or anywhere. In a footnote he grudgingly admits its beauty, but in the text he descants on an alleged "indifference to justness of declamatory utterance" in two or three words, which in truth is not worth mentioning, and which will bother no experienced singer. The assertion that "in his songs the composer does not often achieve an ideal correspondence between the significance of the text and the effect of his music" is preposterous. We should say, on the contrary, that the music of these songs is "dyed in the wool" of the underlying poems. It could hardly be otherwise in the case of a composer who made even his piano pieces for the most part echo the spirit of the poetic lines prefixed to them.

That MacDowell is, "in a singularly complete sense, the poet of the natural world," yet no less the "instrument of human emotion"; that the range of his emotional expression is astonishing; that he has a remarkable gift for extremely compact expression; that his music is "touched with the deep and wistful tenderness, the primeval nostalgia"; that much of its charm lies in its spontaneity and the utter lack of self-consciousness; that no musician has ever felt the spell of the ocean as has MacDowell, whose "Sea Pieces" are full of the "glamour, the awe, the mystery of the sea; of its sinister and terrible beauty, but also of its toxic charm, its secret allurement"—these and other characteristic points Mr. Gilman dwells on, thus giving his readers as good an idea of the music as can be obtained without hearing it. It is to be regretted that no bibliographic note has been appended.

The Basses. Fresh-water and Marine. By William C. Harris and Tarleton H. Bean. Edited and illustrated by Louis Rhead. The Frederick A. Stokes Co. 1905.

Fishes I Have Known. By Arthur H. Beavan. London: T. Fisher Unwin; New York: A. Wessels Co. 1905.

The literature of angling is of the same uncertain character as the sport itself. The net result of your hours of effort is apt to be slight in either case, and yet the devotee is never willing to admit that his time has been wasted. The brook brings you into pleasant contact with nature, even if the trout refuse to rise, and if one possess a fairly active imagination the book may do the same, even if it fails to satisfy all applicable objective tests of good literature. It is chiefly from this point of view that we must commend the sumptuous volume which Mr. Rhead has devoted to the basses, for one does not really find any striking positive merits to distinguish it from other literature available on the same subject. Friends of the late William C. Harris will, of course, be interested in his portion of the book as his last literary effort, and for that reason we deplore the blunder which has been allowed to mar his discussion of the names of the two species of black bass known to inland anglers, the one point upon which Mr. Harris doubtless expended his most laborious efforts for strict accuracy. We are told on page five that there are two species of black bass—the small-mouthed, *Micropterus Dolomici*, and the large mouthed *Micropterus Salmoides*. Those who do not need the information at all are aware that this is correct, but the uninformed will be disturbed by an exact reversal of the names only two pages further on. The carelessness cannot be fairly attributed to Mr. Harris, for he was lying in St. Vincent's Hospital, never to emerge alive, when the book went through the press. Editor and proof-readers should have done their part more conscientiously under such circumstances. Mr. Harris is like Dr. Henshall in ranking the black bass even above the brook trout as a game fish, though he is willing to admit the comparative inferiority of the large-mouthed variety—a thing Dr. Henshall could never be induced to do.

It must be said in general that there is no very good reason for grouping all the so-called basses together in a single book, as the name indicates no scientific connection, nor have the various kinds of "basses" any game qualities in common. About one-third of the present treatise is given to the marine species, which are described by Dr. Tarleton H. Bean. Mr.

Rhead contributes chapters on the cooking of bass, the choice of flies, and bass in the Beaverkill. Upon the reception which this volume receives, we are told, depends the carrying out of plans for a "Library of Rod and Reel," to cover the entire field. Such a series might find a market sufficient to justify its existence from the business point of view, but the best angling literature comes when the pen is moved by the spirit, not by the call of the maker of books.

Mr. Beavan's volume might almost be described as the ichthyological section of a popular cyclopædia of natural history, so numerous and varied are the forms described. It is a book which any intelligent reader might presumably enjoy if he enjoys animate life, travel, and adventure of any kind; but we imagine the average ten-year-old boy would read it with keener interest and more profit than the angler. The yellowish-green binding is hardly an æsthetic success, nor, to revert to the other volume, does the eye find any satisfaction in the whim of decorating its cover in the likeness of the skin of a striped bass. Both books are in the main well illustrated, but if Mr. Rhead intended to represent a bass rising from the water in the picture entitled "The Best Time for Bass," he has sadly missed the likeness.

BOOKS OF THE WEEK.

HENRY HOLT AND COMPANY 29 W. 23d St. NEW YORK

RAHAB By Richard Burton

A three act verse drama of the fall of Jericho, with Rahab, the impetuous oriental beauty, for the central character. The author is well known for his "Literary Likings," "Forces in Fiction," etc. "It is in verse," says Hamilton W. Mabie, "that one gets the full flavor of his personality. There is an edge on his thought and a tang in his style. Honesty, veracity, and frankness pervade his work, and give it a marked ethical quality without making it didactic." (Just published, $1.25 net. By mail, $1.31.)

PROBLEMS OF BABYHOOD
By Rachel Kent Fitz, A.M., and George Wells Fitz, M.D.

A vigorous, readable discussion of the controllable features of child development toward building a constitution and forming a character, intended to give frank and practical guidance to all who are confronted with the problem of parenthood. There is nothing technically medical in the book, which is embellished with some twenty drawings by Edward A. Bell, the well-known artist of child life. (Published this week, $1.25 net, by mail, $1.31.)

NATURE AND HEALTH By Edward Curtis, M.D.

A straightforward, terse book by this well-known New York physician on breathing, eating, drugging for delectation, seeing, hearing, clothing, bathing, disinfecting, exercising the body, exercising the mind, sleeping and waking, working and playing, living and dying, etc. (313 pp., $1.25 net. By mail, $1.37.)

"Entertaining as well as valuable . . . regarding the way to be healthy, wealthy and wise. . . . His ideas are distinctly of the common sense order. . . A brisk and amusing manner . . . much more readable than the ordinary screed upon hygiene."—*Providence Journal.*

"Among all the health advice we are getting . . . it is a relief to get a good, sound, sensible talk from this pleasant and wise old doctor, with his genuine rank in his profession. . . . Pleasant reading too, never dull and often amusing. . . . Lacks nothing of professional knowledge."—*Hartford Courant.*

IMMIGRATION: and Its Effects Upon the United States By Prescott F. Hall

Secretary of the Immigration Restriction League.

In the important new series, "American Public Problems," edited by Ralph Curtis Ringwait of the New York Bar. (393 pp., $1.50 net. By mail, $1.65.)

"A fascinating subject as treated by Mr. Hall; . . . he writes with conviction, but not with prejudice or passion. Perhaps nowhere else can be found equally full and conveniently arranged statistics, and as good an epitome of legislation."—*N. Y. Times Review.*

"Will take its place . . . as the standard authority."—*Baltimore News.*

*** The next volume in this series will be Geo. H. Haynes' "Election of Senators." (March.)

HEREDITY IN ROYALTY
By Frederick Adams Woods, M.D.

A statistical study in history and psychology of the mental, moral, and physical qualities of the fifteen leading royal families of Europe; $3.00 net, by mail $3.15.

"A book for which I venture to predict a cosmopolitan reputation, calculated to shed new lustre on the growing credit of American research."—*Brooklyn Eagle.*

"Not only gives some remarkable conclusions about the effect on the individual of his ancestors, but places in a new light nearly every crowned head in Europe. . . . Dr. Woods has bared the truth with unsparing hand."—*Chicago Evening Post.*

THE COMING OF LOVE
Rhona Boswell's Story and Other Poems
Seventh and Enlarged Edition by
THEODORE WATTS-DUNTON
12mo. Photogravure Frontispiece. $2.00 net. Post. 10c.

CHAMPAGNE STANDARD
Essays on the Salient Features of American and English Social Life.
"A merry critic."—*N. Y. Tribune.*
12mo, $1.50 net. Post. 12c.

ANTHONY TROLLOPE
Handy Pocket Edition.
24mo, 6x3¾ in. upon thin opaque paper. Cloth 75c. net, leather $1.00 net. Post. 6c. extra.

JOHN LANE COMPANY
The Bodley Head, N. Y.

THE ACORN PRESS
The Swarthmore College Press
Swarthmore, Pa.
By WILBUR MORRIS STINE

THE WRECK OF THE MYRTLE, and Other Verses. A collection of Ballads, Odes and Lyrics. Printed in Caslon types on Mittineague paper. 12mo, 128 pages, title-page and initials in color; cloth, with side and back stamps in gold; price, $1.25 postpaid.

THE PALACE OF VISION. A lyrical poem of sustained power and beauty. 160 pages; bound uniformly with the above book; price, $1.50, postpaid.

ARIEL, and Other Writings in Verse and Prose. The themes of these three tales are beauty, love and sorrow. They have the elevation and sure sense of beauty of Maurice de Guérin's prose poems. Printed with Caxton borders on Mittineague paper and handsomely bound in boards. 82 pages, small 12mo; price, 75 cents, postpaid.

In press.

NATURA IMPASSIONATA, a continued poem in blank verse.

These books are refined and elegant specimens of book-making; and are important contributions to our best literature. They are supplied to the Trade; or copies will cheerfully be sent on approval.

JUST PUBLISHED

SOME DOGMAS OF RELIGION
By JOHN ELLIS McTAGGART, Litt.D., Fellow and Lecturer of Trinity College, Cambridge. 8vo. Pp. xx-300. $3.00 net.

LONGMANS, GREEN, & CO., New York

McCLURE, PHILLIPS AND COMPANY ANNOUNCE

A NEW BOOK BY THE NEW ENGLISH ESSAYIST

G. Lowes Dickinson

entitled

THE MEANING OF GOOD

A DIALOGUE

IN this fascinating book, which takes the form of the Platonic dialogue, yet which preserves all the delightful informality of a familiar conversation among men of our own day, Mr. Dickinson finds fullest scope for his powers, both as a perfect prosateur and as a subtle dialectician. As to his style, the *Atheneum* said in a recent review that he is "one of the few living Englishmen who can really write prose . . . prose, limpid, natural, musical." Perhaps he is the *only* living Englishman who, possessing such a marvelous instrument, uses it to such high ends as Mr. Dickinson invariably has in view in his books. Here the end is that highest of all ends, the determination of what is fundamental in that idea of good which underlies the theory and practice of conduct, and is the mainstay of our hope for the future. Cloth, net $1.20; postage 9 cents extra.

BY THE SAME AUTHOR

THE GREEK VIEW OF LIFE

"Deserves the thanks of all readers who believe in the desirability of an historical basis for the pursuit of the things that are more excellent. . . . Ought to stimulate a real interest in a period that invariably fascinates our eyes." *The Dial.* "Admirably proportioned . . . itself illustrates that Hellenic balance and moderation which is its theme." *The Nation.*

Cloth, net $1.00; postage 8 cents extra.

A MODERN SYMPOSIUM

"Ought to be welcome to all lovers of prose and to all students of modern civilization . . . impossible to do justice to the security and ease, the lightness and penetration combined. . . . The book is as charming as it is suggestive." *Athenaeum.*

Cloth, net $1.00; postage 8 cents extra.

LETTERS FROM A CHINESE OFFICIAL

A little book that has made a great stir among thinkers on both sides of the water. It presents an estimate of the Anglo-Saxon from the point of view of a Chinaman, and is calculated to make the American reader wonder whether we have really reached the high social and political organization that we pride ourselves upon having attained. Paper board, net 50c.; postage 5 cents extra.

RELIGION: A Criticism and a Forecast

"The most pregnant and provocative of recent writers on this and similar subjects." Gilbert K. Chesterton in "Heretics." Paper boards. Net, 50 cents; postage 5 cents extra.

OTHER NEW SPRING BOOKS

The Life of a Star — **CLARA MORRIS**

A new volume of stage reminiscences by America's première emotional actress and author of "Life on the Stage." Cloth. Frontispiece. Net, $1.50; postage 13 cents extra.

The Struggle for Self-Government — **LINCOLN STEFFENS**

Being an attempt to trace American political corruption in six States of the United States. With a dedication to the Czar. Cloth. Net $1.20; postage 12 cents extra.

Wayside Talks — **CHARLES WAGNER**

Pastor Wagner not only finds sermons in stones, but in everything, and all the commonest sights and experiences of the way seem to point some simple lesson of life. Cloth. Net $1.00; postage 8 cents extra.

The Far Country — **FLORENCE WILKINSON**

A new book of poems by the brilliant author of "Kings and Queens." This book shows the wide sweep of her emotions and an unusual breadth of knowledge. Cloth. Net $1.00; postage 10 cents.

McCLURE, PHILLIPS & CO., 44 East 23d Street, New York

The Nation.

NEW YORK, THURSDAY, APRIL 5, 1900.

The Week.

All students of legislation have agreed in denouncing the Congressional practice of passing general legislation as part of the appropriation bills. This year, at the hands of a group of embattled members, the House of Representatives got, as the phrase is, "just what was coming to it." Out of a difficulty of its own creation it extricates itself by an action which, however "practical," is without justification in logic, law, or precedent. In the face of the absolutely definite rule against expenditures not authorized by existing law, the Appropriations Committee has followed its own sweet will so far that the Legislative, Executive, and Judicial bill has been "riddled" by perfectly valid points of order, and can be saved only by a special rule to the effect that it shall be passed whether legal or illegal. The point of order in Congress has long been regarded simply as a club. The Speaker does not enforce the rule against new legislation or provisions not germane unless somebody brings the case to his attention. Thus many of the most necessary bills, as in the present instance, come upon the floor in a shockingly vulnerable state. As for the extraordinary expedient adopted to save the measure, we hope the incident will merely be a salutary warning to the House, and not the beginning of a line of precedent that will still further tighten the grip of the Speaker and the Rules Committee upon the organization.

Never, certainly, was there a bill which appealed to more sorts or conditions of people than that reported from the Ways and Means Committee providing for free alcohol. The farmer and the manufacturer stand side by side in its favor. The former expects to gain a new market for odds and ends of grain, potatoes, and fruit, the latter to get greatly cheapened a material important to almost every line of industry. The Trust-buster—for the Standard Oil Company is reported as strenuously opposed to free alcohol—makes common cause with the automobile-owning magnate. Even the temperance organizations, it appears, favor the bibulous-sounding bill on the psychological ground that the special kind of alcohol the production of which is to be encouraged will be poisonous, and that its general use and familiarity will cause the coming generation unconsciously to regard all alcohol as a poison, and not a beverage. The bill thus has plenty of friends. Whether they are the kind that can make an impression on a Congress, especially a Senate, which gets itself into an artificial hurry in the years of the long session, is another question. Legislation that would cheapen anything would be regarded by some as a bad precedent.

Every one interested in the preservation of Niagara Falls should second President Roosevelt's recommendation that there be enacted into law the suggestions of the American members of the International Waterways Commission. If the Falls are to be saved, there is no time to lose. The Commission was composed on both sides of able and far-sighted men, who are strongly of the opinion that any further diversion of water will bring ruin with it. There was substantial agreement on the facts by both Canadians and Americans, and the Canadian Government, it is announced, is ready to act. According to its Minister of Public Works, the right to export power will henceforth be granted only subject to revocation at short notice, while the water-power companies will be subject to such rules and regulations as the Government sees fit to impose. The preservation of the scenic beauty of the Falls will henceforth be the special care of the Government. The United States must not lag behind. Congress ought to adopt the suggestion of the Commission, which the President, with his well-known love of nature, is so prompt to reinforce. The destruction of Niagara Falls for money would forever stamp this country abroad as a nation dead to anything but what touches the pocket.

President George F. Baer was quite right in telling President John Mitchell that the order to the anthracite miners to quit work on Monday, pending an agreement, was "most extraordinary." The operators had expressed their entire readiness to meet their employees and discuss the points of difference. The postponement of such a conference till after the first of April had been in deference to President Mitchell's own desire. Under the circumstances the calling out of the miners was a gratuitous exhibition of bad manners. The act, however, relates to etiquette rather than principle; and the operators are well advised in proceeding with the conference as if nothing unpleasant had happened. Both sides are in duty bound to take up the negotiations in a conciliatory mood. The United Mine Workers have apparently begun to realize that they cannot have everything they ask for. At first they proposed to tie up every bituminous mine until every bituminous operator had yielded—a relentless and wholly unjustifiable sympathetic strike. John Mitchell, however, now urges them to work for any operator with whom they can come to terms. Unless his advice is followed in this respect, the mine workers can succeed in nothing but the alienation of public sympathy.

The "Dawkins Bill," lately vetoed by Gov. Warfield of Maryland, is a fine example of labor legislation rampant. What organized labor demanded, and what but for Gov. Warfield the Legislature would have granted, was this: Baltimore is to spend something like $10,000,000 in public improvements, including a sewer system; the work is to be done, at the direction of competent engineers, as quickly as possible under the stimulus of the "new and better Baltimore" movement; but the labor leaders of that city conceived it to be a fine opportunity to show their hand, and Mr. Dawkins introduced a bill into the Legislature providing that only registered voters of Maryland should be employed on public work in Baltimore. As first drawn, the bill included architects, engineers, contractors. Later, it was amended, as a great concession, to except "technical employees." In both House and Senate this extraordinary proposition to create a labor monopoly was passed by large majorities, the labor lobbyists threatening political vengeance in the event of an adverse vote. But, to the credit of the Governor, he disposed of the bill in so effective a veto message that upon its resubmission to the Legislature it won only the slightest showing of support.

Judge Greenbaum's reputation as a careful and firm magistrate will be heightened by his action in making permanent the injunction against violence by the striking printers. The evidence was overwhelming that the typographical union, or its agents, had resorted to assaults as well as threats, in its efforts to deter free printers from accepting the work offered them. At the hearing, this was not denied. Nor could Judge Greenbaum find that the union had ever protested against the brutal outrages committed in its behalf, or done anything to punish the guilty. It appears that the union has no "rules" covering such cases. It is quite right, therefore, and highly necessary that the courts should enjoin organized labor from acts of intimidation and violence. In Washington, also, the Typothetæ have secured a similar ruling from a judge there. He took occasion to lay

down the sound opinion that lawless acts are especially criminal when directed against the liberty of a man to take what work and wages he may please.

The Republican situation in this city is rapidly going from bad to worse. The wave of reform which put Herbert Parsons in the county chairmanship and led to the selection of Mr. Wadsworth as Speaker, seems to have spent its force, and decent Republicans are once more confronted with the fact that Odell dominates the situation. Through all the righteous attacks upon him he has held on with brazen effrontery to the State Chairmanship, and on Thursday he came to town and calmly annexed the City Committee. Twenty-two of the thirty-six district leaders joined him at the Fifth Avenue Hotel, and mapped out a Senate and Assembly reapportionment act in accordance with his desires. Mr. Parsons was deliberately ignored. Halpin, Van Cott, Alexander, and all the rest of the gang were there, and L. E. Quigg, too. It was not so very long ago that Odell, in his fine zeal to reform the city's politics, declined to see Quigg at any time or place; yea, rumor had it that he would not even hold telephonic communication with him. Bidwell, Quigg, Frank Platt, Dunn, and others were to be driven out of public life for the good of the party. Evidently, these rumors were base fabrications. Mr. Odell sees that the way to reform is to cherish the professional politicians and spurn the reformers. Mr. Parsons had better look out; a silk-stocking of his kind ought to get ready to resign. Odell is in the saddle to stay, and respectable Republicans had better submit—Choate, Root, Higgins, Roosevelt, and all the rest.

We never did think that Mr. Jerome could long be content with his strangely chosen rôle of William the Silent. So it was no great surprise to find him passing, on Friday morning, from his stern "nothing to say" to four columns of carefully prepared explanation. This, at least, is the man we knew—the Jerome of extraordinarily developed sensitiveness to popular feeling, the frank and talkative official, the "good advertiser." Better late than never is what he now says about his own campaign fund. None of it, he tells us, came from corporations; certain proffered contributions were refused, because Mr. Jerome looked the gift-horse in the mouth. So far excellent. The only wonder is that Mr. Jerome did not say as much long ago. His assumption that he was insulted by questions on that point was wholly gratuitous, and his temporary pose as the strong man contemptuous of public opinion was not at all in character. Now that he has abandoned all that, we expect him to go on and make that full statement about his campaign receipts and expenditures which their important bearing on the whole question of electoral reform renders pertinent and urgent.

Mr. Jerome's apologia as respects his handling of the insurance cases does not do much, unhappily, to explain how it was that, having advised the Grand Jury to ask instructions from Judge O'Sullivan, he became angry when those instructions did not square with his own expressed views. He does not make it clear why, after having, as he says, convinced himself in his conscience and on his oath of office that Mr. Perkins was not guilty of grand larceny, he had him arrested on that charge. We hear but one opinion about this unfortunate vacillation of Mr. Jerome's, which may easily prejudice the legal determination of the criminality of the insurance gifts to political corruptionists. But the District Attorney now practically admits his blunder. In all that remains of the insurance cases, he is evidently preparing to act with greater vigor and directness. He has asked for and obtained a special Grand Jury for May, to devote itself exclusively to the investigation of insurance offences. It will be a chastened Jerome who devotes himself to that critical inquiry, and we look for no mishandling of it.

The important amendments of the insurance bills introduced on Thursday for the Armstrong committee enlarge the permissible ratio of "contingency reserves" to outstanding insurance; extend the maximum ratio of expenditure on obtaining new business, and allow the companies to retain such collateral trust bonds as they now possess, though further investment in those securities is still prohibited. The change in the "contingency reserve" section is a concession to the argument presented by President Ide at the recent hearing. He contended with much force that absolute restriction of this fund amounted to "putting a limit on conservatives." With the proposed limitation applied in 1903, shrinkage of Stock Exchange values would have placed one of the three largest companies in a position of technical insolvency. These objections the committee now meets by raising substantially the maximum limitation on such reserves, and by permitting the companies, with the assent of the Insurance Superintendent, to go beyond even the new limitation in case of a general fall of investment values. To the original bill for limiting first expenses, three objections of weight were made at the hearing—one, that the limitation would not allow a living profit to the agent; another, Mr. McClintock's statement that so rigid an artificial limitation as was proposed "would cramp the company and increase the cost of its business"; a third, that the committee's own estimates of resonable first cost had not included due allowance for medical and other routine outlay. To these arguments the committee defers, enlarging moderately the agents' commission and renewal rights, and allowing for other necessary first charges.

These amendments have to do with technical questions, and do not affect the original aim—namely, to put an absolute barrier in the way of extravagance in the race for the "biggest showing of insurance written." A different question arose in the collateral trust bond matter. Such investment of insurance funds was forbidden in the committee's bills, on the perfectly proper ground that bonds whose sole security is the stock deposited behind them, must be classed with the stocks as an investment, and should therefore be excluded as are the stocks themselves. It developed, at the hearing of March 9, that $107,000,000 of such bonds are already held by New York insurance companies. It was then contended that compulsory sale of that amount, even in a five-year term, would seriously upset values. This was a matter of opinion; the committee, however, has deemed it best to err, if at all, on the side of conservatism in its changes, and it allows the companies to keep such collateral trust bonds as they already hold. If this is a concession in principle, it is nevertheless probable that no harm will result from it; for further purchase remains prohibited, and holdings of actual shares in other enterprises, to which the practical objection was more serious, must still be sold within the five-year period.

To all budding logicians we commend Gov. Higgins's latest utterance on the subject of investigating the Banking Department:

> "I believe that the Banking Department should be investigated, and the responsibility for action now rests with the Assembly. There is a bill before them. The Assembly passed a resolution, which the Senate did not see fit to approve. The Senate has sent to them a bill which I do not think any one can honestly question."

In other words, the Assembly passes a bill for a thorough and genuine investigation—the kind of thing which Gov. Higgins and his friend, Superintendent Kilburn, do not want. The Senate rejects the Assembly bill and proposes a limited, whitewashing investigation. No one opposes the Senate bill except those leaders of a forlorn hope who wish to see the Banking Department administered without fear or favor; and these idealists in politics do not count. If they refuse to assent to the plan of sprinkling rose-water over Mr. Kilburn,

they are, in the view of Gov. Higgins, responsible for the failure to investigate. Nothing could be plainer or more convincing.

The Assembly passed on Thursday by a large majority a resolution changing the requirement for the passage of Constitutional amendments. It was doubtless greatly influenced by the almost ridiculously small vote on the amendments last submitted and adopted. When only about 8 per cent. of those participating in an election take the trouble to vote upon such propositions at all, the process of submitting them seems farcical to many. It has been the general experience with the referendum that the affirmative sentiment on a proposition has a far better chance of casting its vote than that on the other side. Hence, it is urged, the vote does not fairly represent popular sentiment, and all sorts of proposals can be carried by the vote of a small minority of the population. On the other hand, the system provided by the resolution which on Monday passed the New York Assembly, making a majority of the total vote at the election necessary to adopt a Constitutional amendment, would render it almost impossible to carry any proposal submitted. This may be, in some ways, a good thing, but its consequences should be carefully considered. For instance, in 1903, when the canal question was submitted and carried, the affirmative vote was 673,010. The vote in the State election for judge of the Court of Appeals that year was 1,412,788. So, had the canal improvement involved a Constitutional amendment, it would have been defeated under the proposed new rule.

Whatever the final count may show, in the contest between Governor Davis and Senator Berry of Arkansas, the people of that State have really succeeded in electing a Senator by popular vote. Heretofore the Senatorship has been an issue at the party primaries, but members of the Legislature have been bound only by the vote of their separate constituencies. This year, however, Governor Davis and Senator Berry agreed to abide by the result of the Democratic primary throughout the State, and the campaign has been as active as the Montague-Martin primary fight in Virginia last year. Davis has won on the face of the returns, and if he proves to be the Legislature's choice for Senator, it will be another triumph for the "stormy petrel" school of statesmanship. In his five campaigns in Arkansas—one for Attorney-General, three for Governor, and the present one for the Senatorial nomination, Davis has made 2,000 speeches, has had half a score of personal encounters, and has ridden roughshod over all kinds of opposition in his party. He is charged with the responsibility for the reduction of a normal Democratic majority of 70,000 to less than 20,000. As a "cornfield" statesman, Davis is proud of his sharp angles, and has even made political capital out of his rebuke by President Roosevelt.

Milwaukee made the first trial the other day of the primary law passed after such a long fight. A great many citizens, according to the report, could not seem to get through their heads the distinction between the primary and the regular election. The newspapers were full of warnings against ticket-splitting on the analogy of the November election, for Republicans, seeing the name of a high-class aspirant for the Democratic nomination, were prone to put his name on their own ticket. This difficulty will doubtless disappear when the law becomes more familiar. But, for one thing, it shows strikingly how little the people knew about the process of making nominations under the old system. That is, they failed to understand the primary because the old caucuses, which theoretically corresponded, were absolutely unfamiliar to the average citizen. For a first test of the new law, the Milwaukee primary vote of 43,000 seems to us encouragingly large. While the figure is some 13,000 short of the vote in the last Presidential election, it is estimated by the *Evening Wisconsin* to be at least 16,000 greater than the attendance at the 1904 caucuses.

In fifteen inches of closely printed amendments to the football rules, we cannot find a line that is likely to improve the game. The penalties for various kinds of foul play are greatly increased, but umpires practically never enforced the old penalties. Reducing the defensive line from seven to six largely offsets the ten-yard rule. The requirement that the two rushlines must stand separated by the longest diameter of the ball is practically incapable of enforcement. An additional blind umpire is provided, but no rule is drawn by which he shall be forced to penalize foul play when he sees it. Minor prohibitions, such as that of hurdling, of kicking the ball on the ground after a kick, actually makes against a more open game. We believe there were just two ways of handling the football situation. An experimental trial of the ten-yard rule without further modification might have resulted in restoring the open game of the eighties. Failing that, there was nothing to do but to reform the game altogether, by reverting to Rugby of the English or New Zealand type. As things stand, complicated rules become more complicated than ever, and old measures of reform that have proved ineffectual are merely reduplicated.

Ever since the Taff Vale decision established the financial responsiblity of unions for damage inflicted in their behalf, labor leaders in England have been seeking legislative immunity for union funds. The present Liberal Government would virtually grant this immunity, by stipulating that unions shall be held in damages only for acts clearly authorized by their governing bodies. As a matter of fact, it is practically impossible to prove that acts of violence in a labor war are thus authorized. Common sense suggests that a certain responsibility attaches to the body that profits by the lawless deed. However, the labor members were not thus satisfied. They require not merely practical immunity for union funds, but an explicit and comprehensive release from any financial responsibility whatever. This, as the Attorney-General remarked, would confer an exceptional exemption upon the proletariat, and cries from the Laborite benches showed that precisely this was demanded. With this claim of superiority to the organic law we are only too familiar in America. Only the other day, Mr. Roosevelt had to administer a sharp reminder that one class of labor cannot set itself up as privileged beyond the rest. In England the unions have long been conducted along saner and more business-like lines. The objection of the labor members at Westminster to a measure giving more than they can reasonably demand, indicates a change of temper, and hints of a future closer alliance between British unionism of the opportunist type and the more advanced forms of Socialism.

To have changed front, or retreated outright, twice in one week, is what the new English Government may be charged truthfully with having done. Perhaps the very size of its majority gives it, with Falstaff, an alacrity in sinking. At any rate, the Colonial Office lost little time in capitulating to Natal. Of course, Lord Elgin rode off on the excuse that, if the government of that colony had kept him fully informed about the proposed execution of natives, he would not have intervened at all, but that is palpably a lame horse. The obvious inference is that the Colonial Secretary acted hastily, and then reversed himself still more hastily. Even more significant as a sign of divided counsels and of vacillation is the yielding of the Premier to the Labor party in the matter of giving trades unions what is practically immunity from the law. There may be good arguments for this course, but for Sir Henry Campbell-Bannerman to turn round after the stand made by the Attorney-General and incontinently go the full organized-labor length, certainly looks like poor management and unstable convictions.

PERILS OF "CORNFIELD" LAW.

Senator Tillman has invented a new phrase to describe the attitude of men like him who make light of legal and Constitutional difficulties in legislation. He is, he says, only "a cornfield lawyer." As such, however, he gayly sallies forth to rail at the arguments of real lawyers like Senators Knox and Spooner on the Republican side, and of Messrs. Bailey and Culberson on his own. His pose is simply a variant of the old one of pitting rough-and-ready horse sense against legal expertness. The President is reported to be much taken with this method of Tillman, who continually refers to himself as merely a nurse in charge of Mr. Roosevelt's baby. There has been, the dispatches say, much hearty laughter and applause in the White House for "cornfield" law.

It has, however, its drawbacks and perils. Some of them were exposed by Senator Knox in his weighty speech on March 28. The gist of it was a plea for the courts as against the cornfield. The ex-Attorney-General contended that care and skill are necessary in drafting intricate legislation, with a knowledge of the legal effect of the language used, and some faint effort to shape your important bill so that it will not be judicially found null and void. Mr. Knox made an unimpassioned legal argument. He did not attempt to answer Tillman with homely or proverbial phrases. Had he done so, he might have reminded the South Carolina Senator, who is so willing to "chance" it with the Constitution, that it is better to be sure than to be sorry.

The Administration has just emerged from an experience with cornfield law which ought to make it a little more chary of that article. It was in the finest manner of a cornfield jurist that the President set about the prosecution of the Beef Trust. He cheerfully mixed up friendly inquiries with criminal indictments—the Bureau of Corporations with the Department of Justice. To a man with a hoe in a cornfield, this would have seemed an eminently fitting procedure. First get your suspected magnates confidentially to admit their evil deeds, then prosecute them. But the courts have had a word to say about that. There is such a thing, they held, as recognized criminal process. The Government had ignored it. It had made the defendants immune without intending to do so. They could not be first asked to make privileged communications and then tried on the strength of them. Thus one little decision by a judge upset that entire cornfield prosecution.

The cornfield lawyer, we see, is in danger of taking his own impulses, good and unselfish as he is sure they are, for sound legal maxims and trusty guides to action. They have a way, however, of proving not to be. The President strongly urged Congress, for example, to undertake the Federal regulation of life insurance. He perceived that the subject was one of national interest; hence it was clear to him that it was one under national jurisdiction. That, be it said with all respect, was the cornfield view. The legal and Constitutional view—and, incidentally, the conclusive view—has just been enunciated by the Judiciary Committee of the House. Its members did not settle the question with a hoe or cultivator, but studied law and precedent and the decisions of the Supreme Court, and came unanimously to the conclusion that the course recommended by Mr. Roosevelt was plainly unconstitutional.

What is the present status of the argument on the railway-rate question? Such, we think, as to call imperatively for the amendment of the Hepburn bill. The best lawyers of the Senate have been heard from—Foraker, Rayner, Bailey, Culberson, Spooner, and finally Knox. There is practically a consensus of opinion among them that the Hepburn bill, as it now stands, is unconstitutional, and would surely be so held by the Supreme Court. Most of the Senators named have offered amendments intended to cure the legal vices of the bill. These relate chiefly to the want of due provision for a judicial review of the findings of the Interstate Commerce Commission. On this point Senator Knox spoke with much emphasis and confessedly great authority. He has himself introduced an amendment which would remove the Constitutional objection while safeguarding the rights of both shippers and carriers, and providing for a speedy hearing and determination of all cases. Why is there any hesitation in taking the advice of so sound a lawyer, so well-approved a prosecutor of oppressive combinations? Apparently, because the word has gone out from cornfield and cottonpatch that they must have the Hepburn bill, the whole bill, and nothing but the bill. Pass it unamended, is the cry of the men who, like Senator Dolliver, profess to be directly inspired by the President. But this foolish attitude is becoming daily more discredited. The weight of argument is too heavily against the cornfield. And there seems now to be little doubt that an amendment guaranteeing judicial review will be adopted by the Senate, and that the President will accept it with the assurance that it is the thing above all others which he from the first ardently desired.

OUR CONSULAR DISGRACE.

The confidential report in regard to our former consuls in the East, published on Thursday, must everywhere evoke a sense of shame. This is not the testimony of a sensational writer, or of a politician in search of notoriety, but a sober, official statement filed with the Secretary of State by an Assistant Secretary of State detailed to make a special investigation. From Mr. Peirce's report it is plain that the most important consular representatives of the United States in the Far East have been either common drunkards or grafters—men who accepted office merely to fill their own pockets, legally or illegally. The official report recalls the statement of the American admiral who, returning from a long cruise in European waters, declared that half our consuls in the Mediterranean had been in jail, and that the other half ought to be there. Conditions in the East seem to have been fully as bad, for if ever men ought to go to jail, they are official representatives of this Government whose misconduct reflects upon the entire country.

Americans not in the habit of travelling abroad have often wondered why it is that the United States has stood so low in foreign estimation. They even rejoiced that the favorable outcome of the Spanish war seemed to assure this country a better position. But if any one factor has helped to give foreigners a poor opinion of the United States, it is our wretched consular representation. Of this the proof is unending, but rarely has it been put before the public so concretely and authoritatively as in Mr. Peirce's report. The more one studies it, the more the wonder grows. If there is anything that the Americans are proud of, it is their reputation as business men. Yet, with all their eagerness to obtain foreign trade, to show the back-number German, the frog-eating Frenchman, or the antediluvian Hungarian a trick or two along trade lines, they have supinely sat by and let the politicians run the foreign business of the country with men of low calibre such as no reputable mercantile house in this country would think of employing.

Because the men most severely criticised by Mr. Peirce are now out of the consular service, or because a reform bill is on its way through Congress, it must not be thought that nothing remains to be done. While there has been much progress, there are many consuls who do not reflect credit on the country. There was the one at Coburg, for instance, who turned the consulate into a disreputable resort, and made every exporter contribute a "sample" for use in furnishing the consulate or to be disposed of for the benefit of the consul's pocket. Careful investigation would have shown the man's unfitness for office before his appointment. The State Department removed him for the "good of the service," but Mr. Roosevelt, in the eyes of the Coburgers, added insult to injury by appointing as his successor that Saylor who obtained unenviable notoriety by

trying to defraud the State of Pennsylvania when serving in its Legislature, and who was officially denounced by the Governor. There are plenty of other cases on record in which the President or the State Department connived at the appointment of unfit men. Mr. Peirce found that no less than eighty-two charges were on file against Consul-General Goodnow of Shanghai. Yet Mr. McKinley knew precisely what kind of man Goodnow was when he selected him. Delegations expressing the best moral sentiment of Goodnow's home town went to Washington and protested against his appointment, on the ground that his character was detestable.

Mr. McKinley, indeed, was responsible for all the men who figure most prominently in Mr. Peirce's *chronique scandaleuse*. McWade at Canton, who was "disgracefully drunk" on one public occasion, and, while "boisterously drunk" on another, swore and wanted to fight because some one said "hurrah for Ireland," and who was believed throughout China to be notoriously corrupt, bore McKinley's commission. So did Oscar F. Williams, who was appointed to Singapore after a blemished record elsewhere. Mr. Greener of Vladivostok, "whose habits are said to be extremely bad," and Levi L. Wilcox at Hankow, who "cannot be said to be a useful consular officer," are, we believe, also of the McKinley régime. Their careers and the dishonor they have brought on the country ought to facilitate the passage of the Consular Reform bill, now in conference. Much of the "starch" has, unfortunately, been taken out of this measure; as it now stands, it is merely a changeling substitute for Mr. Root's hopeful child of the early session. Yet, such as it is, it is a great step forward, and it is bound to raise the tone of the service. The blight of politics will be largely lifted. Neither permanency of tenure nor regular promotion is guaranteed, but these may be established by special acts as time goes on.

Most of the civil-service reform features have been cut out by the Congressional spoilsmen. Much can be done by the President, however, to offset this. He can prescribe regulations precisely as he and his predecessors have done for the civil service, and he can absolutely decline to appoint men who, although able to pass examinations, are still not men of the highest character. Consuls and consul-generals are still "demanded" by Senators and Representatives, but President Roosevelt ought to be able to decide for himself. Secretary Root is certain to continue his agitation for a complete reorganization of the service, and a readiness on the part of the Administration to do its full duty would complete the reform it has so well begun.

SKY-SCRAPING TARIFF TAXES.

The Republican delegation from Massachusetts in the House of Representatives, having failed by ordinary methods of petition and argument to obtain the free hides and other tariff concessions it needs, has now announced its purpose to make itself a centre for all the revision sentiment in Congress. Without being over-sanguine, the members hope to attract to themselves, a few at a time, other disaffected Republicans, a handful who want free lumber here, a group who want the steel schedule revised there, and so on, until, possibly in some far-off happier day, the scale may turn and the revisionists compel some sort of action. It is a more courageous thing to do than the public unfamiliar with the ways of Washington understands, and, even if it does not yield results in the statute-book, it gives new and public backing to an important cause.

We noticed the other day the humorous petition of a small group of Michigan manufacturers for the imposition of a 125 per cent. duty on wooden shoes, in order that this promising, though hitherto unheard-of, American industry might be able to hold its own with foreign competitors. So far as we have yet seen, no one has regarded this request as anything but a joke. The Protective Tariff League is thus far silent, and Mr. McCleary, the higher-duty advocate, has not said a word. Apparently, such of our citizens as still wear wooden shoes are welcome to buy them in whatsoever country turns them out most cheaply. Yet the band of Massachusetts revisionists can, if it chooses, point to a large number of duties higher than the wooden-shoe makers' request, and to some quite as preposterous.

To be specific, there are twenty-one different commodities on which there were collected in the last fiscal year duties equivalent to more than 125 per cent. ad valorem. There were fifty-seven instances of duties equivalent to over 100 per cent. The facts in these cases are obtainable by any one from the reports of the Bureau of Statistics in the Department of Commerce and Labor. Mr. John Sharp Williams tabulated the particular data for use in a recent speech. Of course, there is no clause in the Dingley law which mentions any such rates. These are all specific duties or specific duties combined with moderate ad-valorem rates; but the rate actually charged may be figured from the simple ratio between stated values and duties paid. Moreover, tobacco and spirituous liquors, where a high tariff tax is laid to offset the revenue tax, are not included.

There have been extreme instances, as in the case where mica, under the turn of the law, was made to pay 4,000 per cent. on its commercial value. But these are interesting chiefly as curiosities, and the highest duty regularly exacted is, according to this table, a bare 251.73 per cent. This was collected on vanillin, the active principle of vanilla, of which $423 worth in 1905 paid $1,064.80 duty. Vanillin, it is true, is not a necessity of life, and perhaps even a prohibitive tariff would not be generally felt. But shoddy, which affects the poor only, paid the equivalent of 250 per cent. Silk handkerchiefs of a certain grade paid 221.27 per cent., and dress facings or skirt bindings, not bleached, dyed, or printed, paid 201 per cent.

The articles on which duties between 200 and 125 per cent. are collected may be briefly given here, with the understanding that in most instances the rate stated applies only to a particular grade of the product, and in some cases to unimportant or unusual ones.

Per cent.	Articles.
185.76	Bay rum.
165.11	Dress goods.
159.32	Blankets.
157.52	Dress goods.
151.93	Cloths, woollen or worsted.
151.07	Plate glass.
143.72	"Other manufactures of wool."
141.02	Plushes and other pile fabrics.
140.29	Plate glass.
140.05	Plushes and other pile fabrics.
139.7	Boracic acid.
138.06	Yarns.
136.44	Plate glass.
130.70	Flannels for underwear.
129.80	Mineral waters.
125.70	"Other manufactures of wool."
125.44	Blankets.

We have stopped this list advisedly at the rate of duty asked for in the ridiculous wooden-shoe petition. Is there a single one of the schedules above mentioned which could be defended on its merits on the floor of Congress, or anywhere else? Is there one of those duties which a nation not made up of lunatics would even think of levying if it had the task of making a tariff *de novo*? And if it is preposterous to establish a new 125 per cent. duty for the benefit of a few struggling Western wooden-shoe factories, is it not just as preposterous to retain similar duties for the benefit of other interests which have grown great on tariff favors? We have cited merely the extremes, the cases about which most men, whatever their political opinions, would agree without hesitation. But to grant that the 251 per cent. duty on vanillin differs only in degree of extortion from a dozen of the schedules on the commonest and most necessary articles of life is a logical step from which Republicans draw back. The very men who laughed at Mr. Williams's "banana speech" will not extend and apply his reasoning.

DIFFICULTIES OF RETRENCHMENT.

The case of the English Liberals just now illustrates a tendency of government which is more and more coming to prevail all over the world. We mean

the fact that public expenses are steadily rising, and that it is steadily more difficult to cut them down. A distinct item in the Liberal election programme was retrenchment. The Tories were accused of having pushed the public outlay, not only above all precedent, but beyond all reason; and the people were asked to elect a Government that would economize. Well, the economies in prospect are beggarly; the new objects of expenditure already pressed upon Parliament make lavish demands. The army bill, into which the Liberals were going to thrust so deep-cutting a knife, they have been able to pare down by only $50,000. Meanwhile, projects urging new appropriations of many millions are insistently urged upon the Government. The Chancellor of the Exchequer reminded the House the other day of the promises with which his party had taken office, and then ran over the list of measures calling for great and fresh outlay advocated by Liberals within the seven days past, ending with the sarcastic: "Pretty well for one week."

Yet this same Chancellor of the Exchequer, Mr. Asquith, in addressing delegates from the Conference of Taxing Authorities, agreed that, in municipalities at least, it is impossible "to cut down or arrest your expenditure." The reason he gave was as follows:

> "We are constantly adopting a higher and, I may call it, a more exacting standard of municipal life. Sanitation, education, and a number of other interests of that kind, the due attention to which we all feel to be bound up with the real prosperity and welfare of the community —these are things which you cannot put upon one side or postpone without serious risk to the interests which our municipal bodies are intended to represent. Therefore it is of paramount importance that some additional reservoir should be found upon which, in justice and equality, drafts can be made to meet the ever-growing necessities of the community."

This is undoubtedly true. It is as true of American as of British cities. It is true of our State and national governments as well as our municipal. In all of them we believe that great retrenchment could be effected. The public business is extravagantly or wastefully done. Almost anywhere, a vigorous and trained administrator in public office could cut off sinecures and stop leaks. Yet his most unremitting efforts would not prevent the gradual rise in the scale of public expenditure. It mounts not alone absolutely, but relatively; and so far as we can see, is bound to do so for some time to come. Every extension of the functions of government is costly, yet the people are everywhere demanding that they be more and more extended. What they keep on demanding they are pretty certain to obtain, at the end of the chapter; and if they get a bigger tax bill along with it, they should not grumble —but they do.

This was Mr. Asquith's point, and it is the chief one to bear in mind in the whole business. Expenditure goes with taxes, and as the former mounts so do the latter. Indeed, from the statesman's standpoint, the increase in taxes is more directly significant than the increase in their outlay. He has to find the added revenue. This means either a screwing up of old taxes or the discovery of new ones. In either case the result, for the taxpayers, is the same. They are called upon to surrender a larger and larger part of their income to the State. This is really the practical aspect of the matter which it is primarily more important to understand than any question of theoretic Socialism. Hence there was point in the remark of the old professor of political economy to the eager young fellow who came asking what he should study in order to grapple with the questions of municipal and government ownership, socialistic experiments, and what not. The reply was: "Study taxation."

The duty of counting the cost thereof is too often overlooked in plans for enlarging and improving the activities of government. Yet it is vital to the whole question. Take the proposal that public schools should give the children of the poor at least one nourishing meal a day. Its latest eloquent advocate here distinctly dismisses the question of expense. Into that, he has not thought it worth while to go. He is sure that it "can be managed." Perhaps it can, but note what happens when the same proposal is brought up in Parliament and reduced to pounds, shillings, and pence. The Minister of Education, Mr. Birrell, had exact estimates of cost prepared, and showed that the total would be too great for the Imperial Exchequer to undertake at present. The step may yet be taken in England, as we presume it will be in American cities, but it certainly will make necessary new forms of taxation.

Taxes will surely become more burdensome as the functions of government are multiplied. That is a truth which ardent social reformers should not attempt to deny. They will have to pay more themselves; so will all their friends. The old professor was right. Fundamental to every new governmental experiment is the question where the money to carry it on is to be found. We are not now saying that such experiments ought not to be made, but they should be made with our eyes open to the fact that taxpayers will have to foot the bill.

THE MOROCCO SETTLEMENT.

Last Saturday, just a year after the Kaiser's sensational visit to Tangier, the Algeciras Conference arrived at the following agreement: The Sultanate is to be policed by troops under French and Spanish officers, who are jointly answerable to the Sultan and to the diplomatic corps at Fez. In the important havens of Tangier and Casablanca there will be both French and Spanish officers; Spain will have the exclusive officering of Tetuan on the Mediterranean and of Larache on the Atlantic, France that of the four Atlantic ports, Mogador, Saffi, Mazagan, and Rabat. This police agreement holds for five years. On the financial side, France gets a substantial plurality interest in the new Morocco bank, holding three out of fifteen shares, of which no other European nation controls more than one. Such, in brief, is the settlement of a highly delicate, and at times fairly ominous, dispute.

In the compromise, France gets practically all her concrete claims, but her pretensions to exclusive jurisdiction in Morocco are disallowed; Germany obtains full acceptance of her abstract championship of internationalism, but is denied all but the very smallest part in the actual administration of Morocco. One may fairly say that both the ideas of Germany and the policy of France have prevailed, with the important difference that France has renounced the monopolistic claims set up by Delcassé with the assent of Madrid and London, and has accepted a temporary but renewable trust as mandatory of the European Concert. Germany has made it plain that she must be consulted in Mediterranean matters, and has called a halt to limited agreements like that between France and England. On the other hand, the conference has shown that if the Powers admit the German principle of internationalism, they are disinclined to invite the practical aid of Germany in the Mediterranean. In fact, the most striking diplomatic result of the conference is the demonstration of the isolation of Berlin. The new friend, Russia, was as cold as the old ally, Italy, towards any plan that put Germany even indirectly in control of the police or the bank. Only Austria saved Germany from standing alone before united Europe.

Since Germany has gained all she contended for as a matter of principle, why does she appear to have suffered a rebuff? The reason must be found in the sadly mixed motives, the sudden shifts of ground, the wearisome delays that characterized all the actual negotiations of Germany before and during the Algeciras conference. Had the Kaiser made his altruistic intentions clear and unmistakable from the first, he might to-day claim an unclouded victory. Had he maintained his pose as the champion of the open door and the enemy of particularism as regards weak Powers, he would to-day be as unmistakably the hero of the play as poor M. Delcassé is, in retrospect, its villain. As a matter of fact, the position of Germany was from the first unhappily ambiguous. Professedly the tribune of Europe, Ger-

many fell under the unfortunate suspicion of taking up that policy of grab which France, by dismissing M. Delcassé and by consenting to the conference, had expressly disavowed.

Of course, anything like justice between nations is usually obtained in such tortuous ways. National motives are apt to be mixed. Yet it is clear that if the German Foreign Office had taken a passive attitude in the conference, any settlement whatever must have been hailed as a victory for German diplomacy, while no settlement was likely to have conceded more to France than she now gets. The honors are distinctly with M. Rouvier. His withdrawal of the extreme claims made by M. Delcassé, his frank, opportune, and moderate statement of the minimum programme of France, his patience under the ambiguous and obstructive policy of Germany, constitute an admirable example of straightforward, considerate, and enlightened diplomacy. Equally praiseworthy was the moderation of the French press—the better sort, we mean—throughout the controversy. Everywhere was shown a disposition to meet Germany, if possible, and to discountenance talk of war.

The general feeling that Germany has met with a check is exaggerated, perhaps, by a natural confusion between the diplomatic manners and the diplomatic aims of the Wilhelmstrasse. To do a disagreeable duty as disagreeably as possible is no royal road to popularity. It would be interesting, for example, to inquire how far the impression of German defeat is due merely to the bristling and masterful personality of Count Tattenbach. Such a temperament always gives the impression of intending more than it really intends. Yet it is fair to add that at no time has the German Government pushed the point of national prestige to perilous extremes. Retrospectively, the Kaiser and M. Delcassé must share a common regret that the conference was not called very promptly and conducted in a non-contentious spirit. M. Delcassé must see how little France had to fear from the appeal he combated so stubbornly, and the Kaiser must perceive how hopeless it always was to seek from Europe in council any admission of especial German prerogative in Morocco.

THE NEW MONT PELÉE.

FORT-DE-FRANCE, MARTINIQUE, March 11, 1906.

The better part of three years has elapsed since I last visited the great mountain whose name is still in the mouth of every inhabitant of this beautiful, even if desolate, isle of France. *Eh bien, le volcan?* It is the old inquiry which has now become almost sympathetic with the people, but which has lost none of its significance in consequence of the recent earthquake disturbances. On February 16 the capital city of the island saw thirty of its loosely constructed habitations marked out for repairs, heaps of débris stood in the place of former walls, and the affrighted people were camped in the *savane* which surrounds the noble statue of Josephine. Some two dozen or more earthquake tremors have been registered since that date, and nightfall still sees many of the less courageous departing for the *campagne*, where low wooden buildings, perched on breezy hilltops, place one, if not necessarily outside of the field of the seismic movements, at least beyond reach of the much-dreaded *raz de marée*. Naturally enough, Pelée is held largely responsible for the recent happenings, and the observations on the volcano that are at frequent intervals sent down from the observatory of Morne des Cadets, are eagerly scanned and studied. But these observations tell only that the mountain is "calm," or is "covered," or that it "disengages much vapor." Mont Pelée has, in fact, entered upon a period of repose, and not since June last has it given signs of a recrudescence of activity. It is true that its smoldering dome is still far from being a picture of quiet nature, but the luminous points have entirely disappeared, and one hears no more of that ominous rumbling and roaring which is so happily expressed by the French word *grondement*.

Pelée is to-day much less active than is Vesuvius, and it has again taken its place among the beautiful objects of nature. Vegetation is slowly but steadily creeping up its deeply rifted slopes, the desert sands have already largely disappeared beneath the new growth of tree-fern, grass, and moss; and even on the smouldering dome diminutive oases of green are being wrapped about the fuming fumeroles. It would be difficult to find a more enchanting view than that which overlooks this mountain from the Morne des Cadets. It is the Bay of Naples over again, both in mountain form and in color—lacking, of course, nearly everything that is indicative of man's activities, but exuberant in all that a bountiful tropical nature offers. The *grands bois* of Martinique, with their giant tree-ferns, bamboos, and broad-leaved cannas as the distinctive physiognomic vegetable types in a wilderness of melastomes, magnolias, cecropias, and figs still cover the rugged mountain slopes, and only here and there in the deep valleys have they yielded place to fields of cane or to planations of cacao and coffee. The forests are silent, perhaps more silent than they were before the cataclysm of Pelée, and only at rare intervals is the life within made known through the exquisite piping tones of the little bird that is here called the *siffleur de la montagne*.

Three years ago Pelée was a mountain of almost exactly the height, in its normal summit, of Vesuvius, but it was then capped by a giant obelisk of rock which carried its apex a full thousand feet higher. To-day this obelisk, except in jagged teeth that mark where it was implanted on top of the volcano, no longer exists, and, with its destruction, the geologist has noted the disappearance of one of the most remarkable features of the earth's surface. Vast blocks of rock, some of them hardly less large than the *cases* of the villagers who at one time looked up with awe to this stupendous monument of nature, lie scattered about in the wilderness of débris that helps to fill in the former crater-basin, and they read well the story of disruption and fall. I made the ascent of the volcano on the 27th of February, with the hope of being able to descend into the crater-basin and of studying these rock débris close at hand. Until now the Pelée tower had repelled direct scientific investigation, and the constitution of its rock-mass remained necessarily within the domain of hypothesis. To-day the fires of the mountain have been drawn, and approach is made possible.

I selected for my descent into the crater a position on the northwestern border, where the bounding-wall had been reduced to a height of perhaps not more than a hundred feet, and where the angle of slope hardly exceeded 65 or 70 degrees. A sharp wind swept over the knife-edge, which we were obliged to straddle, but with some caution we passed the line of first offence, and before long reached the crater-floor—the *rainure* of the French Scientific Commission. Here we were placed directly in face of the giant dome, which still carries at its summit the jagged remains of the former obelisk. The day, unfortunately, was not so favorable as one might have wished for. Clouds passed and repassed in seemingly endless masses, and only once did the dome disclose itself in its entirety. But that one occasion revealed a splendid spectacle—the giant mound of rock-débris, here and there scarred by lines or ridges of solid lava, rising to a height of about 500 feet, and from its sides puffing out noiseless streams of heated and sulphurous vapors. Carefully measuring the stability of the loose-lying débris, we slowly crawled up the steep slope of the dome; my associate, at whose *habitation* I had passed the fateful night of August 30, 1902, giving me the advantage of his personal guidance. He had attempted this same ascent a few weeks earlier. We reached a position on the dome which clearly overlooked the bounding-wall of the crater, and beyond which only bad counsel would have dictated further progress. This was the limit of our journey.

I had attained the object of my mission—the determination of the structure of the rock-mass which formed the great tower of the volcano. A vast andesitic block, as solid and compact as the more ancient masses which constitute the core of the island of Martinique, it gives evidence of having been heaved up from the deep interior in its present condition, firm and rigid—a monument of the Titanic force of the awakening volcano.

ANGELO HEILPRIN.

NAPOLEON, KING OF ELBA.

PARIS, March 14, 1906.

M. Paul Gruyer has just published a very fine volume, illustrated with engravings, on a subject which cannot fail to draw attention—'Napoleon, King of the Island of Elba.' We see on the first page a fine reproduction of the well-known picture by Paul Delaroche of Napoleon at Fontainebleau, before his departure for the Island of Elba. The Emperor is sitting in a chair, bareheaded, with his high boots still

on, looking tired, grave, full of dark thoughts; his sword lies beside him on a table. He wears his gray coat, already legendary, without any decoration.

On the 11th of April, 1814, it was agreed, in Article III. of the treaty signed in Paris with the approbation of the Provisional Government of France—by the plenipotentiaries of the Allies, and by Caulaincourt and Marshal Ney for Napoleon—that the Island of Elba, "chosen by Napoleon as his place of residence, should form, during his lifetime, a separate principality, which he would possess in full sovereignty and ownership." An income of two millions, inscribed in the Grand Livre of France, was assigned him. The King of Elba was to receive all the honors due to crowned heads, but he ceased to be a French citizen. On the 20th of April, after the famous adieux to the Garde in the court, Napoleon left Fontainebleau in a post-chaise. All the incidents of his journey are well known: he was accompanied by a number of people, among them four commissioners of the armies of the Allies—an Austrian General Kohler, the Russian General Shuvaloff, the Prussian General Waldburg-Truchsess, the English Colonel Sir Neil Campbell. The Emperor went aboard the *Undaunted* at Saint-Raphaël, the very place where he had disembarked fifteen years before, on his return from Egypt. He landed at Porto Ferrajo in the island where he was to remain till the 15th of February, 1815.

"What is," asks M. Gruyer, "and what was the Island of Elba, and what did the Emperor do there during these ten months? What was the existence of the man who was yesterday at the summit of the Occidental world, and in twenty-four hours had become something like the sovereign of the Val d'Andorre or of San Marino?" Napoleon's sojourn on the Island of Elba is a period which has never much detained historians; they have been more occupied with the events which were taking place at the time in France. "The Island of Elba," says M. Gruyer, "has remained a mere name. It evokes no idea, no precise image, like Saint Helena and Corsica, which call up Hudson Lowe and the familiar house at Ajaccio." M. Gruyer had the curiosity to visit Elba. When he arrived there, in this *terra incognita*, he imagined he should find some bare rock fronting the sea, and was surprised to find a varied and picturesque surface. Civilization has not much affected it, and he had the pleasure of viewing the same houses, the same rocks, which Napoleon had often seen. Even the Italians seldom visit Elba, though the distance from Porto Vecchio or Leghorn is very short. Porto Ferrajo, where the traveller lands, was founded by Cosmo de' Medici in 1548; its bay is very fine, and resembles that of Naples. The first scream M. Gruyer heard on landing was that of a man who ran by his side: "Signor! la testa di Napoleone," and who conducted him to the church where, in an ebony coffin, he saw the bronze head of a dead Napoleon, a copy of the mask which Dr. Antommarchi took in plaster at Saint Helena after the death of the Emperor. The inhabitants of Elba pay annual honors to this tomb, with its bronze mask, on the 5th of May, the anniversary of the death. The coffin is placed on a catafalque surrounded by wax candles, and in the presence of the official authorities a solemn mass is said.

At the Town Hall is kept the flag which Napoleon adopted, white with a red band, on which are three bees. In the Council Room there is a copy of Gérard's fine portrait, sceptre in hand, a gold laurel crown on his head and an ermine mantle on his shoulders. In the library is found what remains of the Imperial Library—a motley collection, where, side by side with various scientific and military works, occur Montaigne, La Fontaine, 'Don Quixote,' Voltaire, the 'Cabinet des Fées'—forty volumes containing fables and legends.

Napoleon was received with much enthusiasm in the island. The inhabitants were proud to welcome him and to become his subjects. The Emperor landed in his green uniform, with white breeches; he wore the Legion of Honor and the Iron Crown of Italy. He had put on his "petit chapeau" the new cockade of Elba. Behind him were Gens. Bertrand and Drouot. A Te-Deum was sung in the church, and the Emperor had the Town Hall for his first residence. In his first conversation with the notable inhabitants, he astonished them by his acquaintance with all the resources of the island and its needs; he knew how much the salt tax yielded annually, how many fishing boats were employed; he was acquainted with the date of foundation of all the cities and villages, he was familiar with the topography, with the altitude of the mountains. At Fontainebleau he had before starting asked for all the official documents concerning the island, and had mastered them with the rapidity and concision to which he was used. He had studied all the maps and books concerning the island, and among others a 'Journey to the Island of Elba,' published in 1808 by Arsène Thiébaut. The day after his arrival he visited the iron mines, famous for the excellent quality of their ore. He made in turn a visit to all the communes, constantly accompanied by two chamberlains, two officers, a captain of gendarmerie, the subprefect Balbiani, whom he had appointed General-Intendant of the island; the mayor, and the presiding justice of Porto Ferrajo, by the faithful Bertrand and the English Commissioner Campbell. Everywhere he was received under rustic triumphal arches with showers of flowers. He examined with care all the forests. He rode ten hours a day without seeming to experience any fatigue. He chose for his residence a house which was called the Palace of the "Mulini." He had it rebuilt and enlarged, and was his own architect. The furniture was partly sent from the Palace of Piombino, which had belonged to his sister Eliza. There are in M. Gruyer's volume two interesting photographs, one of the garden and the terrace of the Mulini, with their fine view over the sea; another of the great drawing-room, now entirely empty.

Napoleon was allowed to keep a small detachment of his Guard. The old soldiers joined him in the island; he added to their number a battalion of Corsicans, and after a short time had a little troop of 1,592 men, which did not seem alarming to the Powers that had seen him at the head of great armies. He had besides a small fleet. He had about four millions of francs when he started from Fontainebleau; the French Government was to ensure him an income of two millions of francs. With these resources he had to cover all the expenses of the administration of his small kingdom. He entered on his new rôle with his usual ardor; issued decree after decree, created establishments of all sorts, improved the coast trade, uniformed his soldiers, fortified the coast, gave an entirely new life to the sleepy little island. His activity was partly instinctive and natural; partly it was a mask with which he covered further designs. He wished to create in the government of the Bourbons and the Allied Powers the belief that he had really abdicated, had renounced his dreams of ambition, and had retired to his little island to live in peace and quietness.

There was a witness who kept a constant eye on him, and who alone remained to watch the formidable exile, viz., Col. Campbell, the English commissioner, who had fought in Portugal and Spain under Wellington. He fulfilled his mission as a gentleman, but took daily notes of all he saw. Napoleon heard at Elba the news of the death of Josephine; he was expecting day after day Marie Louise, but she did not appear. He had a visit from the Countess Walewska, whom he had first known in Poland, who had borne him a son and had joined him at Fontainebleau. She was at first taken for Napoleon's wife. She gave him news of the Empress. She could stay but a short time, and, crossing the island on horseback during a gale, she reëmbarked for Italy at Porto Longone. Soon afterwards arrived at the same port his sister Pauline Borghese. While she was with him he learned that Talleyrand had proposed to the members of the Congress of Vienna to transport Napoleon to a safer place than Elba. Several islands of the Atlantic Ocean were mentioned, among them Saint Helena. The Emperor affected not to be moved by the alarming information he received from different quarters. "Europe," said he, "will not do such a thing. From the point of view of England especially, Saint Helena above all is impossible. I should be too near India. And, after all, I can defend myself here for two years." In reality he was alarmed. An unknown visitor, who stayed only two hours with him, seems to have precipitated the crisis. Napoleon was afraid of being kidnapped or even assassinated; he received warning and confidential letters from many sources; he became very restless. M. Gruyer enters into the most minute account of the life he led, going from place to place incessantly, occupied with a thousand details, receiving visits, trying to keep his little army disciplined, and to get recruits in the place of the old soldiers who were leaving him.

There can be no doubt that the idea of a return to France never left him for a moment; he had kept the secret to himself from the day when he left Fontainebleau, but it became more and more imperious in the solitude of Elba. The agitation in which he lived was factitious; his little government of Elba was a mere comedy. He was determined to try fortune once more. The return from Elba is well known; history has followed Napoleon from the day when he landed with his small troop on the French coast at Antibes to the battlefield of Waterloo, and to the island of Saint Helena.

M. Gruyer's volume is a very interesting

contribution to Napoleonic literature. It has been published with much care by Hachette, and its illustrations bring vividly before the reader the incidents of Napoleon's brief sojourn in the lonely little island of the Mediterranean.

Correspondence.

MEYER'S WORK ON RAILWAY RATES.

To the Editor of The Nation:

Sir: In connection with the review of Prof. Hugo R. Meyer's book on Government Regulation of Railway Rates in the issue of the *Nation* for March 8, may I call the attention of your readers to a review of the same book in the January-February number of the *Archiv für Eisenbahnwesen* by Dr. Alfred v. d. Leyen, a recognized authority upon the subject of transportation, who has written much concerning both American and German railways? This review, which is devoted mainly to a consideration of the portion of the book relating to Germany, shows that Professor Meyer's treatment, under cover of an apparent erudition, is quite superficial, and that he is in many places guilty either of deliberate misrepresentation or of inexcusable ignorance. I feel constrained to call attention to this review because the book has been widely read in railroad circles, and has been accepted as a true statement by those who are either unable or unwilling to test its assertions by an investigation of the facts.

Frank Haigh Dixon.

Hanover, N. H., March 27, 1906.

POOR RICHARD'S POETRY.

To the Editor of The Nation:

Sir: May I add a postscript to my letter in the *Nation* for March 22?

A good deal of the poetry printed in Poor Richard's earlier almanacs was derived from 'Witts Recreations,' a humorous miscellany published in London in 1640, and reprinted, under the title of 'Facetiae,' in London in 1817. This volume accounts for ten pieces of verse in each of the first two almanacs, for six pieces in the issue for 1736, for the two "fantasticks" set down for September and October, 1738, and for a dozen of the shorter epigrams printed between 1735 and 1746. In some cases the space which the almanac devoted to poetry ("on the heads of the months") was filled by combining two four-line epigrams, not always on closely related subjects. Examples may be seen in the verses for August and November, 1734, and for August and September, 1736.

Another volume which ought to be mentioned here is 'A Collection of Epigrams,' printed for J. Walthoe, second edition, London, 1735. This collection seems to have supplied Poor Richard with about twenty pieces of verse (eight for 1737, five for 1738, two for 1741, and three couplets for 1739). And perhaps it is worth while to add that the verses for March, 1737, and January, 1739, occur in 'The Muses Choice: or The Merry Fellow,' London, 1754.

W. P. Mustard.

Haverford, Pa., March 29, 1906.

Notes.

One of the features of the International Exposition to be held at Milan next autumn will be the meeting of the first Historical Congress of the Italian Risorgimento, which has been organized under the direction of the most eminent historical authors and students in Italy. The congress will open on November 1, and, besides sessions at which papers and discussions will be in order, there will be an exhibition, chronologically arranged, of documents, letters, and memorials of all kinds concerning the Risorgimento—the period, that is, between 1796 and 1870. Committees have been appointed for each section of Italy and for France, England, Germany, and the United States. The delegate for the United States is Mr. William Roscoe Thayer, who will be glad to communicate with any persons who may have documentary or other material which they may be willing to lend to the congress. His address is No. 8 Berkeley Street, Cambridge, Mass.

A Life of Sir Henry Irving, by Bram Stoker, is to appear in the autumn with Macmillan's imprint. Other announcements by this firm are a Life of Lord Leighton, in two volumes, by Mrs. Russell Barrington; a Life of Walter Crane; and 'Vacation Rambles in London,' by E. V. Lucas.

We welcome the seventh issue of Mr. James Clegg's handy and valuable 'International Directory of Booksellers and Bibliophile's Manual,' whose further description of itself merits quotation *in extenso:* "Including lists of the Public Libraries of the World, Publishers, Book Collectors, Learned Societies and Institutions, Universities and Colleges; also, Bibliographies of Book and Library Catalogues, Concordances, Bookplates, etc., etc." And if we proceed to analyze the etcetera, we must add as novelties in the present triennial revision Bookbinders in London and the Provinces; Record and Literary Searchers, Translators, and Indexers; Colonial and Foreign Learned and Scientific Societies; Literary Agents; South African Public Schools; and American Educational Institutions. But we can assure our readers that there is much more beside for one who carefully examines this compact thesaurus. It should be in every public library. Mr. Clegg's address is the Aldine Press, Rochdale, England.

Two more volumes have just appeared in the charming series of "Les Classiques Français" (Dent-Putnam). One is George Sand's 'Mare au Diable,' the other a selection from Sainte-Beuve's "Lundis," 'Profils Anglais'—the first profile being of Franklin, and the others of Mary Stuart, Gibbon, Chesterfield, and Cowper; solid entertainment. Each volume has the author's portrait, a biography with appreciations, and a choice bibliography. In Sainte-Beuve's, one may read a French translation of Wordsworth's "Scorn not the Sonnet."

Mr. Eustace Ball, a writer by no means inexperienced in this sort of composition, has issued a small guidebook to Rome (London: Black; New York: Macmillan), about which the most that can be said is that it is perhaps no worse than some others of the same sort. The author had apparently several of the best-known guidebooks in English open before him, and has drawn upon them, but to no useful issue. No one ought to write even briefly upon the remains of ancient Rome who must pick up miscellaneous scraps of information from various, and often discordant, tertiary authorities, and trust to luck about his reconstruction of them. The result is sure to be an incongruous and misleading conglomeration, and to abound in blunders that are sometimes ludicrous. The publishers are perhaps responsible for inserting a plan of the Forum which is labelled as up to date (1904), but is merely a slight modification of J. H. Middleton's plan, and even leaves the Comitium and the Basilica Æmilia still buried.

No two artists could well be more unlike, either in person or in production, than the subjects of two of the latest of the Knackfuss "Künstler-Monographien," Anselm Feuerbach and Constantin Meunier (Lemcke & Buechner). Feuerbach never tired of painting his own handsome face, and, from the pretty boy of 1846 to the splendid swell of 1878, it is always the romantic ideal of an artist that he represents. Of Meunier we have only photographs vividly presenting the home-spun ugliness of an elderly workingman. Yet the romantically beautiful Feuerbach was that most tiresome of created beings, a German classicist; the plain Belgian artisan was a true Romanticist of great individuality and power. To look over the plates of Feuerbach's pictures and the preliminary studies for them is be appalled at the result of the misapplication of so much knowledge; to glance at the cuts after Meunier's sculpture is almost to wonder, at first, whether any academic knowledge is necessary to an artist of native force. Of course the truth is that Meunier's work is much more learned than it looks, and that Feuerbach's learning is much less sufficient than it seems. The remedy for any revolutionary feeling into which one may be betrayed is a course of the old masters or of the greatest Frenchmen.

E. B. Greenshields has made an oddly composite book of 'Landscape Painting and Modern Dutch Artists,' which is published by the Baker-Taylor Co. It begins with a brief history of landscape painting, goes on with a discussion of the theories on art of various artists and critics, and then, at page 127, comes to the real business of the book, which is a presentation of the work of seven Dutch painters, Bosboom, Israels, Mauve, the three Marises, and Weissenbruch. The gist of the first part is the elaborate proof of what, at this day, seems hardly worth proving, viz., that art should be "subjective." The result of the method is to give the impression that not only are these Dutchmen fine painters, but that they are the heirs of the ages, for whom the world has been waiting—the first truly great landscape artists. Fine painters they are, but there were heroes before Agamemnon.

'Bruges and West Flanders' (London: Black; New York: Macmillan) is one of the typical books of travel, illustrated in colors, which modern methods of color-printing have made common. The text, by G. W. T. Omond, accompanies thirty-seven water-colors by A. Forestier, interesting in subject, and sound, if not distinguished, in drawing; but, whether

through the fault of the artist or of the process of reproduction, rather violent and sometimes quite inharmonious in color. In especial there is a prevalent raw purple which we find most distressing.

Prescott F. Hall's 'Immigration' (Henry Holt) is the first of a proposed series of volumes dealing with the political and economic problems of the day, which is to be brought out under the editorial direction of R. C. Ringwalt. The author is secretary of an association formed to advocate the restriction of immigration. It was time for a new book upon this subject to appear, since Mayo-Smith's treatise is already out of date and represents a point of view long outgrown. Mr. Hall has made a careful study of a mass of materials, and has produced a readable work containing a large amount of valuable information. He advocates various additional restrictions upon immigration, but does not take a narrow or illiberal attitude towards the question. Especially to be commended is the discussion of the racial effects of immigration. The book would make an even more favorable impression if the footnotes did not sometimes indicate a lack of discrimination in the use of materials. It may be accepted, however, as a trustworthy general guide; and to college debating societies—which, we suspect, the editor of the series has especially in mind—it should prove a godsend.

'Studies in American Trade Unionism' (Henry Holt), edited by Professors Hollander and Barnett, is a volume of essays by members of the seminary of economics of Johns Hopkins University. The several papers deal with the organization, government, finances, and policies of leading labor unions, and conclude with an essay upon the Knights of Labor and the American Federation of Labor. They are based, in considerable part, upon original researches made possible by a private gift of money and a grant from the Carnegie Institution. Though confined to particular features of particular trade unions, the data dealt with are comprehensive and typical; so that the result is a substantial contribution to our knowledge of trade-union structure and functions, even though the discoveries of the investigators do not always have the charm of novelty. The preface, by Professor Hollander, is devoted largely to the consideration of economic method, in which the only thing that calls for criticism is his apparent conviction of the importance and necessity of such a discussion. Whatever may or may not have been true some twenty years ago, it seems unnecessary to-day to remind us that safe theorizing in matters economic must be based upon "qualitative data," amassed as deliberately and laboriously as chemical or physical data are collected by the natural scientist. It is needless also to dwell upon the "unwholesome relation which existed between political economy and the laboring class for the first three-quarters of the nineteenth century." However, if any of our readers need reassurance upon either of these points, they will find comfort in the excellent studies brought together in this volume.

Dr. Alfred A. Woodhull's 'Personal Hygiene' (John Wiley & Sons) contains within 200 pages the substance of lectures on personal hygiene given at Princeton "in the last few years." It embodies in the first place a short but practical and sufficient account of the anatomy and physiology of the different organs and functions of the body, and then considers, one by one, the reasons that should guide us in exercise, in food, in bathing, in our choice of clothing, and in reference to stimulants and narcotics. The position which the writer takes in reference to these questions is temperate and sensible, and while total-abstinence reformers will not find support for their extreme position, both they and all moderate-minded people cannot fail to be pleased to note in the author's arguments a decided leaning toward pronounced temperance.

In the 300 pages of Dr. Edward Curtis's 'Nature and Health' (Henry Holt & Co.) very interesting subjects are taken up. The reason why we should ventilate our houses, and the arguments for and against open windows at night; the chemical principles and the social considerations that should guide us in the choice of food and in the manner of serving it; the alcohol and tobacco question; the risks to which we are exposed as regards our sight and hearing; how we should keep the body and mind properly exercised without fatigue; even the problems of living and dying, and many other questions of like sort, are all touched upon in a practical fashion. The style of the writing is easy and unconventional, possibly at times a little too colloquial.

A dictionary is a book which does not lend itself to brief reviewing, and it is perhaps enough to say that 'Black's Medical Dictionary' (Macmillan) is well executed, and that the illustrations are interesting and well chosen, at least from the physician's point of view. It and the two foregoing works are all unusually good presentations of practical medicine for those who wish to be their own physicians. Black's Dictionary, indeed, goes further than this, and furnishes good food for many a practitioner or studious layman.

The Essex Institute of Salem, Mass., has recently published a valuable monograph on the 'Physical Geography, Geology, Mineralogy and Paleontology of Essex County, Massachusetts,' the result of twelve years of patient work by John Henry Sears, curator at the Peabody Museum, in Salem; a quarto of 417 pages, with many plates and figures, and a geological map. The rocks are elaborately described according to modern petrographic methods, and their intricate structure is unravelled. Glacial geology is also treated in detail, and a discussion of postglacial subsidence is presented, with the conclusion that it is still progressing at the rate of about two feet in a century. Although fossils are rare in this district, careful search has found some specimens in the ancient (Cambrian) rocks of Nahant and in the postglacial (Leda) clays at various points. The list of minerals includes over 100 kinds.

The learned world has waited forty-five years for the appearance of the second volume of the Catalogue of Sanskrit Manuscripts in the Bodleian Library. The first volume, by Aufrecht, did not contain all the titles (some being accidentally omitted) of the manuscripts then in the library, so that a nucleus of material for the second volume was at hand even before the first volume was published. In the meantime there have been many accessions, and the present volume, begun by Professor Winternitz and completed by Mr. Arthur Keith ('Catalogue of Sanskrit MSS. in the Bodleian Library,' Oxford: Clarendon Press; New York: H. Frowde), makes good the deficiencies of the first volume and continues the work to date. Among new acquisitions are the famous Bower MS. and the Weber Fragments (of the fifth century), several MSS. of the tenth and eleventh centuries, and nearly five hundred MSS. of the Hultzsch collection. The importance of the present volume will therefore be apparent to all Indic scholars. It should be in every public and university library. The imprint of the Clarendon Press is a guarantee of the care with which the work has been done, and the excellence of its typography.

Dr. Paul Cohn of the Industrial Museum in Vienna, who visited this country in 1904 as a member of the International Jury of the Louisiana Purchase Exposition, and prepared an important report to the Austrian Handelsministerium on the Chemical Industries at that Exposition, has collected his observations on American educational affairs in a pamphlet, 'Das Bildungswesen in den Vereinigten Staaten von Nordamerika' (Vienna: Hölder). The bulk of his notes is devoted to the colleges and universities, and gives as clear a view of the difference in administration and organization of the various kinds of our higher educational institutions as could well be expected in the small compass of forty-seven pages. The author has evidently made very careful studies, and might well have filled a much larger volume to advantage, had he been so inclined. Especially do the introductory and concluding chapters, on "The Creation of the American Nation" and on "The Future of the American Nation," seem too condensed. The latter contains a much-needed warning to "Europeans who pay a short visit to the United States and want to see and study everything on the run, and who turn up their noses at everything because everything is not arranged according to European notions, which they regard as 'higher.'" A well-made index—not a common thing in a German book of this size—enhances its value as a book of reference.

The report of the Geographical Society of Berne for the year 1903-04 contains an account by Dr. W. Volz of his impressions of the Sandwich Islands, together with some facts in regard to the fauna and flora. Other articles are by Dr. M. Groll on the Oeschinensee, a Swiss mountain lake, and an interesting paper on weather prophets by Prof. E. Brückner. The earliest whom he mentions were the priests of Apollo at Delphi, who for money would foretell the weather at any required time. The Roman astrological forecast, in which Cicero, Virgil, and Tacitus were believers, was obtained by dividing the year by seven, the remainder indicating the planet which ruled the weather for that year. The planet for 1906 is Venus, whose characteristics are an excess of moisture and heat. In treating of modern weather prophets, Brückner confines himself to the Germans, and especially to the late Rudolf Falb.

The first number of *Petermann's Mitteilungen* for the present year opens with

the route notes of an expedition for the geologic study of the Bolivian Andes headed by Prof. G. Steinmann. Among the places of interest visited in the heart of the mountains was Cochabamba, a flourishing city of 30,000 inhabitants, the centre of a rich and well-cultivated region, the granary of the land. Rittmeister Isachsen summarizes, in a series of quotations from the reports of Arctic explorers, beginning with our Capt. Hall of the *Polaris*, 1871-3, the condition of the palæocrystic ice, and concludes that the existence of glaciered land to the north of Greenland and America is highly improbable. Some of the results of an investigation of the four atmospheric strata of the Atlantic, a continuation of the work of the Prince of Monaco by Professor Hergesell, are given by the editor, Professor Supan. The departure is chronicled of Dr. Sven Hedin on his new expedition, the expense of which is borne by King Oscar, E. Nobel, and others. After an examination of the deserts of Eastern Persia, he will visit the sources of the Indus and Brahmaputra Rivers, and from thence go to the great lake region of central Tibet. A German scientific expedition has sailed in the steamer *Planet* to determine, among other things, the temperature and salinity of the waters of the Bismarck-Archipelago, as well as to analyze the gases suspended in the sea-water and to study the atmospheric strata.

Prof. Edward G. Bourne, chairman of the Historical Manuscripts Commission of the American Historical Association; Mr. Worthington C. Ford, of the Library of Congress; and Dr. J. Franklin Jameson of the Carnegie Institution, have issued jointly a four-page leaflet of suggestions respecting the transcription and printing of historical manuscripts. The suggestions are eminently sensible, and follow as a rule the accepted practice of the best modern editors. The leaflet should be carefully studied by all whose duty or pleasure it is to prepare historical documents for the press.

The American Committee of the Egypt Exploration Fund, which was constituted in 1902 upon the discontinuance of the long-standing relation between the Fund and its active representative in this country, has now resigned, and, after July 31, 1906, the London Committee will itself assume direct control of the work of the Fund in the United States. Mr. Edward R. Warren and Miss Grace I. Gay, who will serve respectively as treasurer and secretary for America, will continue the Boston office of the Fund in the Pierce Building, Copley Square.

The University of Aberdeen has issued invitations to certain academic bodies to send delegates to her celebration next September of the happy completion of her fourth century of life. The older of the colleges that now form the single university was founded in 1494; but the birthday party was postponed till it could be held in the new academic buildings, which are now completed. The precise date has not yet been fixed, apparently in expectation of adjusting it to accord with the convenience of King Edward, whose presence at the festival is hoped for.

The authorities of the Royal Library in Berlin, of which Professor Harnack is now the head, have appointed a commission, consisting of recognized experts in the department of incunabula, or imprints of the fifteenth century (the total number of which is estimated to be about 30,000), in order to furnish an exhaustive historical and literary description of these precious publications, and thus eventually prepare a *Gesamtkatalog*. It is estimated that the work will take about ten years, and that the total cost will be nearly 100,000 marks. For the first year's work 12,000 marks has been appropriated.

The town of Montmorency in France has opened an international subscription towards erecting there a statue to J. J. Rousseau. A century and a half ago this genius was composing on the spot his masterpieces, the 'Nouvelle Héloïse,' the 'Contrat Social,' and 'Émile'; and this fact, with the ineffaceable memories of the Hermitage of Mme. d'Houdetot, Mme. d'Épinay, and the Maréchale de Luxembourg, will forever make Montmorency a literary and political Mecca. Subscriptions of any size may be addressed to M. le Receveur Municipal de Montmorency.

Announcement is made of a meeting commemorative of Paul Laurence Dunbar, the well-known colored poet, lately deceased, in the vestry of the Rev. Dr. Hale's church in Boston next Sunday. Col. Higginson will read some of Dunbar's short poems; some of his best songs will be sung; and there will be addresses. Contributions will be solicited for a modest memorial to be erected at the poet's grave in Dayton, Ohio.

—The *Atlantic* is particularly strong this month in reform literature, taking the term in its better meaning, and not in the sense of the yellow journalist. Willard G. Parsons pleads for more definite aims in education, and especially for the rescue of cultural courses of study from would-be scientific methods, which are appropriate only to vocational courses. Mrs. Justine Bayard Ward writes of the movement back towards the Gregorian Chant as the appropriate form of church music, confining herself chiefly to the music of the Catholic Church, where the movement has the earnest support of the Pope. Her chief argument is that appropriate church music must pass the test not only of its beauty as music, but also of its capacity to weld harmoniously with the spirit of prayer. From this point of view, she holds, the modern forms, with all their beauty simply as music, are far inferior to the Gregorian. George W. Alger presents the necessity for reform in the substance and methods of the criminal law, if it is to win the respect of the masses and answer present social needs. He does not strengthen a good argument, however, by attributing lynching almost wholly to disgust with the non-enforcement of the law against murderers, since lynching is and has been most prevalent in a class of cases in which the law would work with all due speed if left to itself. In fact, the only great danger in such cases would be that the law would proceed too swiftly to ensure proper identification and proof of guilt. In reviewing a group of books on the Far East, John W. Foster makes use of the occasion to plead for justice in our dealings with China, while William S. Rossiter of the Census Bureau asks for reform in the publication and distribution of public documents. Alexander D. Noyes writes of railway securities as an investment, and here, too, we have an incidental plea for reform, in the matter of publicity of accounts on the part of enterprises appealing to outside investors. Four short stories, three poems, and a few miscellaneous topics save the predominant note from danger of monotony.

—The *Century* opens with the hitherto unpublished narrative by Lady De Lancey of her experiences during the last days of the life of her husband, Col. Sir William Howe De Lancey, who was mortally wounded in the battle of Waterloo. In 1825 the manuscript was shown to Scott, who said that he had never read anything which affected his feelings so strongly. Dickens read it in 1841, and referred to it as an astonishing and tremendous account, the perusal of which constituted an epoch in his life. The narrative is introduced by the comments of Scott and Dickens, contained in letters written to Capt. Basil Hall, Lady De Lancey's brother. The harrowing features of the account, however, are personal, and involve no general description of the horrors of the battlefield. It is hard to see that the reproduction of Romney's painting of Lady Hamilton as a Bacchante illustrates the sad narrative in any fitting way, notwithstanding such mention of Lady Hamilton as it contains. Christian Brinton contributes a short paper on Constantin Meunier, the sculptor of the laborer, with a half-dozen reproductions. Mr. Bryan's manifold energy attempts, in four pages of space, to reconcile the individual and the socialist, as two workers who are both striving for the good of society and may each have something of value to contribute.

—*Harper's* opens with another English paper by Mr. Howells, an account of a visit to Great and Little Brington, famous as the residence of the Washington family after the vicissitudes of the civil war had driven them from Sulgrave. The science article of the month, by Robert Kennedy Duncan, borders a little on the sensational in setting within very narrow limits, about nineteen years hence, the date when the starvation of the human race is to begin, provided some new source of nitrogen for fertilizing purposes is not discovered in the meanwhile to take the place of the saltpetre beds of Chili, then to be depleted. But, of course, there is hope left, as nitrogen-fixing microbes innumerable are waiting for the job, and the raw material immerses the whole earth at the rate of about 33,880 tons over each acre. The Senate may as well go on with the Rate bill discussion, and there may even be time to revise the tariff before the nitrogen supply is wholly exhausted. Professor Lounsbury comes to the defence of usage against the pedants again, this time in behalf of the very common employment of the present tense with future significance, and of a direct object with a passive verb. An extremely interesting bit of biography is given by two ladies who for eight years, 1889-1897, kept house for Herbert Spencer, and have felt disconcerted that all that has been said of him comes either from great men who care only for his philosophy, or little men who can see only his quaint peculiarities. A youthful disappointment in love, lingering still after fifty years, is one of the incidents related, and will doubtless serve as a basis for much

theorizing as to the subsequent course of his life.

—In *Scribner's*, Mr. Brownell's appreciation of Cooper challenges special attention. Cooper's early environment rendered his literature inevitably unliterary. It was perhaps even a piece of good fortune that he did not know the meaning and value of literary art, for he was thus left unhampered by a consciousness of his artistic deficiency. No writer of one-tenth his ability would to-day commit his faults, but the vitality and largeness of his conceptions triumph over all defects. The "stock" Indian generally supposed to derive from Cooper, is not Cooper's at all. His Red Men are at once Indian to the core, and thoroughly individualized as well. A whole section is devoted to a spirited defence of Cooper's women against the shafts of Professor Lounsbury, "who is the wittiest of writers, and, in consequence, a little at the mercy of a master faculty." As to the phenomena of nature, "nowhere else has prose rendered the woods and the sea so vividly, so splendidly, so adequately—and so simply." The assertion of critics that Balzac derives largely from Cooper is taken as striking evidence of the vivid reality of Cooper's characters, for nothing but a very energetic vitality could impose imitation on a romancer conspicuously noted for his originality. Again, Cooper was distinctively, but rationally, American. It is slander to attribute his democracy in Europe to pure idealism, and explain his disgust with demagogy on returning home, as due to an irascibility which changed his opinions. The discriminating American must naturally be an advocate of democracy when abroad, and a critic of it at home, as shown by the example of Lowell, for instance. That some of Cooper's work is inferior is willingly admitted, but his good work is so abundant and so good as fairly to earn negligibility for such exceptions as 'Mercedes of Castile' and 'The Ways of the Hour.' Mr. Brownell's paper, and the discussion which it has already set in motion, are likely to result in a distinct revival of interest in Cooper's works.

—Mr. Duncan Campbell Scott, whose stories and poems have given pleasure to many readers of *Scribner's Magazine*, now appears in the rôle of a historian. Besides acting as editor of the "Makers of Canada" Series (Morang), he contributes to this work its latest volume, the life of John Graves Simcoe. Sometimes a transition from the domain of pure literature to that of biography involves but a slight wrench, since so many lives are neither more nor less than a glorified romance. In the present case, however, the hero's career offers little of the picturesque. Simcoe did, indeed, see much active service during the Revolution, and won personal recognition from George III. by his activity in leading the Queen's Rangers; but there is nothing in his personal or professional experiences to make him stand out brilliantly from many soldiers and colonial administrators of his time. For example, he possesses neither the individual interest nor the historical importance of Lord Dorchester, with whom his views clashed on more than one occasion. Here, as Mr. Scott points out, fortune was unkind, not that Simcoe failed to reach Dorchester's eminence (for that is a separate question), but that, like his father before him, circumstances prevented him from realizing public expectation. With health impaired by the hardships of guerrilla warfare, he came to Upper Canada as its first governor under the Act of 1791. His chief function during the next five years was to organize according to the terms of recent legislation a region whose inhabitants were drawn largely from the stern and unbending Loyalists of New York. Simcoe, as a Tory of somewhat more pronounced views than Lord Eldon, enjoyed the opportunity thus afforded him of guiding Upper Canada into the paths of conservatism. Gifted with excellent parts, he added thoroughness and geniality to his other qualifications for a post which imposed considerable responsibilities. *Non tibi sed patriæ* was the self-effacing motto of his family, and Mr. Scott considers that he lived up to this lofty sentiment by accepting an office which made heavy demands upon his health while at the same time retarding his promotion in the army. Simcoe's limitations as a colonial governor are to be found in his lack of sympathy for democratic aspirations, and in a stubbornness which sometimes degenerated into unworthy suspicion of his opponents. The crisis of 1793 disclosed the nature of his trials more clearly than they are illustrated by any other episode of his career in Canada. Considering that his part of the British dominions was certain to be attacked by his old foes, the Americans, he took the most active measures for the defence of the frontier, and probably would have welcomed a brush with Wayne. At the same time, his official letters show how inferior he was to Dorchester in control of temper and in power to take a broad view of the problem. This lucid and well-ordered sketch by Mr. Scott exhibits a sturdy and active Briton whose resentments were seldom kindled save by those whom he looked upon as enemies of his king, his church and his nation.

—One of the latest publications of the British Academy is Dr. F. J. Haverfield's 'Romanization of Roman Britain' (Oxford: Clarendon Press; New York: H. Frowde). The author is the leading epigraphist of the United Kingdom; and it is on archæological data, not on considerations suggested by law or philology, that he bases the results of this paper. According to most English writers the Romans remained as distinct from the Britons as the modern English from the Indians. They left them almost as Celtic as they had found them. Dr. Haverfield maintains, on the contrary, that, in the south and east at any rate, Britain shared the fortunes of the other western provinces. Before the age of Constantine, Romanization had obliterated the differences between conquerors and conquered in material civilization, in politics, and in language. Relying on the evidence of extant remains—those at Silchester for instance—Dr. Haverfield points out that the public buildings in the civilian area, the private houses, the decorations and household furniture were almost always on the Italian pattern. Art, it is true, shows survivals of Celtic traditions, notably in the New Forest urns and the Castor ware from the banks of the Nen. But, in spite of exceptions, Dr. Haverfield holds that the rule stands that the external fabric of life was Roman. He thinks that this was true also of the legal and economic framework. The province must have been made up of Roman municipalities, of imperial estates, and, most numerous of all, of tribal "civitates" constituted on Roman lines. Again, he shows reason for believing that Latin was spoken in the towns not only by the upper classes, but, judging from the Silchester graffiti, by the lower classes as well. Possibly, too, it may have been the language of the rich in the country districts. While he thus lays stress on the Romanization of Britain, Dr. Haverfield denies that there, any more than in other provinces, it uniformly and at once destroyed all traces of national sentiments and fashions. Under the superimposed layer of Roman culture there must have remained, at least in the remoter districts, a native element which, if not actually Celtic, was capable of atavistic reversion. The departure of the legions was followed not only by an English invasion, but, in the military areas, in Cornwall and Devon, in Wales and the North, by a Celtic revival.

"SALLY."

The Dissociation of a Personality: A Biographical Study in Abnormal Psychology. By Dr. Morton Prince. Longmans, Green & Co. 1906. Pp. x, 569.

In the scientific study of abnormal psychology, in which France was the first to take the lead, she is now being outstripped by America, as regards both the intrinsic interest of the cases observed and the manner in which their observation is recorded. A year or two ago Drs. Sidis and Goodhart described the strange case of "Mr. Hanna," which stands alone in the completeness of the amnesia it exhibited, and in the wealth of suggestion it contained for psychologists, moralists, and philosophers in general (cf. *Nation*, No. 2067). And now Dr. Prince regales us with the full biography of the "Beauchamp" family, of which he had already published a fascinating but somewhat tantalizing sketch five years ago, in the Proceedings of the Society for Psychical Research (Part 40). The present work is intended as a preparation for a more technical and theoretic study yet to come of the problems of abnormal psychology (for the purpose of furthering which we are glad to note that Dr. Prince and Dr. Sidis are also establishing a special journal); but it is complete in itself, well written, and, despite its length and some little repetition, of absorbing interest, even to such as usually confine their reading to lighter literature. But even those who take up Dr. Prince's book in this spirit will find the fortunes of the "Beauchamp family" a first-rate romance of the "detective novel" order, whose interest clusters round the search for "the real Miss Beauchamp," and the question, "Who was Sally?"; and we can assure them that the secret of the first is well kept to the end, while the problems presented by the latter will probably exercise psychologists for years to come.

"The Beauchamp family," it is now high time to explain, was a group of secondary personalities into which the original "Miss Christine L. Beauchamp" was dissolved in 1893, as a consequence of a severe nervous

shock. As finally added up by Dr. Prince (p. 465), their total number amounted to no less than sixteen, all occupying, or inherent in, the same body, and coming to the fore as the vicissitudes of life compelled, or the ingenuities of experimentation evolved them. The chief actors, however, in the dramatic history of this very distracted family were only three, to wit, "B I," "the Saint," who came under Dr. Prince's care in 1898 as a pronounced neurasthenic; "B IV.," the irascible "Idiot," so called because she awoke in 1899 with no knowledge of the past six years; and "B III," the irresponsible but continuously conscious and ever-entertaining "Sally."

The medical problem, of course, was to reconstitute the original "Miss Beauchamp" out of the fragments into which she had been shattered, and thereby to cure the neurasthenia of "B I." For both purposes hypnotism was resorted to. All the personalities could be hypnotized and given suggestions to remember each other's lives; and the theory was that if "B I" and "B IV" could be thus amalgamated, they would have so great a working majority of the psychic processes connected with "Miss Beauchamp's" body that "Sally" would be suppressed. That such methods are effective was proved by the Hanna case; but the results here were different. When "B I" and "B IV" were made aware of each other's nature and past, they were shocked and disgusted, and so far from agreeing joyfully to recombine, like "Mr. Hanna's" two selves, "B IV" resisted her own extinction and formed a coalition with "Sally," who also declined to be "squeezed" back into subconsciousness. How together they resisted Dr. Prince's curative suggestions, baffled him for years, and nearly defeated him, how they fought and tormented each other, and afflicted their common body, must be read in full in the chronicles of the "Beauchamp" family. It would not be fair to Dr. Prince to betray the secret of his triumph and the dénouement of his tale. Suffice it to say that in the end "the real Miss Beauchamp" was reintegrated, and that she now seems capable of maintaining herself so long as she is not subjected to too much emotional disturbance. When this happens, "B I" and "B IV" resume their interrupted lives and dissensions for a season, and "Sally" her pranks. Still, with "therapeutic suggestion at regular intervals to offset the wear and tear of her life," "the real Miss Beauchamp" can manage to exist in comfort. At the time of writing, Dr. Prince tells us, she had persisted without a relapse for six months.

Thus the restoration to existence and health of the real Miss Beauchamp has settled the medical aspect of the case. For the psychologist, however, "Sally" remains over as a unique and fascinating problem. Who or what was "Sally"? She came upon the scene when the hypnotized "B I" (= "B II") was allowed to rub her closed eyes until she got them open; and ever after was able periodically to control the organism until "the real Miss Beauchamp" was restored, when not even automatic signals could any longer be elicited from "Sally" to prove her continued existence. But though thus born into the external world so late as 1899, she at once claimed to have existed internally long before. Indeed, she professed to go back to "Miss Beauchamp's" earliest infancy, to have had memories and points of view distinct from those of the primary personality from the first, to have experienced and watched her whole life, though impotent to act, to be continuously and unsleepingly conscious of all that happened to the organism, to know everything that the other personalities did, and everything that all but "B IV" thought. She had, moreover, great power over them; she could "bring" either "B I" or "B IV"; she could instruct them by visions or afflict them with illusions and hallucinations (positive and negative), often of the most painful and terrifying sort (as, *e. g.*, the grisly story on p. 484), even when she was not in control of the organism.

Now these are large claims to credit on the *ipse dixit* of so enigmatical a being, and Dr. Prince shows commendable caution in his mode of presenting them. At the same time, they were verified so far as they could be tested, and Dr. Prince not only plainly shows that he himself was convinced of their substantial truth, but also succeeds in imparting this conviction to his reader. The latter's sympathies, indeed, will mostly be with "Sally." She was by far the most interesting member of the "Beauchamp" family, and her racy and unconventional letters and amusing pranks contribute vastly to the literary value of the book. Scientifically, also, "Sally," despite her dislike of "psychological rot," was a godsend; without her priceless information and cooperation, Dr. Prince would hardly have achieved success. Morally her self-sacrifice in assenting to her own extinction (p. 487-9) is pathetic, and her inability to resist "B IV's" bribes (pp. 499-501) most human. And so Dr. Prince's suppression of her seems a little cruel. His theory about her was that she was the subliminal or subconscious self, in the sense of "a co-acting mind of which the primary self is not aware," and a phenomenon of dissociation. We venture to think this far from proved. "Subconsciousness" is clearly nothing but a provisional label put upon perplexing facts. And as a subconsciousness "Sally's" case is certainly unique; it goes definitely beyond anything that has so far been indicated as to the existence of double consciousness and hypnotic selves (cf. 49). Nor can she be simply disposed of as pathological. It was no doubt a disturbance of the normal psychological structure that gave her an opening; but the evidence goes to show that, even when suppressed, she continues her latent existence, and manifests again whenever the pressure is relaxed. She must therefore be regarded as a normal constituent also of the *healthy* "Miss Beauchamp." And if it be true that the "abnormal" arises only out of the perversion of the "normal," does not the whole case strongly suggest that something analogous to "Sally" exists normally in all of us, though we become aware of our subconscious double only when a disturbance of equilibrium enables it to manifest itself through the various forms of automatism?

Psychologists, indeed, have yet to realize how entirely "normal" certain dissociations of personality really are. That our dream self, *e. g.*, is normally dissociated more or less from our waking self, is proved by our rapid forgetfulness of dreams. But even this is not all, for the dream-self does not *make* its own dreams; it is the victim of an unknown "maker of dreams" behind the scenes. And the "Beauchamp" case seems strongly to suggest that what came to the surface as "Sally" is really this mysterious dream subconsciousness. She confesses that she is conscious of the dreams of the other personalities, and that what she thinks they sometimes dream (p. 332); she has the power to produce dream-like visions and hallucinations in them even in their waking life. She herself, on the other hand, neither sleeps nor dreams (pp. 340, 376). Dreams, moreover, have in general just such a character as might be given them by a childish, sportive, teasing imp like "Sally," relieving the tedium of a pent-up existence by a fantastic play with the contents of our consciously or subconsciously noted memories. "Sally" does not, indeed, confess to quite so much, but this can hardly be regarded as untruthfulness, seeing that apparently she was never asked about her relation to the dreams of the other personalities. It is to be hoped, therefore, that when Dr. Prince discusses the theory of the case, he will consider the possibility that in "Sally" science has at last caught and dragged to light the dream-constructing imp that lurks in all of us. And whether or not Dr. Prince can solve the mystery of "Sally," only an incorrigible skeptic could doubt that he has shown the "Beauchamp" case to be in truth, as he says, "a perfect gold mine of abnormal psychology"—a mine, it may be added, likely to be fraught also with much enlightenment as to the normal functioning of the human soul.

HOLMAN HUNT'S AUTOBIOGRAPHY.—II.

Pre-Raphaelitism and the Pre-Raphaelite Brotherhood. By W. Holman Hunt, O.M., D.C.L. With 40 Photogravure plates and other illustrations. The Macmillan Co. 1905.

It was while drawing in the British Museum that the acquaintance with Millais began, which soon ripened into a warm friendship, and was one of the completely fortunate events of Hunt's life, for no changes of fortune or differences in aim and style of work altered the affection of those two friends. Hunt gives a most attractive description of the talented young fellow whose success began at the early age of eight, when he carried off the medal of the Society of Arts. Millais's facile talent and luck were extraordinary; he had also every encouragement and aid of adoring parents to further in every way his progress. This especially struck Hunt as remarkable, his own experience of the family attitude towards art being exactly the reverse. The pages in which Hunt tells of his relations with the Millais family are perhaps the most charming in the book: the mother finding subjects for her son, making up costumes for his pictures, looking up questionable points for him; the father ready to sit for various figures in the same work in any disguise, the devoted and admiring elder brother and the delightful boy full of happy self-assurance and high spirits, never demurring at difficulties, because certain of success in the end, sure of getting his own way at home by affectionate flattery and bluster, however wayward and absolute he might be. This

friendship was of great importance and encouragement to Hunt at that juncture. The young men consulted each other about the pictures they were carrying on at home while they were still working in the Academy.

Illumination came from an unexpected channel. While Hunt was copying the "Blind Fiddler" of David Wilkie, a visitor, looking over his shoulder, remarked that Wilkie's system was to thoroughly finish each bit day by day without any dead coloring. The speaker, Claude Lorraine Nursey by name, had been a pupil of Wilkie's. He subsequently showed his own work, which he carried on in this manner. This proved to be of immense value to Hunt, for he recognized that the purity of color of the quattrocentist painters was due to the surety of touch which fresco-painting exacted. From that time he practised this method, his taste for clear forms and tints developing the while. The reading of Lanzi further convinced him that

"all the great Italian artists, including the cinquecentists, had grown in a training of patient self-restraint imposed by masters who had never indulged their hands in uncertainty and dash, and that the wise and enthusiastic pupils had delighted in the devotion of humility till far on in their maturity. The dandelion clock in the 'St. Catherine,' by Raphael, and the flowers—notably the purple flags—in the 'Bacchus and Ariadne' of Titian, were edifying examples of this spirit in the great masters, wilfully overlooked by modern students."

These convictions were shared with Millais, whose ambition was to seek out a truer method of interpreting nature in his pictures, putting aside received rules. The young men's discussions on these new aims and ideas, their impressions of the work of old masters, and other kindred topics, are given in conversational form. Holman Hunt conscientiously tells us in a note (what must occur to every one) that these cannot be vouched for as verbally exact, although the substance of the arguments remain vividly impressed on his mind. It was also the reading of 'Modern Painters' by an Oxford graduate which suggested the high mission of the artist, who, like the prophets of old, is appointed by God to carry a sacred message to the world. Keats's poems fell into Hunt's hands at this time, and filled his brain with images which inspired illustrations. From "The Eve of St. Agnes" he chose the subject of the escape of Madeline and Porphyro from the castle as the subject of his next Academy picture, and communicated his enthusiasm for Keats's poems to the less-impressionable Millais, who also found congenial themes for pictures in them. In their observation of the methods of old masters, the young men used their judgment untrammelled by accepted authority, coming to their own conclusions. Raphael's "Transfiguration," for instance, which at the time held such a transcendent position, was condemned as a signal step in the decadence of Italian art for its artificiality of arrangement and the pompous posturing of the Apostles. The fellow students at the Academy, hearing these unorthodox criticisms, called Hunt and Millais "Pre-Raphaelites" as a *reductio ad absurdum*—a designation which Hunt accepted as appropriate.

It was at the opening of the Academy that Rossetti, who was known to Hunt only through occasional meetings at the school, approached him with impulsive cordiality, congratulating him on his picture, which he loudly proclaimed to be the best in the collection, and asked permission to call at his studio, where a few days later Hunt showed him the beginning of "Rienzi," and expounded his views, which in this instance he meant to carry out rigorously for the first time by direct application to nature for every part. Rossetti was much impressed by the soundness of this system of work, and confided his own discouragement in his art studies. Madox Brown had consented to direct these on terms of pure friendship, and, after setting him to paint a copy from a study of his own of cherub angels watching a crown of thorns, had recommended him to study still life from pickle jars and bottles lying about in the studio. In desperation at the dulness of the task, Rossetti had thrown it up and consulted Leigh Hunt, a complete stranger to him, as to the likelihood of his being able to earn his living by poetry, submitting his small collection of poems to his judgment. Leigh Hunt too well knew how unremunerative poetry was; he counselled the youth to follow painting if he had any chance of success at it, although he was very appreciative as to the poems. Rossetti asked for Holman Hunt's advice as to the necessity of exercise in still life, and was recommended to choose one of his own designs which had been much admired by Millais and himself in the folio of the Cyclographic Club to which many of the young artists contributed. The design once transferred to canvas, he might begin by painting the still life carefully so as to acquire proficiency before arriving at the figures.

The suggestion pleased Rossetti, who immediately determined to try this plan and wished to do so under Hunt's immediate direction. This was not practicable at the time, as Hunt had another pupil, but soon after, when he quitted his father's house and took a studio, Rossetti shared it, paying half the rent, and it was there that he painted the "Girlhood of Mary Virgin," his first work in oil. The idea of an association of a few ardent spirits to reform art appealed strongly to his enthusiastic nature; he wished to be accepted as a member himself, and shortly after pressed Hunt to extend the circle to certain elect spirits—Woolner, a young sculptor who wished to be enrolled; his own brother William, who joined the subscription life school Rossetti had instituted, and who arduously worked at night at conscientious transcripts from the nude, while by day holding an appointment in the Inland Revenue Office; James Collinson, a young painter who had achieved a certain amount of success in genre painting; and F. G. Stephens, who had done nothing, but who was Hunt's nominal pupil, and, carried away by the whirl of enthusiasm, seemed likely to become an artist. Millais, on his return to town after executing some decorative work at Leeds, expressed surprise at Hunt's enterprise in adopting these adherents; D. G. Rossetti being the only one who by the originality of his designs seemed likely to help them in the advancement of their views.

On entering into this question of the origin of the Pre-Raphaelite Brethren and their aims, ethical and pictorial, we come to the point that chiefly preoccupied Holman Hunt during the writing of this book, which asserts his first claim to the ideas and leadership of the movement, and his still greater and less just pretensions to its subsequent influence on the entire art of England during the last century, ascribing to its pioneership and the battles it fought against well-worn traditions and the Academy at large, the high position accorded later to artists of views so entirely different from his own as G. F. Watts, Leighton, Burne-Jones, Walter Crane, etc., besides the reform in house decoration and stained glass effected by William Morris and the reproduction of lustre ware by W. De Morgan—truly exorbitant pretensions when we note the short duration of this coalition; Millais asserting his independence even before joining the Academy ranks, while Rossetti soon gave up exhibiting his pictures and never conformed to what he called "Hunt's hide-bound theories."

The accounts published in England and abroad Hunt considers far from exact. The idea, generally received, that Madox Brown, although never a member of the Brotherhood, had been the pioneer of the movement, having exhibited works in which a closer approach to nature had been observed, he repudiates entirely. Another point to which Hunt reverts with acrimony is that it is supposed that D. G. Rossetti was already proficient in painting in oil when he shared Hunt's studio, having acquired this knowledge of Madox Brown, while, to quote our author, "had he not been very closely, thoughtfully, and affectionately guided by me hour by hour in my studio for seven or eight months, I unhesitatingly maintain that he could not have appeared as a painter in 1849, and not even in 1850, *if ever*." This is too great a claim in the face of such decided gifts as those of D. G. Rossetti, for, with his unlimited enthusiasm and unwearying industry when interested in his work (according to Hunt's own account), he must surely have found for himself a method of expression sooner or later even without guidance. Those who have known the great artists of our day must have observed with how much generosity they are always ready to impart their especial methods to serious workers without attaching much importance to these favors. The frank admiration Madox Brown felt for the pictures produced by Millais and Hunt during the early years of the Pre-Raphaelite Brotherhood, and his sympathy with their aims, led to his adopting many of their methods, especially after Millais, in the exuberance of his confiding nature, explained to him their newly found system of flesh painting, which ensured purity and brilliancy of tint. The elder painter's works later on are classed by Hunt as Pre-Raphaelite, although he never adopted their restrictions, being averse to cliques. Hunt emphasizes the fact that he was never invited to join the circle, as his eccentricities in design made them fear to attract the further opprobrium of the critics on their already much derided society.

That foreign critics should have attributed to Rossetti the leadership in the Pre-Raphaelite Brotherhood is another grievance for Hunt, who maintains that these mistakes on the part of French art critics are due entirely to the writings of William

Rossetti, F. G. Stephens, W. B. Scott, Hall Caine, etc., and he brings this accusation with scant courtesy against his old friends. With regard to Rossetti, his adherence to Pre-Raphaelitism was not of long duration, for so original a genius would not be embarrassed by formalities and proscriptions. Hunt claims only two of his pictures as conforming to the school—"The Annunciation," now in the National Gallery, and "Found," which was never finished and is now in Mr. Bancroft's collection at Wilmington, Delaware. On the publication of Chesneau's book, 'Les Nations Rivales dans l'Art,' in 1868, Rossetti at once wrote the following to the author.

"En ce qui concerne la qualification de 'Chef de l'École Pré-Raphaélite' que vous m'attribuez d'après vos renseignements, je dois vous assurer le plus chaudement possible qu'elle ne m'est nullement due. Loin d'être 'Chef de l'École' par priorité ou par mérite, je puis à peine me reconnaître comme y appartenant, si le style du peu que j'ai fait en peinture venait à être comparé avec les ouvrages des autres peintres nommés Pré-Raphaélites. Ainsi, quand je trouve un peintre si absolument original que l'est Holman Hunt, décrit comme étant mon 'disciple,' il est impossible de ne pas me sentir humilié en face de la vérité, et de ne pas vous assurer du contraire avec le plus grand empressement. Les qualités de réalisme émotionnel mais extrêmement minutieux, qui donnent le cachet au style nommé Pré-Raphaélite se trouvent principalement dans tous les tableaux de Holman Hunt, dans la plupart de ceux de Madox Brown, dans quelques morceaux de Hughes, et dans l'œuvre admirable de la jeunesse de Millais. C'est la camaraderie, plutôt que la collaboration réelle du style, qui a uni mon nom aux leurs dans les jours d'enthousiasme d'il y a vingt ans."

This complete disclaimer to leadership having been published in Édouard Rod's 'Études sur le Dix-neuvième Siècle' in 1888 and in William Rossetti's Memoir of Dante Gabriel Rossetti in 1895, one would think this matter closed. With even greater injustice and bitterness Hunt attacks the character of his old friend and Pre-Raphaelite brother, F. G. Stephens, who for many years was art critic of the *Athenæum*, and whose frequent and eulogistic reference to Holman Hunt's work and the narrative of his experiences when in the East did much to establish the latter's position and to keep him before the public during his long absences from England. Mr. Stephens, in a letter to the *Times*, emphatically repudiates the passages in the book which Hunt quotes from the *Athenæum* as his, he not having had any connection with that paper at the time they were published fifty years ago. He shows other allegations to be utterly fallacious.

After the lapse of a few years, Hunt's position as an artist being firmly established by his exhibited pictures and the patronage of certain lovers of art who acquired his works at generous prices, he was enabled to carry out the project he had for many years entertained of visiting the East, the Holy Land especially, and painting scenes from the New Testament from their actual surroundings. This he felt to be his life's mission, his contribution towards making the history and teaching of Christ more tangible by the actual representation of Palestine and the knowledge of the manner of life and customs of its people. It was in 1854 that he first went out—a moment when the difficulties and expenses of travelling were enormously greater than at the present time, for the enterprise of Cook had not made Easterners familiar with the appearance and eccentricities of Western people. Obtaining models at Jerusalem was no easy task, since painting was regarded as witchcraft, endangering the sitter's soul. Then, fever was inevitable and cholera often supervened in the places stayed at. Hunt's indomitable will enabled him to surmount innumerable hardships and to pass through serious ordeals. His picture of the "Finding of Christ in the Temple" was completed in London six years later, and he has no reason to feel disappointed in the attitude of the English public from this time forward with regard to his art. He received for that picture, painted when he was thirty-three, the highest price which had hitherto been given for any modern work, viz., £5,500 sterling. It was exhibited in a special gallery by itself, with the pomp and circumstance of draperies and a darkened room, the full light being on the picture—also quite unusual then. It attracted, by its own merits and the way it was judiciously advertised by the press, a very special public, which has remained faithful to Holman Hunt's pictures ever since, and in which the clerical element predominates. Every new work is to his admirers the goal of a pilgrimage, even from remote parts of the country, for the artist is supposed to reveal new truths connected with the Bible, and his symbolism is discussed with bated breath and extreme reverence. Only two years ago his larger replica of "The Light of the World" was bought by the Right Hon. Charles Booth, who, sympathizing with the artist's desire that it should be seen in the Transvaal, has generously sent it to be exhibited throughout the colonies before being presented to the national collection at the Tate Gallery. Few artists of our day have achieved such manifest popularity as Holman Hunt while asserting independent views and remaining outside the Academy. He was, according to his own showing, the first and remains the last Pre-Raphaelite painter.

The illustrations in photogravure, which are extremely good, besides reproducing all Holman Hunt's pictures, give examples of the work of J. E. Millais, Madox Brown, D. G. Rossetti, R. Martineau, Sir W. Richmond, Henry Wallis, Spencer Stanhope, Charles Collins, and others; and in the text there are pen-and-ink sketches and studies after Holman Hunt which are full of interest.

SHALER'S MAN AND THE EARTH.

Man and the Earth. By Nathaniel S. Shaler, Professor of Geology, Harvard University. Fox, Duffield & Co. 1905.

We have known Professor Shaler as an Interpreter of Nature, but in this little volume he assumes the rôle of a Prophet, and foretells, from his study as a geologist of the past history of the earth and of man's interference with the processes of nature on its surface, what the probable fate will be of our globe, and of the vegetables and animals subsisting on its rocks, soils, waters, and atmosphere. Primitive man, like other animals, depleted earth's resources no less rapidly than nature repleted them, but civilized man is drawing lavishly, and even recklessly, on nature's stores; therefore, the questions are vital: How long will these continue to supply his demands? And if he exhausts material which now seems essential to his well-being and his progress, are there in nature available substitutes for it? To the solution of these questions much scientific research has been devoted. In his 'Earth and Man' Professor Shaler gives his answer in popular form and untechnical language.

Almost as essential as food to our existence to-day is fuel, and of it we possess in sight and in prospect a comparatively limited quantity. Accepting the assumed life of the accessible coal deposits of the world as about 300 years, and allowing but a few decades as the duration of supply of liquid and gaseous fuel, from even the most prolific petroleum fields, Professor Shaler allays our fears as to the suffering of our very great-great-grandchildren from cold by pointing out that heat being, as Tyndall described it, "a mode of motion," the winds, the torrents, and the tides, as long as the sun shines, can be turned into heat with less toil than the grimy concentrated sunshine which we dig with so many labor troubles from our coal mines. The secondary battery, when improved, or some better appliance for storing energy and accumulating power, will remove the objection to the use of these intermittent and variable agents. As to petroleum, the world possesses a substitute, though it will be costly, in bituminous shale. The term "coal-oil," which came to be subsequently applied to the oil from the Pennsylvania wells, was first used for the light product of distillation of these shales from Scotland, Australasia, and from this country. Professor Shaler computes that "the oil which may possibly be had from the Ohio shales alone will much excel in volume the amount of water contained in Lake Superior."

His forecast of the world's supply of useful metals is less cheerful than that of its heat and power-giving capabilities. Mr. Carnegie, in his St. Andrews address, allowed sixty years as the life of our rich iron deposits. Our author reduces this estimate to fifty years. Our copper mines, which have been so prolific for thirty years, will certainly not continue to help us to maintain our preëminence in the metal markets of the world as long as will our iron and steel. Of all the gifts of nature which we selfishly spend and sometimes waste, as though we were actual owners instead of trustees for future generations, none are more transitory than the metals. The miner himself watches with regret the progressive signs of exhaustion in his estate which he cannot repair like the farmer. The historian of mines describes the actual disappearance of copper mining during last century from the list of British industries, and the decline of Chili from being the world's main source of supply in 1870 to its present insignificant position in the ranks of copper producers. Nevertheless it is difficult to conceive of the actual obliteration from commerce of an article which, when plentiful, seems essential to our economic system; yet this will actually take place, and many centuries may not pass before substitutes for some, if not most, of our useful metals will have to be found. In his despair, Professor Shaler, like other speculators who dip into

the future, falls back on aluminum, the base of which exists in clay. Though nothing is inexhaustible, this ingredient of the earth's crust exists the world over in quantities immensely greater than the ores of the metals, and is still being produced from decaying feldspathic rocks. Aluminum possesses qualities which, when its cost permits, will enable it to take the place of iron and copper.

However, the exhaustion of what we account ore to-day, leaves intact vastly greater quantities of the metals as constituents of the rocks of the earth, which our children will extract through the application of such improved methods as their wider knowledge and greater skill will enable them to invent and apply. There need, therefore, be no apprehension lest the world at large suffer from scarcity of iron and copper, within a measurable length of time; but the ungovernable speed with which we are drawing on our own rich resources of iron and copper, will within a few generations involve our loss of supremacy in the production of these metals and possibly shift the centres of metallurgical activity to foreign shores, and almost certainly raise the price of these staple articles of the world's industrial life.

Professor Shaler sees a less gloomy prospect than did Crookes, in his Toronto address as president of the British Association, of remote generations of our children starving for want of corn. The lands under salt and fresh water which can be recovered to the use of man by efficient dykes and drains; the large area of the earth's surface, now desert, which will be rendered prolific by artificial irrigation, will provide enough new land for the increasing population. Meanwhile, better conservation of the land, by preventing the upper soil and its valuable soluble salts from being wastefully washed into the sea, and the extraction, if need be, from the atmosphere of its carbon and nitrogen, for the restoration to the soil of its depleted fertility, may prevent the famine from which our posterity might suffer by having grown too numerous to be supported from the present arable lands of the globe.

There is a moral to all such vague speculations, interesting and depressing as they may be; and the moral is, that while there may be doubt as to the fulfilment of these prophecies, there is no doubt that the good things of this world are fleeting, and that, being limited in quantity, they should be consumed in moderation and not wasted. Petroleum as a cheap illuminant has brightened many gloomy dwellings where the tallow candle formerly made darkness visible. No one believes it to be stored in lasting quantities in the buried sandstones of the earth's crust, and yet it is tapped so recklessly that, in a new district where the first wells belch it forth faster than it can be caught, new wells are nevertheless sunk almost as close together as derricks can be erected, and the oil flows so much faster than it can be caught and transported to market that the price shrinks below a figure at which it can be normally produced. For a time it is then burnt under a boiler by the tank-carful, instead of in a lamp by the gallon.

Under our existing uneconomical systems, this misuse of one of the most precious resources of nature cannot, perhaps, be avoided, but we are guilty of avoidable wastes of which less reckless manufacturing communities are innocent. To take an example: we are converting into coke annually 40,000,000 tons of coal. From retort coking ovens, such as are almost exclusively used in Germany, the volatile constituents of coal are caught, and from each ton of coal there is recovered about 7 per cent. more coke than when the same coal is coked in the more cheaply constructed but more wasteful bee-hive oven, and there are recovered from the gases, per ton of coal, 10 gallons of tar, and ammonia enough to make 20 pounds of ammonia sulphate. And yet, of the 40,000,000 tons of coal which we coke, only about 7 per cent. is coked in by-product ovens. From the balance, coked in bee-hive ovens, whose gases escape into the air, are wasted 370,000,000 gallons of tar, and ammonia to make 370,000 tons of ammonia sulphate, besides heat enough to generate over 6,000,000,000 horse power, or probably more than we realize from all our water powers combined. Most of this waste is made in Pennsylvania and Virginia, in the very heart of our industrial system. The value of these wasted coal products should not be estimated in dollars and cents. Our forests are being cut away in a great measure to supply the railroads with ties. The best wood preservative is creosote, a distillate from tar: and if the creosote from our coke ovens were recovered, and used as a preservative, what we now waste would treat about 37,000,000 ties a year. There would then be less temptation to go to Venezuela for bitumen, as the heavy residue after the extraction of the creosote from the tar would be a substitute for that politically troublesome material. While destroying our forests in building our railroads, our farmers are reluctant to restore the fertility of their fields, depleted by continuous cropping, by reason of the high cost of manure, and yet we are wasting monthly in the Ohio valley itself over 400,000 tons of the very richest ingredient of artificial fertilizers.

The importance of these problems cannot be overestimated; and while state interference with our industrial activity may be repugnant to our principles and habits of business, it must sooner or later be enforced, if not to regulate production, at least to forbid waste. Our children will be obliged by necessity to find a solution, but the difficulties imposed on them will be the greater the longer we neglect our own obligations and duties.

Vikings of the Pacific. By A. C. Laut. The Macmillan Co. 1905. 8vo, pp. xviii., 349. Ill.

No wilder and more romantic tales have been given to the world as fiction than may be inferred from the scanty records of the exploration of the shores of the North Pacific up to the first quarter of the nineteenth century. The innumerable reprints of Cook's Voyages and the success of the books of travel in which the work of less distinguished explorers is recorded, testify to the popular interest they have always excited. To bring before a new generation of readers the tales of heroism and endurance, of savagery and greed, of the pursuit of fortune in defiance of starvation and death, which the bare records offer, is a worthy ambition, and it is this which Miss Laut has attempted.

Her book is divided into three parts, the first dealing with Russian explorations, beginning with Bering and his two voyages eastward from Kamchatka. Then follows an account of the expeditions of the free Promishleniki consequent upon the reports brought by Bering's crew of the sea otter and fur seal obtainable on the newly discovered coasts. After them are treated the companies formed to exploit the trade as capital and organization became necessary, and, finally, the adventures of the escaped exile Count Benyowski afford material for a chapter. The second part takes up successively Drake's voyage; the work of James Cook on the coast of America; Gray's discovery of the Columbia River; John Ledyard's adventures; and Vancouver's explorations. Vancouver, by the way, is called the "Last of Pacific Explorers," as if the North Pacific coast terminated at Cook's Inlet. Part third has two chapters. The first, entitled the "Russian American Fur Company" (which was not the name of the organization described), is headed "1579-1867," though why the forays of Yermak in western Siberia, in no way connected with the fur trade, should be considered part of the history of a nineteenth-century corporation, is not clear. The last chapter is devoted to the history of Baranoff, resident director and virtual creator of the Russian American Company as a successful instrument of Russian commerce.

The arrangement of material, it will be observed, is illogical; the natural sequence of events would have been better observed by a chronological treatment. As it is, Drake in 1562 is made to follow the Promishleniki of 1760, and so on. No account is given of the Cossack expeditions which long preceded Bering at the strait named after him, and were the probable cause of the organization of the later official explorations.

As we have intimated, the genuine records are in many cases surprisingly brief. Bering's report of his first voyage occupies only a few pages, and to the labors of Archdeacon Coxe we owe almost all our knowledge of the voyages on the part of the Russians immediately succeeding those of Bering, the whole of which is preserved in one small octavo volume. Chaplin's journal, with Bergh's commentary occupies a little duodecimo. The manuscript records relating to Bering's voyages were reported by the Russian Government to our State Department as comprising about four thousand folio pages—not "thirty thousand," as stated in Miss Laut's preface. The original records of the minor explorations in eastern Siberia perished by fire in Yakutsk about a century ago, and we have only the extracts fortunately made by Müller and the emissaries of Coxe.

To these data the literary purveyor may be justified in adding for the general reader such a modicum of imaginary background as will fill out the picture and complete as a consistent whole the version which in itself is an unfinished outline. But this justification is dependent upon several qualities in the added matter, such as accuracy in detail, a truthful atmosphere, and a subordination of the added fiction to the framework of fact it is in-

tended to illustrate and adorn. These qualities can hardly be attained from book lore; the writer must himself have had some personal experience of conditions, natural and social, in the region treated of, and self-repression enough to let the facts relating to persons tell their own story and awake in the reader his appropriate judgment on the characters depicted. The writer may have, and exhibit, an opinion of his own, but too eager an insistence on it makes of the text a sermon, and not literature.

Miss Laut seems, from the character of her text, not to claim English as her native tongue; which, if it be the case, to some extent excuses certain blunders that mar the flow of her narrative. For example, in endeavoring to reproduce the eighteenth-century atmosphere by employing marine slang, she repeatedly uses the word "beachcomber" as meaning a "breaker" on a reef or shore. But "beachcomber" is a South Sea Island hobo, usually a deserter from some ship, living as a parasite on the natives—not a breaking wave. The word "wash" seems to have a fascination for her; terrible things happen in the "wash" or "backwash" to which she is fond of referring, and which seems to mean the "undertow." In her endeavor to furnish a natural background, the author goes too far in many instances; one might almost believe she had inspected the dunnage of the sailors on Bering's expedition. Many things are reported "verminous," as, for instance, hammocks, though these would be about the last articles likely to harbor vermin; nor is there any reason to suppose the Russian adventurer was more uncleanly than other men of his time, especially as the weekly steam-bath was regarded by him as his chief luxury.

Leaving petty incongruities of style, one may inquire into the accuracy of the facts of historic origin which the author has woven into her text. In the main her narrative is fairly correct, after one rejects its imaginary setting and presumptuous epithets. She has followed the chief authorities, though not always the latest, and in the main her stories need no serious correction in their historic matter. Yet even here a certain carelessness is obvious even so early as the table of contents. The baptismal name of Count Benyowski was Moricz Aguston, or Maurice Augustine in English, not "Mauritius," as Miss Laut prints it, and his shrewd and gallant fight for freedom from the barbarities of Russian exile is hardly deserving of her epithet of piracy. He doubtless fought the devil with fire, but to one who, like the present reviewer, has seen, fifty years after Benyowski, a Polish exile in Kamtchatka, who, for participation in some plot, had his nose cut off and was condemned to total loss of civil rights, and lived perpetually in danger of the knout—to put up a pretty good fight seems a tolerably natural thing under the circumstances. Miss Laut, taking her cue from Lauridsen's partisan Life of Bering, is profuse in her derogatory epithets for the scientific men who were ordered to accompany Bering on his second voyage, and ignores the undoubted facts that to Müller and Steller, two of these scientists, is due the preservation, as well as the collection, of nearly all that was valuable in the results of this expedition. Bering was deficient in the chief necessity of a commander, namely, executive capacity; he cringed before the petty nobility of his environment, and signed himself "your slave" in his report of his first expedition. During his second expedition he became a broken man, physically as well as mentally, and at the last was dependent upon the tender and faithful service of the scientist Steller, who stands out as the one capable person in Bering's own party, after the expedition set sail.

Miss Laut, in the case of Captain Cook, passes over unmentioned his chief claim to the gratitude of posterity, namely, the reorganization of the commissariat of his expedition, so that by suitable food and drink the plague of scurvy was banished from his own and subsequent expeditions. Vancouver was an even more capable explorer than Cook, but Cook had the first chance at the shores of the new ocean, and Vancouver was his pupil.

We may summarize by saying that, in spite of imperfect accuracy and style, Miss Laut has succeeded in giving a vivid picture, as she has conceived it, of a strenuous series of explorations which will always be of interest to the adventurous reader. To some future Parkman remains the task of putting the vivid picture in a setting both accurate and harmonious; meanwhile, Miss Laut's work is considerably better than nothing.

John Knox and the Reformation. By Andrew Lang. Longmans, Green & Co. 1905.

John Knox, the Hero of the Scottish Reformation. By Henry Cowan, D.D. (Heroes of the Reformation Series.) G. P. Putnam's Sons. 1905.

When a man reaches the historical eminence of John Knox, books may, not unfitly, be written about him at any time. That the Quater-centenary should have been celebrated in 1905 seems a little unfortunate, since probability fixes the date of his birth several years later. However, chronological exactness is not very important to the promoters of festivals, who as a rule feel that they have done their duty in paying some sort of homage to the decimal system. Last year having been marked, whether rightly or wrongly, by a commemoration of Knox, we get the usual crop of occasional literature. To notice all the publications thus provoked would be impossible, but we bring together two of the most notable.

Any one who has kept up with Mr. Lang's writings, whether literary or historical, would hardly expect to find him writing a panegyric of John Knox, and in this case one's natural forecast is justified by the event. As giving the point of approach, we can do nothing better than cite the opening paragraph:

" 'November 24, 1572. John Knox, minister, deceased, who had, as was alleged, the most part of the blame of all the sorrows of Scotland since the slaughter of the late Cardinal.' It was thus that the decent burgess who, in 1572, kept *The Diurnal* of such daily events as he deemed important, cautiously records the death of the great Scottish Reformer. The sorrows, the 'cumber' of which Knox was 'alleged' to bear the blame, did not end with his death. They persisted in the conspiracies and rebellions of the earlier years of James VI.; they smouldered through the later part of his time; they broke into far-spreading flame at the touch of the Covenant; they blazed at 'dark Worcester and bloody Dunbar'; they include the Cromwellian conquest of Scotland, and the shame and misery of the Restoration; to trace them down to our own age would be invidious."

Prof. Hume Brown, who also stands among the biographers of Knox, has recently given it as his opinion that, "in the struggle between the old and the new religions, a national life in a real sense first began in Scotland." When one thinks thus he can hardly avoid ascribing to Knox the honor of creating the Scottish nation. To be sure, Melville shaped the lines of Presbyterian government, but between the two men as personal forces there is no comparison, even if we leave out of the question Knox's priority in point of time. But neither Mr. William Law Mathieson nor Mr. Lang is willing to admit that on the creative side Knox was conspicuously successful. Mr. Mathieson is confident that nature intended him to be the leader of a revolution, while destiny, at cross purposes with nature, gave him formative work to do.

"We are accustomed to think of Knox as a lover of truth; and in the sense of fidelity to the best that was in him, or to what he believed to be such, no man ever served it more faithfully; but of that other and rarer form of truth, which consists of sobriety of judgment, clearness of vision, 'seeing things as they really are,' he was not so much devoid as utterly incapable."

The highly qualified enthusiasm for Knox which Mr. Mathieson displays in his 'Politics and Religion,' appears once more in the present work by Mr. Lang. Indeed, both writers have been anticipated by Lord Hailes, Hume, Robertson, and Hallam. Mr. Lang's special quarrel is with Knox's head. The Reformer's heart, he admits, was essentially sound.

"That Knox was a great man; a disinterested man; in his regard for the poor, a truly Christian man; as a shepherd of Calvinistic souls, a man fervent and considerate; of pure life; in friendship loyal; by jealousy untainted; in private character genial and amiable, I am entirely convinced. In public and political life he was much less admirable."

The work which illustrates his peculiar shortcomings most strikingly is his 'History,' with its strong partisanship and its penchant for special pleading. One of the littlenesses in Knox as a writer is his fondness for petty scandal. Wherever, for example, Mary of Guise is mentioned, it is always with a slight or an innuendo; and in disparaging enemies of the faith generally he accepts hearsay with the same readiness which Milton displayed when waging wordy strife against Salmasius and Morus.

Among the many episodes which Mr. Lang examines in detail with a view to disclosing Knox's aptitude for sailing near the wind, none is more characteristic of the Scottish Reformation than the Truce of July 24, 1559, between Mary of Guise and the Lords of the Congregation. Outnumbered two to one by the Regent's forces, the Protestant leaders were forced from the field and compelled to accept an armistice of nearly six months. It was an age when public opinion supported authority, when Calvin denounced opposition to rulers in the strongest terms, and when Elizabeth of England, a prop upon whom the Scottish Protestants largely relied, loathed nothing so much as a rebel. According to Mr. Lang's elaborate plea,

Knox and those of his party were anxious to get full credit for loyalty, while actively contriving the overthrow of established government. Regarding the nature of the terms agreed to, and the way in which these terms were kept, there are certainly many equivocal statements in the History. "At this point," says Mr. Lang, "Knox's narrative becomes so embroiled that it reminds me of nothing so much as of Claude Nau's attempts to glide past an awkward point in the history of his employer, Mary Stuart." How far Knox was misled, or of set purpose deceived, by erroneous information, seems to be the only question in doubt, for numerous dispatches of Sadler, the English ambassador, make clear the duplicity of the Lords in their dealings with the Regent. Throughout the account which he gives of 1559, Knox is either shutting his eyes, or is deceived, or is deceiving himself.

While Mr. Lang is not unsuccessful in disclosing the perfidies of the Protestant lords and in exhibiting the self-persuasive power of their apostle, he has let rather too much cleverness and subtlety creep into his book. Whether through eagerness to prove his point, or repugnance to Calvinistic intolerance, he permits his volume to assume the character of a pamphlet. Admitting in general terms the historical greatness of Knox, he takes it for his particular function to disclose the Reformer's shortcomings. Such compliments as are paid to Knox in his private character carry little weight when balanced against the tale of his inconsistencies as a writer or leader. Those who would see why the Reformation left a crop of rancors in Scotland may well turn to these pages, but it helps one little if any to understand the fundamental strength of a nature which made itself the rallying-point of a national movement.

Dr. Cowan's work is less a piece of detraction or of eulogy than a plain narrative of events, with occasional comment upon the main issues which claimed Knox's effort. The most notable single statement which we have discovered in it is suggested by the quarrel between Knox and Moray, where it is said of the reformer: "He preferred internal conflict with all its hazards, while a Protestant ascendancy was maintained, to internal peace which would give Romanists the opportunity of recovering their strength, increasing their numbers, and preparing for a future struggle." This observation sums up, in our opinion, the whole state of the case as between Knox and his aristocratic allies. Having gained something from the concessions of the Government, they were willing to temporize in 1565, at the critical moment of the Scottish Reformation. Knox, who was determined not to hold parley with the accursed thing, kept on his way in complete disregard of the effect to be produced by action upon the peace of Scotland, then or in subsequent generations. It is doubtless worth Mr. Lang's while to define the nature of Knox's limitations, but modern Scotland chiefly remembers the fact that his illiberality brought with it emancipation.

The Risen Sun. By Baron Suyematsu. New York: E. P. Dutton & Co.

The Japanese Government has many times followed precedents furnished by the United States and to the advantage of the nation. Furthermore, no modern people has been more eager in seeking to know, or sensitive in responding to, the best public opinion of the world than the Japanese. They have carefully studied the American way from the days of Franklin and Adams to those of Lincoln and Seward. As, in our civil war, private envoys were dispatched beyond sea to explain and defend the Union cause, so, on the eve of the outbreak with Russia, Mutsuhito dispatched several elect, highly cultivated and amply equipped servants to win and hold the world's sympathy. Baron Kaneko, graduate of Harvard in America, Takahashi, pupil of American missionaries, as financial director on both continents, and Baron Suyematsu, student at Cambridge, and able to use German, French, and English in Europe, have creditably fulfilled their mission. Their pens have conquered for Japan both credence and credit, sympathy and aid. No less skilfully than Oyama and Nogi and Kuroki, Togo and Uriu on field and deck, have the Japanese controlled the sources of information and manipulated the levers of world-moving opinion.

While we wait for Kaneko's book and Takahashi's report, we have Suyematsu's London-made volume named by the British publisher. It is well edited and attractively presented. The title is hardly a product of Bushido, which aims at modest self-repression and depreciation of one's own. Among the most conceited of men and quite equal to the Yankee, is the Japanese gentleman, but he is refined even in his methods of egotism. This volume is made up of the papers contributed by Baron Suyematsu during the war to various books or periodicals in three languages. The matter is distributed tripartitely, the "books" being severally entitled: Antecedent to the War; A Nation in Training; and, External Relations. Light in hand but weighty in contents and indexed, the volume is of permanent value. That portion, already included in Stead's 'Japan by the Japanese,' treating of ethics and religion, has been already glanced at in these columns.

Since these papers are all accessible in periodicals, we need not examine each in detail, but inquire as to the real riches and note the possible poverty in the collection now so conveniently at hand. To put these valuable products of mind, heart, and pen in a special volume is to incur the responsibility of scientific appraisal and frank criticism. It is well to know the Japanese ways in the art of apologetic writing of history. While the virtues are great, the sin of omission is of equal proportions. As is now said of Motley by perhaps all the Dutch historians and critics—he grasped the outside relations and set forth admirably the story of the Netherlanders for foreigners, but never really entered the penetralia of Dutch politics; so, with consummate adroitness, our Japanese writer answers the questions and refutes the objections lying on the surface, but is apt to parry searching scrutiny that might lay open unpleasant realities. As cool, as judicial, as self-restrained as Benjamin Franklin, he shows in four chapters how the Russians brought on the war. In his opening paper on "An Anglo-Japanese View of the Far Eastern Question," before the Constitutional Club in 1904, he rightly names as the key to the situation the Anglo-Japanese Alliance, which made Japan's path clear to smite the Muscovite, while sustaining Great Britain's position in the Far East. When he expatiates on woman's education, ethics, freedom of conscience, etc., etc., the inquirer into reality is hardly satisfied. Do the Japanese really want their women to have and to enjoy the higher education? If so, why do they leave the work and cost to private initiative and expense? And why is the reform of licensed prostitution left almost wholly to aliens? Why is the atrocity of parental sale of daughters still permitted? So long as the demands of filial piety override woman's strongest hope and ambition—chastity—can Japan be called civilized? As for all the intellectual and religious freedom boasted of, can the sun have risen when freedom of academic investigation is under ban? We can understand "the real significance" of hara-kiri, even while we see clearly its moral poltroonery. What kind of courage is that of suicide? Can self-murder be justified even though one's face is saved? So long as the tombs of assassins are flower-covered by an admiring populace, and the victim of defeat or failure can shirk inquiry and deserved disgrace, so long as a villain can redeem his reputation by the belly-cut, non-Japanese opinion will be cool in its admiration.

Again, in writing of "The Great Change in Japan" consequent upon the introduction of Western civilization, our author in the first paper utterly ignores the Hollanders' influences of a quarter of a millennium, and in the second paper unduly minimizes it, while giving no credit whatever to the American teachers who began, nine years before the Tokio Government got into power, to fill the minds of native lads (now and since 1870 among the leading men of the country) with the ideas of freedom and representative government. In brief, why, in the days of "The Risen Sun," when concealment of facts is no longer possible, should so frank a scholar, refined gentleman, true patriot, and man of the world as Baron Suyematsu is, and with so noble a recorded service, seek to imitate the uncanny fashion of his old-time literary brethren?

The paper on the historical expansion of China is an admirable bit of scholarship. The naturalization of foreigners in Japan is also explained, but one contemplating the step had better read Lafcadio Hearn's profound and penetrating work on 'Japan: An Interpretation'—as frank as a missionary report, and as pitiless in its exposure as a Salvation Army tract—in which it is clearly shown that the Japanese family is still in the Homeric stage of evolution. The word "family," an expression of a legal entity only, has not the meaning or perspective which the English word carries.

The Story of Cambridge. By Charles W. Stubbs. Illustrated by Herbert Railton. London: J. M. Dent & Co. 1905.

How curious it is that we cherish Oxford and ignore Cambridge, when there are so many reasons why it should be just

the other way about. Is Oxford older? Both universities spring from a remote past that defies the dating power of antiquarians. Is Oxford more beautiful? She has no single building that compares with King's College chapel; she has no glimpses so lovely as may be found at every step of that wonderful half-mile along the Cambridge backs from Queen's Bridge to the Bridge of Sighs at St. John's. Has Oxford produced greater men? Far from it; more than her share of the great names of England is associated with Cambridge. Bacon, Cromwell, Macaulay, Byron, William Pitt, Newton, Tennyson, Milton, Darwin, Wordsworth—such are a few that come haphazard to the memory. Has Oxford any more intimate association with America? On the contrary. Oxford has always stood for King and Church, Cambridge for Parliament and freedom. The eastern counties, swept by the stinging winds from the North Sea, long produced the hardiest race of England; and if now the counties of Cambridge and Lincoln and Norfolk no longer show the vigor that marked them from the time of the Danes to that of the Commonwealth, the reason is largely that, in the seventeenth century, the best part of the population crossed the Atlantic and founded New England. Go from Cambridge in any direction, but especially north and east, and you will pass through the towns whose names are those of Massachusetts. Ipswich and Norwich, Ware and Milton, Boston and Lynn, Malden and Lincoln, and many familiar villages are all within those eastern counties that fed the University of Cambridge and peopled New England in the past. And although at the present day Oxford and Cambridge no longer draw their students from a local constituency, yet much of the old tradition survives; all good Oxford and Cambridge men are content that the two universities should be equal sisters in learning and culture, and yet there persists a difference of tradition and of ideal which should, but does not, draw Americans rather to the banks of the Cam than to those of the Isis.

This little book is a handy guide to the university town, which it may be hoped many will use. It will prove sufficiently accurate for the ordinary traveller, and even for those who stay at home it may give a pleasing impression by its exceptionally well-executed illustrations. It is a pity, however, that an artist of such ability and charm as Mr. Railton will not make any concessions to accuracy.

BOOKS OF THE WEEK.

The Novels of

Henry James

A STUDY

By ELISABETH L. CARY,

Author of "The Rossettis," etc.

16mo, with Photogravure Portrait, net $1.25

"This is a surprisingly acute and systematic piece of criticism. . . . Miss Cary has studied her subject with admirable patience and insight. Readers of Henry James will recognize the truth of her analysis. . . . On every page of this book we find criticisms that are just, appropriate and distinctive. The book is one worth reading and re-reading."

The World's Classics

18mo, cloth, 50 cents, postpaid; LEATHER, LIMP, GILT TOP, 75 CENTS, POSTPAID

(SIZE 6 x 4 INCHES)

"These miracles of publishing are both the cheapest and the most charming series of classics in existence."

The best recommendation of THE WORLD'S CLASSICS is the books themselves, which have earned unstinted praise from all the leading critics and the public. Upwards of 1¼ million copies have been sold.

Already issued—Sixty-five volumes. Forty are in a Second or Subsequent Impression

POETRY

3. Tennyson's Poems. 1830-1858. Fourth Impression.
7. Keats' Poems. Third Impression.
9. The Ingoldsby Legends. Third Impression.
13. English Songs and Ballads. Compiled by T. W. H. Crosland. Second Impression.
16. Herrick's Poems. Second Impression.
18. Pope's Iliad of Homer. Second Impression.
27. Macaulay's Lays of Ancient Rome.
34. Burns' Poems. Second Impression.
36. Pope's Odyssey of Homer.
37. Dryden's Virgil.
42 and 56. Chaucer's Works. Vols. I and II. From the text of Prof. Skeat. Complete in 3 Vols.
58. Robert Browning's Poems. Vol. I.

BELLES LETTRES

2. Lamb's Essays of Elia. Fourth Impression.
5. Hazlitt's Table Talk. Third Impression.
6. Emerson's Essays. Fourth Impression.
15. Hazlitt's Sketches and Essays Second Impression.
19. Carlyle's Sartor Resartus. Second Impression.
22. White's History of Selborne. Second Impression.
23. De Quincey's Opium Eater. Second Impression.
24. Bacon's Essays. Second Impression.
25. Hazlitt's Winterslow.
30. Emerson's English Traits. Second Impression.
32. Selected English Essays. Chosen and arranged by W. Peacock. Second Impression.
33. Hume's Essays. Second Impression.
45. English Prose from Mandeville to Ruskin. Chosen and arranged by W. Peacock.
46. Essays and Letters by Leo Tolstoy. Translated by Aylmer Maude. Second Impression.
57. Hazlitt's Spirit of the Age.
61. Holmes' Autocrat of the Breakfast Table.
62. Carlyle's On Heroes and Hero Worship.
65. Montaigne's Essays. Vol. I. Complete in 3 Vols.

FICTION

1. Charlotte Brontë's Jane Eyre. Third Impression.
4. Goldsmith's Vicar of Wakefield. Second Impression.

FICTION (continued)

8. Dickens' Oliver Twist. Second Impression.
10. Emily Brontë's Wuthering Heights. Second Impression.
14. Charlotte Brontë's Shirley. Second Impression.
17. Defoe's Robinson Crusoe. Second Impression.
20. Swift's Gulliver's Travels. Second Impression.
21. Poe's Tales of Mystery and Imagination. Second Impression.
26. Hawthorne's Scarlet Letter. Second Impression.
28. Thackeray's Henry Esmond. Second Impression.
29. Scott's Ivanhoe. Second Impression.
31. George Eliot's Mill on the Floss. Second Impression.
38. Dickens' Tale of Two Cities. Second Impression.
40. Sterne's Tristram Shandy. Second Impression.
47. Charlotte Brontë's Villette.
50. Thackeray's Book of Snobs.
63. George Eliot's Adam Bede.
66. Borrow's Lavengro.

12. Bunyan's Pilgrim's Progress. Second Impression.
49. Of the Imitation of Christ. Thomas a Kempis.
60. The Meditations of Marcus Aurelius (*shortly*)

35, 44, 51, 55, and 64. Gibbon's Roman Empire. Vols. I and II. Second Impression. Vols. III-V. Complete in 7 Vols.
41, 48, and 53. Buckle's History of Civilization. Vols. I and II. Second Impression. Vol. III.

43. The Prince. By Niccolo Machiavelli. Translated by Luigi Ricci.
54 and 59. Adam Smith's Wealth of Nations. Vols. I and II. Complete.

11. Darwin's Origin of Species. Third Impression.

IN PREPARATION

Gibbon's Roman Empire, Vols. VI and VII.
Montaigne's Essays, Vols. II and III.
Chaucer's Works, Vol. III.

The Nation.

NEW YORK, THURSDAY, APRIL 12, 1906.

The Week.

The assumption that the Rate bill is a "non-partisan" measure was pretty rudely shaken in the Senate on April 4. Mr. Long rose as the spokesman of the recent Republican conference at the White House, only to be quizzed by Messrs. Bailey, Bacon, Aldrich, and Foraker. The Democratic Senators wanted to know why a bill assiduously represented as non-partisan was discussed and amended in secret committee of Republican Senators. Messrs. Foraker and Bacon stood on the point of Senatorial prerogative, questioning the propriety of this form of Presidential meddling with legislation. Now no Senator need be precisely shocked at the spectacle of a bill "steered" from the White House. Our more startling *ballons d'essai* are usually inflated, not at the legislative, but at the executive, end of Pennsylvania Avenue. Still, the recent conference at the White House was so specifically announced, and made such pretensions to authority, that it is natural, first, that all Senators should challenge its propriety, or, conceding that point, that Democratic Senators should resent being left out. Finally, the spectacle of the President's accredited spokesman under unfriendly cross-examination indicates the disintegration of the so-called Roosevelt party.

While there developed in the House some Democratic opposition to the National Quarantine bill, the passage of that measure is a real triumph of practical considerations over political theories. Every epidemic for the last forty years has revived the preëminently sensible sentiment that the guarding of our shores against disease is as properly a national function as their protection against enemies. Between times, the easy doctrine that the States might as well look after it for themselves would reassert itself. The real battle was won when most of the States, Southern as well as Northern, voluntarily turned over their quarantine stations to the national authorities, whose efficiency had been proved on so many past occasions. For one thing, we hope that the new law will prevent the unseemly wrangling between neighboring States, with the everlasting charges of local selfishness and laxity which have usually accompanied epidemics in this country, and even the threat of epidemics.

The proposal to reinstate the dismissed midshipmen is difficult to understand. When the hazing inquiry began, it was stated that the reappointment by act of Congress of three midshipmen who were dismissed for hazing in 1904 had done much to demoralize their fellow-students. It was taken by the whole body of cadets to mean that the Navy Department would be very slow to punish any one again for a practice its official representatives seemed to wink at. The midshipmen were thoroughly undeceived, and the hazing court-martial has dismissed or forced the resignation of a large number of them, while there are still thirty cases to be disposed of. Now, because Congress has passed a law making the punishment for hazing less than dismissal, both the Secretary of the Navy and the Naval Committees seem to be willing to put back those dismissed. This would be a grave mistake, and not only because it would leave the midshipman's mind in doubt as to the Department's actual attitude toward hazing. The offences committed bordered on crime; they included indecent acts as well as dishonest ones, and revealed, according to the Underwood Committee, a total failure to understand or respect the sanctity of the oath of service. Surely, for such wrongdoing there should be exemplary punishment. Moreover, the naval service ought not to have foisted upon it young men who are so obviously morally defective.

As a sign that the Democratic Club of this city is in earnest in its desire to become "nationalized"—that is, to dominate the party throughout the nation—the announcement is made that it will look with a friendly eye upon Bryan. This has been in the air for some days. Intimates of certain politico-financial magnates in this city have been whispering it around that those great men have about made up their minds condescendingly to "take Bryan." He is expected to drop his 16-to-1 nonsense, and then the course will be open to him to become the "idol" of the New York Democracy. These gentlemen seem to have forgotten, however, that Bryan's latest platform is Government ownership of railroads. Will he abandon that also to win their approval? Will he, in a word, be as anxious to "take" them as they are to take him? Those are questions which must be left to the future. What is perfectly plain in the present is that Mr. Bryan, while giving many evidences of growth and broadening in statesmanship, is essentially a radical. If he is again nominated for the Presidency, and especially if he is elected to that office, it will be because he is the choice of the workingmen and farmers and planters of the West and South, and not because he is patronized by rich Democrats in New York.

There are now at least nine generally recognized aspirants for the Republican Presidential nomination, and the greatest of these is unquestionably Fairbanks. With all the leisure of the Vice-Presidential office at his command, he has built, perfected, and extended the most workmanlike political machine, probably, that a candidate ever possessed two years and three months before the nominating convention. The prophecies of his enemies have regularly come to naught. He has blocked plans, he has carried off their spoils, and still the wrath of Heaven does not descend to consume him. In fact, nothing seems to touch him. All the boomers of other Presidential candidates use him as a standard of comparison. No one ever heard a Taft man, for instance, say that his candidate was gaining ground faster than Shaw, or Root, or Foraker. No; if he wants to make the ultimate claim, he says that Taft is outstripping Fairbanks, and the Shaw men, the Root men, and the Foraker men, in their most optimistic moods, can say no more for their standard-bearers. The flame of Fairbanks enthusiasm is as impossible to extinguish as the phosphorescence of a fish.

Although busy enough with the Rate bill, Senator Tillman has to find time for home politics as well. The Columbia *State*, whose editor, as will be remembered, was shot three years ago by Tillman's nephew, making up an impressive list of things which the senior Senator has *not* done for the welfare of South Carolina, observes that, "after going to the Senate, ... he evinced no interest in State affairs until the dispensary, involving, as he believed, his political future, was assailed." That assault, as we have noted from time to time, has been a formidable one. Not only have various counties voted out the institution locally, but one house of the Legislature passed a bill to abolish it completely. But the Senator has so far managed to save his "baby." It is rather interesting to see a campaign against Tillman based on his home record during those very years when, as all opinion agrees, he has grown so greatly in national stature.

The Massachusetts Legislature has under consideration an interesting "public opinion" bill. As presented by the Massachusetts Referendum League and amended, it provides that "on a written application signed by 10 per cent. of the registered voters of the commonwealth asking for the submission to the voters

of any question of public policy for an expression of opinion, the Secretary of the Commonwealth shall place such question on the official ballot for the next State election." Other provisions are for county and city and town referendums. Not more than two questions, it is proposed, shall be submitted at one election, and in case an adverse vote is cast, the same question shall not be resubmitted for three years. That there is hope of getting such a measure through is indicated by the recent vote in the lower house of the State Legislature on a resolution to permit voters at State elections to express their preference for United States Senators. An adverse report had been made by the House committee on this question. On motion to adopt the resolution despite the report, 74 affirmative votes were cast to the 100 negative. Without the question of Lodge's or Crane's political fortunes to complicate the proposition, the Election Laws Committee hopes to make this further step towards securing for Massachusetts electors a chance to vote their "opinions," in addition to maintaining them at hearthstone and in hall.

However rapidly Socialistic doctrines may be progressing, this growth is not reflected in the vote of the Socialist party. The elections which have been held since the great Socialist effort of 1904 have in most cases shown losses, or, in a few, slight gains. In Milwaukee, where in 1904 the Socialists rose to the second place among parties, casting a considerably larger vote than the Democrats on the national ticket, last week's municipal election put them back in third place. Their strength fell from 17,028 in 1904 to 16,538. Of the seven States which elected one or more State officers last fall, six showed a smaller Socialistic vote than that cast for Debs in 1904. In Massachusetts the drop was only from 13,604 to 13,195, but in Michigan it was from 8,941 to 6,235, in Nebraska from 7,412 to 3,241, in Ohio from 36,260 to 17,795, in Pennsylvania from 21,863 to 10,390, and in Rhode Island from 956 to 364. Only in Maryland was there a gain, from 2,247 to 2,603. In New York city the Socialist Mayoralty vote also rose from 11,318 in 1903 to 11,817 in 1905. The normal "off-year" lessening of the vote will account for these changes only in part. Besides, theoretically, an organization like that of the Socialists, cemented by doctrines applicable to the affairs of the smallest municipality as well as those of the nation, full of militant zeal, dependent little on direct self-interest, but uncompromising in its opposition to other parties, ought to keep its vote more nearly intact in "off-years" than the great parties.

Municipal ownership but private operation seems to be the popular combination with voters this year. Other cities than Chicago have made this compromise between the radicals and the conservatives. In Kansas City, Mayor-elect Beardsley stands pledged to grant no more franchises for privately owned street railways or for privately owned gas works. He is not to be classed with the Dunne type of "ownership" advocate, however, for his backing in the campaign, in strong contrast to that of the Chicago apostle, came from the solid business men. The arguments that won for Beardsley were far from being "Socialistic"; it was pointed out that the companies operating the street-car lines and the gas works were making a great deal of money out of their grants, and that it would be good economy for the city to retain control of the franchises. In Seattle, where Mayor Moore was recently chosen on an issue of municipal ownership, it is now proposed to obtain for the city permanent control of certain of the main streets of the city. A street railway company has asked for franchises to extend its lines, but the Mayor proposes instead that the city develop a system of its own—build it anyway, and lease it to a private operating company if that be thought best. With voters, long-term franchises to private operating companies seem to be about the least popular form of municipal grant just now.

The ousting of John Alexander Dowie from all control, temporal and spiritual, of the various enterprises clustering about Zion City in Illinois, marks the end of a religious movement in some respects more noteworthy than any in this country since Joseph Smith received his revelations. In fact, such an effective combination of religious solemnities, miraculous healing, and business enterprise has had hardly any parallel. This unlucky year for Dowie happens to be the thirteenth since he opened his first small "tabernacle" near the World's Fair gates in Chicago. It is the eleventh from the "year of persecution," when the prophet was arrested more than a hundred times, spent, according to report, some $20,000 in fines and legal fees, but ended by defeating the ordinances directed against him, and won his final cases in the courts. It is about eight years since his establishment of Zion City and its industries. The bill of particulars telegraphed to Dowie by the coterie now in control names among the charges "extravagance, hypocrisy, misrepresentation, exaggeration, misuse of investments, tyranny, and injustice," as well as "polygamous teaching." These are grave and comprehensive enough, but the man's personality has simply triumphed in the past over all disaffection. About the legal status of the existing properties there is likely to be some dispute. When the Legislature once proposed to investigate the Zion bank, it was compelled to desist by proof that the institution was not properly a bank at all. The capital was subscribed by an unincorporated association. There was no limit to the stock; Dowie sold more whenever he needed more money. And the stock itself, on examination, proved to be merely Dowie's personal note, guaranteeing interest. It carried no right to vote or participation in the bank's management. Whether Zion will disappear entirely as a separate entity, or will become an ordinary stock concern after the precedent of the Oneida Community, is the chief question remaining.

It was inevitable that the Irish should find occasion to break with the Liberal Government. Mr. Redmond has just had a meeting of his followers to condemn the course of Mr. Bryce, Chief Secretary for Ireland. The point of condemnation seems ill chosen. It is a question of offices. There was much Irish muttering, upon the formation of the Ministry, over the retention of Sir Horace Plunkett in the Irish Agricultural Department. Mr. Bryce explained that, however, as a temporary arrangement. But now he has reappointed a score of land commissioners who were distasteful to the Irish and whose places they wanted. Hence their angry resolve that this will never do. But it is precisely in such a matter of permanent administrative service that Mr. Bryce is bound to be firm, and it is there that the Nationalists can least afford to make an issue. With the Government preparing to fulfil their hopes in the items of Irish education and a reasonable extension of local government, it seems a mistake to make a row about twenty land commissioners. The incident shows what the Irish would have done had they, as they hoped, held the balance of power in the Commons.

Mr. Birrell's Education bill, which passed first reading in the Commons on Monday, is evidently a valiant attempt to redeem the elementary schools from sectarian control. Under the Education act of 1903, something like 14,000 voluntary (mostly Church of England) schools were taken over by the nation. Salaries and all properly educational expenses were met out of the public funds. The managers of these Church schools merely agreed to provide and maintain the buildings, and to submit in pedagogical matters to the local educational authority. Financially, the act meant that thousands of schools that had been supported by private subscription were put upon the public funds. The evident favoritism of the procedure led to wholesale refusal to pay the school taxes, and some hundreds of convinced Dissenters were haled to court. The bill itself was called the "Bishops' bill,"

which, curiously enough—in a nation that makes a bishop a high grade of public official—passed for a term of reproach. It was, then, a very difficult situation that Mr. Birrell had to meet. On the one hand is a multitude of Church schools and an army of their teachers in actual possession of a public subsidy—and naturally loath to give it up; on the other is a radical body of Nonconformists that will bitterly oppose any sort of religious teaching in State schools except that which pleases the Nonconformist conscience.

The bill drawn in view of these opposing interests is of a pretty drastic sort. The nation will no longer subsidize any denominational school. It will, when necessary or desirable, purchase the buildings of any voluntary school that is in the market. The national authority will not provide religious instruction, but will permit it to be given outside of school hours and free of cost to the funds. But no teacher shall be permitted to give any such religious instruction, nor shall any religious test be applied in the selection of teachers. In other words, the bill really provides for secularizing the schools, with a permissive clause by which parents in the various communities may supply such religious teachings as they desire. Since most of the voluntary schools were, before the Bishops' bill, in a struggling condition, the new act would mean a great diminution in their number. Both within and without the Liberal party such a consummation will be vigorously opposed. Many a Liberal member who is personally convinced of the expediency of the measure, will, should he vote for it, have a sorry time when he next faces his constituency. For Liberalism, however, the conflict is irrepressible. Some time or other British education must be managed according to educational values. If Mr. Birrell's bill becomes law, it should measurably hasten the process of secularizing the schools.

It is not usual with Mr. Asquith, the Chancellor of the Exchequer, to speak strongly on non-political matters, for he is a lawyer whose criticisms are apt to be somewhat cold. But he has just been scoring the London rich of the West End for their indifference to the London poor of the East End. The East London Church Fund supplies Christian workers to 200 parishes, yet, despite appeals, the total annual income is only $100,000, and most of this is made up of the coppers of the poor themselves. The rich, says Mr. Asquith, are not only indifferent, but are becoming more so, for their contributions to the Fund show a decrease almost year by year; and he boldly tells them that the facts of the case are "a scandal and a reproach." Yet it is only fair to bear in mind that the rich of London have innumerable calls made upon them, and that the response they make is by no means ungenerous. They contribute very large sums every year to the hospitals alone. Moreover, few cities are so fortunate as London in having people of rank and wealth who throw themselves with enthusiasm into the work of grappling with misery and sin. Lady Henry Somerset has devoted her life to combating the drink evil; "Father" Adderley, the son of a peer, lived for years in a humble lodging on about 25s. a week, and is now carrying on his social-missionary work in Birmingham; Lord Kinnaird labors unceasingly in similar ways, and there are hundreds of others. They, however, merely throw into relief the callous selfishness of the vast majority of the "smart set."

Nearly thirty years ago the Russian advance into Afghanistan was checked indirectly by the Treaty of Berlin. The recent Japanese success, combined with Lord Curzon's policy, now seems to have put Anglo-Russian relations in Central Asia beyond the possibility of immediate disturbance. In the *Revue des Deux Mondes*, M. Rouire reviews the dealings of Afghanistan with the two rival European Powers. Afghanistan has become an armed state subordinate to British control, and recognized as such by both Russia and Persia. Lord Curzon in 1904 sent a mission under Mr. William Lane to strengthen the bonds between the new Amir and the Anglo-Indian Government. As the result of a treaty made at that time, Afghanistan can have no political relations with any foreign Power. Great Britain, in return, has agreed not to interfere in the domestic affairs of the border State. This arrangement, which guarantees the existence of Afghanistan as a "buffer" between Russia and India, has caused some dissatisfaction among English extremists who favored colonization in the Amir's country. But experience has shown that such settlements must be perilous so long as the country remains inhospitable to European civilization. All attempts made by Englishmen to gain even a peaceful footing there have met with disaster. The Cavagnari massacre led to Lord Roberts's famous expedition. But a railway has now been built from Peshawar to Dakka, and other changes in the means of transportation have been made to encourage commerce as well as, in case of necessity, to send Indian troops rapidly across the border. There is therefore no reason, thinks M. Rouire, why England should be jealous of Russian influence at Kabul, even as Russia does not apprehend a British encroachment upon Turkestan.

The Hungarian *modus vivendi* bears almost the look of a reconciliation. Magyarists of the stamp of Andrássy, Apponyi, and Kossuth are to serve in the Wekerle Cabinet. This compromise Government has agreed to vote temporary supplies and continue existing tariff and treaty relations in the Diet about to be elected. At the approaching session, a universal-suffrage bill will be passed, and, after the first election on that basis, the Ministry will be reconstituted, according to the parliamentary returns. It will be seen from this outline that the agreement between the Independence party and the Crown is really in the nature of a postponement. To avoid a Constitutional *impasse*, the Hungarian Nationalists consent to take office and to submit the more grievous disputes—the army and language questions—to a popular referendum. To have refrained from pushing an immediate controversy to revolutionary extremities is not necessarily a surrender. The actual compromise, then, indicates merely that the Independence party wishes a delay, and confidently awaits the verdict of liberalized elections. Until the reorganized Diet is in session, it will be impossible to learn whether or not Austro-Hungarian relations are permanently improved. Meantime, the willingness of the chiefs of the Independence party to accept office must pass at least for a notable courtesy, and a striking tribute to the persuasive influence of the venerable Emperor-King.

The Liberal trend of the Russian elections is unmistakable. If the Duma is allowed to make an uncensored utterance on national policy, it will unquestionably advocate a constitution and representative government. Avowed reaction will apparently have no weighty spokesmen; in fact, the reactionists who sit at St. Petersburg will, for the most part, be imposed by fraud upon ignorant districts. To measure the extent to which official interference may cripple the work of the Duma is difficult. It may fairly be assumed, however, that the bureaucratic cabal will hardly dare suspend the sittings or otherwise silence the Assembly. The most encouraging feature about the elections is the fact that a number of well-educated men of the lower classes are chosen. They, it is to be hoped, will be aware of the enormous difficulty of sudden and radical change in the Russian order, ready to accept partial reforms, and content to trust somewhat to time and gradual processes of education. From genuine coöperation between a party of this temper and a great manager like Count Witte much might be hoped. Whatever the outcome of the Duma, the tide has set away strongly from absolutism. No Czar who does not take this fact into account, is likely to enjoy for long the usufruct of the Empire.

FORWARD AFRICA!

From illustrious Plato down to insistent Mr. Wells the Utopists have generally cast their visions of accomplished human destiny in terms of their own city. But just as the slow tide of historical evolution has long since destroyed the hope that the Acropolis might develop into the citadel of perfectionism, so it will as surely destroy the aspirations of Trafalgar Square to be the ovum from which mankind's jubilee is to spring. Indeed, if we gaze into the future, and to do so is markedly a fashion of this new century we move in, we can see not unclearly that nearly all the nations now in the van of progress are rapidly rearing obstacles that must throw them seriously back in what may still be called the struggle for the survival of the fittest. The last few years have produced many symptoms that Africa is not to become a white man's continent, and that the black race may eventually assert its independence, its equality, and, perhaps, in remote centuries, even its superiority. A remarkable article was published at the close of the Boer war by a Western scout who had been employed on Lord Roberts's staff. In this he concluded that, with the methods of warfare involved by the long-range, quick-firing rifle, it would not be many years before the African native, with his superior scouting and physical powers, would meet conscripted European armies with every advantage on his side. The defeat of the Italians by King Menelek's army, the ill success of the Germans against the Hottentots, the recent fighting in Natal, all tend to confirm this very plausible opinion.

It is in Natal that the question of Africa is just at the present beginning to take on a national, or racial, or anti-European aspect. The colonists, surrounded on every side by a black sea, cling strenuously to the dominant race idea—an idea that leads nearly inevitably to the scourge, to the gallows, to injustice, and to brutality. But a policy of repression, the policy of sixteenth-century Spain and nineteenth-century Russia, can be neither successful nor justified at the present day. Already the African has learned enough from the white missionary or from his American brother to perceive something of the realities of his position. And if the rule of the European in Central and Southern Africa is to be long maintained, it must be by the adoption of the best methods of colonization, such as those practised by England in Egypt and India. That such methods can be applied in colonies possessing self-government does not appear possible.

It is important to notice such trends as these just at the moment when the celebration at Tuskegee accentuates other and better facts. There black man and white have met with joy, regard, and hope in their hearts, confident that, while hands may be honestly clasped in a mutual effort towards what is better, the happy and right advance of civilization will continue in the path of peace and good will. This school was not the pioneer in the uplifting of the negro race in this country by means of industrial training. That honor belongs to Hampton and its noble founder, Gen. Armstrong. But the wonderful growth of the newer school is noteworthy because it represents a remarkable creative and constructive effort on the part of the colored people themselves. It was started by a colored man of little schooling, and was made world-famous by its great principal, Booker T. Washington. Its buildings are almost wholly the work of its own students, and its teachers to-day are colored people, while those at Hampton are nearly all white. True, most of Tuskegee's endowment was contributed by white friends; but this does not alter the fact that in every essential this school is the creation of colored people, with their own ideals and their own leaders. It was a favorite theory for decades, and still is in some quarters, that the negro is merely imitative and never constructive. The originality displayed in the development of Tuskegee ought, it seems to us, to put that fallacy to rest.

It is, of course, undeniable that Tuskegee has been singularly fortunate in its principal. Mr. Washington, as Mr. Choate has pointed out, is one of the four or five Americans whose names are widely known abroad. No other colored man of to-day has developed equal talents. And yet most of the small industrial schools which have sprung up all over the South as a result of the inspiration and success of Hampton and Tuskegee are managed by colored men and women of much promise and of unusual soundness of judgment. It is the double duty of these schools to produce leaders for the race among the teachers while training the children. But behind them all lies the colored people's thirst for knowledge. Were the desire to rise confined only to a few, Mr. Washington could never have built up such an institution as he has done. Granted that thousands upon thousands of negroes in the South are idle and worthless, there are hundreds of thousands of others whose zeal for the advancement of their children is in every way comparable to that of the bulk of the whites. The very obstacles and the persecution the negro has had to encounter have stimulated him to press on to overcome the conventional Southern feeling about him and his future. Surely a race which, starting with nothing, has accumulated within forty-three years of emancipation property roughly estimated at 450 millions of dollars, has a record to be proud of.

n the history of this movement ten, Mr. Washington's share in it m even greater than is believed He has not merely devoted him- h rare single-mindedness to the work in hand; he has steadfastly declined to have his attention drawn away from the industrial development of the race by those of his own people who would have him lead the campaign against their political wrongs. For Mr. Washington to approve of race discrimination or prejudice would, of course, be impossible. That he is opposed to disfranchisement, save on equal terms with the whites, he has plainly affirmed. But he has chosen to be the educational leader of his people, preaching the doctrine of industry and thrift as the great need of the hour. And in this he is right. To some one else must be assigned the political leadership, and the more the race grows in wealth and knowledge and efficiency, the greater and more effective will be its steadily swelling protest against the theory that honest Americans may be disfranchised merely because of color.

That so rare a leader as Mr. Washington should still, after a quarter-century, be begging for the necessary endowment for his work is the shade upon the recent celebration. No friend of his people wishes him to stop altogether his speaking tours. Wherever he goes, North, South, East, or West, he educates whites and blacks alike by his addresses, precisely as his 'Up from Slavery' has opened the eyes of hundreds of thousands who never before understood the work that Hampton, Tuskegee, and their kindred schools are trying to do, or the possibilities of the colored people. But to carry on a moral propaganda is one thing; to have to beg, year in, year out, for the means to keep the doors of the school open, is an oppressively onerous undertaking. Yet this is Mr. Washington's position, and even more that of Dr. H. B. Frissell, Hampton's devoted principal. The service of these men to the country cannot be estimated in dollars and cents. Their precious strength ought not to be spent in appealing for $25 here and $50 there.

Only $5,000,000 would give both these schools the endowment they need. It is but half the cost of the latest battleship upon which the country is asked to squander money. The one is a barbaric instrument of death and destruction, likely to be relegated to the scrap-heap any day, and certain to be within fifteen years; the two schools are doing most efficiently a splendid service to the whole country, and the more honest and industrious American citizens they turn out, the more they add to the wealth and prosperity and happiness of the nation, the nearer they bring the solution of our greatest national problem. The best white men of the South see this. The appeal to generous Americans

should be irresistible. Mr. Carnegie has pointed the way by his recognition of Tuskegee. A modest citizen of Orange, A. J. Dotger, recently left, contingently, the splendid sum of $650,000, the bulk of his fortune, without having seen Tuskegee. Surely the comparatively small amount these two great Southern schools need must soon be forthcoming.

THE CHICAGO ELECTION.

The election of Tuesday week in Chicago was important both directly and indirectly, both locally and generally. When, on April 4, 1905, Mayor Dunne was elected, by more than 20,000 majority, upon the platform of "immediate" ownership of the street railways, the result was hailed as a sort of signal for a municipal-ownership movement throughout the United States. To a certain extent it was so. The Chicago example undoubtedly had much effect in New York. It helped shape our canvass of last November, and had much to do with bringing on the Hearst candidacy. Hence we are all interested in trying to read aright the lesson of the recent voting in Chicago.

In general, the electoral battle appears to have been nearly drawn. By a majority of less than 4,000, the city voted to approve the issue of $75,000,000 street railway certificates, for the purpose of buying in the property of the various companies as their franchises lapse. By an equally narrow majority, it was voted that the City Council "proceed without delay to secure the municipal ownership and operation of the street railways." This, of course, has no legal effect in itself; and, on the other hand, the popular vote in favor of municipal operation did not amount to the required three-fifths—it being about 120,000 for to 110,000 against. These figures are to be contrasted with Mayor Dunne's vote of 161,000 a year ago and the crushing majorities—nearly 100,000—by which the proposals were then carried to put a stop to private ownership of street railways. All told, the net result must be regarded as showing a chilling of the movement in Chicago. Mayor Dunne frankly admits his "disappointment." The Hearst papers practically confess that they have met a defeat. The Mayor announces that he will at once issue the $75,000,000 certificates to buy up the roads. It should be said, however, that the constitutionality of the law authorizing such securities is yet to be tested in the courts. In any case, "immediate" operation seems farther away than ever, though Mayor Dunne talks cheerfully of asking another referendum soon. The more sensible course would seem to be to lease the purchased roads to new companies under guarantees of an adequate return to the city treasury and an improved service.

One plain lesson of it all, which advocates of municipal ownership should lay to heart, is that steadiness of purpose and tenacity of conviction cannot be counted upon in a large electorate. Voters may seem to "rise as one man" in demanding something one year, only to have it discovered a twelvemonth later that they have ceased to care very much about it, or are off in full cry after something else. After such a supposed "conclusive demonstration of the popular will" as was offered in the Chicago election of 1905, there is an inevitable reaction. The falling off occurs at both ends. Conservatively minded voters begin to think of pulling up; the radicals impatiently desire to go further and faster. Two of Mayor Dunne's most ardent champions of a year ago—Clarence Darrow and young Joseph M. Patterson—left him disgustedly in the present canvass. Their stomachs craved the stronger meat of Socialism. Then there is always a great mass of rather colorless voters who go along enthusiastically with any popular movement, but who have no root in them, and get tired of the whole thing when difficulties arise or delays ensue. After a year of "immediate" municipal ownership leading no whither, they impatiently cry out, "Oh, don't bother us any more about it!"

Furthermore, it is impossible to escape political entanglements. No such issue as municipal ownership can long be kept single and whole. Other matters sprang up in the Chicago election to confuse the public mind. There was the high-license question. In their absorption with that, many voters forgot all about municipal ownership and operation. Then, too, the labor unions rose to inquire what there was in it for them. Their devotion to the principle of municipal ownership was strictly limited by their desire to advance their own interests thereby. Unless they could be assured that municipal employees would be permitted to organize, no municipal ownership for them. Mayor Dunne, with what appears to have been too much of a willingness to create a political machine in that way, agreed that the street-railway employees should be allowed, under city ownership, to organize—only, of course, they "must not strike." Leave that to them! We mention the matter here, however, merely to show what confusing issues were involved with municipal ownership in the Chicago election. Until American politics changes its spots, that sort of mixing of questions is sure to be with us.

Fickleness and confusion are, of course, an old political phenomenon in democracies, but they go ill with far-seeing business management. If Chicago is ready to invest $75,000,000 this year, but next year will be thinking only of how to get out of the enterprise altogether, the inevitable waste and loss are evident. Detailed administration of a great business requires a fixity of purpose and a steadfastness of popular attention which our politics, whether municipal or national, has never yet yielded. This fact is certainly one that the municipal owners must reckon with and meet, if they can. Their arguments are those of far-sighted business men; yet the political forces they have to work with are as unstable as water. However that may be, we think the other large cities of the country will be quite content to stand aside for a time and watch municipal ownership in the interesting experiment station at Chicago.

ABUSES OF CRIMINAL APPEAL.

In the last *Atlantic*, Mr. George W. Alger recurs to a theme, "Criminal Law Reform," upon which we have lately heard many warning voices of weight. The well-known writer on law, Professor Wigmore, has protested against the "exaltation of technicalities" in behalf of "the man who upon the record plainly appears to be the villain the jury have pronounced him to be." Secretary Taft and the President himself have spoken of this serious evil from the point of view of public men, while Judge Brewer has dwelt upon it as it appears to a member of the judiciary. To prevent absolutely the scandals and abuses which spring out of our right of unlimited appeal in criminal cases, Judge Brewer would have us adopt the English system, which admits of no appeal at all.

It happens, however, that the English system is at this moment on the point of being altered. A bill is now on its passage through Parliament to establish a Court of Criminal Appeal. The present denial of appeal is not absolute. If a judge trying a case thinks fit to reserve a point of law, it can be taken to the Court of Crown Cases Reserved. But this is purely at the option of the trial justice. There are also the infrequent instances of indirect appeal by *certiorari*, for the purpose of bringing up the case, both as to law and fact, in the King's Bench. But, as the Lord Chancellor declared, such cases are "very rare," and "no matter how bad a law may be that the judge laid down, there is at the present moment no means of obtaining redress in any court of appeal in this country." Resort may, of course, be had to the Home Secretary, who will grant a pardon if extreme injustice has been done; but his function is that of governmental clemency rather than judicial review. Several gross miscarriages of justice in recent years, notably that in the person of Adolf Beck, have roused a popular demand that the country cease to stand almost alone among civilized nations in having no court of criminal appeal. The contrast with the practice in civil suits is glaring. In any action involving as much as £100, ap-

peal may be taken all the way to the House of Lords.

It must not be thought that the English are about to embark on that trackless sea of indefinite and technical appeal of which Mr. Alger describes the perils. It is a strictly limited procedure that is contemplated. A new court will be created, and the Home Secretary will have power to send to it cases which present intricate and puzzling features. Judicial machinery to weigh evidence, as well as to pronounce upon the law, will be provided, and then it will be expected to work promptly. Especial stress is laid upon speedy determination in murder cases. Said one law Lord: "The country would not permit that a man sentenced to death should be kept with the sentence hanging over him for a month or six weeks until the court of appeal had given judgment." What would he think of Patrick, arrested for murder in 1900, and under sentence of death since 1902, but still arguing appeals?

Lesser criminals, under our loose system of appeal and the growing fondness of the higher courts for reversing the lower on the barest technicalities, too easily go unwhipped of justice. Mr. Alger states the unpleasant fact that every one of the St. Louis boodlers whom Mr. Folk sent to jail has been released, all the convictions having been set aside by the Supreme Court of Missouri. In one of the worst cases, that of Faulkner, the higher court did not question that he had a record "reeking with venality," but reversed the lower court because of two trifling errors in applying the rules of evidence, and a nice "variance" "between the indictment and an instruction." It is this predilection of judges of appeal which gives to criminal lawyers their great opportunity to make a dragging farce of what should be a swift drama of justice. They try their worst cases, not with the idea of clearing their clients, but of trapping the trial justice. Their men are to be acquitted, if at all, not by a jury, but by the judges higher up. So they plan their case from the first for an appeal, and exert all their ingenuity for the purpose, not of showing the innocence of the accused, but of laying a good foundation for "going up." As Mr. Alger tersely puts it:

> "In many of the States a criminal trial means two things. It means not only the sifting of the evidence of guilt or innocence of an accused person—it means also a rigid schoolboy's examination of the trial judge on the law. If the accused be found guilty on sufficient evidence, but the judge has not passed a perfect examination, there must be a new trial."

Between the absence of criminal appeal in England and the very riot of it in this country there must lie a practicable mean. It is for our bar and our judges to find it, and for our legislatures to make it effective. When the law's uncertainties are added to the law's delays, the burden becomes too great. There can be no doubt that our practice has gone too far in making every kind of legal refinement and quiddity turn out to the advantage of unquestioned criminals. Law reformers should not rest till they have done something to make justice among us more certain and more swift.

TEACHING LITERATURE IN COLLEGES.

An American university teacher of literature who sojourns at Paris is very likely to excite something between admiration and ridicule on the part of his French comrades. They marvel that an expounder of Greek, for example, has read only a small portion of the Iliad and Odyssey, though he be, perhaps, an acknowledged authority on Apollonius Rhodius. It strikes them as strange that a professor of Latin may be ignorant of Lucretius, but learned in Oscan and Umbrian morphology. Their amazement knows no bounds when they learn that an American professor of French has read only desultorily beyond the twelfth century, but is preparing a *magnum opus* on the sub-variety of the Wallon patois. They think it grotesque that a doctor in German literature should have an intimate acquaintance with the psalmist Notker and the Minnesänger, but know Lessing, Herder, and Heine only casually. From such instances the critical Gaul of the *Pays Latin* infers that American professors are preferably trained in subjects they are not to teach, and that governing boards gladly appoint professors to teach subjects they do not know.

Only on that theory can budding doctors whose university studies have been almost exclusively philological and extra-literary, be set to teach the literatures of classic and modern times. A very little observation of the incumbents of the best chairs of literature, ancient or modern, in this country will show that for this service philological training is regarded as indispensable, whereas the ability either to produce or to teach literature as such is regarded as wholly negligible. If a doctor emerges from the purlieus of Anglo-Saxon devotional translations, or of Middle English doggerel romance, with any capacity for forming or conveying general ideas, say, on Shaksperian drama or the poetry of Wordsworth, why, that is so much good luck; it is nowise nominated in his bond of appointment. Not only are hundreds of our graduate students untrained as regards literature; they are also expressly trained away from any fruitful thinking on that topic. Why is it that we are privately informed of each and every philologer in a chair of *belles-lettres* that his personal ation of literature is exquisite, lom get such a testimonial from lergraduate classes? It is simanse men who for years have fetish of so-called scientific distrust their own admirations, regard speculation of a comprehensive or humane sort as so much dilettanteism, and accordingly are ashamed to present to generous youth the kind of provender it most needs.

Research, falsely so called, and scientific method have tyrannized over our university education chiefly because they afford a ready road by which mediocrity may proceed to academic honors. From the truly difficult task of teaching what great literary movements mean in their social and æsthetic implications, our university professors have shrunk. It is easier to teach the Indo-European "ablaut rows"; as easy, in fact, as to teach the multiplication table. It is difficult for a modern intelligence to coordinate and interpret the enormous mass of reading required in genuine literary research; it is open to the merest gradgrind to tabulate a grammatical construction in a score of texts otherwise unnoted and unread. Because it is easy for men of a merely plodding sort to teach philology, and difficult to teach literature, literature is neglected. Because men of no training have taught literature with unballasted ecstasy and cheap phrase-making, men of good training fear to teach it at all.

With linguistics and the minutiæ of literary history, we have no quarrel. We hold in heartiest admiration the kind of scholarship represented in this country by Goodwin and Gildersleeve, by the late Francis J. Child and his successor, Professor Kittredge. The trouble is that studies for which only a few individuals have a real vocation are imposed upon all graduate students in lieu of the more discursive and humane training that should fit them for a life-work of teaching. Nobody can blame the exponents of the philological school for getting all the academic advantages they can for themselves and their pupils. Strong personality and singleness of aim will usually prevail over a more suave and dispersed activity. The philological syndicate is omnipotent in American education chiefly because its literary opponents have, as a class, been so weak. Blame lies, however, with the college authorities who have blindly accepted philological as the equivalent of literary training.

That literary study may be as severe and disciplinary as philology itself, has been learned in France, at least. There the University—the collective educational authority of the State—accepts no candidate in literature who has not some historical background and training. But the university curriculum of a professor of literature is, strange to say, literary. He devotes himself to the.

authors he is actually to teach in the college or lyceum. He has before him such models as Faguet, Lanson, and, until lately, Brunetière. He learns not merely the history of literature, but the art of clear and effective writing. By examination he qualifies for a position as a professor. If he desires the degree of Docteur ès Lettres, he gradually prepares, while he is teaching, a thesis that represents a personal predilection and is usually a thorough, well-considered, and readable contribution to literary history or criticism. Compare with this decent, orderly, and progressive course that of the average American university student of letters. He spends three or four years studying subjects that he will rarely teach, and which, in bulk, he will repudiate on the day of his liberation. He produces under stress, and merely to gain the needful hallmark of a Doctorate in Philosophy, an inchoate dissertation that preposterously passes for "a contribution to the sum of human knowledge." Then for the first time he really begins to study the literature which he is called upon to teach—in whose name he has devoted the best years of his youth to extra-literary pursuits.

It rests with real lovers of literature to combat this delusion. The serious teachers of literature might do worse than practise the "means of arriving" so successfully used in the philological camp. Above all, university presidents should go beneath "cathedral" nomenclature and learn what is said to be taught, what is best worth teaching, and what is actually taught in their universities. It may some day occur to this class of leaders that literature is not merely a label in four syllables that may be clapped on any philological back, but that it actually connotes a worthy and most useful department of study. From this point of view, Mr. Bliss Perry's appointment to a chair of literature at Harvard is welcome. It shows that wide reading, good judgment, ability to teach and inspire, and capacity to handle the English language with tact still count for something without the panache of original research of the "cold frame" order.

A TRIUMPH OF FREE TRADE OR OF SOCIALISM?

LONDON, March 22, 1906.

Recent debates in Parliament reveal two facts, none the less noteworthy because the existence of the first is denied by the Opposition, while the importance of the second is ignored by the Ministry.

First, the rout of the Unionists is due to the disastrous attack on "Free Trade," as that term is understood by ordinary Englishmen. Secondly, the crowds who rallied to the support of Free Trade were, to use the political slang of the day, "Free Fooders." Whether they were Free Traders in any wide sense of that term is dubious; they were assuredly not disciples of the old Manchester school. The ideas of Cobden and Bright, and of those Liberals who more or less shared their convictions, formed something like a coherent political creed. Peace and retrenchment were, in the eyes of the great Free Traders, as important as Free Trade itself. Every innovation or reform advocated by the Manchester school was, in truth, an expression of the individualism which taught that the prosperity of a country depended on the development of individual freedom and of individual energy, and that State intervention, which was at best a necessary evil, became an evil for which there was no necessity at all when State aid enfeebled self-help. No human being can believe that this is the spirit of the majority of those electors who support the present Government.

To see that this is so, let us fix our eyes upon the attitude of members of Parliament towards retrenchment. The Premier, the Chancellor of the Exchequer, and other members of the Cabinet may wish to cut down the national expenditure; and every man, whatever his political sympathies, of course wishes to diminish the money spent on objects for which he has no desire. But this is a very different thing from the passion for economy which actuated a generation among whom Joseph Hume exerted acknowledged influence. Consider the language of a leader among the Labor party who can speak freely because he is out of office. Mr. Keir Hardie said

"that whilst he and the bulk of his colleagues believed in Free Trade, they could not find that Free Trade itself had solved the unemployed problem, had provided for the necessity of the aged poor, or had solved the social problem. He had, at the outset, entered a caveat against the time being given to this motion at all. He repeated that now with emphasis. They had wasted a day and a half of valuable time in discussing an issue which was a foregone conclusion; time which might have been profitably spent in redeeming some of those promises upon the strength of which the Government won so handsomely at the late election. Whilst he and his friends should vote against the amendment, it must be understood that in so doing they were not committing themselves to the theory that Free Trade was the issue upon which they won their election. It was an incident in the election campaign; but the great question upon which they won was the condition of the people, and the need for having a party in the House *which was tied neither to Free Trade nor to Protection, but was free to use its time in any way necessary to bring about social reform.*"

Let these words, and especially those I have underlined, be read with care. They are the language not of any Cobdenite or genuine Free Trader, but of a man who desires that neither Free Trade nor Protection should hinder the lavish expenditure of the nation's wealth on what he terms "social reform," or what opponents might describe as "socialistic revolution." Turn now to the words of Mr. Asquith. He is among the ablest and most respected of the Ministry. As Chancellor of the Exchequer he is in a special sense the guardian of the nation's purse. He, rightly enough, calls the attention of the House to its own love for expenditure, which really means the passion of the electors for schemes that involve heavy taxation.

"Let me point out," he said on the 14th of March, "to both sides of the House that the worst offenders in this matter are not the heads of the spending departments. Who are they? The members of the House of Commons. [Hear, hear.] Just let me ask the House to remember how it has been engaged since it came here just a month ago. As soon as we had disposed of the address, an honorable gentleman, I think sitting there [indicating the benches occupied by the Labor party] raised a demand for free postage for members of Parliament, a return to the old system of franking which was abolished because of the abuses it had led to and also its enormous cost. [Hear, hear.] The next day the House proceeded to pass, with unanimity, the second reading of a bill to provide free meals for all the underfed children in our elementary schools. [Hear, hear.] They followed that up, I think the next night or the next night but one, by recording, by an enormous majority, the necessity of throwing the burden of returning officers' expenses off the shoulders of members of Parliament and candidates upon the public. [Hear, hear.] And it finished up the week [laughter] by passing, with an enormous majority, a motion declaring the urgent necessity of voting out of public funds a stipend of not less than £300 a year to each one of its own members. [Laughter and cheers.] A very good week's work for a Parliament elected to promote retrenchment and economy. [Opposition cheers.]"

These words should be read and reread. Circumstances add to them untold significance. They are part of a speech in favor of founding a system, at some date unfixed, of old-age pensions provided at the expense of the nation. The desired system has not yet been thought out by any responsible statesman. No man ventures to assert with confidence what may be the expense it will entail. The estimates of experts vary from £10,000,000 to £13,000,000 or £26,000,000 a year. The resolution asserting the desirability of this innovation is voted by the House of Commons without opposition. These facts tell their own tale. The alleged Free Trade triumph is a protest against all taxes on food, but, when critically examined, looks far more like a victory of Socialism than of Cobdenism. AN OBSERVER.

PRINTS AND DRAWINGS AT THE INTERNATIONAL.

LONDON, March, 1906.

To open in London an exhibition on a large scale that shall consist entirely of prints and drawings, to make it interesting and representative, to arrange it so it will be effective as well, is to achieve a triumph. This is what the International Society of Sculptors, Painters, and Gravers has done. In the second section of its sixth exhibition, it has filled the New Gallery with the sort of work that in most London shows is thrust away in odd corners where no one would think of penetrating in search of it. Much of the sculpture remains as I have described it in the first section of the exhibition—M. Rodin's "Baiser," Constantin Meunier's and Mr. Bartlett's bronzes; and to these have been added an athlete and an Amazon in bronze by Franz Stuck, and examples of the work of Rosso, which certain people have raved about as the new impressionistic sculpture, and which the members of the International, whatever they may think of it, are quite willing to show, exhibition being the fairest test for experiments and for new departures. But in the three large rooms and the balcony, pictures have been exchanged for etchings, engravings, and lithographs, pastels, water-colors, and black-and-white drawings in every me-

dium. It is astonishing how well these things, tho most difficult of all to hang, have been spaced and grouped so as to produce a fine decorative effect. The endeavor has been to represent each exhibitor by a characteristic series, and to keep his work together—to make virtually a succession of "one-man shows"; and the various groups have been so well balanced and distributed that unity, not discord or confusion, is the result. When you come to look at the work itself, the discrimination and care with which it has been selected will seem no less astonishing.

Of course, within the limits of the New Gallery, the collection could not be as exhaustive as it is representative, and gaps might, no doubt, be pointed out. But, on the other hand, the work is as international as the name of the Society, and, moreover, gives a fair idea of what is best and most individual and independent in the art of each country represented. It is some years now since one began to notice in the Salons at Paris, especially the New Salon, the immensely interesting experiments that artists were making on metal and stone and wood. Much of the most successful achievement that has come out of this experimenting has a place in the French group, together with the studies and drawings of men who are the most distinguished artists and strongest draughtsmen now at work anywhere. The chief centre, naturally, is reserved for M. Rodin, the present president of the society. I am afraid the remarkable series of his drawings—genuine notes and memoranda—have bewildered the British public, who do not care for that sort of thing anyway, and can be induced to put up with it only when the notes and memoranda are faithful imitations of the Old Masters. M. Rodin, in recording his impressions of a pose, of movement, or of grouping, has evolved for himself a scheme of drawing that is extremely interesting, more like the Pompeiian frescoes or the Etruscan decorations as one sees them on the old vases; and the examples now at the International form a series of color harmonies of great beauty, and, therefore, quite unappreciated in England. They are not, indeed, appreciated at their true value even in France, where it has become the fashion for the critic to wait for what England, or America, or Germany may say before venturing upon an opinion of his own. With these drawings hang Rodin's etchings—portraits of Victor Hugo, Antonin Proust, Henri Becque, and "La Ronde"—all too well known to be described again, but important here as reminders of how carefully and with what finish—finish in the right sense—Rodin can draw.

Another Frenchman who is less experimentalist than master, is Degas; and the fans with the decorative arrangement of ballet dancers, the rare landscapes in pastel, are beautiful examples of his work. The vigorous draughtsmanship of Louis Legrand in his pastels and etchings, of Forain in his pen-and-chalk drawings, of Léandre in his studies, make the sham Old Masterly performances in the same mediums of certain Englishmen who are the mode of the moment—a mode which I hope is not to be imported into New York by way of the Metropolitan Museum—seem sadly and feebly amateurish; while you have only to look at the splendid richness of the water colors by Luigini, Latouche, and Rouault to admit how much wiser it is to develop a medium than to carry it no further than the first tentative essays by the earlier craftsmen. In England, just now, one sees far too many sham Girtins, sham Cozzenses, sham Cotmans. The wonder is that the Englishman really does not go back to his real Primitives and paint himself blue!

The larger part of the French collection is made up of prints—etchings by Legrand, Chahine; etchings in color by Villon, Cottet, Latouche; lithographs by Lautrec, Lunois, Léandre, Blanche, Belle Roche—prints, these, by men whose reputation has long been assured everywhere save in England. Fortunately, the International is too liberal to refuse the good work of a man who happens to be dead. Manet's etchings have been included, and a remarkable collection of the less well-known etchings, lithographs, and water colors of Camille Pissarro—sketches of the streets and squares of Paris and Rouen, of fields and meadows and peasants, notes of color, light, movement, which preserve all the first vividness and freshness of the impression.

The German section has been another and still more startling revelation to the English, not only because of the quality of the work, the sudden realization that even art is "made in Germany," and by artists never before heard of on this side the Channel, but because of the number of fine things by artists whose names have become too famous to be ignored by the most artless of people. Adolf Menzel was an honorary member of the Royal Academy, but it has been left to the International to give the first notable showing of his prints and drawings attempted in London since his death. The German museums have for long been collecting Menzels, and most museums object to lending their treasures to a private body. However, the National Gallery at Berlin was induced to contribute, a few private owners were generous, and all one side of the large room has been filled by his most characteristic etchings and lithographs, water-colors and drawings; marvellous studies (some of them portraits of German statesmen and generals) for his paintings, epoch-making illustrations, even several from the "Uniforms of the Army of Frederick the Great." The Society has managed, too, to make a little "one-man show" of Böcklin, who was an honorary member, and whose work is almost as difficult to get from the museums, that mostly own it, as Menzel's. A number of his chalk drawings have been lent, principally studies for "The Pest" and other pictures; very powerful, very personal, and, like the notes of Rodin, a curious contrast to the self-conscious so-called studies of the modern British critically labelled genius, seeking to be original by borrowing the methods of artists who worked years or centuries ago, under totally different conditions, in a totally different stage of development. The German prints are chiefly by Liebermann, Klinger, Otto Fischer, Otto Greiner, Käthe Kollvitz, one of the strongest women artists at work to-day; Emil Orlik, Otto Gampert. Where so much is good, it is impossible for me to speak of everything in detail. Besides, I want more especially, by explaining what the exhibi- tions, to demonstrate what an in- it is for the International to ha- -nized it. I have seen many of the already in French, German, and Belgian shows. New to me, however, are the wood blocks printed in color by Emil Orlik, who, in his use of flat tints and simple color schemes, has learnt a great deal from the Japanese, while going to them for many of his motives. I was struck, too, with the excellent designs of the big, cheap colored lithographs, now published in Germany, mainly, I understand, to hang in school rooms: models of what such prints ought to be. In the midst of all these things, it was with something of a shock, but a shock of pleasure, that I came upon three huge water-colors by Van Bartels, who works in this medium much as if it were oil.

The American section has been quite as great a surprise for the Englishman who is ready to believe that when he has seen the work of American artists living in London, he has seen everything America can produce in the way of art. The gaps are not a few in this section, but what work has a place is representative. The wood engravings of Mr. Cole and Mr. Wolf prove that America, however practical, has still the leisure and, what is more, the sense to cultivate and appreciate an art considered over here too commercially out of date to be encouraged, and not even in France producing anything to surpass the work of these two men. There are also the etchings of Otto Backer, Charles Platt, Dr. S. MacLaughan, Joseph Pennell, and the dry points of Miss Mary Cassatt, as well as two of her delightful experiments in color-printing. Then there are water-colors—dramatic seas by Mr. Woodbury, Canadian types by Mr. Hallowell, arrangements of steam and smoke by Mr. Horton, sky-scrapers by Mr. Cooper. If I pass over these lightly, it is only because they are already known at home, and because, as I have said, where so much good work is exhibited, I can do no more than suggest the general character of the collection. The pastels of Mr. Fromuth and Mr. Muhrman, the charcoals of Mr. Mura, have been often seen before in London; but seldom, if ever, drawings for reproduction by Guérin, Brennan, and McCarter, Elizabeth Shippen Green, Jessie Wilcox Smith, Violet Oakley, Sarah Stillwell, Charlotte Harding. This is absolutely the first time, as well as I can remember, that American illustrations have been seen to such advantage in London. The selection is much better than it was in the case of the American pictures sent to the first section of the exhibition.

The Dutch exhibitors are overpowered by Bauer, whose etchings make an impressive group; among them those huge plates, Oriental in subject, that are in entire contradiction to the law of size laid down by Whistler, but a contradiction so splendid and vigorous as to be a law unto itself. The Belgians, in their turn, are overshadowed by Constantin Meunier. But to this there can be no objection, for in his drawings and water colors one can see how carefully and elaborately he studied the miners and laborers who were the models for his bronzes, still in the central court. It adds further to the interest of these drawings that they should appear in the

same exhibition with the studi[illegible]din. Nothing could well be more d[illegible] than the way these two great se[illegible] have gone about their work, nothing mo[illegible] different than their notes and memoranda. Fernand Khnopff cannot be effaced even by Meunier, for this year he is once more the Khnopff who charmed by the tenderness of his sentiment and the beauty of his handling. He has only one drawing, a very large interior of a church, cool, gray, solemn, mysterious, with a mystery that is much more nobly conceived and rendered than the symbolism of Rops, a few of whose etchings are exhibited. From the Scandinavians there is little, but that little includes an almost, if not quite, complete collection of Zorn's etchings, and two of Thaulow's large color prints. It must be confessed that as these prints by Thaulow increase in popularity, they grow more commonplace. This year they have slight, if any, distinction in subject and composition, and they repeat the elaborate color scheme it is not the business of the printer to get out of an etched plate, or, for that matter, out of a plate or block of any kind.

The British section is the least interesting of all, and yet pains have been taken to select the best that British artists have accomplished in the various mediums classed under the division of "Graving." The British work looks sad and heavy and lifeless, without the brilliancy of the French, the determination of the German, the intelligence of the American. Color is dulled, experiment stifled, achievement lowered. There are exceptions, it is true. The color prints by Mr. Morley Fletcher and his pupil, Mr. Seaby, have the right feeling for the use of color and the due deference to the limitations of the wood block. They hang side by side with the color work of Orlik, and they can stand the test. The lithographs by Mr. Edmund J. Sullivan, with such ambitious motives as "The Awakening of Chaos," "Icarus," "Tithonus," are good, strong examples of the color and depth and variety the stone can be made to yield, and Mr. C. H. Shannon also has a fine lithograph. Mr. Brabazon's simple notes in water color and pastel are suggestive, though the tendency in England is to overrate them inordinately. They cannot compare, for instance, with the water colors of Mr. Mann Livens, who is still almost unknown, though his work is much more personal than Mr. Brabazon's far-away reëchoes of Turner. Mr. Crawhall and Mr. Swann can draw animals better than almost any modern artist, but Mr. Crawhall has shown far stronger and more spirited designs than those by which he is now represented. Other exceptions are Sir Charles Holroyd's etchings, a drawing by Mr. Pryde, a big water color on silk by Mr. Conder, as dainty a decoration as you could house, and still others might be discovered. But the bulk of the British work is terribly pretentious and absolutely commonplace. It is just the other way in the foreign sections. There the commonplace is the exception. And, seeing this, you realize what a great work the Society, by keeping to its liberal international standard, has already accomplished in England; what an influence for good it is bound to exert on the art of the country if it can but continue in the way pointed out by its first president, Whistler, and hitherto more or less faithfully adhered to, despite opposition and ridicule and abuse. N. N.

Correspondence.

"NEW LIGHT ON AMERICAN HISTORY."

To the Editor of The Nation:

Sir: Anent the communication under the above heading in the last issue of the *Nation*, permit me to supply, at least in part, the hiatus in the memory of the German professor. The statement he had in mind is contained in a work published in Cincinnati and Leipzig, in 1847, entitled 'Geschichte und Zustände der Deutschen in Amerika,' Franz Loeher author. In the chapter describing the growing preponderance of the English over the German-speaking population of Pennsylvania occurs the paragraph which the professor had in mind. It is as follows:

"We need, therefore, be no longer surprised that, also in politics, in the courts and other public deliberations, the English gradually obtained the leadership and introduced their language, at least in the principal assemblages. Nevertheless, this was not easy in Pennsylvania. When deciding whether the ruling (*herrschende*) language in the Legislature, in the courts and public documents of the State should be German, the votes were tied. One-half were cast for introducing the German as the legal language, which is of great significance when one reflects that it was intended to make a State German which had heretofore been English. The speaker of the Assembly, one Mühlenberg, by his vote gave the decision in favor of the English language."

The author omits mention of the date of the session when this vote is stated to have been taken, and it will require the aid of a student of early Pennsylvania history to verify or disprove the incident.

Max Lowenthal.

Rochester, N. Y., April 2, 1906.

OTHER WOODEN-HEADS.

To the Editor of The Nation:

Sir: "The ligneous English" mind, says your correspondent "Nemus" (*Nation*, March 29). That some fragments of it have escaped across waters wider than the English Channel, take as evidence this clipping of editorial comment, fresh and accurate, from *Appletons' Booklover's Magazine* for the current month:

"The Balfour Government passed away at the end of last year and Sir Henry Campbell-Bannerman was asked by King Edward to form a ministry. Thus the Unionist party in England, after having been in power *almost continuously for nineteen* years, has ceased to exist and its place is taken by *a protectionist organization.*"

Or is it only that particular variety of the wooden that is impenetrable by anything that touches the one subject—our most particular and peculiar protection?

X. Y.

Madison, Wis., April 2, 1906.

Notes.

A volume of symphonic verse, 'The Building of the Organ,' by Nathan Haskell Dole, is in the press of Moffat, Yard & Co.

Forthcoming from Macmillan Co. are A. C. Benson's 'Life of Walter Pater' and W. S. Harwood's 'The New Earth.'

The John C. Winston Co. will issue directly 'Panama: The Isthmus and the Canal,' by C. H. Forbes Lindsay.

Paul Elder & Co., San Francisco, have in in press 'The Garden Book of California,' by Belle Sumner Angier.

We are glad to learn that Signora J. W. Mario's 'Stansfeld-Mazzini' proves to be much more in a condition for publication than the lamented author was inclined to believe. It will, in fact, be given to the light by T. Fisher Unwin.

A work on 'Greek Theories of Elementary Cognition from Alcmæon to Aristotle,' by Prof. John I. Beare, is about to be published by the Oxford University Press, along with an essay on 'The Nature of Truth,' by H. H. Joachim.

Mr. H. C. Moffatt's 'Old Oxford Plate' (London: Archibald Constable & Co.) is intended to serve in some measure as a companion to Messrs. J. E. Foster and F. D. Atkinson's book on 'Old Cambridge Plate,' and to bring into notice a good many specimens practically unknown outside Oxford. It includes all the early ones and as many as the space allows of the finer or more curious seventeenth and eighteenth-century pieces. Over one hundred and thirty are described with their marks and measurements, with brief biographical notices of the donors, and in nearly every instance with an accompanying illustration in photogravure or collotype. The issue is to be limited to two hundred and fifty copies.

Part 4 of Prof. A. De Gubernatis's 'Dictionnaire International des Écrivains du Monde Latin' has just reached us, and carries the biographies from Henriques to Naccari. It pursues the methods and has the qualities described in our references to the earlier parts. It was Prof. De Gubernatis's intention to complete the work in four sections, but he has amassed so much more material than he expected that there will be six parts—about 1,500 pages—in all, which will be distributed to the original subscribers without additional cost. The editor is his own publisher, at Rome.

A. C. McClurg & Co., Chicago, have brought out a popular (sixth) edition of their translation of the Baroness von Suttner's 'Die Waffen Nieder!'—'Ground Arms!' American readers will find some difficulty in understanding the effect produced by this tract in Europe, as in bringing about the Hague Tribunal, for which the authoress has lately received the Nobel Peace Prize of $40,000. Constructively it shows no literary genius, and its war pictures fall far short of those in Tolstoy's 'War and Peace.' But may its influence be prolonged!

Mr. Paul Fountain, author of 'The Eleven Eaglets of the West' (E. P. Dutton & Co.), evidently belongs to an impressionist school of literature. Like the painter who dashes a splash of color here and another there to produce an effect which it requires a special aptitude to appreciate, he introduces a little natural history, a little science, and a few incidents of travel. Thus he wafts us with dizzying speed over the eleven Rocky Mountain States and Territories which are the "Eleven Eaglets of the West." Fortunately we are spared a flying trip to distant Alaska, with its own

bewildering distances. He starts us from Death Valley, without any premonitory warning as to where Death Valley is; jumps from Death Valley to San Francisco; tells of meeting the pioneer gold-digger in those early days when the Southern Pacific had not yet stretched its rails from end to end of California; gives us a glimpse of the Yosemite; then in a flash carries us, by undefined mountain trails, to within sight of Mount Shasta, a thousand miles to the north. Mr. Fountain has published other books of the same indescribable character, to which he refers us if we wish to repair the geographical lacunæ of this the last which he proposes to write. He tells in some detail of his ascent of Mount Shasta, and of his observation of active fumaroles on a ledge below the summit. Then he launches us into Oregon; and thus he crosses from State to State and Territory, landing us in Nevada near our starting-point, but leaving us generally in doubt whether the conditions he describes were those prevalent during his earlier or his later trip. Any one unfamiliar with that section of the continent would carry away from the perusal of his book a most confused impression of its geographical features, and of either its past or its present social and industrial conditions.

Eugene F. Ware, the well-known Kansas lawyer and politician, has collected and translated the various sections of Roman law relating to the use of water (St. Paul: West Publishing Co.) Mr. Ware has arranged the matter by subjects, such as Rivers, Rain Water, Irrigation, Drip, etc., using a consecutive section numbering of his own throughout the volume, but giving a definite reference to his source in each case. The English of the translation sometimes lacks in clearness, but perhaps that is too much to ask of the language of law.

'Chatwit, the Man-talk Bird,' by Philip Verrill Mighels (Harpers), is documentary evidence that the shafts of Mr. Burroughs, reinforced from the White House armory, have not silenced the "new school" of nature writers, who avoid the long and tiresome process of acquainting themselves with the more primitive psychology of animal life by substituting therefor the more varied and interesting psychology of man. We may hope, however, that the recent discussion has established the relation of such literature to genuine natural history sufficiently to curtail its power for harm And yet we should hardly be willing to put the present volume in the hands of a child without impressing upon his mind empbatically the fact that real birds and animals never, *never* act as here represented. The book purports to tell the tale of a talking magpie, "whose loosened tongue and human inclinations gat wrath in the breasts of the West-land animals," and of course that wrath engendered ten thousand woes, and sent many souls of brave birds and animals across the Styx before their natural time.

For nearly fifty years a teacher of the subject, Dr. Austin Flint, the author of repeated treatises, now presents students and practising physicians with a newly written 'Handbook of Physiology' (Macmillan Co.), copiously illustrated in colors as well as in black and white. It neither weighs unsettled questions nor takes up the more recondite theses which require a bigh general education to comprehend, but it offers to daily workers, for their daily needs, a practical volume whose character the writer's well-established reputation guarantees.

An index of the revolution in the popular and the professional mind as to the curability of tuberculosis is Dr. F. R. Walters's 'Sanatoria for Consumptives' (London: Swan Sonnenschein; New York: Dutton). Three hundred of its large octavo pages are practically a universal directory for such sufferers. Doubtless the intention to include all has not been realized; it hardly could be, in view of the rapidity with which sanatoria are springing up, and some of the information is meagre. But the patient who can reach a sanatorium at all, certainly may select here a place suited to his needs. Sixty pages discuss the general principles and methods which these institutions represent.

The French school system—primary, secondary, and superior—clearly and accurately described in a volume of 129 pages and 15 chapters, is a boon that many will welcome with gratitude. This book, by M. Gaston Rouvier, 'L'Enseignement Public en France au début du XXe Siècle,' with a preface by M. Louis Liard (Paris: Hachette & Cie.), is the result of a course of lectures delivered in French by the author at the summer session of the Upsala University in 1903. He very wisely added the more recent school legislation dealing with religious communities that was passed by tbe Combes Ministry in 1904. All the problems agitated with reference to the secondary-school system and the attempts to put it in harmony with modern needs are well and completely explained. As a merely descriptive book of existing conditions, this leaves very little to be desired, and ought to be in every pedagogical library.

Whoever has followed the recent reaction against chauvinism and militarism in France, with the counter reaction that accompanied it, cannot fail to find much to interest him in the two books by M. Gustave Hervé, 'Leur Patrie' and 'Instruction Civique' (Paris: Bibliographie Sociale; New York: Brentano). The author, who will be remembered as a professor dismissed from the French schools for antimilitarist propaganda and rejected from the Paris bar on the same ground, is now in the Clairvaux State prison, serving a four-years' sentence for having, with a score of other anti-patriots, signed a revolutionary appeal to the young conscripts. The theme that M. Hervé develops in 'Leur Patrie' with brilliant, if not always convincing, logic, is that the fatherland, with its ethnic historical or political ties, groups men of different and widely separate interests, and sets against each other the very men who, by the nature of their economic conditions, ought to stand together. He points out with a good deal of humor the absurdities and follies of the exalted patriots, and urges the Socialists of all countries to stand in time of war not by their country, but by their class. The boldness of M. Hervé's deductions, the absolute contempt that he shows for political expediency and compromise, the terror that his attitude has inspired in his party, give to this brilliant and paradoxical little book a very peculiar flavor. 'Instruction Civique,' written in a more objective spirit, aims at giving to French school children the elements of civics—colored with the author's peculiar ideas. It is a most readable textbook, reliable in its information, humorous in its argumentation. Teachers of French will find it a very useful book of reference on the institutions of present-day France.

The letter L comfortably fills from cover to cover the twelfth volume (sixth edition) of 'Meyer's Konversations-Lexikon' (Leipzig: Bibliographisches Institut; New York: Lemcke & Buechner). Relatively speaking—for letters as well as books have their fate—it is not distinguished in our Lexikon's alphabet. The conspicuously great names are Lessing and Luther; and Leipzig, Liverpool, London, and Lyons are the chief cities among not a few charted plainly or in color—in the latter case always with an index of names. Leipzig, Leuthen, and Ligny furnish the great battlefields. Lhassa is brought up to date with a bibliography of the Younghusband expedition. Under *Landesaufnahme* there is a notable survey of Government cartography in the principal countries of the earth. Under *Literatur* a synchronous conspectus by tabulation is attempted; and here the United States is reduced to its lowest terms. It has no column to itself, but, tucked away under England in the period since 1830, we find: "American humorists: Aldrich, Bret Harte, Mark Twain." Shades of Holmes and Lowell at least! Lowell has a respectable article to himself in his alphabetic place in this volume. Other interesting rubrics are Ballooning, Lungs and the Diseases thereof, Lithography, and Life Insurance; but here again the editors are at fault, for, in the reference to American life insurance, there is not a word regarding the revelations of the past half year.

The Proceedings of the Scottish Antiquaries for 1904-1905 (vol. xxxix., 4th Series, vol. iii.) is a number of more than usual interest. It contains reports on no less than four sets of excavations, undertaken by the Society or by private persons, in different parts of Scotland, viz., on the excavations at Fethaland and Trowie Knowe, Shetland, by the Hon. John Abercromby, on the excavations of stone-circles in Kincardineshire and Aberdeensbire by Mr. Fred. R. Coles, of forts on the Poltalloch estate, Argyll, and of Rough Castle on the Antonine Vallum by Dr. Christison and Mr. Mungo Buchanan. The bulk of the other papers are descriptions of stone coffins and sculptured or inscribed stones (very interesting is Dr. Christison's account of the Kirkyard Monuments of the Lowlands), and of finds of prehistoric and Romano-British vessels and ornaments, burial urns, caldrons, coins, etc. "The Ornament of the Beaker Class of Pottery," by Mr. Abercromby, continued from volume xxxviii., is particularly suggestive. Of the remaining article we mention only the "Pigmies' Isle," by Mr. Mackenzie—the pigmies, it would seem, are none other than tbe fairies. The book has upwards of three hundred illustrations, and may be obtained from Neil & Co., Edinburgh.

The *Geographical Journal* for March opens with a preliminary report, by Mr. C. G. Seligmann, of the Daniels Ethnographical Expedition to British New Guinea. There is much interesting information as to the natives, their homes, manners of life, boats and totems, as well as a description of

the regions visited. Major Gibbons, [illegible]f of a commission appointed to examine the Guas Ngishu plateau in East Africa, the region offered to the Zionists for a Jewish colony, describes it as a "white man's country" with a considerable agricultural and pastoral future. There is a large extent of forest land abounding in a giant cedar. In the discussion following the reading of the paper before the Royal Geographical Society, Sir Charles Eliot, former governor of the protectorate, characterized the plateau not only as a place where Europeans can live comfortably, but as a singularly beautiful and attractive country, and absolutely uninhabited. Among the other contents are an illustrated description of the rivers of Cape Colony, by Professor Schwarz of Grahamstown, and a summary of recent regulations in regard to teaching geography in the English schools.

In the March Bulletin of the Metropolitan Museum of Art, Mr. Frank Weltenkampf presents grounds for believing the busts of Franklin attributed to Ceracchi to be not from life, but after a terra-cotta bust made by J. J. Caffieri in 1777. He quotes Mr. Charles Henry Hart as authority for the statement that Franklin and Ceracchi never came together. A medallion based on Caffieri appears to have been the parent of numerous engravings.

In a recent mention of the current annual report of the Hagerstown public library, we quoted the fact that this new avenue to enlightenment was eagerly resorted to not for the works having the bubble reputation of the hour, but for the best literature. A similar encouraging tale is told in the report of the public library of Passaic, N. J., a manufacturing town. The relatively low percentage of fiction circulated is explained "by our large patronage by foreigners, who, even after they have mastered the English language, are more anxious to read our literary masterpieces than the latest novel." The library has extended the use of its hall "to the Dante Literary Society for their lecture in Italian on Dante, by Mr. Biasi, and the Slavish societies for their lectures in Slavish, Bohemian, and Russian."

Dr. J. W. Mackail, Mr. Andrew Bradley's successor to the chair of poetry at Oxford, gave his Inaugural Address on March 10. Its title, 'The Progress of Poesy,' was suggested by that of Gray's famous ode, the structure and matter of which he discussed in his opening sentences. He led up in this way to the statement that the subject to be dealt with by the holder of his professorship is none other than the subject of that poem, the function and power of poetry, and the large lines of its progress from country to country and from age to age. He did not on this occasion attempt to give anything in the nature of a general sketch. To the new fields, Celtic, Scandinavian, Oriental, etc., which have been revealed to the poet in the last hundred and fifty years —fields whose treasures Gray was the first to suspect—he merely alluded in passing. He was content to illustrate the progress of poetry by reference to the history of the chair from the time of Trapp, the first professor (1708-1718), down to 1857, when the advent of Matthew Arnold marked the beginning of a new era. In the century and a half which followed its foundation, its province, as generally understood, was to discuss poetry as a grammatical or scholastic art (Trapp laid it down as an axiom that poetry can be and should be taught like grammar or rhetoric), or else to set forth the result of search among documents bearing on it. Since the days of Arnold, the aim of the lecturer has been to show it in one or other of its varied aspects as a function of life. He professes poetry, but he does not profess to teach it; to show how it is made, as was once thought possible, is as vain as the attempt to define its essence.

The study of Roman history suffers a considerable loss in the recent death of Mr. A. H. J. Greenidge, a number of whose books have been noticed in these columns during the past few years. Mr. Greenidge was an indefatigable student, and was manifesting, from book to book, a steady improvement in the art of communicating his knowledge to others. The first volume of his 'History of Rome during the Later Republic and the Early Principate' gave promise of a work of great value. The undertaking contemplated six volumes, but, from statements made in the preface, we assume that no great portion of the remainder was left in shape for publication.

—Miss Susan M. Kingsbury has made a study of the sources for the history of the Virginia Company of London, and the resulting publication must rank high in point of thoroughness and general form. Some 764 separate documents are listed and described in such a way that the location, nature, and place of publication may be easily determined. The writer made many discoveries of new documents in the English archives, and established the loss of many more by the receipts and memoranda of books and papers received or delivered in the various changes in the form of the ruling body. These gaps are more noticeable in the earlier years of the Company's existence; in the middle period the Manchester and Ferrar papers gave rich finds which supplement the invaluable manuscripts obtained by the Library of Congress from the Jefferson collection. Indeed, that Library now possesses, in original or in transcript, whatever early Virginia material in manuscript was found in the British Museum, the Privy Council Office, and the Bodleian and Magdalene College Libraries. In printed matter it is not so rich, having only three of eighteen documents issued by the Company after 1616. The Smyth of Nibley papers in the New York Public Library are another invaluable source of information, and that library also has the transcripts made by Brown for his 'Genesis.' But, after the careful examination of the field by Miss Kingsbury, it must be concluded that there is a fair chance of finding in some of the great collections in England the missing books and papers of the Company, and in this work the activity of the Historical Manuscript Commission is proving its value. As the Virginia Company did not differ materially from other companies formed for trade and colonization, its records will serve to explain the meagre remaining records of all similar bodies. Profit was the first object of the adventurers, and the establishment of a settlement was incidental. The beginnings of a settlement having been made, regulation ripened into government. As the author states: "Every phase of colonial development, from the mixed system which existed under the patent of 1606 to the chartered proprietary company after 1609 and the royal province after 1624, is here illustrated."

—The fourth volume of Mr. Worthington C. Ford's edition of the 'Journals of the Continental Congress' (Government Printing-Office) covers the period from January 1 to June 4, 1776. An examination of the four hundred pages of record shows how rapidly the business of Congress was expanding, and how detailed and varied were the affairs with which that body undertook to deal. Even the concurrent action of the several colonies, though tending to circumscribe the field of Congressional action, had not yet diminished greatly the labors of the numerous committees through which Congress mainly did its work. One notes, in the present volume, the continued efforts to obtain supplies of gunpowder, saltpetre, and general military necessities; the skilful and cautious management of the Indians; and the strenuous attempts to provide a stable currency. Large space, naturally, is given to military affairs, especially army organization and recruiting, the treatment of prisoners of war, the defences of New York, and relations with Canada. The suggestion to the assemblies that Loyalists be disarmed and kept under surveillance further aggravated the unhappy lot of the many who still sympathized with Great Britain. Of new matters, the most significant are the numerous regulations regarding privateers and their prizes; the establishment of a "treasury office of accounts," the precursor of the later Treasury Department; resolutions for the regulation of trade and the encouragement by the colonies of domestic manufactures; and directions for the sale of tea then in the country or subsequently obtained through prizes. The settlers in the Wyoming country, driven to outbreak by the conflicting claims of Pennsylvania and Connecticut to their allegiance and their lands, are urged to "cultivate harmony," and to "consider themselves as jointly interested in the event of the American cause." The resolution of May 10, recommending the assemblies and conventions of the several colonies "to adopt such government as shall, in the opinion of the representatives of the people, best conduce to the happiness and safety of their constituents in particular, and America in general," with John Adams's preamble, of five days later, declaring that "it is necessary that the exercise of every kind of authority under the said crown should be totally suppressed," presaged the independence soon to be declared. Mr. Ford's additions and notes continue to shed light on nearly every page of the record, and we can only repeat the praise which we have given to the previous volumes of this admirable edition.

—The fourth volume of Mr. Poultney Bigelow's 'History of the German Struggle for Liberty' (Harper & Bros.) bears the subtitle, "1848." It deals fully, however, with but two phases of the German movement of that interesting year—the revolutions in Munich and in Berlin. Some of the other events of 1848 were anticipated in the third volume of this history; others are postponed to a forthcoming fifth volume; and the present volume harks back four years to describe the Silesian famine, twenty-

three years to sketch the reign of Louis I. of Bavaria, and ninety-three years to illustrate Jesuit ethics by citations from Liguori. This disregard of chronology is a necessary result of the author's episodical method. Another result is a sacrifice of historical perspective: occurrences are treated rather in accordance with their picturesqueness or with the degree of attention which they excited at the time than with their permanent significance. Add to this the author's interest in striking personalities, and the result is an allotment of space singularly disproportionate to the importance of the persons and events described. Lola Montez holds the centre of the stage through two chapters; to Carl Marx are given three or four pages in a chapter on Socialism, which bears the forgotten name of Weitling. The inconclusive collisions between soldiers and citizens in Berlin, March 13-22, and the vacillations of the pusillanimous Frederick William IV. fill more than a hundred pages, a full third of the book; while the National Parliament at Frankfort is described in five pages, and what is said of it is concealed under the chapter-heading "Robert Blum."

—Mr. Bigelow's attitude is essentially that of the German revolutionists of the time; his only criticism upon them is that they were too tame. It is true, however, as he urges, that the history of 1848 has been rewritten by the German historians of the past thirty years under the influence of the events of 1864-1870; that the extent to which the unsuccessful revolution from below prepared the way for the successful revolution from above has not been recognized; and that Prussian writers in particular are inclined to treat the attitude of the German people in 1848 as a temporary aberration of the national mind, which should be forgotten as soon and as completely as possible. For this reason it is useful to have the other view of the period—the contemporary Liberal view—set forth afresh; and this Mr. Bigelow has done on the basis of wide, if somewhat desultory, reading and patient, if not always judiciously directed, research. His episodical method, his interest in the picturesque, and his practice of exhibiting tendencies and explaining events through the study of more or less typical persons, have at least the advantage of making his books readable. In noting the appearance of volume iii. we complained of the lack of an index; it should therefore be stated that the first two volumes were indexed, and that we have now an index to volumes iii. and iv.

—Dr. Roland G. Usher has edited for the Royal Historical Society a useful and meritorious volume which he entitles 'The Presbyterian Movement in the Reign of Queen Elizabeth.' This study is made to centre around the classical movement as illustrated by a typical record, the minute book of the Dedham Classis. For an explanation of technical terms we are taken back to the 'Book of Discipline,' wherein, shortly after 1570, Cartwright and Travers advanced their ideas regarding the true form of church government. Here the classis is a group of ministers brought together to discuss parochial questions in which all have an interest. For every twelve parishes there is a classis. Next higher in the scale of ecclesiastical gatherings is the provincial synod, whose members are drawn from the ministers and elders of twenty-four classes. Delegates, in turn, from these synods constitute the national assembly. The causes which account for the failure of Presbyterianism in England are discussed lucidly by Dr. Usher in his introduction. Considered as a party, the essential weakness of Cartwright's followers was that "they attempted to construct a system legally within one alien to it"—namely, within the national church itself. The bishops would have none of them, and, save for the ultimate secessionists, Presbyterianism seems to have been a preference rather than a deep conviction with those who entered into the classes. The minute book of the Dedham Classis occupies about fifty octavo pages, and is simply a recital of the leading topics that came up for discussion among the members of this small religious group. Though bald in the manner of its entries, the book shows perhaps more intimately than any other writing now extant the nature of the subjects which English Calvinists were discussing in the days just preceding Babington's Conspiracy and the Armada. Dr. Usher renders a further service by reprinting, with adequate comment, the essential portions of Bancroft's 'Dangerous Positions.' This tract and the minute-book of the Dedham Classis mean much more when taken together than when studied in detachment; for the minute-book affords testimony to Bancroft's substantial accuracy, while 'Dangerous Positions' contains general statements which enable us to see what the Dedham Presbyterians, and others concerned in the classical movement, were really aiming at. Dr. Usher at the close of his introduction enumerates a few of the more obvious results to be associated with Presbyterian propaganda in England. Among these was a reinforcement of Low Church principles when the evangelical party took form, and also an indirect reinforcement of the political theories "which blossomed forth in the English Commonwealth."

—During the year 1904-05 the work of the Egypt Exploration Fund was carried on in two places, at Deir el-Bahari and on the peninsula of Sinai. At the former place M. Naville continued his laborious task of excavating the temple of Mentuhotep III., laying bare the ramp, the southern colonnade, and the great central platform. This last structure was apparently not the base of an actual pyramid, and soundings have failed to reveal any tomb within its area. Around it, however, several tombs of priestesses and princesses were disclosed, one of the latter adorned with quite remarkable sculptured reliefs, representing the life of Princess Kauit in the lower world. The work at Deir el-Bahari is not yet completed. The expedition on the Sinaitic peninsula was in charge of Mr. Petrie, whose first visit was to the ancient turquoise mines of Maghara, whence he reports that the modern mining company which worked the old site in 1901, has utterly destroyed twenty-four of the ancient inscriptions before noted at that place, and has injured six others, leaving only eleven intact. These have now been removed to the Cairo museum. A recognition of distinctly Ethiopian characteristics in a portrait of Sanekht, the first king of the third dynasty, leads Mr. Petrie to surmise that the second dynasty may have been overthrown by an Ethiopian invasion. At Serabit el-Khâdem Mr. Petrie completely cleared the temple and its surroundings, finding many new inscriptions, and copying others completely for the first time. One piece of sculpture was discovered which is ranked by the explorer as not only of great historic interest, but among the best specimens of Egyptian art. This is a head of Queen Thyi, with her name on the front of her crown. It is well figured in the Fund's 'Archæological Report,' just issued. The existence of lavers evidently for ceremonial purification, of altars for incense, and of an immense mass of ashes before the sacred cave, apparently the débris from burned offerings, points to Semitic ritual in this place. A similar indication of Semitic influence is found in the sacred stones, or bethels, "on every high hill." Mr. Petrie will continue his investigation of Semitic relations in early Egyptian history by work the present year in the eastern side of the Delta, under the Egyptian Research Account. The results of the year's work at Deir el-Bahari will be published in the fifth memoir of the Fund on that subject, while Mr. Petrie's investigations will appear in an atlas of plans and inscriptions, with translations, published by the Fund, and in a more popular book of narrative and description, accompanied by 160 photographs, which Mr. Murray is to issue.

—The campaign of Messrs. Grenfell and Hunt, for the Græco-Roman Branch, on their old site of Oxyrhynchus was more richly productive of papyri than that of last year, though the pieces were for the most part of the first four centuries of the present era, and included fewer theological and classical fragments than were found in, for example, 1903. Among the Hibeh papyri, which will be published in June, are a number of marked interest, such as parts of perhaps the "Tyro" of Sophocles, the "Oineus" of Euripides, a gnomic poem of Epicharmus, the play of Philemon on which Plautus based his "Aulularia," with sixty-eight consecutive verses probably from Menander, several portions of Lysias against Theozotides, previously known by title only, fragments of Euripides's "Alcestis," "Iphigenia in Tauris" and "Electra," fifteen or sixteen centuries earlier than the mediæval MSS., and three hundred lines from the treatise on rhetoric now generally assigned to Anaximenes. Other Homeric fragments are said to add new weight to the contention of the editors concerning the Alexandrian origin of the Homeric vulgate. Messrs. Grenfell and Hunt return to Oxyrhynchus this year for the last time, but the immediate continuance of excavations beyond this season under the auspices of this branch of the fund is said to be doubtful, on account of the falling off of subscriptions.

VERRALL'S EURIPIDES.

Four Plays of Euripides. By A. W. Verrall. Cambridge (Eng.): The University Press; New York: The Macmillan Co. 1905. Pp. 288.

It is eleven years since Dr. Verrall published his 'Euripides the Rationalist,' a work that endeavored to account for the

admiration of the Greeks and Ro[illegible] his plays as well as for the moder[illegible]y to criticise them or defend them as [illegible]e-fends what the majority think open to criticism. How, in fact, was one to get round Mr. Swinburne's remark that Euripides was a botcher? Was it to see a botcher that Philemon, the writer of comedy, declared that he would hang himself, if only he could be sure that death would bring him face to face with the tragic poet? Mr. Verrall's solution of the problem is well known. Where Euripides introduces the gods or divine intervention, as in the "Alcestis" or "Ion," it is with the express purpose, perfectly intelligible to all his educated admirers, of discrediting the deities, of making them ridiculous or ineffective, of conveying by constant innuendo that they were quite unnecessary to the story. This, then, was what delighted antiquity; and if we want to appreciate the "Alcestis," we must not swallow it whole like Balaustion in Browning's poems; we must look out for subtleties, innuendo, thrusts at theology of which she never dreamed. Most readers of Euripides have accepted the grain of truth in this book, which, like all works of the kind, assumes, and, assuming, thinks to prove, far too much. We refer to it here because no one can appreciate the second set of essays who has not read the first.

The new volume is written with the acuteness and scholarship, the excessive ingenuity, the sensational manner of the old. The first essay is on the "Andromache," "A Greek Borgia." The late Sir Richard Jebb said of the "Andromache," only last year, that it was "a poor play," and the Alexandrian "argument" or abstract which called it "one of the seconds" had hitherto passed unchallenged. But Dr. Verrall interprets the Alexandrian comment very differently. It meant that the play was not second-rate, but second, a sequel, which we, who have not the preceding drama, must from mere ignorance consider formless and obscure. Dr. Verrall proceeds to construct a complete chain of evidence out of the "sequel" itself, evidence too long and complicated to be repeated here. We can only say that, read with his eyes, the existing play does indeed call for a predecessor and that explanatory prologue which he assumes to have been lost, and that if the Athenians could follow intelligently in a single performance in the open air the dialogue of Orestes and Hermione as he interprets it, they were riper than ourselves for grasping at sight all the complexities of psychology and social philosophy in the modern drama.

The treatment of another inferior play, the "Helen," "Euripides's Apology," is the most drastic of all Dr. Verrall's surgical operations on the Greek drama, worthy of the heroic mood in which, long ago, he cut out the choruses of the "Agamemnon" of Æschylus and put in scenes with conspirators. The "Helen" is a weak play, based on a situation which might be effective in a lyrical poem, as Stesichorus made it effective in his famous palinode, but on the stage could only seem absurd. Menelaus has fought for ten years to recover Helen, has wandered with her, as he thinks, for another seven after Troy's fall, arrives in Egypt with her, and, when he lands, is confronted with the real woman at last, who tells him that those seventeen years he has pursued and held a phantom. Her strategy for their joint escape closely resembles the devices of Iphigenia in the "Iphigenia in Tauris." "We shall see more in the play if we know what to look for," says Dr. Verrall.

This is a bare outline of what he sees: The "Helen" is a parody of the "Iphigenia in Tauris" in particular, and the methods of fifth-century drama as a whole. It is no more meant to be taken seriously than "How He Lied to Her Husband," the antidote to "Candida." It was written not for the Dionysia in the first place, but for private performance at a domestic feast of the Thesmophoria held on the island Macris (now Macronisi), also called Helene, on the east coast of Attica, which has for centuries been inhabited only in the summer and by herdsmen. Even as Milton composed "Comus" for the noble owner of Ludlow Castle, did Euripides write the "Helen" for the family of the respectable apothecary Proteas, who lived on Macris, and especially to do honor to his daughter Eido, whom he put in the play as Theonoe, daughter of the King of Egypt. Proteas himself was dead "these ten years," as is proved, says Dr. Verrall, by the reference in Aristophanes, "Thesmophoriazousae," 850 ff. All this, it should be remembered, is constructed by Dr. Verrall directly out of the play. The idea of private performances of the dramas that afterwards appeared at the Dionysia is all his own, and there is not a single passage in Greek literature to support the theory. But when one can manufacture one's own evidence, what need of scholiasts? He actually grows sentimental over this creature of his own imagination, the apothecary's daughter, as a woman "of intelligence and humor," who "deserves not to be altogether forgotten," till he almost persuades the reader to forget that she never existed, and that men have read the "Helen" for centuries and will read, without detecting even the shadow of such a personality. Dr. Verrall devotes nearly one hundred pages of argument and explanation to a theory which we must dismiss in a paragraph; and this is to do injustice to a most ingenious and searching study of the play, for Dr. Verrall is a thorough scholar, and no one can read him without profit. It is his method, not his knowledge, that is at fault. When, in 1897, Mr. S. Butler wrote his book to prove that a young woman wrote the Odyssey, he met with ridicule because he was not a competent scholar. Dr. Verrall's theories are no less far-fetched than Mr. Butler's, but his erudition is beyond question.

The "Heracles," "A Soul's Tragedy," has always been regarded as in some respects parallel with the "Ajax" of Sophocles. In both the hero is visited with madness, is led by it to furious slaughter, and, on the recovery of reason, can see no escape from the situation but death. Dr. Verrall gives a new interpretation of the character of Heracles as envisaged by Euripides. He is a megalomaniac, always on the verge of some violent outbreak, constantly under the illusion that he has performed marvellous exploits. For instance, Theseus and he have visited some cave or mine together and were perhaps imprisoned with the victims of a fatal accident. Theseus, as he tells us, was utterly unmanned. Heracles retained his courage and strength, and found an escape for both. "Euripides," says Dr. Verrall, "gives neither these details nor any, but indicates plainly to educated spectators or readers of his day that it is some incident of this kind, some natural incident, something like what was figured in this connection by rationalistic writers, that Theseus and his Heracles jointly remember." It is really astonishing that Dr. Verrall should be in sympathy with those dull and unimaginative persons, the rationalists, who merely succeeded in making the fine old myths seem trivial, and should suppose that a great poet would condescend to use their methods, and reduce the famous descent into Hades to a visit to a mine. But, given the mine, and suppose Hades abandoned as a conception that Euripides would not have tolerated here, we are still confronted with the hound of hell, Cerberus, who, as we all know, had been brought to the upper air by Heracles when he rescued Theseus. Cerberus is clearly mentioned, and it would be hard, indeed, to drag him into the mine episode. Dr. Verrall has the courage of his conviction, and interprets Heracles as saying to Theseus that "there is a miserable dog" which he had bargained to convey to Argos. Dr. Verrall reminds us that Euripides was tender to animals, and admires the care for dumb creatures which makes Heracles remember this neglected pet. So much, then, for the hound of hell. Why anything so irrelevant and unexplained as this wretched dog should be dragged in, Dr. Verrall declines to say. It is characteristic of his method that he leaves us with more difficulties than before. This is natural. You cannot import a quantity of fresh interpretation into a drama without stultifying what was already plain to see. And nothing to the unsophisticated reader could be plainer than the references to the descent into Hades, the rescue of Theseus, and the rape of Cerberus. One other fence there was to be leaped, and Dr. Verrall takes it with ease. Madness herself personified, Lyssa, sent by the implacable Hera, appears in the play above the house of Heracles, and is bidden by Iris to inflame him with the murderous frenzy in which he is to slay his children. Lyssa accepts the task, and describes the first signs of the hero's seizure before she enters. This is all against the theory that Heracles was "curst from his birth with a taint in his blood, a recurrent and progressive malady of the brain." So Dr. Verrall explains that, when the audience saw those supernatural appearances above the house and heard those words, they were to imagine that it was all a dream, a sickly dream of the chorus of old men who have fallen asleep at this crisis as they lie on the house steps.

The "Orestes," "A Fire from Hell," to quote the last of Dr. Verrall's sensational subtitles, was a favorite play with the Greeks, partly, no doubt, because it indulged that liking for melodrama which is the amiable weakness of most theatre-goers. Dr. Verrall thinks that, like the "Helen," it was written for private performance, with no chorus, that being added afterwards in view of the Dionysia. In the domestic version the play ended, as a melodrama should, with Orestes, Pylades, Electra, and Hermione burning alive in Agamemnon's

palace, where, a few minutes earlier, Helen has been murdered by Orestes. Not so could it end in the public theatre, where there was no curtain and the actors must walk off, while the audience, who knew well the later careers of the characters in Greek legend, would hardly accept the holocaust as convincing. Therefore, we are told, Euripides tacked on to the revised play the scene in which Apollo intervenes as the god from the machine, to bid Orestes marry, not murder, Hermione, and bestow the hand of Electra on Pylades, an unfortunate youth, if we follow Dr. Verrall in his description of the daughter of Agamemnon as a "fiend," a "demon," a "tragic cat, with the hideous malice of an old maid." While eliminating Apollo, Dr. Verrall tries to convince the reader that all the references to the oracle of Apollo as having bidden Orestes murder his mother are meant by Euripides to be taken as sneers at the theory which the sensible Argives described in the play would not have admitted for a moment. This is part of his effort to prove that Euripides avoided the introduction of the supernatural, discredited it when he could, and, in almost every case where gods are introduced, compels us to "suppose them unreal."

What vitiates these essays is the strong element of the fantastic, the evident yielding to caprice, which, on almost every page, pulls up the reader who is trying seriously to follow the course of the reasoning. A glaring case of this is in the essay on the "Helen," on page 121, where Dr. Verrall reduces the scene to mere farce by representiug the chorus as eagerly watching for some hint that they will be invited to the bauquet in the house of the apothecary's daughter, and ruefully uttering the familiar tag, "Many a shape hath fate, and many a surprise the gods decree, . . . and so hath this action ended," to express their private disappointment when the chief actors have passed into the house, leaving them to their usual tasks. If all this be true, then we must more than ever conclude that when Euripides wrote tragedy, his genius, as Jebb said, "was at discord with the form in which he worked."

LUCAS'S LAMB.

The Life of Charles Lamb. By E. V. Lucas. In two volumes, with fifty illustrations. Vol. I., 1775-1817; Vol. II., 1818-1834. G. P. Putnam's Sons. 1905.

Eleven hundred pages of biography and biographical appendix make a substantial postscript to Mr. Lucas's five generous volumes of the 'Works' and two of the 'Letters' of Charles and Mary Lamb. Having in these seven prior volumes industriously helped Elia and his sister to tell the story of their lives and thoughts after their own fashion—that is, for the most part imaginatively—and having in the process gained an exceptional familiarity with the immediate circumstances under which they were inspired to write, their most competent editor now causes them and their acquaintances to tell a similar story in *his* way—so to speak, scientifically. This chronicle of Lamb and his friends, the last that we are likely to have for some time, is a vast congeries of quotations, superficially disordered, since they flow from every source and form a bewildering panorama of styles, yet all grouped round one central figure, and all promoting a sequence in time, the rigor of which grows manifest as the years of Lamb's life unfold. The quotations draw largely, of course, from Elia himself, owing to Lamb's "inveterate habit of autobiography"; yet they come also from Coleridge and the Lloyds, from the Wordsworths and Southey, from Hazlitt, Haydon, and De Quincey, from Talfourd and Crabb Robinson—in fact, from every one whose orbit touched the circle of Lamb's activity and who has left for Mr. Lucas any significant record of the contact. To be sure, with the exception of hitherto inaccessible entries from the MS. diary of Crabb Robinson, comparatively little of this material is new; parts of it, as the amusing sketch of George Dyer, are incorporated with little or no change from Mr. Lucas's own previous publications. Nor does the new, comprehensive aggregation of materials, mostly old, bring with it any essential change in our traditional conception of the Lambs—in "the dear memory of a frail good Man" or the equally dear memory of his sister, "the self-restraining, and the ever kind"; unless perhaps there is still some reader who needs to be assured that not Charles Lamb's solicitude for his sister, but the gentle mitten of Fanny Kelly, was the cause of his continuing a lifelong bachelor. However, as its accuracy is well-nigh unimpeachable, so the epic amplitude of the work is impressive; no résumé could give a hint of its opulence in vivid, pathetic, and humorous detail.

The captious might, indeed, ask whether Mr. Lucas has not garnered with a hand too free and easy; whether, in Ben Jonson's phrase, he has not piled up excerpt and incident "with that facility that sometime it was necessary he should be stopped"; and, furthermore, whether in passing from one island to another of rare Elian prose he has not now and then slipped into tame, or even blind, transitions. If the substance of his final tribute to Lamb represents the investigation of years, the fusion of the parts, the mere technique of composition, seems in places to have been achieved with a rapidity scarcely Horatian. Zealous to surpass in thoroughness all extant biographies of Lamb, Mr. Lucas, trained journalist though he be, has not kept a steady eye upon the due retrenchment of his style and matter. His very first paragraph (vol. i., p. 1) illustrates his occasional prolixity, as well as a curious and useless precision which he displays throughout in giving the relative ages of persons whom he brings together for whatever purpose:

"In 1775, when Charles Lamb was born, Goldsmith had been dead a year, Gray and Smollett four years, Chatterton five, Sterne seven, Hogarth eleven, Richardson fourteen, Fielding twenty, Swift thirty, and Pope thirty-one. In the same year Dr. Johnson was sixty-six, Garrick fifty-nine, Horace Walpole fifty-eight, Reynolds fifty-two, Burke forty-five, Sheridan twenty-four, Crabbe twenty-one, William Blake eighteen, Burns sixteen, Bowles and Cobbett thirteen, Wordsworth five, Sir Walter Scott four, Coleridge three, and Southey one. Landor came into the world eleven days before Lamb, Jane Austen at the end of the same year."

This painfully graded list is ineffective not simply because of its length; its minuteness is annoying. Let us compare it with the opening of Mr. Morley's introduction to Wordsworth; here is a passage which with slight alteration might serve as beginning in a life of Lamb, and may very well serve as a model of style for his biographer:

"Most of the great lights of the eighteenth century were still burning, though burning low, when Wordsworth came into the world. Pope, indeed, had been dead for six and twenty years, and all the rest of the Queen Anne men had gone. But Gray only died in 1771, and Goldsmith in 1774. Ten years later Johnson's pious and manly heart ceased to beat. Voltaire and Rousseau, those two diverse oracles of their age, both died in 1778. Hume had passed away two years before. Cowper was forty years older than Wordsworth, but Cowper's most delightful work was not produced until 1783."

Of course it is hardly fair to set Mr. Lucas in an uninspired moment beside Mr. Morley at his best; yet one naturally expects something more than colorless prose, at all times, from a man who is weaving together an anthology of the happiest things ever said by and about Charles Lamb. Mr. Lucas writes in the long run with more light than warmth, his excuse being that he is "a stage-manager" who simply attends to the entrance and exit of his manifold speakers, and further, perhaps, that he is not trying to present his central figure as above all a man of literary bent. The chief lines, as he has conceived them, of the likeness he is executing in a sort of living mosaic, this biographer never permits himself to forget; for example (vol. ii., p. 60):

"The life of Charles Lamb, as these pages testify, is the narrative of one who was a man and brother first, an East India clerk next, and a writer afterwards. Hence, although from time to time we have had and shall have glimpses of some of the finest intellects of his day—the sixty years between February, 1775, and December, 1834—the story is that rather of a private individual who chanced to have literary genius than of a man of letters in the ordinary sense of the term. The work of Charles Lamb forms no integral part of the history of English literature; he is not in the main current, he is hardly in the side current of the great stream. As that noble river flows steadily onward it brims here and there into a clear and peaceful bay. Of such tributary backwaters, which are of the stream yet not in it, Sir Thomas Browne is one, Charles Lamb another."

The ring of a fine sincerity in this goes far toward justifying Mr. Lucas in his method of restoring the man and brother and the East India clerk to life, rather than the writer, and harmonizes well with his abundant success in a difficult attempt. The method of biography, in turn, necessarily relegates any systematic discussion of Lamb's reading to Mr. Lucas's appendices, in the third of which, "on the principle that the books a man likes are a sure index to his mind," we are offered "a list of a number of Lamb's favorite volumes." One is tempted to add: a careful history, not a mere list, of any cultivated man's reading is an index to the *growth* of his mind, to his spiritual biography, that no biographer can well afford to treat as of secondary importance.

After all, Lamb's place in literature is patently the reason why Mr. Lucas has read and produced literature about him, and his place in English literature the reason why scholarly men in this age, if not to a large extent during the latter part of Lamb's own, have taken interest in

him, the reason why Mr. Macdonald, Ainger, Mr. W. C. Hazlitt, and M. Derocquigny have studied him. Mr. Lucas emphasizes the individual note in 'Elia': "Our prose literature probably contains no work more steeped in personality." Does he consider the history of literature an impersonal thing? If even in the very first analysis it is impossible to dissociate the life and personality of Lamb, of the man and brother and clerk—and the reader—from their literary expression, in the last it is unsafe to regard him in any measure apart from that living stream of which he drank so copiously; that stream which, among the currents of European literature, has been distinguished by its individualism. Was Milton, for example, in the "great stream"? His "soul was like a star, and dwelt apart." Was Wordsworth, in Lamb's own time? According to Emerson, "Wordsworth's genius was the great exceptional fact in the literature of his period." Was De Quincey? The "Opium-Eater" has always been deemed *sui generis*. Now Lamb is not less an "integral part" of his national literature than either De Quincey or Wordsworth, both of whom became literary men neither more nor less accidentally than he. He has, however, as they, met many interpreters who, like Mr. Lucas, insist upon looking at an individual case in and for itself, and who regard Lamb almost exclusively with reference to "the sixty years between February, 1775, and December, 1834"; whereas Elia declared with whimsical assurance that he "wrote for antiquity," herein suggesting, by an odd manœuvre of the comic spirit, that "he was *not* for an age." So far as English criticism is concerned, Elia has yet to be put in vital relation with "all time"; his literary biography—'Lamb and his Congeners,' we might style it—has not been duly recorded. In Germany a young Cornishman, Dr. Lake, working under academic stimulus, has at least commenced the sort of comparative study that we have in mind. His dissertation (Leipzig, 1903), which pays fruitful attention to the influence on Lamb of Burton's 'Anatomy of Melancholy,' is, in spite of its artlessness, a step in the right direction. In France M. Derocquigny has begun a more comprehensive examination in 'Charles Lamb, sa Vie et ses Œuvres,' a broad, genetic analysis, noticed some time since in these columns; this will not readily be superseded.

Mr. Lucas belongs very clearly with a school of expert literary investigators in his own land, who, within recent years, have rendered an essential service to the study of English by a narrow yet affecting personal attachment to various men of letters in the age of Wordsworth, and whose external reward is that their names are to be indissolubly linked with the objects of their devotion: Mr. Forman with Keats, Dykes Campbell with Coleridge, Mr. Hutchinson with Wordsworth, to give a few notable instances—and now Mr. Lucas with Lamb. Exactitude and completeness of an author's text and accuracy and fulness of knowledge concerning his outer life are, however, subsidiary ends, not the final goal of literary study. That final goal, we take it, is, so to speak, literary biology; it is the solution of a problem which, in Lamb's case, Mr. Lucas avoids by a tendency to deny its claim to existence—the problem of the direct connection between the life and work of each author, and the life and literature of his race. Whether the solution of narrower, preliminary questions, the hewing of wood and drawing of water, can be done to the best advantage by men who have not either for themselves or their successors that ultimate goal and ideal architecture continually in view, may seem an ungracious query to put in the presence of a work so high-minded and so fascinating as Lucas's 'Life of Charles Lamb'; yet in strict justice it is not wholly out of place.

LE ROY'S PHILIPPINE LIFE.

Philippine Life in Town and Country. By James A. Le Roy. Illustrated. G. P. Putnam's Sons. 1905.

There is neither a Filipino people nor a Filipino tongue. Our unhappy Asiatic burden is in the main Malay, crossed in the north with Mongol and Hispanic strains. Alongside are less familiar barbaric tribes, the Igorrotes being a type. In the south we call Filipinos Moros, a metaphor for Mussulmans. These are unallied bands of the same stock in a different environment; and unvexed, certainly uncurbed, by Spanish rule, Ishmaels of the deep, they exercised the sea-power that was theirs and harried the less turbulent natives north of them much as the swooping vikings distressed the English coasts. In this discussion we pass by pagan and Mohammedan, important enough where administration is concerned, and confine ourselves, with the author, to the Christianized and linguistically dissociated tribes with whom commerce and the West are in commoner contact. Were our newly-acquired "colonists" Canadians or Australians, for example, they would not be so puzzling. We might disagree along lines of self-interest, but otherwise both parties would understand the object of government, and certainly would appreciate, however they might dislike, its methods. What is the prospect of the intellectual and moral absorption of a radically different tropical race? Is the Filipino ethos compatible with the American, or is the brown man essentially irreconcilable with the white?

Mr. Le Roy is content with describing conditions as he understands them, and maintains no dogmatic thesis about the islands or the islanders, or their masters past or present. This sinking of the speculative beneath the objective has peculiar value for readers with all shades of preconceptions, the more as almost, if not quite, without exception the observations are accurately made and always temperately expressed. Avoiding detailed history, our author lays stress on one historical fact, that the purpose of the various revolts against Spanish rule is evidence of the elevating influence of that rule. No other Orientals have attempted to break the conquerors' yoke with an avowed purpose of improving the government. The Spaniards made no pretence of civil liberty even for themselves, but by degrees they raised these Malays to a position whence they aspired to it. It was not their design, but both Spain and the Church builded better than they knew; and the people should be credited with a laudable yearning, however irregular their route and grotesque their immediate ideal.

Our real concern is with the people of to-day. These are divided into classes of property-holders rather than into proscriptive castes. The social barriers are industrial and political conditions, virtually more difficult to surmount than those of birth, so that the native aristocracy, an aristocracy of possession, are masters and not brothers. The elders of these are, naturally, conservative; from the younger come leaders, revolutionary and martial in war, radical in peace—radical not in the European sense, but as against the established order. The masses controlled by them, especially in the country, are in virtual peonage—a bonded indebtedness, not an inherited slavery, which is fostered by the extortionate obligations imposed through primitive forms. In time of scarcity a poor man borrows rice for his pressing needs. The landowner who advances it charges an interest in kind equal to 30 or 40 per cent., besides which repayment is required, not simply of the quantity borrowed and the usury, but of an amount in time of plentiful harvest equal in value then to that which had been transferred at a high price when the crop had failed. The obligation to serve off the debt, with its additions, is a strict social one, compulsory upon descendants as well. Native, one may say natural, improvidence, the universal proneness to gambling, and the very moderate requirements of the climate combine to discourage thrift and accumulation. "From them that have not shall be taken away"; so that the lower classes are kept low chiefly from material need.

Growing out of this state is the political and social condition of caciquism, a combination of the "boss" rule of the American machine and the leadership of a true landed aristocracy. Where in a tropical environment a dozen families out of ten thousand live in stone houses and have solid floors under them, and the others are sheltered in bamboo huts, borrowing from the former money, produce, or the use of land for cultivation, it may be understood that the few are the political agents and religious leaders, not teachers. With the friars as over-lords, these local directors were practically dictators and absolutely controlled their respective communities; and although the schoolhouse is replacing the *convento* as the active centre of influence, the *presidentes* and other magnates must for a long future be found among, and only among, the same class as before. There is every reason to suppose that this class as a class has not been, and now is not, desirous of increasing the political liberties of the masses, or of educating them towards assuming greater responsibilities. But the Civil Commission, while compelled to accept such leaders as really standing for if not representing the people, is establishing an alternative educational or property qualification for the protection of the franchise, and has made that barrier low and the way to overcome it easy.

The education offered by Spain was most meagre, and there is every reason to believe, although Mr. Le Roy does not directly express that opinion, that there was no intention of supplying the masses with a common language, especially with one that

might open European literature. *Divide et impera* was a good working rule, and Tagálogs and Viscayans (Bisayans), Ilocans, and Bikals, all with numerous dialects, were encouraged to maintain their individual speech and to be content with little that passed for learning—certainly for practical learning—at all. An attempt at higher instruction was dominated and restrained by an ecclesiastical influence which, in Manila itself, had explained that "the natural sciences are materialistic and impious studies," and had denounced political economy as a "science of the devil." The course leading to the A.B. at the University of St. Thomas, royal and pontifical by charter and control, was so arranged in teaching and prolonged by vacations as to cover six or seven years (beginning, it is true, with mere boys), and to hinder, if not to preclude, the attendance of the poor. The Dominican spirit was clearly that of the Athenian, in Georgia, who (even after the war) thought it good public policy to require an education to cost $20,000. In this connection, the author seems to have overlooked the Nautical School, successfully maintained, we think under Jesuit auspices, during the Spanish régime, for he mentions it along with the Normal School and the School of Arts and Trades as "established," not reëstablished, "by the insular Government."

The position of the married woman, unique in the Orient, as the business head of the family, is referred to more than once as due to the Christianity which the Spaniards established wholesale *vi et armis*. It does not seem to be recognized as an imitation of the foreign rulers. These, bringing no families with them, acquired common-law native wives. The consideration for the alliance was the bestowal of the house upon the brown partner, with sufficient means to rear the family after the departure of the white man. The real estate was hers. With the lapse of generations other brown women with higher moral claims came, by force of example, into similar responsibilities. It became the custom of the country. The reverse of the shield is the frequent, by no means universal, acceptance of a relaxed code of personal conduct for the weaker, if not the fairer, sex. Some of us are too apt to confer upon our little friends virtues they hardly possess and to ignore qualities they surely exhibit. Repulsive and abundant barbarity has been incontestably proved before formal courts, displayed against hostile clansmen more frequently than against the invading whites, to show how thin is the veneer upon the essential savage. Especially under the encouragement of numbers, the insurrectos displayed courage and endurance; at the same time Government-employed Macabebe scouts, hereditary enemies of the Tagálogs, would sit down and weep when hard marching followed short rations or none. Reversing the circumstances, the conditions doubtless would have shifted correspondingly. The apparent heartlessness at and after native funerals has often been commented upon (although in other lands an Irish wake is not unknown); and yet in the height of the hostilities a Filipino lower-class woman has been known to cast her tribute in the open grave of an American soldier, in avowed sympathy with his distant and unknown mother. The human nature that makes the whole world kin is theirs as well as ours, and there are also quirks and eccentricities in their make-up that we might blush to own.

We can follow in no further detail the problem, important as it is, or the volume full of interest as every one will find it. The book is packed with impartial information about the people we have adopted by force and are governing with difficulty, through their and our own limitations. There is no true public spirit in the archipelago, but, like the cave of Æolus, the islands are filled with winds of oratory, more destructive than beneficent. It is impossible for this people, even more ignorant of politics than of literature, to stand alone, and we must supply crutches if not wings. Ladronism will be insurrection whenever wholesome restraint is lessened. Whoever wants trustworthy intelligence, untainted by visible prejudice and clearly presented at first hand, may keep this account of our unwilling wards within his easy reach. It is a well-arranged thesaurus of facts. We lay down with regret this story of the fierce yet humble, the weak but aspiring, the individually insignificant but numerically important Filipino, commending it to students of public affairs and to intelligent citizens at large. Trade, education, and religion find their place in it, as well as the matters we have touched upon. And because we have taken it up, the lure of the East revives. The crowded traffic over the stately Bridge of Spain, the light-crowned processions in the balmy night, the picturesque avenues of the fire-trees and the heavy perfume of the ylang-ylang, the palm-girdled drive of the Malecon, the open-air concerts on the Luneta—site of execution as well as of fashionable concourse—the gorgeous sunsets over Merivales as the lost day passes across the China Sea, come back with all their charm, and one forgets the vileness of man when so nearly every prospect pleases.

The Political History of England. By W. Hunt and R. L. Poole. Vol. I. From the Earliest Times to the Norman Conquest. By T. Hodgkin. Vol. II., by G. B. Adams. Vol. III., by T. F. Tout. Longmans, Green & Co. 1906.

Further instalments of 'The Political History of England' demonstrate the ability of the editors. The wonderfully firm and scholarly handling that has won for Mr. Poole a well-deserved reputation as editor of the *English Historical Review*, is clearly to be traced here, and the History already shows that it is to be well compacted, homogeneous and of uniform quality. In this respect the editors will undoubtedly be able to challenge comparison with Lavisse and Rambaud; more could not be said.

Mr. Hodgkin's contribution to the above series has been looked forward to with some curiosity; it may be said at once that it is likely neither to increase nor to detract from the author's previous reputation. The work is decidedly uneven. As might have been expected, the author shows a full knowledge in matters pertaining to Roman Britain; and such passages as the chapter on the coin-kings display (in addition to a fondness for Teutonic hyphenated forms) an erudition in numismatics that is often of the highest interest and value. But when we reach the Anglo-Saxons, and especially their institutions, Mr. Hodgkin perceptibly lowers his standard; he is now content, and frankly tells us so, to follow the judgment of those who have made that field their special province. The result is, as a whole, a narrative that reads well and is generally safe to follow, but with occasional passages that are not satisfactory.

Thus, at page 77, where he discusses the question of Saxon land tenures, the arguments of Seebohm are balanced and adopted against those of Freeman and Kemble, but with no mention of Vinogradoff or Maitland. A striking example of the author's lack of independent knowledge and criticism in this period is his account of the battle of Hastings. This event, one of the most dramatic and important in English history, and the one with which this volume closes, afforded him a splendid opportunity for a fitting climax. But the climax, such as it is, is merely rhetorical, and the interest of the intelligent reader is entirely forfeited by the obvious lack of grasp on the facts and details of the business in hand. Thus, for the death of Harold, the old story is repeated that William ordered his archers "to shoot high up into the sky so that their arrows might fall from on high on some unshielded part of their enemies' persons." The absurdity of this ought to strike the least critical of historians. The nature of the case, confirmed by the Bayeux tapestry's representation of Harold trying to tug the arrow from his eye, suggests clearly that what William did was to order his archers to shoot higher up the hill over the heads of the front Saxon ranks, on which they were probably making little impression, at the conspicuous mark offered by Harold and his housecarls. In the same way the flight stratagem, which Mr. Hodgkin adopts without discussion, is one of the most unusual, difficult, and dangerous employed in war; the fact that we are informed that it was several times repeated might have aroused the author's suspicions. This statement suggests very strongly that what happened was merely that the Norman footmen were several times beaten back and pursued, and that on each occasion the pursuing Saxons were caught at the foot of the hill and in turn driven back by a counterstroke of the Norman horse. The stratagem might well be the embellishment of a scribe anxious to maintain Norman prestige. The account of the battle is as confused and unconvincing as it was possible to make it, and it is not unfair to say of Mr. Hodgkin, as Mommsen said of Tacitus: "A worse narrative. . . . concerning this war is hardly to be found even in this most unmilitary of authors."

All deductions made, however, the volume is well written and up to the standard of the series.

Professor Adams's volume is characteristic of the writer. He covers the period from the conquest of England by William of Normandy to the granting of Magna Carta and the death of John. Within these limits he shows more acquaintance with the chroniclers than with the records, he is stronger in political narrative than in institutional knowledge. In the latter respect, although never very far from the mark, Professor Adams is too apt to generalize

on insufficient grounds. Where [illegible] students of institutions like Ma[illegible]r Vinogradoff advance only in the m[illegible]-ed manner, he does not hesitate [illegible]e-yond their utmost bounds. This h[illegible]u-perficial generalization is the g[illegible]w-back to Professor Adams's wor[illegible]be-comes at times quite irritating to the [illegible]re-ful reader. A typical example of it occurs at page 23, where, referring to the effect of the Conquest on England, he writes: ". . . in the main, as concerned the great mass of facts, there was no change of importance." Ten lines further on we find: "It is because we can see the results of the changes which it really introduced that we are able to estimate their profound significance." Perhaps the most curious example is that to be found at page 186, where we are presented with a novel and amusing computation of the space of time implied by the word "generation."

Among the very few slips noticed is one at page 68, where, in dealing with the Domesday Survey, we are told that the *missi* were to ascertain the number of hides each manor contained; this should be at what number of hides they were rated, which was quite a different thing. At page 152 the footnote is apparently mistaken; the reference is probably intended for Professor Haskins's article on the Norman Jury. All deductions made, this volume has many good points and will probably come up to the average of the series. The style, however, is far from vigorous, and is not unfrequently disfigured by such passages as the two following: "This would have been sufficient under a King like the first two Williams"; "William was determined to be strong, not because of any theory which he had formed of the value of strength, or of the way to secure it, but because he was strong and had always been so."

Professor Tout's volume begins at the accession of Henry III., and brings us down to the death of Edward III.; it is excellent in every respect. The style is direct, the scholarship sound, the judgment sane. As an example of balanced and clear statement the relations of Edward I., Bruce and Balliol may be cited, and the chapter on authorities is admirable. The treatment of military questions is especially good, though the novel description of the Black Prince's victory at Poitiers may well arouse question. Favorable mention must also be made of the treatment of questions connected with the Welsh marches and of the particularly valuable maps. Professor Tout, whose bias against the chroniclers appears strongly, will have no dealings with such tales as those of the six burghers of Calais and the incident marking the creation of the Order of the Garter that were current as history in our childhood.

There is perhaps more serious cause to quarrel with him for his apparent neglect of the influence of the Jews in the beginning of the thirteenth century. Again, the one incidental reference to Richard de Bury appears inadequate for a writer ranked by some as the English counterpart of Petrarch. One more small point that may be raised is the passing over of the fact that before 1231 the University of Cambridge was attracting large numbers of students from abroad, as is witnessed by a royal writ of that year quoted in Cooper's 'Annals.' On the whole, Professor Tout may be congratulated on an excellent and readable volume.

Studies in Architecture. By Reginald Blomfield. The Macmillan Co. 1905.

This book of studies is unusual in some respects, for it is a collection of detached essays written by an architect in very active practice. According to the books of reference, he is not more than fifty years old, and yet the well-known buildings which he has designed and superintended form a very long list. His 'History of Renaissance Architecture in England,' published in 1897, gives evidence of a careful noting down of experiences and special observation, and skill in weaving these together into a narrative. One approaches the new book, then, with a sense of respect and also of expectation conducive to a careful examination of what the author has wished to say. Some of the papers are the general essays of such an active and observing man, written without the need of much investigation, and giving general impressions rather than separate pieces of investigation. Such a paper is that on Andrea Palladio, to which thirty-three pages are devoted; such an one is the much longer article on Philibert de l'Orme; for in these there is, perhaps, no array of facts and dates more than can be obtained from books that are under the hand of any active student, and the general conclusions of such a student form the one theme of the essay. On the other hand, the article on the architect and the architecture of Newgate, with its considerations of the extraordinary building itself, rebuilt by George Dance the younger, who is always said to be the architect, is devoted to a subject which involves considerable original thought and some investigation, and the argument takes up with sufficient cause and without undue repetition the old question as to "paper designers" and practical workmen in architecture.

The paper entitled "Byzantium or Lombardy" contains in itself many of the characteristics of the whole book. It is devoted to an examination of Signor Rivoira's Italian treatise, published in 1901, 'Le Origini della Architettura Lombarda,' a quarto very richly illustrated with half-tone cuts of excellent quality inserted in the text, and having also a very few plates in phototype. That book was an almost avowed plea for the independence of Italian design, and formed a detailed argument against the theory that all that is good in the early Italian Romanesque came from the Byzantine Greeks. As a study more patriotic than critical, and as presenting a vast number of interesting analyses of existing monuments, this work was of importance, and yet the student can hardly avoid sympathizing with the counter-plea set up by Mr. Blomfield. Indeed, the immense importance to mediæval Europe of the influence coming from the Eastern Empire is only in part recognized as yet, and Mr. Blomfield's paper may be thought to exercise a useful influence in spreading a knowledge of that most important fact in art history. The paper, too, is full of minor points extremely well met. Thus, the remarks upon the preposterous book by "Leader Scott," which has been reviewed in these columns—the book which laid before the English reader an Italian theory about an imaginary company of masters of the art of building, whose headquarters were taken to have been at Como in Lombardy, is entirely welcome, for such a darkening of counsel should not be allowed to pass out of mind lest students of a new generation should take up that book, 'The Cathedral Builders,' and be led astray by it. In like manner, the discussion of the mediæval clumsiness seen in the Italian taking over of the Byzantine cupola and its supports is perfectly just and is well worked out. Many such points made in the essay might be dwelt upon and praised. James Fergusson's unlucky remark about a "fluke" in the designing of Newgate leads to several deprecatory remarks about that ill-informed and injudicious historian, and here is a delicious bit of criticism for one artist and writer whose work is accepted in a most uncritical way by the majority of recent English writers on art: "William Morris used to say that architecture must start again at the beginning; a remark of far-reaching sagacity, in singular contrast to his own practice in ornament."

There are odd bits of testimony to a certain haste in writing down the propositions and the conclusions of the article "Byzantium or Lombardy." Here is, for instance, that most curious and precious monument of antiquity which is called by Murray's and by Joanne's guidebooks S. Giovanni in Fonte, and which Baedeker and Gsellfels agree in calling by the same name and with the additional title (very familiar in Ravenna, as every traveller will say) "Baptistery of the Catholics" (*Battistero degli Ortodossi*). Three of these four writers speak of "Archbishop Neo" or "Archbishop Neon," but they speak of him only in passing. Now, this important building, a "real document," if there ever was one, is spoken of by Mr. Blomfield as the Baptistery of Neone (exactly as if "Neone" were an Italian town), and while one may look in vain through the article, seeking to discover what building is referred to, he may also look through a score of recent books of reference hopelessly if he searches for "Neone" as the name of either a man or a locality. This seems, in short, to be a hasty transference of the descriptive title "battistero di Neone" from Mr. Rivoira's book, which is printed in Italian, and which uses that descriptive epithet many times, and gives it in the index. A similar hasty remark is that which is repeated many times, about Imperial Roman building with "concrete." Now although this is a common phrase, it is so inaccurate that a first-rate practical architect should have avoided it. The great walls and vaults of the period, beginning with Hadrian, were not built with concrete, but with rubble stone in an abundance of strong mortar used in a very liquid condition. The stones are laid as bricks are laid upon a wall, one by one, and in courses, though unevenly.

It remains to be said that there are, in Mr. Blomfield's book, a number of very good half-tone plates, of which the seven devoted to Old Newgate will be most unexpected, and the most welcome to the already well-furnished student, while the two or three interiors of Venice churches by Palladio are the most attractive. We have all denounced Palladio so

strongly for his indifference to construction and his activity in pushing on the decadence of architecture, that the real charm of his designs is almost forgotten among men; but the interior of the Redentore—the church upon the Giudecca—should be enough to set us right in that matter.

Mental and Moral Heredity in Royalty: A Statistical Study in History and Psychology. By Frederick Adams Woods, M.D. Henry Holt & Co. 1906.

Recent applications of mathematical analysis to biology have vastly extended the practical domain of that science. Ten years ago the more complex subjects called by courtesy biological were scarcely sciences at all in any exact sense of the word. Now the statistical method has placed anthropology on a firm foundation, and bids fair to organize psychology and even history into systems of definitely observed and rationally correlated phenomena.

An important impetus must be given to this movement by Mr. Woods's study, which is an exhaustive analysis of the characteristics of the members of the reigning families in Europe from the sixteenth century (in some cases from the tenth century) downward, in the light of present theories of heredity. The choice of material is singularly fortunate, and the method of treatment as far as possible fair and impersonal; estimates of character being founded solely on the consensus of a series of histories and genealogies chosen before the beginning of the investigation.

The first part of the book, which will prove of most interest to the general reader, traces the individual history of the various royal houses in detail; and the peculiarities are in several cases as characteristic as if they had been prearranged for a laboratory experiment. The house of Saxe-Coburg-Gotha exhibits the combination of high-minded virtue with a genial and cultivated intellect, and all through the lines of descent these characters are manifest. Dr. Woods says: "No royal family has been able to maintain itself without degeneration unless it has taken a good share of Saxe-Coburg blood." Contrast with this the line of the early Romanoffs in Russia, where, surrounding Peter the Great upon the genealogical chart, appears a startling group of degenerates sharing the same violence and epilepsy which marred his mental power. At the very summit for intellectual ability stand the houses of Nassau-Orange and the first Hohenzollerns; a group of interrelated geniuses began with the mingling of the bloods of Condé, Montmorency, Coligny, and William of Orange, which in five generations produced Elizabeth of Palatine, Sophia of Brunswick, the Great Elector and William III. of England, culminating in Frederick the Great of Prussia, his brilliant brother and sisters, and his nephew, Gustavus III. of Sweden. In Spain, for twenty-one successive generations from Sancho II. in the tenth century to Charles V. in the sixteenth, there were only five monarchs "who did not possess a high degree of strength and ability." All this time only good stock was introduced in the female line; and, as among the Hohenzollerns, quite close inbreeding produced no bad results. When, however, insanity was somehow brought in, appearing first distinctly in Isabella, the Queen of John II. of Castile, inbreeding intensified it to a fearful degree. The Hapsburg insanity and the Hapsburg lip appeared generation after generation, in the horrible procession with which Rostand appalls the Duke of Reichstadt.

In each family the character of the individual may in almost every case be accounted for by the simple influence of heredity. Alternative inheritance, by which a character in the ancestry is inherited by each child either in full force or not at all, is generally manifest. In large families, the law of ancestral heredity appears by which one-quarter of the children resemble each parent, one-eighth each grandparent, and so on. The biological law of regression by which children of exceptional parents tend to approach again to the mean of the race, is manifest. Inbreeding is bad only when the characters bred are in themselves pathological. There appears no general tendency to degeneration due to the ease and luxury of court existence; on the whole, it seems that a related group of 800 persons in which among the men alone there are twenty-five who must be classed as geniuses, stands far above the average. "The royal breed, considered as a unit, is superior to any other one family, be it that of noble or commoner."

The last chapters of the book bring out various points in more exact mathematical fashion. Dr. Woods divides his 832 individuals into ten grades for mental, and ten grades for moral, qualities, and shows that the correlation in grade with parents, grandparents, and great-grandparents is very close to that theoretically postulated by Galton and determined for various physical characters in other investigations. Apparently, hereditary tendencies alone are as sufficient to account for intellect and character as for the coat color of the classic Basset hounds. Even a mathematical comparison of those persons who inherited the succession with their less fortunate relations fails to show any appreciable influence of environment. Dr. Woods finds a very striking correlation between mental and moral traits, about as high as that which exists between a man's strength of pull and his weight. He also observes a distinct correlation between moral character and the number of children reaching adult life. Thus the prospect of general progress for the race seems fair. "We have found among royal families the morally superior surviving, and in the inheritance of mental and moral excellence we see ground for a belief in the necessary progress of mankind." On the other hand, "it is true that on this view we can do but little for the individual once born into the world."

There can be no doubt that the weight of current biological evidence tends strongly toward the preponderating influence of heredity. Nevertheless, there is a mass of credible testimony from various classes of social workers as to the practical results of environment, and most men can testify from their own inner experience to the impact of external influences which have profoundly modified their natures. The struggle between these two points of view is really a phase of the old problem of Predestination and Free Will which has passed from the church into the laboratory The apparent conflict follows, perhaps, from the fact that the hereditary process, although mechanical, is so complex. Acting on a brain containing many and various ancestral potencies, the selective action of the environment may easily draw out one or the other in such a way as to alter at least the outward significance of a life in the profoundest manner. Whatever one may think of these problems, Dr. Woods's book is a solid and valuable contribution toward their solution. To the biologist, it fills an important place in the development of the theory of heredity. The historian who is wise enough to read the signs of his own as well as of other times, may ponder radical modifications of traditional points of view in the light of such promising scientific methods. All who are working for social progress must weigh the evidence it presents upon the ultimate aim of humanitarian effort, the improvement of the living stuff that men are made of.

Excavations at Nippur. (Part I.: Babylonian Expedition of the University of Pennsylvania.) Plans, details, and photographs of the buildings, with numerous objects found in them during the excavations of 1889, 1890, 1893-1896, 1899-1900, with descriptive text by Clarence S. Fisher. Philadelphia. 1905.

Mr. Clarence S. Fisher, architect of the last expedition to Nippur of the University of Pennsylvania, has begun the publication of a work entitled as above. Beyond the words, "Babylonian Expedition of the University of Pennsylvania," there is nothing to indicate that this is an official publication of the University. As no publisher is named, it would appear that it is published by Mr. Fisher at his own risk, and copies are to be ordered from him at Rutledge, Delaware County, Pa.

The first part, which is all that has so far appeared, contains sixteen pages of text (11x16 in.), with two cuts and sixteen plates, partly plans and drawings and partly photographic reproductions. By these means Mr. Fisher throws welcome light on some perplexing points. In his 'Babylonian Expedition of the University of Pennsylvania,' the only account of the later excavations heretofore accessible, Hilprecht published an ancient map of Nippur, which, he asserted, was part of a small archæological collection made by a late Babylonian priest and found by himself in a vase on the "library hill." No explanation of the map was given; it was, in fact, published sidewise, and thus rendered quite unintelligible. Fisher states that the map was not found in a vase with other objects, nor even on "library hill," and was discovered months before Hilprecht reached Nippur. He has analyzed the map, which is fortunately provided with descriptive text, turned it right side up, and, by a comparison of the map and the excavations, restored the topography of the ancient city at a period about or a little before 3000 B.C. This is the earliest topographical map ever found. It is much to be regretted that the Director of the expedition, an Assyriologist, did not perceive its character while the expedition was still in the field, for it would have been an invaluable guide in the conduct of the excavations.

In his account of the excavations temple of Bel at Nippur contained book above referred to, Professc precht reported that evidences of occupation were found not only heneath the present plain level, hut even helow virgin soil down to water level. These earliest remains consisted of layers of ashes with fragments of pottery. From this he argued that the temple of Nippur was originally connected with the burning of the dead. But this theory did not account for the fact that excavations conducted to an equal depth in the parts of the Nippur mount farthest removed from the temple showed exactly the same conditions. Moreover, his account left us with a huge hole in the ground, helow plain level and virgin soil, and no explanation of its meaning and origin. Fisher has given an entirely intelligible and reasonahle explanation of these conditions. At the outset, when the marshes of the Euphrates delta were just emerging from the sea, the settlers were a rude population, living in reed and mat huts, similar to those occupied by the degenerate natives of those regions to-day. As now, so then, these villages were suhject to frequent and disastrous conflagrations, of which the layers of ashes are the remnant and the proof. Gradually the land emerged from the marshes, hy deposits of soil through inundations and by accumulation of débris. Out of one of these rude villages developed the town of Nippur, and out of the primitive sacred place of that village the temple of Bel. This temple grew *pari passu* with the growth in civilization of the town. By Fisher's plates we are ahle to follow the growth of this sacred place and temple upwards in a literal sense as it came to he raised on a terrace or platform, and then finally to be furnished with the *ziggurat* or artificial mountain. At the same time that it grew upward it expanded outward, occupying more and more space, until hy the time of Sargon, circa 3000 B. C., the temple area was many times larger than the whole of the original walled town.

In tracing this development in its intermediate stages, effective use is made of the ancient map mentioned ahove, according to which Nippur was situated on the River Euphrates, and intersected and almost surrounded by canals, including a moat. Mr. Fisher certainly deserves great credit for the manner in which he has exhihited the topographical and culture development of Nippur and its temple. In this regard his work constitutes an important contribution to Bahylonian archæology, and scholars will await with interest the puhlication of the remaining five parts, in which, it is to be hoped, more care will he bestowed on the proof-reading of the descriptive text.

The Spirit of Rome: Leaves from a Diary. By Vernon Lee. John Lane Co. 1906.

This hook of impressions does not adequately fulfil the promise of its title or the expectations raised by the name of its author. In an explanatory apologetic preface, Vernon Lee tells of her childhood spent in Rome, of frequent subsequent visits confirming her conviction that Rome itself is too predominant and alive to allow of any distinct individual experiences being worked up in remembrance of its identity, as is the case with other cities; and for this very reason she has not attempted a portrait of Rome, but has left her notes untouched as a record rather of what Rome has said to her. These entries in her diary during the years from 1888 to 1905 read like hasty memoranda, jotted down carelessly at the end of a tiring day of sightseeing. Many of them are too fragmentary and personal to convey to the general reader any clear idea of what they mean, hut here and there he will, if gifted with patience, come across vivid descriptions of the country and of events in that picturesque, impressionist manner which is natural to Vernon Lee even when, as in this book, she is as it were in her dressing-gown; for with her keen insight and freshness of vision she generally strikes a point of view utterly unconventional. In all the excursions to distant villas, bicycle rides to remote parts of the Campagna, religious functions, and wanderings in Roman gardens and among the ruins, we get the prevailing idea of immensity of scale and grandeur of line pervading everything—the feeling Piranesi has so effectively given in his exaggerated representations of Roman monuments, which Vernon Lee considers so truly representative of the very spirit of the place in things material. We quote from her note on the English Cemetery:

"I was right, I think, when I wrote the other day that it would he easier for us to face the thought of danger, death, change, here in Rome than elsewhere. To die here might seem, one would think, more like reentering into the world's outer existence, returning, as Epictetus has it, *where one is wanted.* The cypresses of the graveyard there under the city walls among the ruins do not seem to unite folk with the terrible unity Death, so much as with the everlasting life of the centuries."

It is a pity the hook has heen given to the puhlic without eliminating all that is purposeless and inadequate—the brief mention of villas and galleries and the references to persons hy initial. These futilities disturh the equanimity of the reader, and will prevent many from hestowing more than a cursory glance on its pages.

BOOKS OF THE WEEK.

The Nation.

NEW YORK, THURSDAY, APRIL 19, 1900.

The Week.

A long step, if not towards a national law of marriage and divorce, at least towards a better national rule in such matters, was taken by the Supreme Court on Monday. Its decision that a divoree granted under the loose laws of one State need not be given "full faith and credit" in another, deals a blow at the long-standing scandal of "Dakota divorces." The court holds that the validity of a divorce granted almost *ex parte* in Connecticut can be successfully attacked in New York. Justice White, who read the opinion, had undoubtedly a diffieult position in constitutional law to maintain, but his moral reasoning is certainly powerful. He shows how absurd it is for one State to be asked to give full faith and credit to the act of another which would destroy its own laws. "If," he says, "the-full-faith-and-credit clause were now to be held applicable to the enforcement in the States generally of decrees of divorce of the eharcter of the one here involved, it would follow that the law of nearly all the States would be overthrown." The upshot of the decision appears to be that a divorce of two citizens of one State can be binding, when granted in another State, only when both parties were there present. This should either double or destroy the "divorce colony" in Sioux Falls and elsewhere. At any rate, the decision of the Supreme Court will do much to end the more disgraceful hugger-mugger of divorce that has so long been a national reproach.

Congressman McCall makes the point that the President might better busy himself about repealing unjust laws that conduce to swollen fortunes, than be so anxious to tax them when accumulated. Mr. Roosevelt declared that we must "grapple with problems connected with the amassing of enormous fortunes"; yet he himself has always favored, and now appears to favor, the ciass legislation which not only diverts wealth into the hands of a privileged few, but carries with it the sting of social injustice. The President at this moment is urging a ship-subsidy bill which is designed to put public funds into private pockets. He has never lifted a finger against the tariff, though it enables its beneficiaries to levy taxes upon the people. Think of the many "steel" fortunes "swollen beyond all healthy llmits"; then think of the steel schedules in the Dingley tariff, and remember that the President has been so intimidated that he cancelled the tariff-reduction message which he had written. Far more important than the taxation of great fortunes after they are made; is the prevention of their being heaped up by means of purchased laws which destroy the only equality possible.

Senator Bailey's reputation, already great, will doubtless be heightened by his speech of April 10. To have held a crowded Senate and packed gallerles for four hours listening to a close-knit legal argument, is an extraordinary achievement. On the validity of his contentions about points of law, we will not here undertake to pronounce, but he had a distinguished convert, in the very act, in the person of Senator Hale. The feeling was general that Mr. Bailey's speech had put a new face upon the whole rate-bill situation. In all the vacillation, however, it is gratifying to note that the President stands absolutely firm. Just where he stands, no one appears to know, but his friends indignantly deny that he has budged an inch from his original position, whatever that may have been. Seemingly, he has not got out of the realm of abstractions. He is heart and soul for a bill which will do "equal and exact justice," which will be "fair to railroad and shippers alike," and which will stand the test of constitutionality; but as to the actual details of a concrete bill, he refuses to commit himself. It is most reassuring, however, to get it on authority that he has not "surrendered."

It is obvious that a desperate effort is making to get the ship-subsidy grab through this session, after all. The bill slipped through the Senate, after perfunctory debate, though with marked Republican opposition, on the distinct understanding that the House would not touch it this year. Speaker Cannon's hostility to it was well known. But Grosvenor's approaching retirement from Congress seems to have spurred him to new exertions: his committee has begun a series of "hearings"; the lobby is at work; the press is being used; and the plan is plainly to make a grand onslaught and pull this bounty out of the Treasury, if possible, before the country is aware of the raid. The movement has every appearance of a sort of foreclosure on the Republican party by the ship-subsidy men. How much they gave to elect Mr. Roosevelt, Mr. Cortelyou could tell, but will not. They are now demanding that the goods they paid for be delivered. So transparent is this situation, and so unblushing the demand for a subsidy from the public funds, that a greater piece of folly than for the Republican managers to give way to the impudent appeal, could not well be imagined. Their Congressional campaign looks none too bright as it is. If they pile a ship subsidy on top of the tariff burdens which they have refused to touch with one of their fingers, the outlook for them will be black with political disaster.

The House Committee on Elections which has reported favorably upon a resolution providing for the election of Senators by direct vote, has heeded a growing sentiment. "Has again heeded," would be more accurate, of course, since the House has on four separate occasions passed such legislation as the committee now recommends. As a matter of fact, action by Congress to compel the choice of Senators by popular vote is becoming relatively unimportant. The States are falling into line, one after another, in insisting that at the State elections Senatorial candidates shall submit themselves to the judgment of the voters. So far, the popular verdict has not been regarded as absolutely mandatory, but practically the people's choice is as sure of being ratified formally by the Legislature as is the decision of the voters in a Presidential contest by the Electoral College. The Legislatures of Virginia and Arkansas may refuse to send to the Senate the man who won at the Democratic primarles; but the chances of this are small.

It would be strange if the United States, which opened Japan to Western nations, should be the first to shut the door in the face of the Japanese immigrant. In Congress the other day Mr. Hayes of California spoke in support of a bill to extend the Chinese exclusion laws so as to embrace the subjects of the Mikado and the Koreans. He professed to represent 95 per cent. of tho people of his State in this matter, which, he said, is one of domestic policy, not of international law. He admitted that the Japanese had shown extraordinary intelligence and courage in the conduct of the war, but he condemned them for their dishonesty as a people, and declared that the vast majority "do not understand the meaning of the word 'morality.'" It would, indeed, be unfortunate if the Arcadian simplicity and purity of our politics were to be corrupted by admitting our Asiatic neighbors. The economic aspects of the question deserve more consideration. Mr. Hayes, who is himself an employer, presented statistics going to show that the Japanese coolie could greatly underbid the European and American workman. However this may be, it is to be hoped that Con-

gress will never exclude the Japanese who come here to attend our universities and technical schools. A continuance of intellectual relationship should increase the friendship between the two nations.

The American Federation of Labor evidently meant business when, through President Gompers, it announced that it was in politics. He now is circulating among the labor unions what must pass for a pretty definite programme. Its chief terms are these: The working people "will act as a unit at the polls of every election." It will "elect men from our own ranks to make new laws and administer them along the lines laid down in the legislative demands of the American Federation." Alongside this manifesto it savors of the bathetic to read that all labor candidates must have "clear, unblemished, paid-up union cards in their possession." President Gompers undoubtedly realizes that, however desirable a possession an untarnished union card may be, it is by no means the equivalent of a certificate of election. The labor leaders generally are probably encouraged by the success of their British colleagues. It was proved the other day, in the Commons, in the matter of immunity of union funds from damage suits, that about ten minutes of Mr. Keir Hardie's reefer was worth an hour and a half of the Attorney-General's robes. Mr. Gompers possibly foresees similar triumphs in the Capitol. However that may be, nobody need regret that American unionism is about to try its political luck. We are glad that the people are going to have a chance to vote on the claims of the labor oligarchy, and we have no fear of the verdict. Even for unionism itself we anticipate only good from a policy that will abate the present guerilla warfare, substituting therefor a comprehensive and unambiguous plan of campaign.

Secretary Taft's speech at Tuskegee has stirred up the Southern press not a little. Several editors are so frank as to say that no matter how far the negro may progress in wealth, education, and civic worth, he will never be allowed to vote. The Atlanta *Journal* finds in the Secretary's remarks fresh reason for the proposed Georgia disfranchisement laws, which, it tells its readers, "will insure the elimination of the ignorant and venal negro vote without disfranchising a single uneducated white man for at least the next quarter of a century." One Georgia editor has expressed great indignation at Mr. Taft for letting the negro know that, after the expiration of the grandfather clauses, he will be in an enviable political position, holding the balance of power between the two parties. This editor, betraying that regrettable ignorance of the educated colored man so noticeable among Southern men, exclaimed bitterly: "Mr. Taft tells the negro just what we have been trying to keep from him." As well might the South attempt to keep from the blacks the colors in the American flag as to hide from them any phase of the political situation. On this the negroes are becoming better informed and more dissatisfied every day. They do not share Mr. Taft's roseate hopes of what will happen after the grandfather clauses expire, for they fear that they will be defrauded anew. Recently two teachers in a Virginia school, one white, the other black, and both worthy American citizens, were disfranchised because they were held to have failed to answer properly some abstruse Constitutional questions propounded by an ignorant "poor-white" registrar for the deliberate purpose of disqualifying them.

The lynching at Springfield, Mo., presents anew the too familiar paradox of an apparently civilized—at any rate a representative American—community suddenly inflamed by the lust of blood. Springfield is a county seat. It is evidently a public-spirited town, for, with a population of some 23,000, it contains a college, a private academy, a high school, and maintains a zoölogical garden. It is, presumably, like most cities of the Middle West, a religious community. In fact, one of the most distressing details of the dispatches is the description of Sunday-school children searching the ashes in the spot where three negroes were burned—for souvenirs. The inhabitants of Springfield employ probably the considerate courtesy common to all communities with an infusion of Southern blood. Yet they disputed, on Sunday, a bit of the charred skull of a negro whom the mob had taken from the jail and consumed in a bonfire. Individually the citizens of Springfield would deny any lack of personal courage; but a sheriff and a group of armed deputies discreetly effaced themselves while the mob battered in the jail doors, wrecked the building, and hanged the prisoners from the windows. Probably Springfield would deeply resent any insinuation that its civilization is defective in sweet reasonableness. It perhaps reads with some amazement Gov. Folk's just characterization of the members of the mob as murderers. But what must one think of the civilization of a community where race hatred lies so near the surface that the representation of an incendiary play, the occurrence of a crime of violence, the consumption of bad whiskey, are sparks enough to kindle an *auto-da-fé?* We must in fairness add that both city and State are making such amends as are possible for the atrocity. The militia has cowed the mob, the bench has promptly issued warrants for the ringleaders, and the "better element," we are informed, is "shocked" at the belated discovery that the wrong negroes were lynched. Gov. Folk, in particular, has acted with exemplary vigor, both in supplying troops and in condemning the mob.

In Gov. Deneen's hurry call for an extra session of the Illinois Legislature to remedy the defects in the primary law passed last year, and just declared by the Supreme Court of the State to be unconstitutional, he says: "The old nominating system has been discredited. . . . The people have demanded the substance instead of the semblance of participation in the nomination of candidates." The Governor's general interpretation of State sentiment has been supplemented by ex-Gov. Yates's illuminating remarks upon the act that has been declared to be of no effect. Yates, of course, is an aspirant for Senator Cullom's seat, and he has been conducting a campaign for some months with the expectation that the choice would be made at the Republican primaries. Now he charges that the law as it passed the Legislature last year was "doctored" by "the friends of the Senatorial machine in Illinois." He declares that these plotters intended that it should be declared unconstitutional, and that they prefer the old convention system to any primary at all. We may doubt Yates's implication that it was all a plot hatched to kill his boom for the Senate; but it is evident that Gov. Dineen has public sentiment behind him in his desire to secure the prompt amendment of the faulty statute.

"Comic" is the only word to apply to the surprise and pain of our own rose-water and angel-cake Socialists, now that they have discovered that Maxim Gorky is not a hero for the *Ladies' Home Journal.* Gorky in turn is equally amazed and puzzled. He cannot understand why Americans who pine for that intellectual and moral freedom which will result from destruction of the existing social order, should look askance on a man who does a little destroying on his own account. Gorky is astonished at his own moderation. He has done nothing but leave his wife in Russia and come to America with another "spiritual affinity." The performance is not strictly legal, but—like all such cases—it has the sanction of the "higher law." Can it be that our own apostles of emancipation are still the slaves to grovelling superstition? Do they still make a fetish of the bourgeois virtues? Would Robert Hunter, James Graham Phelps Stokes, and Edwin Markham shackle a man to one woman for all his days? When she has borne two or three children and has lost her youthful comeliness, must he still

be compelled to gaze at her, fat and forty, across the breakfast table? This is to tie a soaring soul to earth and turn it to a clod. Mr. Markham's Man with a Hoe has a jolly time of it compared with the Man with One Wife. Let us drop a passing tear for victims of cruel and stupid conventions, and then push on to the goal of a revolutionized, glorified, and polygamous humanity.

For a good many years past the *American Grocer* has performed the important service of translating the Government excise statistics into current retail prices, and thus determining how much the people of this country actually spend for beverages, both alcoholic and non-alcoholic. The data thus obtained serve as valuable and exceptionally accurate indications of current changes in certain social habits and conditions. The figures for 1905, just issued, show a continuation of the same steady annual increase in this item of national expenditure as has been observed in the years previous. We spent for beverages $1,548,708,307, as against $1,498,622,715 in 1904, $1,451,633,379 in 1903, $1,369-098,276 in 1902, and $1,273,212,386 in 1901. The total drink bill to-day, as the compiler states, is "one-fourth of the total estimated production of the cotton, wheat, corn, hay, and tobacco crops, and every other product of farms, orchards, cattle ranches, dairies, and every other agricultural industry. It amounts to one-eighth of the nation's total expenditure for food." Although this increase has been larger not only absolutely, but relatively to the population—21.6 per cent. during a period when the population increased 6.5 per cent.—it would hardly be contended by any one that it has been a period of increased intemperance. It has been characterized, it is true, by the abandonment of statutory prohibition in two small States, but the local-option system has made great headway at the same time, and the area of legalized liquor selling has been very considerably decreased in many States, especially in the South. Corporations in certain lines have taken to requiring total abstinence from their employees, and the demands of industry have steadily become less compatible with over-convivial habits.

If we compare the per-capita consumption of liquors in 1905 with that for 1840, the first given in the current statistical abstract, we find a tremendous change in the relative proportion of alcoholic beverages consumed. Here are the figures in gallons per capita:

	Wines.	Malt liquors.	Distilled spirits.	Total.
1840	.29	1.36	2.52	4.17
1905	.43	18.50	1.45	20.28

That is, in sixty-five years, the average American has increased his allowance of beer fourteen times, and learned to drink half as much again of wine, but at the same time cut off three-sevenths of his consumption of whiskey. Only one of these changes, however, has been at all steady. The consumption of wine, as shown by the official statistics, has been wholly erratic, ranging as high as .63 gallon in 1902 and as low as .26 in 1896. The individual consumption of whiskey and other spirits showed an irregular decline until it reached its minimum of 1.01 gallons, also in 1896, after which it mounted again steadily for eight years to 1.48 gallons in 1904, and only this year has the increase ceased and a slight decline been indicated. But the increase of beer-drinking has been as steady and seemingly inevitable as that of population. From 1863 to the current year there have been only six years in which setbacks of even a fraction of a gallon occurred. In the days when practically untaxed whiskey sold for 25 cents a quart, this was emphatically a whiskey-drinking country. The question is now whether the present changes are to go on until we are to settle down beside Germany as characteristically a beer-drinking nation.

The Harvard Overseers having voted their disapproval of the Athletic Committee's decision to continue football at that institution next fall, the situation at Cambridge is in a worse muddle than ever. Faculty and Overseers, it will be remembered, voted against the game; the Corporation is still to be heard from, and has been holding off with a view to getting the final decision of the Athletic Committee. That body, it seems, failed to comply with the request of the Overseers to submit a report on the proposed changes in the game, and decided to go counter to the opinion of both Faculty and Overseers. Obviously, Harvard is suffering from a division of powers, and it would be difficult to forecast what the next step will be. The Athletic Committee may persist in its attitude, in which case the Corporation might end the whole controversy by abolishing football outright. The present condition of affairs contrasts unfavorably with the clear-cut action of other colleges. Surely, the oldest of American universities ought by this time to have reached a decision and, like Columbia and Northwestern, forbidden the game, or, like Wisconsin, prohibited it for a year. Harvard ought, also, to limit the powers of the Athletic Committee in such a way that it should be incapable of delaying the settlement of broad questions of policy. Curiously enough, the undergraduate members of the committee have generally been more radical and more sensitive to public sentiment than either the graduate or Faculty members.

When Emperor William's epitaph comes to be written, it will need to be almost the reverse of the satiric one on the English king who never said a foolish thing and never did a wise one. The Kaiser does a great many wise things, but whenever he speaks or writes—especially whenever he telegraphs—he is apt to go off in a blaze of indiscretion. His telegram on Friday to the Austrian Foreign Minister, apropos of the Algeciras Conference, is about as needless a blunder as one could well imagine. He speaks of Austria as his "brilliant second on the duelling ground." But this is to imply that there was a deadly combat, not a free and friendly conference, at Algeciras. It implies also that Germany was badly beaten. The "brilliant second" and the German principal were repeatedly outvoted; thus, according to the Kaiser's awkward figure of speech, Germany must have received several ugly thrusts in the "duel" at Algeciras. This is incontinently to repudiate Prince Bülow's public statement that the German contentions had been satisfactorily upheld. So much for Imperial rushing into print. Some one ought to send the Emperor a copy of Van Buren's old counsel of political wisdom: "Walk eleven miles rather than write a letter." In the Kaiser's case this might advantageously be amended: "Sail a thousand leagues rather than send a telegram."

Vesuvius will very soon be in politics. In fact, the legislative sequel of the eruption may very well outweigh its recent spectacular interest. The destruction of entire communes will push thousands of people over that narrow margin which in all Southern Italy separates a scanty livelihood from dire distress. Successive Parliaments have dealt with this South-Italian question without arriving at a solution. To-day that problem, to which Premier Sonnino has devoted especial study, becomes doubly acute. These Vesuvian villages are typical of Southern Italy generally. Their inhabitants suffer under a grievous burden of taxation, amounting in the case of small farmers to a full quarter of annual income. Besides the national and local taxes, an over-numerous priesthood takes toll of a superstitious populace. Of course, the distressed communes will be promptly relieved, both by suspension of taxation and by direct gifts; but this will only make the burden heavier elsewhere in Calabria and Apulia. In other words, the destruction on the Vesuvian plain furnishes the strongest argument for carrying promptly into effect the benevolent intentions long expressed towards the "Mezzogiorno." Tax reform is the most pressing need, but it is probable that a rather paternalistic programme of public works and agricultural improvement will also be instituted.

OUR SENTIMENTAL PRESIDENT.

Mr. Roosevelt has become a fearsome Socialist a little too suddenly to be entirely credible in that guise. He did, indeed, ruin his carefully prepared corner-stone speech on the Man with the Muck Rake by a chance phrase which made him look to the unwary like the Man with the Crowbar, ready to prize over the pillars of society. As a mere lapse in taste, this was deplorable enough. His speech was wholly sacrificed to one interjection. It was much as if the preacher of a temperance sermon had wound up by inviting all his hearers to go out and take a drink with him—they would not remember what had gone before. But we cannot ourselves see in the President's happy-thought proposal to limit private fortunes the deliberate and formidable political programme which some are reading into it. We have had too many of his impulsive utterances before to be unduly alarmed. His choice of a text from Bunyan should have suggested the true character in which he appeared on Saturday. One of the prototypes of our day whom the inspired tinker "saw in his dream" was Talkative. He thus described his own function:

> "I will talk of things heavenly or things earthly; things moral or things evangelical; things sacred or things profane; things past or things to come; things foreign or things at home; things more essential or things circumstantial."

Thereupon Christian smiled, and sagely remarked to Faithful:

> "This man with whom you are so taken, will beguile, with this tongue of his, twenty of them that *know him not*."

In short, we are inclined to think that those who know our Presidential Talkative will not be so much frightened as amused by his latest identification of his own temporary personal feeling with the policy which the nation ought to adopt permanently. He has gayly done the same thing many times before. It does, indeed, require a certain "pitch of presumption," as Burke said, for a man to think of his country as merely a piece of white paper upon which "to scribble whatever he pleases," but no one has ever accused President Roosevelt of erring through too great distrust of himself. A thing which appears to him overnight as really an excellent proposition, becomes *ipso facto* wise, feasible, Constitutional. So it was with his ready and confident proposal that Congress take over the regulation of life insurance. He thought it ought to be done, and that was demonstration enough. But the House Judiciary Committee felt compelled to look into the laws and Constitution, and then unanimously reported that the President's plan was absolutely unconstitutional. Since then he has made haste to "forget it." So it would be with any other splendid idea which occurred to him yesterday, and which he will abandon to-morrow.

People are beginning to have a more correct idea of Mr. Roosevelt's nature. The conception of him, fostered by some indiscreet friends and easily given color by his tremendous energy and loud speech, as a man of iron will and slowly formed determination and far-reaching thought and mature choice of line of action, is breaking down. We know better now what his "spontaneity" implies. His public speech is filled, like his private conversation, with whatever pops into his head. His view of his duties is essentially jovial. He loves to slap the country on the back with a "bright" thought, just as he delights to startle a foreign visitor by wild and whirling words that make the hair of the timid stand on end. He means no mischief by it.

It is time we understood that it is sentiment which predominates in the Presidential character. He has a surge of feeling; this he immediately translates into what he calls a "personal conviction"; then he identifies that with true public policy. No one should imagine, however, that he has given real thought to the matter, or that he will not drop it as hastily as he took it up. In a word, he seems to belong to what Cobden called the "genus sentimentalist." Of public men in that class he said: "They are not to be depended on in political action, because they are not masters of their own reasoning powers. They sing songs or declaim about truth, justice, liberty, and the like, but it is only in the same artificial spirit in which they made odes to dewdrops, daisies, etc. They are just as likely to trample on one as the other, notwithstanding."

Yet this, the most charitable explanation of the President's vagaries, does not diminish the regret and disquiet which his unconsidered deliverance on Saturday must cause. The very fact that, as he confessed, he had not thought out a single detail of his proposal to fix a limit beyond which private wealth should not go, and that he is absolutely without the Governmental means to effect that purpose, makes his rash utterance a serious discredit to him. It is too much like a boy wantonly thrusting a stick into a delicate machine. A truly responsible statesman, urging such a revolutionary proposition, would come forward as if with a halter round his neck, and request that it be drawn if he could not show that a law could be drafted to carry out his ideas. But what glimmering of a suggestion did Mr. Roosevelt make about his "progressive tax on all fortunes," to be laid by the national Government, with the end of keeping them within "healthy limits"? An inheritance tax would not do the business. Besides conflicting with State taxes of that kind, and leading to the grossest injustice, it would not accomplish the purpose at which the President professes to aim. He himself, for example, is said to have inherited something like $500,000. Of course, to a thorough-going Socialist that would be a thoroughly "unhealthy" fortune; but suppose that a Federal inheritance tax could be devised which would forbid any one from coming into a greater amount than that. It is clear that a man of Mr. Roosevelt's energy and ability, inheriting $500,000 at thirty-five, could double or treble his fortune before he died. So the only way of keeping him "healthy" would be a progressive income tax which would take all above $500,000. But here comes in the vexing trifle that the income tax has been declared unconstitutional.

We do not expect any terrible results from the President's happy-go-lucky remark about a subject to which, it is plain, he has given no serious thought. It will be a mortification to his friends, and a real public misfortune, that his mouthing has made Bryan appear a reactionary, Hearst a conservative, and has elevated Debs and Powderly to the level of Presidential statesmanship. But our laws, the Constitution, the inertia of our institutions, the common sense of the people, the ineradicable tendencies of human nature itself, may still be trusted as against either demagogues or improvisators.

SECRETARY SHAW AND GOLD IMPORTS.

Before passing judgment on Secretary Shaw's announcement regarding his use of Government money to "facilitate" gold imports from Europe, it will be best to make perfectly clear three points—what the situation was which prompted such a decision, what the law is under which his action is taken, and what its effect on the markets is likely to be. It is well known, in the first place, that the strain on our money markets this season has been abnormally great. The usual recourse is heavy borrowing from foreign markets. If this movement is large enough, New York exchange on London falls to a point where gold from abroad can be profitably imported. This is what happened last week; in response to the fall in exchange to the "gold point," gold was engaged for New York in London. With a decline in money rates, however, exchange on London last Thursday rose again to a price which, by general agreement of foreign bankers, rendered further gold imports unprofitable.

This was the moment chosen by the Secretary to use the Government surplus to facilitate imports. In the words of Mr. Shaw's own announcement, "the price of exchange having reached the point where gold ought to have been imported,

and believing the reason why it was not engaged to be the loss of its use during transit," the Treasury notified banks holding public money that it was willing "to increase the deposit to any amount when assured that the money would be immediately used in the engagement of gold for shipment to the United States," and that, as security for these new deposits, "bonds available as security to savings banks" would be accepted. What the Secretary means by "loss of use in transit" is that a banker, engaging, say, $1,000,000 gold in London for import to New York, must forego the interest on that sum during the week when the gold is on the ocean. By making a special seven-day loan of public money to the banks—this is what the Secretary's plan really amounts to—the cost of importing gold is reduced by precisely the sum of "interest during transit." With such allowance, gold could be profitably imported by a bank without waiting for sterling exchange to fall to the normal "gold point."

It should be clear, then, that Mr. Shaw's arrangement is an interference of the Government with the market. Had the Secretary merely announced that the Treasury was again absorbing the market's money supplies through a surplus revenue, and that therefore public deposits in banks were to be increased, the action would have followed precedent. That this was not the primary purpose of last week's step is shown by the conditions laid down by Mr. Shaw. Deposits will be increased only "when assured that the money will be immediately used" for gold import purposes, and, furthermore, it must "be returned immediately on the arrival of the gold." As a matter of fact, the excuse of Treasury absorption of money did not exist last week. Since March 1, the surplus revenue has been $4,600,000; but, in the same period, public deposits in banks have been increased $12,000,000. The fact, however, that the Secretary explicitly provides that the bank must pay back the Treasury money when the gold arrives, shows that he is not thinking of the Treasury drain at all.

Under what warrant does the Secretary make this unusual arrangement? The Federal law undoubtedly gives rather broad powers in the matter. Its stipulation is that the Treasury shall require banks holding public funds "to give satisfactory security, by the deposit of United States bonds and otherwise"; beyond this it states that they "shall be depositaries of public money, except receipts from customs, under such regulations as may be prescribed by the Secretary." It is a somewhat violent construction of this clause to regard the supplying of Government funds to invest in gold imports as within the meaning of the "regulations" referred to, yet we suppose that construction to be the Secretary's recourse. But something more is involved than the letter of the law. The use of Government money, avowedly to influence a financial market with whose movement the Treasury is not itself concerned, is something new. Government bond redemptions, Government bank deposits, and "anticipation" of Treasury interests are expedients which have been adopted repeatedly in times of money stringency; but always on the ground, most carefully set forth, that excessive surplus revenue had caused the trouble. It is true, also, that Government credit has been employed, as in 1895, to enable bankers not only to influence but to control the foreign exchanges and the flow of gold. But President Cleveland's "Government-bond-syndicate contract" was a measure adopted to rescue the Treasury itself from a "run" which threatened suspension of Government gold payments—which is a very different thing from using public money to reduce the normal cost of a banker's private operations.

Our own judgment is that this extraordinary move by the Secretary is wholly unjustified by the law or the circumstances. We further think that it will be futile—if indeed it do not further complicate an already tangled money situation. It cannot be properly compared with the occasional offer of "interest in transit" by the Bank of France or the Bank of Germany. Such offers have been made by banks, not by a Government, and made because banks saw a profit in the operation. Furthermore, it is questionable whether such an offer, in any market, ever actually caused gold imports. With gold going out from London or New York, it is easy to understand why "allowance of interest in transit" by the French Bank might draw all the exports to Paris rather than to Berlin. But the "special inducement' would not have caused the shipment; that is an old and exploded delusion very current in Wall Street during 1892 and 1893, and which we are sorry to see the present Secretary share. All that this very remarkable Government interference has accomplished, so far as concerns the market of the day, is slightly to alter the "gold-import point," as Mr. Sherman, in 1892, altered the "gold export point" by raising the export tax on bullion. Mr. Sherman thought, apparently, that his plan would stop gold exports by making them more expensive, just as Mr. Shaw seems to think that he can cause gold imports by making them cheaper. Both ideas are pure economic delusion. That the effort to further so hare-brained a scheme should have been made through a highly questionable use of the public moneys, does not help the matter.

RURAL CORRUPT PRACTICES.

It is generally agreed by those who have worked hardest and longest at Albany this year to secure the passage of a corrupt-practices act, that the strongest opposition has come from country members of the Legislature. The bill went up with an impressive backing from this city. Other large centres of population in the State were at least ready to give their assent. There would have been no great difficulty about getting the delegations from "corrupt cities" like Buffalo and New York to support the measure, but the pure-minded representatives from the innocent rural regions were the ones who got in the way. They first amended the bill so as to make it as ineffective as possible; and then proceeded to dilly-dally over it until there is now admitted to be grave doubt whether the act in any form can be got from the present Legislature.

The country Senators and Assemblymen who object to a law more stringently controlling the outlay of money in elections, and calling for complete publicity of the accounts of party committees, do not, when you press them, conceal their motives. Behind their assumed legal scruples and doubts on the ground of public policy, lies an intimate acquaintance with the way in which party primaries are carried and elections won in the sparsely settled districts of the State. There the cost is, we believe, much greater per voter than in the cities. It is not charged that direct corruption is resorted to on any great scale; but there are countless methods of indirect bribery. Old Bill Jones of Stony Hill Road cannot really be expected to get to the polls unless paid for the wear and tear of his team. If he brings his hired man along, that necessarily means $5 more. And if he stops on the way to pick up half-a-dozen friends, why, he and they must have at least what the economists call the "rewards of abstinence." They have abstained from earning $100 on their farms, and naturally should, in all fairness, have it made up to them. The habit spreads all through the district, and is clearly one of the most expensive habits known to politicians. The amount of money which it is considered absolutely "necessary" to put out among country people in a political campaign is notoriously large. The debauchery of the hill towns of Connecticut, by such means, has been made the subject of careful study. Investigators in darkest New York, meaning thereby the sweet, clean, unsophisticated villages and farms, would find material as unpleasantly instructive.

We have at hand a slight unveiling of conditions in Putnam County. A contest for control within the Republican party has been going on there, the rivals being Assemblyman Yale and "the

friends of the Hon. Hamilton Fish." Putnam County has, of course, long been a sort of preserve of the Fish family, and the effort to wrest it away could not be other than arduous, spectacular, and costly. Many picturesque details are given in the *Putnam County Courier*, published at Carmel, of April 6. From Ludingtonville, for example, came an account of the Republican caucus of March 31. The Yale men beat the Fish men by 104 to 49. This was not bad—153 votes when the registry showed a total of but 163 voters in a district which the Democrats carried last fall. Some of the forcing methods used to make two Republicans grow in the caucus where only one grew in the election, are suggested in the following:

> "It is estimated that over $5,000 was paid directly to the voters, and that, with the preliminary expenses, over $6,000 was expended. The successful faction paid $40 per vote, and the losers averaged about $16. We hear of one family of four voters who were paid $200, and the Fish faction in some cases is said to have offered as high as $20 for a vote."

It was, however, at Adams Corner on April 2 that the hottest contest was waged. The *Courier's* correspondent waxed enthusiastic in his account of the magnificent political strategy displayed and the glorious fighting witnessed. An expert Republican politician from Peekskill was on the ground to see what he could learn of skilled caucus-packing, and "spoke in the most favorable terms of the impression he had received."

It was hoped that Mr. Fish would be at the scene in person to cheer on his followers, but "at the very last moment he telegraphed that, it being Monday, his busy day at the Sub-Treasury, it would be impossible for him to be present." Yet Deputy Collector of Internal Revenue Donohoe was present "in the interest of Mr. Fish," and "paid strict attention." Democrats as well as Republicans were "lined up on either side," so that, "in looking the crowd over, one could not be sure whether it was a Republican or a Democratic caucus that had been called." But all knew why the gathering was so large. Farmers' wagons were never so thick, and as much as $50 was said to have been paid for a "lift." When the votes were finally counted, the score stood: Yale 127, Fish 122. Thus the Yale faction appeared to be winning, and the *Courier's* knowing correspondent remarks: "It will be necessary for six to change their minds in the convention in order for Mr. Fish to win. Can Mr. Fish manage so many? His friends believe he will."

It is but right to add that the *Courier* is a Democratic newspaper. Hence its zeal in exposing the corruption of the other fellows may have made its details too precise. But the main outlines of the picture, with its life-like rendering of the very atmosphere, are drawn with a veracious pencil. It helps us to understand the holy horror with which the provisions of the corrupt-practices bill are read at Albany, since the contested country primary is not very different from the country election. Section 203, for example, provides that "every political committee shall have a treasurer, and shall cause him to keep detailed accounts of all money or its equivalent received by or promised to, and of all expenditures, disbursements, and promises of payment or disbursement made by the committee or any of its officers or members, or by any person acting under its authority or in its behalf." Imagine that put in force in Putnam County!

A PROBLEM OF ADMINISTRATION, NOT RACE.

In his suggestive essay on "Race Questions and Prejudices," in the current *International Journal of Ethics*, Prof. Josiah Royce discusses with great ability and charm a question which for Americans daily becomes of larger and larger import. No one can hereafter claim to be an authority on race antagonisms unless he has acquainted himself with this scientific and masterly treatment of the subject. Here is the college investigator at his best, for Professor Royce has obviously written without prejudice and solely with the desire to establish certain truths. But he has not contented himself with theoretical studies; a part of his paper rests upon personal observations of the relations of whites and blacks in the West Indies.

Professor Royce's intimation that the race problem is a misnomer for a difficulty of quite another character, of itself throws light. Neither in Trinidad nor in Jamaica did he discover what is known as our Southern problem. There are no mobs there and no bitter antagonisms. There are other topics of conversation than the negro; the whole economic and political life of the islands does not revolve around him. The question of intermarriage between blacks and whites is not the final outcome of every conversation dealing with the future of the islands. Your white West Indian would be astounded to read such an indictment as a Southern white man presents against his own section in the current *South Atlantic Quarterly*. The Rev. John E. White there declares that the source of the South's "past and present weakness" was and is "the absorption of the Southern thought by one single issue—the question of the negro." The Jamaica race question, Professor Royce reports, was solved "by the simplest means in the world, viz., by English administration and by English reticence," and in this he confirms the view of an English colonial official, as expressed last year in the *International Quarterly*. When once the sad period of emancipation with its consequent disorder had passed, the Englishman organized Jamaica, established good courts which by fair treatment gained the confidence of the blacks, and then trained negroes to police the other negroes under white direction. The courts dealt with the too forward and litigious negro by encouraging him to air his grievances in court and by punishing him moderately when he deserved it. This, says Professor Royce, is a "truly English type of social pedagogy," which makes of the negro a "conscious helper towards good social order."

But administration did not stop there. It filled the island with good roads, reduced tropical diseases to a minimum, established a civil service for which in due time black men qualified, taught the population loyalty and order, and helped them "up from slavery." In this work, reticence played a great part: the superior did not dwell upon his superiority nor the other's inferiority; "superiority is best shown by good deeds and by few boasts." Moreover, there was an absence of certain irritating and annoying customs familiar to our South. Legal hanging is regarded as more desirable than lynching; there are no attempts to "make an example" by burning up a negro quarter as at Springfield, Ohio; and black women are not regarded as deserving of abominable violence because of mere relationship to an alleged murderer, as has happened in Mississippi and elsewhere. In short, the law takes its course, and the population remains calm.

All this leads Professor Royce to say to the Southerner:

> "The problem that endangers the sanctity of your homes and that is said sometimes to make lynching a necessity, is not a race-problem. It is an administrative problem. You have never organized a country constabulary. Hence, when various social conditions, amongst which the habit of irritating public speech about race-questions is indeed one, though only one condition, have tended to the producing and to the arousing of extremely dangerous criminals in your communities, you have no adequate means of guarding against the danger. . . . If you insist that in some districts the white population is too sparse or too poor, or both, to furnish an efficient country constabulary constantly on duty, why, then, have you not long since trained black men to police black men? Sympathy with the law grows with responsibility for its administration. If it is revolting to you to see black men possessed with the authority of a country constabulary, still, if you will, you can limit their authority to a control over their own race."

Whether it would thus be possible to limit the powers of a colored constabulary is open to question. But the record of the American negroes in the army of the United States, under both colored and white officers, makes it perfectly plain that they can be trained to be obedient, faithful, and self-restrained servants of the law. At Tuskegee the spirit of discipline inculcated by colored teachers is the school's most remarkable exhibit. We have long maintained that, in view of all the conditions

in the South, his own ignorance, and his terrible heritage from slavery, the negro is singularly docile, singularly law-abiding. That he is wholly without that desire to use a knife or revolver so characteristic of the Italian and the Greek, is creditable to him, and a great piece of good fortune for the country.

We shall not dwell further on the contrast between Jamaican and Southern administrative conditions, save to speak of affairs in Louisville. Its citizens complain that the negroes are a menace, and that they are retrograding. Yet they do next to nothing to elevate them, while setting the worst possible example of bad government before them. As if this were not enough, the city is without modern housing or sanitary laws, and the negroes are crowded into cellars or abandoned stables—precisely the conditions for a high death-rate and for a low morality. Here English administrative methods would work a revolution, if only because the best whites would coöperate with the best blacks—even if they did not eat with them. Truly, Professor Royce is correct. Too many Americans, North and South, "view as a fatal and overwhelming race-problem what is a perfectly curable accident of our present form of administration"; and this is as true in the slums of New York as in the desolate stretches of Mississippi or Arkansas.

DECORATIVE ARTS IN AMERICA.

An English architect visiting among us has made some stir by pointing out the low estate of decoration in America. His criticism touched particularly upon the uninteresting and stereotyped nature of our designs for furniture, and upon the inappropriateness of our architectural ornamentation. A number of local decorators and mural painters who commented on these strictures, agreed in the main. A movement in the National Arts Club to found a school of fine craftsmanship shows a feeling that all is not well in this field. The Director of the Metropolitan Museum undoubtedly feels that he is acting as a missionary *in partibus* when he brings over specimens of fine wood-carving and copies of old interiors. A certain uneasiness on the topic is periodically expressed. Our fathers and mothers hoped to be saved æsthetically by installing "Eastlake" chairs—uncommonly uncomfortable they were to sit or look upon—and we ourselves are only gradually escaping the domination of "Mission" carpentry and "fumed" woodwork.

In the matter of furniture and interior decoration, we have never fully recovered from the hideousness of the decadent Empire style, and the even worse anarchy that prevailed through the sixties and seventies. One has only to observe the woodwork of the houses built in the forties or earlier to perceive that then a standard of taste, narrow, to be sure, but cultivated and intelligent, still existed, and was served by a craftsmanship which, if by no means inventive, was at least competent. A comparison of a very humble interior of that period with those of to-day would show that we have passed from intelligent adaptation of two closely related styles—the so-called Georgian and the early Empire—to haphazard and lifeless copying of all the historic styles. From this point of view, the unenterprising devotion of our handful of Beaux-Arts architects to the Louis XVI. style has at least the merit of being a protest against the ruling flabby eclecticism. It may be that a scholarly revival of one style will furnish a basis for future invention.

All along the line is displayed the same incapacity for the simpler elementary forms of design. The best mural painting of our artists is set up amid machine-made decoration, usually of the most inappropriate sort. Unhappily, the average mural painter is incapable of designing the simplest arabesque for himself; both he and his architects are reduced to selecting a border or moulding from the books, which is coldly copied by a mediocre craftsman. Those artists who, like Mr. La Farge, have rebelled against this condition, and have sought to attain an harmonious setting for their wall paintings, have struggled against practically insurmountable difficulties. In external decoration for architecture the case is the same. How rarely is the eye pleased by a bit of truly inventive design like the façade of the New York Yacht Club, or even by well-executed and effectively distributed ornament, such as one finds in the new Madison Square Church.

Henry James, in his recent analytical ejaculations upon transformed New York, finds the particular root of the evil in the checkerboard skyscraper. When a building must consist of the greatest possible amount of rentable window space, he asks, Where is the place for beautiful design or incidental ornament? This seems to lay upon a particular form of speculative building the blame that should fall upon the public taste generally. One should condemn not the thrift that insists on these steel and glass houses, but the vanity on the owner's part and the hurry on the architect's, which fill these vast wall spaces with superfluous and ineffective ornament. Would that more architects might take the time not to decorate! That might force some study of the actual problem of design, and might lead, along the line of color, perhaps, at least to skilful evasion of the present sieve-like effects.

The real responsibility for the fallen estate of decorative art among us must be sought in the undue contempt in which it is held by artists and the artistic minority, and in the general absence of taste among the newly-rich classes. This scorn of applied design on the part of the artistic is eminently provincial and bespeaks a limitation. The best artists of the Renaissance were willing to decorate furniture, design frames, or undertake an entire interior. They passed readily from painting to sculpture and architecture. Raphael and his school evidently took a keen delight in the invention of arabesque patterns. Even in the eighteenth century, the culmination of academic ideals, nobody seems to have thought it was *infra dig.* for Clodion and Falconnet to apply their exquisite sculpture to the adornment of furniture and clocks. Condemned by the professional artist and misunderstood by its best patrons, decorative design either has fallen into commercial hands, or has fared worse in the keeping of an army of ill-trained amateurs. Mr. La Farge has invented the beautiful art of painting in opalescent glass, only to see it commercially vulgarized in his own lifetime. In architectural bronze work and iron work alone can one discern a promising condition. Meanwhile eager amateurs here and there glaze pots which they have bought in open market, painfully imitate colonial needlework, bind books in unhandy fashion, set stones in random collocations of precious metals, or otherwise illustrate the ineptitude of the individual when unsustained by an artistic tradition.

The remedy will come, we believe, not by direct effort, but by the education of the wealthy classes into something like taste. To syndicate a regiment of under-trained and over-individualized craftsmen into a school would merely increase the output of bad and eccentric craftsmanship. On the other hand, the moment that our rich men and our rulers who have the say in public building, learn to know good design from bad, good design will follow their demand. The growth of museums and the indiscriminate collecting that is going on should further this process of education. The possessor of a single piece of fine wood-carving should gradually come to see the inferiority of those poor excerpts from French châteaux and Italian palaces with which his mansion is decorated. It should not forever be possible to live with the best Persian carpets and the finest tapestries of Flanders and France and tolerate the kind of wall and floor covering that our commercial decorators affect. One may at least hope something from the generation of privileged children that is growing up amid a mixture of the best and the worst decoration. A child's taste is usually singularly sensitive and correct, and despondent æsthetes among us may fairly take this comfort, that, if we are in worse state than our grandfathers, we have at least emerged from our fathers'

complacent acquiescence in ugliness. Our children may actually rise to the conception that an identical merit obtains in a fine mural painting and a fine door escutcheon, that the makers of both are artists, and that a keen appreciation of the minor arts is the surest guarantee of a healthful condition in the fine arts.

NATHANIEL SOUTHGATE SHALER.

Dean Shaler died at his home in Cambridge on April 10. The fluctuations of his last illness, extending over more than a fortnight, were followed with intense anxiety, not merely in Cambridge, but throughout the community. Among Harvard students and graduates he enjoyed a unique popularity. By a common impulse, the flags on the students' clubs and on the city buildings were hung at half-mast; and on the afternoon of his funeral the shops in Old Cambridge were closed—a tribute which, during the past generation, no other Harvard professor has had. In his death the *Nation* likewise mourns an old friend and contributor. His first review, on "Volcanoes and Earthquakes," was printed in 1869, in the eighth volume of this journal, and he continued on its active staff of reviewers until 1898.

Professor Shaler was born near Newport, Ky., on February 20, 1841. His people had migrated from England to the West Indies, and thence to New York State. His great-uncle, William Shaler, was appointed in 1815 by President Madison consul-general to the Barbary States, with residence at Algiers, where, in concert with Commodore Decatur, he negotiated the peace that put an end to Algerine piracy on American commerce. His father, Nathaniel Burger Shaler, after graduating from Harvard College in 1827 and from the Medical School two years later, spent some time in Jamaica, then settled in Kentucky, and came to hold an honored place among the physicians of his section. He married into the Southgate family, which had crossed the mountains from Virginia. Thus, in stock and antecedents, the future scientist had a fortunate inheritance. His early education he received from a tutor, a learned German named Escher, who taught him the humanities, discussed philosophy with him, and fostered his insatiable appetite for reading. His father encouraged his taste for natural history.

In 1859 the youth was sent to Harvard, where he enrolled himself in the Lawrence Scientific School, and very soon attracted notice, whether by his hearty and downright manner or by his quick, keen, and versatile mind. He pursued the course in zoölogy, did special work with Louis Agassiz, and graduated Bachelor of Science in 1862. Not waiting for Commencement, Mr. Shaler hurried to Kentucky, enlisted in the Federal army, and was commissioned captain of the Fifth Kentucky Battery, which came to be known as "Shaler's," and during the next two years he saw active service, for the most part in his native State. At one time he was on Tillson's staff, at another he was chief of artillery for fortifications under Burnside; at Perryville, in 1862, he helped to repulse Bragg's invasion, and in 1863 his command was sent to intercept Morgan's raid into Ohio. The military experience, besides giving him wide human contacts, taught him self-discipline. The impress of it made one feel, in later years, that behind the delightful talker, with his flashes of dazzling speculation, was the man of action, who had looked danger in the face.

Broken in health, he resigned from the army in 1864, and returned to Cambridge, where he received an appointment as Instructor in Palæontology, and in 1869, at what even then was an unusually early age, he was promoted full professor. This chair he held continuously till his death, its title after 1888 being changed to Geology. As he was one of the first American men of science to accept evolution, it required courage in him to interpret that doctrine under the very eyes of Louis Agassiz, who still adhered to the old cosmogony; but he had tact as well as courage, and his relations with the then "pope" of American science remained untroubled. After Agassiz's death in 1873, Mr. Shaler had a free hand at the Museum, where, needless to say, Darwinism speedily prevailed. In 1891, on the resignation of Prof. W. S. Chaplin, he became Dean of the Lawrence Scientific School, which, under his direction, has grown rapidly in numbers, and, what is of real consequence, in efficiency. It was Dean Shaler who, in 1893, brought Prof. I. N. Hollis to Harvard to take charge of the Department of Engineering; he planned the metallurgical instruction, which is already second to none in America; and he has been largely responsible for the improvement in the intellectual standard and moral character of the members of the School. The last months of his life were devoted to the organization of the Graduate School of Applied Science, an object long in his mind, and at length made possible through the magnificent bequest which, at his suggestion, the late Gordon McKay left to Harvard.

But while Mr. Shaler in these and other ways stamped his influence on the structural growth of the University, it was not as an able administrator that forty classes of Harvard students knew him best; it was as a lecturer of unique gifts and as a friend that he stirred their interest and kindled their admiration and affection. He gave a course in geology, known as "Natural History 4," which became the most popular of any at Harvard, frequented by so large a proportion of undergraduates that in the space of a generation it attracted more than seven thousand of them into his lecture-room. There they found a thin, wiry man, somewhat under six feet in stature, but erect, quick of gesture, with a great mass of tawny hair brushed German-fashion away from his forehead, a tawny beard, a long, prominent nose, and pale blue eyes, which had, on occasion, now a penetrating flash, now a humorous twinkle. This was Shaler, and, as soon as he began to lecture, his hearers discovered that he was unlike every one else they had ever heard. He poured out a stream of wonderful entertainment; science, anecdote, wit, humor, reminiscence, pertinent illustration, or mirthful aside, followed each other in sparkling sequence. He used a wholly individual language, strong, vivid, picturesque, with plenty of simple Saxon raciness, and, at need, he coined fantastic but expressive words, or drew from the Shaksperian vocabulary. His laugh, which had many stops, was the laugh of the man of humor, and often confirmed or carried forward his meaning. He alone knew with how large a number of students he came into personal relations, how many he helped with advice or money, how many he found positions for after they left college. If any was sick, Mr. Shaler made straight for his room or the hospital, to see that everything was done for him.

But Mr. Shaler's popular lectures, and his personal friendly oversight of hundreds of students, consumed only a part of his time. He always conducted one or more advanced courses in palæontology, and during the past fifteen years he had shouldered the growing responsibilities of his deanship. He also directed the Summer School, which, in fact, grew out of his practice, early in the seventies, of offering instruction to volunteer students during the long vacation. Still, these various services to Harvard did not exhaust his energy. Appointed in 1872 Director of the State Geological Survey of Kentucky, he held that post for seven years. From 1884 to 1900 he was geologist in charge of the Atlantic Division of the United States Coast Survey. As a geological expert, his advice was sought by some of the largest mining enterprises in the country. At different times he was a member of Massachusetts commissions on highways, agriculture, and the extermination of the gypsy moth. As if this were not enough, he took part in local political matters, to the extent at least of aiding in the election of proper candidates, and he expressed himself freely on national issues.

Mr. Shaler began to print early, and before his death he had brought out twenty-five or thirty volumes, besides unnumbered magazine articles and scientific papers. His books illustrate the breadth of his interests. In science, for instance, there are a geological manual, 'The Story of Our Continent,' 'The Interpretation of Nature,' 'Illustrations of the Earth's Surface,' 'Fossil Brachiopods of the Ohio Valley,' 'Features of Coasts and Oceans,' 'American Highways,' and 'Domesticated Animals.' To history belongs the volume on Kentucky in the "American Commonwealths" series. 'The United States of America' gives an encyclopædic survey of the physical and material elements of the republic. In quite a different class fall four books which have appeared in the past five years—'The Individual: A Study of Life and Death,' 'The Citizen,' 'The Neighbor,' and 'Man and the Earth.' These present in clear and often striking language what we may call Mr. Shaler's philosophy, his final views on the relations of the individual with the infinite, on his political and civic contacts, and on his social and human ties, with an examination, half-scientific, half-prophetic, of man's probable destiny on the earth. Only a critic endowed with Mr. Shaler's versatility could pass an intelligent opinion on this great body of work; but even an unscientific reader cannot fail to do justice to the Shaleresque qualities of these later volumes, so rich in suggestion, so stimulating, so alert, and so human. A few years ago, Professor Shaler surprised his associates and the reading public by publishing at a single volley five dramas under the

general title 'Elizabeth of England.' He undertook their composition to disprove the assertion of one of his colleagues that the pursuit of science destroys the poetic imagination. These plays certainly show that in his case the imaginative faculty never languished, and they are much more than a mere *tour de force*.

After all, it is the great university figure whose passing we deplore. By his many talents and his ceaseless industry, wedded to a large, helpful nature, he showed that the calling of a university professor has the noblest possibilities; he humanized it. There is the constant danger that the drudge, the bookworm, the narrow specialist, shall bring learning into disrepute by divorcing it from life; it was Mr. Shaler's distinction to prove by his example that a professor may touch life on all sides, carrying to the world the disinterestedness of the university, taking to the university the higher practicalness and vitality of the world, and teaching both that that is the true learning which most enriches life and best reveals "come l'uomo s'eterna."

ON INDIA'S FRONTIER.

PESHAWAR, February 2, 1906.

In these days when the Amir of Afghanistan so rigorously excludes all white men from his dominions, there is to the traveller a certain satisfaction in obtaining at least a glimpse of his borders; and when such a glimpse combines a visit to Peshawar and the historic Khaibar Pass near by, a trip to the northwest frontier of India proves to be well worth while. Peshawar itself is reached from Delhi by a journey of thirty-six hours in the train northwards through the Punjab. It is a city with a distinctly northern atmosphere, and, though anything but beautiful in itself, has a decided attraction in its inhabitants, who are for the most part tall, strapping Afghans, clad in dirty white shawls and fantastically wound turbans. They have very light skins and fierce, bearded faces. From their general lawless, if not desperate, appearance we can understand that in entering the native city after dark, an Englishman takes his life in his hands, if he does not actually throw it away.

Ten miles to the west rises a chain of mountains, part of the system of natural barriers which shut off India from Central Asia, but at this very point pierced by the famous Khaibar Pass, through which from time immemorial, from Alexander to Tamerlane, ambitious conquerors have led their invading armies. The pass, which is some thirty miles long and extends across the strip of No Man's Country dividing India from Afghanistan, is in charge of an English officer, called the political agent of the Khaibar, and is fortified by several blockhouse posts, mounted at intervals on the hillsides so as to command the road below. Three quarters of the way through the pass the English have their furthest post, a strong fort called Landi Kotal, garrisoned by several hundred native troops. Six miles further on, the mountains end, and a broad valley marks the beginning of Afghan territory.

There are probably few more unsafe regions in the world than this Afghan borderland. The unruly mountain tribes, who live practically in a state of anarchy, have for generations spent their lives in raiding villages, robbing caravans, and quarrelling among themselves. As a result they are recklessly bloodthirsty, fighters first and foremost, holding life appallingly cheap. Thus the Khaibar Pass is closed, except on Tuesdays and Fridays, when the hills on both sides are heavily picketed. On these days native caravans toil through the defile escorted by squads of native troops. It seems rather curious that these troops should be recruited from the same Afridi villages, and even families, whose warriors are likely to murder passers-through, but the English could not with safety employ other races of Sepoys in such a hostile neighborhood. At the same time internal warfare is so common among the Afridis themselves that they see nothing unnatural in having a son in the English service shoot his own father or brothers who are engaged in some predatory raid.

Ordinarily tourists and even British officers are not allowed in the pass as far as Landi Kotal, but have to be content with the bit extending to Ali Masjid. Fortunately, however, we secured the necessary "special permission" to proceed to Landi Kotal, and, armed with a note in Hindustani to that effect, we set out early one gray morning in a two-wheeled tonga, drawn by a pair of swift ponies. Quickly outside of Peshawar, we raced for an hour over a bare level plain towards the mountains. Then we passed Fort Jumrud, a post connected with Peshawar by a military railroad, and in a few minutes were in the mouth of the pass, ascending the winding and twisting road (also military) which the English have carefully built from one end of the pass to the other. Another hour among the mountains brought us to Ali Masjid, where we dismounted to present our pass, while the driver found a relay of ponies. On this Friday we found starting on its way to Kabul a large caravan of camels, huge, awkward, shambling beasts laden with heavy packs, accompanied by a number of ragged, uncouth drivers on foot, and escorted by a guard of "Khaibar Rifles," the regiment of Afridi troops stationed at Landi Kotal which pickets the pass—against its own relatives.

Soon distancing the slow-moving caravan, we found that the chief interest of the day was about to begin, for a few miles beyond Ali Masjid, we came upon our first Afridi villages, square, mud-walled forts, some of them strengthened by tall mud towers pierced with narrow slits for rifles. From now on, the road, passing through a widening valley, led past several score of these unique communities, each resembling an isolated stronghold. They are in the nature of family dwellings, containing from fifteen to forty inhabitants, and cover on an average perhaps half an acre of ground. The enclosures give one the impression that each Afridi is at war with his neighbor, and that is not far from the truth, for life among these people is anything but tranquil. The pass is wide enough at this point to allow of a certain amount of agriculture, by which they find means of subsistence. But their fighting qualities are predominant, and the distinguishing institutions among the Afridis is the blood feud. It is in this that we find the explanation of their fortified homes.

Since the Afridis cannot always unite in slaying common foes, their bloodthirsty instincts find expression in the system of hereditary feuds, tribe against tribe, section against section, subsection against subsection, down to family against family. The whole thing, with its complicated code of etiquette, presents a maze of quarrels, murders, and revenges far too perplexing for a Western mind to grasp, and entails a familiarity with family pedigrees, histories, and relationships for generations back, quite bewildering to any but these spirited Mohammedans—for they are Mohammedans, and, though their religion does not prevent blood feuds, it regulates to some extent their prosecution. Truces, often of months, are declared at times of religious festivals, marriages, and the like; and a truce may be declared at any time when both parties are willing.

An elaborate code of etiquette, scrupulously observed and rarely broken, is perhaps the strangest feature of the feud system. For instance, the Government road is held to be neutral ground, and no man will harm his bitterest enemy on this highway. Upon this the English insist; otherwise, as far as the authorities are concerned, the murdering goes on unheeded. Accordingly, many of the houses near the road are connected with it by deep trenches protected by stone walls, by which householders may reach neutral territory without exposing themselves to the fire of their neighbors, who may be sitting, rifle in hand, in their towers near by. Another condition of neutrality recognized by etiquette is that of service in the British forces. Hence, as many of the Afridis spend a part of the year in the ranks, two men at deadly feud will serve in the same company as bosom friends. Then, as soon as their uniforms are off, they return to their native village and shoot each other at sight. At the present moment two important natives at feud have made a truce in order to undertake in partnership a Government contract for a road. When the road is finished and the rupees are divided, they will be once more marks for each other's rifles. All the people in the pass on one side of the road are at feud with those on the other. Of course, for the most part, such big tribal feuds by mutual consent are allowed to lag, what with truces and festivals, and only the bitterest private feuds are prosecuted without cessation. Thus two families may wage violent war though their respective sections or tribes are at truce. In the most vehement enmities, where there can be no truce, it is a case of war to the knife; one of the families is ultimately exterminated, including the women and children down to the last family dog or chicken. According to the authorities, there have been about ten "casualties" in the last four or five months, besides some indiscriminate "popping."

Passing by the Afridi houses—each one of which might well be called its possessor's "castle"—we approach the large fort at Landi Kotal, where we find a hospitable Englishman in command, busily drilling some raw recruits from the neighborhood. On climbing a high spur across the valley, crowned by a small outpost, we obtain a splendid view through the end of the pass into Afghanistan. In the clear, bracing air we can see for miles over a broad valley

dotted with villages until our sight loses itself beyond in successive walls of high mountains covered far down their sides with snow. Sixty miles in a straight line beyond those mountains lies Kabul, while Jelalabad is but half that distance—practically as near Landi Kotal on the west as Peshawar is on the east. Finally, descending to the fort again, we take lunch with the Commandant. From him we learn something of the general state of affairs on the frontier and hear some amusing tales about the inhabitants of the Khaibar.

Dark comes on early at Peshawar, and as we have a three-hour drive before us, we take early leave of Landi Kotal, and are soon passing to right and left the silent Afridi strongholds. There are almost no people on the road, and few signs of life in sight save a group of old women with jars on their heads, who are fetching water from a well to one of the houses. Now and then on the hillside we notice stray couples of pickets, stalwart Afridis in khaki uniforms, whiling away their duty with a smoke and a chat. Before long we leave behind the last enclosure with its intrenched pathway leading to the road, and its expanse of forbidding brown walls unbroken except by rows of loopholes. The pass narrows, and there remain only fifteen miles of barren mountains between us and the plains of India. The day has been most satisfactory. Thanks to the pickets, we have been able to penetrate into the Khaibar far enough to see something of the conditions of life among the Afridi tribesmen; in fact, we have so nearly crossed the wild borderland as to get the desired glimpse into the forbidden state beyond. Judging by the character of the Afghans and the uninviting aspect of their mountainous country, we should expect to find Afghanistan still more inhospitable than its Indian frontiers.

RICHARD B. HOBART.

GENERAL LAMARQUE.

PARIS, March 28, 1906.

M. Bertrand Lasserre has used the inedited papers of General Lamarque for a volume which he has just published on the period of 'The Hundred Days in La Vendée.' Let us first say a few words about General Lamarque, who is known now only by his political career, his eloquent speeches in the French Chambers, and the popular demonstration which took place the day of his funeral. He made war for twenty-two years during the period of the Revolution and the Empire. He spent five years in Italy from 1807 to 1811, four years in Spain. On the fall of the Empire he seemed condemned to rest, but the period of the Hundred Days gave him a part to play in Brittany and the Vendée. This episode is not much known; it was lost in the history of the great but brief struggle of Napoleon against the Allies, which ended at Waterloo.

In the popular mind, Brittany and the Vendée are confused even in our times; in reality, the River Loire cuts in two these regions, where civil war so long raged. On the north of the Loire we find Brittany proper, Quiberon, Le Maine, the land of the Chouans and of Cadoudal; on the south is the Vendée.

"During the Revolution, as well as during the Hundred Days," says M. Lasserre, "on both sides of the river people fought for the same cause, without ever succeeding in coördinating or uniting their efforts; the insurrection to the north and the insurrection to the south remained, at different times, completely distinct. In 1815, the events which form the subject of General Lamarque's notes concern only the Vendée—that is to say, the vast quadrilateral bounded on the north by the Loire, from the Ponts-de-Cé to its mouth; on the west, by the ocean; on the south by the Sèvre Niortaise; on the east by the meridian of Bressuire, the hills of lower Poitou and the flat land of the Gâtine."

In this vast region there are three parts of very different aspect, commonly called the Bocage, the Plain, the Marsh, names which constantly occur in the history of the insurrection of the Vendée, which you will find in the memoirs of Madame de la Rochejacquelein, in Balzac's admirable novels, in a hundred other books. This enormous surface, which at the time of the Consulate and the Empire was intersected by very few roads, is attached to the central part of France like a sort of virgin island. Its inhabitants, who belong to the Celtic race, were like a people apart. The inhabitants of the Bocage especially, a very sylvan region, had been preserved from all outside contact; of pure life, savage and distrustful, brave almost to madness, attached to Church and King from generation to generation, they had among them natural leaders, captains of parishes, chiefs of districts, whom they blindly followed. The Royalist party of the Vendée remained quite torpid under the Consulate and the Empire; it began to revive only in 1814. Louis XVIII. disappointed the local chiefs of the Vendée by ordering the Chouans, Bretons, and Vendéans to surrender to the Government their old guns of great calibre for the equipment of the National Guards. The effect of this ordinance was disastrous, La Vendée felt wounded. It was nearly disarmed when Napoleon returned from Elba.

The King was urged for a moment to retire to the Vendée; he preferred to go to Lille, and to remain in touch with the allied Powers. He sent the Duke de Bourbon to the Vendée; the Duke obeyed. The Duke d'Angoulême and his wife were at Bordeaux; the Comte d'Artois was on the road to Lyons. The Duke de Bourbon had left Paris in great haste, without any staff, almost without money; he arrived at Angers on the 14th of March, preceded by M. d'Antichamp. He found at Nantes the Count de Suzannet and Prince Louis de la Trémoille. The Duke de Bourbon, father of the unfortunate Duke d'Enghien, found the Vendée irritated against Louis XVIII.

"In order to draw the province out of its discontented reserve and to galvanize it as in old days, there would have been need of another man than the Duke de Bourbon, the ex-commander-in-chief of the useless army of Coblentz, an old man of fine presence, but of weak and almost vacillating character. Besides, the peasants were far from having their old temper; more than one chief discovered with much sadness the weakening of the royalist energy by the slow infiltration of the new ideas."

The Duke de Bourbon tried, however, to organize some armed battalions, but he soon felt that his efforts were vain when he heard of Napoleon's return to Paris. The Prince left Beaupréau, where he had established his headquarters, in the night of the 24th of March, alone with the Count de Rully; he travelled from farm to farm, and, after a journey of eleven days, he embarked at Paimbœuf in a small vessel which took him to Spain. Curiously enough, it was only after his departure that the royalist chiefs became more active, each of them working in his own district. The principal officers were Saint-Hubert, Dupérat, Duchaffault, Ludovic de Charette, Suzannet, Sapinaud, D'Antichamp. Louis de la Rochejacquelein, having accompanied the King to the frontier, left him to go to England to procure arms and munitions, and reached the coast of La Vendée. Gen. Canuel, who had adopted the cause of the Bourbons in 1814, was among the insurgents and had become their major-general. On the arrival of the Marquis de la Rochejacquelein, the insurrection, which had been prepared in secret, broke out, on the 15th of May. Four army corps were to occupy the Vendée, under the command of D'Antichamp, of Sapinaud, of Suzannet, of La Rochejacquelein. The insurgents hoped to have fifty-one thousand men under arms, but the reality was far below this expectation; two-thirds of the peasants had no other arms but their old-fashioned guns, one-third had no arms at all.

On the 17th of May the Emperor heard at the Tuileries the news of the rising in the Vendée and of the arrival of the Marquis de la Rochejacquelein; he immediately dispatched troops to the Loire. General Corbineau was sent to the Vendée, but the means placed at his disposal were insufficient, as the Emperor intended to limit his efforts in the West, and was giving all his attention to the approaching campaign against the Allies. M. de Suzannet and Sapinaud recognized La Rochejacquelein as the general-in-chief; they all three marched on Napoléon-Vendée. They slept at Aizenay on the 20th of May, and were surprised in the night and obliged to fly. At Cholet, La Rochejacquelein had an interview with another Vendéan chief, D'Antichamp, who delivered his command to him; they all marched towards the coast in order to protect a second disembarkation of English arms and munitions. By that time Gen. Lamarque had arrived and taken command of all the troops of the west, which formed the army of the Loire; he put everything in order, interrupted all communications between the two sides of the river. Full powers were given to him; fourteen departments were placed under his orders. His headquarters were established at Angers.

Fouché, head of the police, sent three agents to the Vendée, in order to make overtures to the insurgent chiefs; he was well acquainted with their divisions, their jealousies, and had always had a foot in both camps. He was as ready to serve the royalist cause as the cause of the Empire; he knew that the fate of Napoleon would soon be decided on the battlefield, and his object was to gain time. The mission of his envoys had for its first effect to create division in the ranks of the insurgent chiefs. The Marquis de la Rochejacquelein and M. d'Antichamp were both jealous of preëminence, and their forces ceased to act in common. The first basis of a pacification was discussed; the forces of Sapinaud, Snzannet, and D'Antichamp returned to their homes. They met on their march Gen. Travot, and, notwithstanding their su-

periority in numbers, they did not attack him.

It is difficult to give a clear account of the confused events which followed. La Rochejacquelein lost his life in an engagement, and consternation became general among the insurgents. Sapinaud took the command; there was another battle at Roche-Servière, in which the Vendéans were defeated, and M. de Susannet mortally wounded. Military operations came naturally to an end after Waterloo; and the Vendéan chiefs signed at Cholet a treaty of peace with Gen. Lamarque. The new Provisional Government formed in Paris after the abdication of the Emperor gave little attention to the pacification of the Vendée; it is to the credit of Sapinaud and his companions that, on the circulation of a rumor in the Vendée that the allied Powers intended to dismember France, they informed Gen. Lamarque that they would unite their forces with his in order to fight against the foreigner. Louis XVIII., on his return, discharged the Army of the Loire. Gen. Lamarque was exiled for a time, till 1818.

In 1828 he was elected Deputy from the Department of the Landes. The history of the brief insurrection of the Vendée in 1815 is told with much care by M. Lasserre, though he recognizes that it was an affair "of pure sentiment. Caused by the return from Elba, it had a laborious beginning, and developed at random, irrationally, according to the caprice of different chiefs, and committed suicide in the end." He adds that twenty thousand men were kept in Brittany and in the Vendée in order to quiet these provinces, and that "these twenty thousand men, flung on the battlefield of Waterloo, would perhaps have hindered the disaster."

Correspondence.

LITERATURE VERSUS PHILOLOGY.

To the Editor of The Nation:

Sir: Your editorial article in No. 2128 on "Teaching Literature in Colleges" must strike a responsive chord in the breasts of a large number of American university men who were compelled to forego the study of literature for the sake of philology—either because the instructors all stressed philology, or because it was practically impossible to get a degree with high credit based on purely literary work.

But shall we not have to wait until a change comes over the "American spirit" before we can hope for a change in the methods of teaching "literature"? So long as this measures the value of a college course by the extent to which it will increase a man's money-making power; so long as we have the "strenuous" spirit penetrating more and more into every department of life, just so long will the Gradgrind method which enables a man's work to be weighed, measured, or counted, be the prevalent method. We Americans are mad for tangible results; and in seeking them we lose sight of the spirit of life which gives force and meaning to these results. G. S. W.

Greensboro, N. C., April 13, 1906.

SANCTA SIMPLICITAS.

To the Editor of The Nation:

Sir: Cannot something be done to check the assaults of those subsidized vandals, the Simplified-Spelling Board, upon the finest of modern arts, the traditional English orthography? They would destroy at one blow if they could, a nice and delicate sense for visual symbols which has been built up through centuries. Consider, for example, the following quotation from one of Keats's letters to George and Georgiana Keats, written under date of February 14, 1818:

"We—*i. e.*, Brown and I—sit opposite one another all day authorizing (N. B., an 's' instead of a 'z' would give a different meaning)."

Is this fine perception of a difference between *authorizing* and *authorising* utterly worthless? Has it no artistic or literary value? Or, to ask a more pertinent question, what is its equivalent in United States Steel bonds? I call on the Simplified-Spelling Board for a reply.

Philologus.

"COMPARATIVE LITERATURE" AND "PHILOLOGY."

To the Editor of The Nation:

Sir: In connection with your recent suggestive editorial on "Aspects of Comparative Literature" (*Nation*, March 29, 1906), it may not be out of place to recall two prior, authoritative utterances on similar themes. Trustworthy documents on the general conception of literary and linguistic study have been relatively infrequent on this side the water, where, perhaps, they are at present needed most; we should do ill to neglect the few that we already possess. At all events, a comparative examination of your editorial and the two earlier articles in question might be of considerable advantage to many teachers of language and literature in this country, if only by way of fostering precision in the use of fundamental and inclusive terms. When, for example, we are handling a weapon of great range like "philological" or "comparative literature," it behooves us to discover the right end and the proper make.

The expression 'comparative literature," as Prof. C. M. Gayley pointed out several years ago (*Atlantic Monthly*, July, 1903), is fashioned improperly; it is a rude, even barbarous term, unfit, assuredly, for employment in the defence of polite learning. To speak plainly, we may brand it as a virtual solecism. According to good usage, the word *comparative* is associated in similar combinations, not with a noun representing an objective material—such as *literature*, in any customary sense—but with a noun containing the idea of a verbal action, a methodical process—such as *anatomy, physiology, philology*, and the like. Thus, we say not *comparative embryos*, but *comparative embryology;* not *comparative forms* (of plants, etc.), but *comparative morphology;* and, finally, not *comparative language*, or *literature*, but, as our safest teachers tell us, *comparative philology.**

*Or simply *philology; comparative* is superfluous. The progress of knowledge in every field, great or small, rests necessarily upon two bases, observation and comparison. The scientist begins with the observation of smaller, contiguous magnitudes, and proceeds to greater and more remote. *Comparative literature* presupposes some such thing as *observative literature.* Our universities ought really to have established chairs in the latter before they took care of the former.

The marriage of *comparative* with *literature* was not made in Germany. *Compared literature* (*la littérature comparée*), we might say, with the French, were the phrase not objectionable on other grounds. *Comparative study of literature*, though clumsy, is tolerable, and may pass muster with those who cannot accustom themselves to the true and inclusive signification of that much-abused word *philology.*

This word we Americans almost invariably grasp by the wrong end, although the Germans since the days of the immortal August Boeckh have been trying to teach us and others its real function. Apparently, we have been willing to appropriate from them anything in or around the realm of *Sprachwissenschaft* and *Litteraturgeschichte*, save a knowledge of the origin and application of this single, embracing term *Philologie.* As a result, most of us recognize no term whatsoever that comprehends the study of language and literature combined, though these two things are never separate in nature; and, in our teaching, some of us even try to divorce what God has joined together. At any rate, the consequence of a lack of precision at the top of our nomenclature is a certain amount of confusion in our thinking all the way down to the bottom of literary and linguistic disciplines. Professor Gayley, of course, has come to our rescue here also, with the admirable essay cited above, "What is 'Comparative Literature'?" But, more particularly, your readers may be referred to Prof. Albert S. Cook's presidential address on "The Province of English Philology," delivered before the Modern Language Association of America in 1897, and printed subsequently in the *Publications* of that society, Vol. XIII., No. 2. Professor Cook's plea for a broader definition of philology seems irresistible. Fortunately, this valuable address is to reappear shortly in a volume of essays by the same author, to be published by Messrs. Houghton, Mifflin & Co. A reprint of Professor Gayley's article would be welcome.

Lane Cooper.

Ithaca, N. Y., April 12, 1906.

[The late Asa Gray used to object to "*Comparative* Zoölogy" in the title of the Agassiz Museum at Cambridge.—Ed. Nation.]

Notes.

G. P. Putnam's Sons announce for speedy appearance Bishop Potter's 'Reminiscences of Bishops and Archbishops,' and a translation of Fogazzarro's 'Il Santo.'

Recent political events lend special interest to the announcement of a new illustrated history of Norway from the earliest time to 1905, by six of the leading historical writers of that country, each of whom will be responsible for the period as to which he is a recognized authority. The first volume, dealing with the Viking period and bringing the story down to 1035,

will be written by Prof. Alexander Bugge, and will appear early in 1907. The sixth volume, which treats of the union with Sweden, will be by Prof. Ernst Sars.

Under the title of 'Les Sources Inédites de l'Histoire du Maroc,' the famous African traveller, Count Henri de Castries, will publish through the Paris house of Leroux a three-volume collection ranging from 1530 to 1845, the material consisting of the reproduction of manuscripts, reports, letters, and other documents. The first volume, of almost 700 pages, has just left the press. The author secured his materials in the archives and libraries of France, England, Austria, Spain, and other countries, and what he gives is the result of years of labor. The work is divided into three parts for as many dynasties. It closes with 1845 because in that year the definitive settlement of the boundary lines between the Moroccan and Algerian territories was made, and the modification of the treaties between the various European states and Morocco took place. Count de Castries criticises quite severely the elder literature on Morocco, especially Sir Lambert Playfair's 'Bibliography of Morocco.'

The Monuments of Egyptian Sculpture, as revealed in typical examples historically and chronologically ordered, are to be luxuriously illustrated in a folio issued at Munich by F. Bruckmann (New York: Lemcke & Buechner). The text will be in German. The twelve parts proposed will be concluded at furthest by the end of 1907. The sample illustration is convincing

Among the works which are being edited for the Hakluyt Society, London, are some of interest to Americans. Mr. Bolton Corney, the chief medical officer of the Fiji Islands, is preparing Four Narratives of Voyages undertaken by order of the Viceroy of Peru, in 1774, with detailed accounts of Tahiti and Easter Island. Mr. A. P. Maudslay is editing the translation, from the original MS. in Mexico, published by photography in 1904, of 'The True History of the Conquest of Mexico.' The honorary secretary and treasurer of the Society, Mr. Basil H. Soulsby, of the Map Department, British Museum, is bringing out a translation (from the copy in the Grenville collection at the British Museum) of Jacques Cartier's Short Narrative of the Voyage made to the Isles of Canada, Hochelage, and Saguenay, which was published at Paris in 1545. In view of the approaching tercentenary of the founding of Quebec, in 1608, this is a very timely republication. The second edition of Sir Walter Raleigh's Discoverie of Guiana, the first Hakluyt edition of which was so admirably edited by Sir Robert Schomburgk, is still promised by Sir Everard im Thurn, now Governor of Fiji, who was for some years an officer of the Government of British Guiana, in which colony he travelled much and familiarized himself with the ways of the Indians.

Volume IV. of Mr. J. W. Fortescue's 'History of the British Army,' now just appearing, ought to awaken fresh interest in the islands of the Caribbean Sea, the Mediterranean of the New World. The story of the campaigns there, from 1793 to 1798, is told consecutively in this volume, for the first time. Among the commanders who figure in it is Sir Charles Grey, afterwards Earl Grey, and father of the Lord Grey of the Reform Law (of 1832), and grandfather of the present Governor-General of Canada. It was this Sir Charles Grey who was named to be the British commander-in-chief against the Americans, had not peace been made in 1783. The volume is a long one, extending to 900 pages, and the author has found this part of his work the most difficult to handle of any subject he has yet attempted, owing to the complications of the narrative. The original letters in the Public Record Office, London, are the backbone of Mr. Fortescue's work; but many collections of private papers have been thrown open to him, so that abundant materials are available. The next volume will probably be delayed, owing to Mr. Fortescue's appointment to be the King's librarian at Windsor, and that will also necessitate his relinquishing the calendaring of the Colonial Series of State Papers at the Record Office, in which service he has so ably followed the late Mr. Noel Sainsbury; but it is hoped that he may yet find himself able to supervise those who will hereafter carry on the work, which is of such deep interest to all who are students of the colonial period of American history.

From the office of the *Publishers' Circular*, London (New York: *Publishers' Weekly*), we receive 'The English Catalogue of Books for 1905,' the 69th issue of this standard list. We need say no more of it except that it is typographically very neat in appearance, and that an appendix gathers up the names and output of learned societies, printing clubs, series, etc., and is followed by a directory of publishers, British, American, and Canadian. Some American books are included in the main list, and in the appendix.

Harper & Bros. have brought out in pale blue covers, rather taking except for the front design, a popular edition of 'Through the Looking Glass,' 'Alice's Adventures in Wonderland,' and 'The Hunting of the Snark.' The illustrations are Peter Newell's, less enjoyable than Tenniel's, whose distinction they lack, but at their best very humorous.

The Russo-Japanese war is already losing some of its prominence as a topic of the hour, but the struggle of the Russian people towards light and knowledge has never been more vividly before the public. For the latter if not for the former reason, J. Taburno's 'The Truth about the War' (Kansas City: Franklin Hudson Co.) may well attract readers. The author, an engineer by profession, sets down readably, candidly, and naïvely the impressions he received while with Kuropatkin in Mantchuria. The way in which his eyes were gradually opened to the shortcomings of the Russian Administration and to the virtues of the Russian peasant may be taken as typical of the larger process at present in active operation throughout the Empire.

Prof. John S. Phillimore has published through the Clarendon Press a verbal index to Propertius, which he had made in preparation for his intended commentary on that poet. It is far more complete than such indices usually are, even including full records of such particles as *et*, *-que*, *ut*, and *non*, which are generally disposed of with a few examples and a comprehensive etcetera. Thus, while the Propertian index in the Delphin edition omits *et* altogether, Professor Phillimore's claims to register 605 recurrences, with 75 under *ab* to the Delphin's four. The index is not strictly analytical, and yet sufficiently so to seem inconsistent because not always so. For example, *et* for *etiam* is separately listed; but *et . . . et* (both . . . and) is not; *ut* is listed by the mood governed, but both *uts*, the adverb and the conjunction, are listed together; *expertus* in I., iii., 18, is listed with the other forms of *experior* without note of its relatively unusual passive sense. But this does not seriously affect the usefulness of the index, nor could it be expected that a list made to meet the needs of one workman should equally suit those of all. It is interesting to note that Propertius's vocabulary does not much exceed three thousand words; but those to whom this seems a limited thesaurus should remember that many words are, either wholly or in certain inflections, excluded from elegiac verse.

'Contributions to the History of American Geology,' by George P. Merrill, head Curator of Geology, United States National Museum, has just been issued as an extract from the report of that institution for 1904 (Washington). It is a serviceable review of the personal side of our geological progress, refreshed by numerous portraits, among which those of Dana, Logan (our esteemed Canadian neighbor, if not of our own country), Hall, and Powell are excellent likenesses of strong personalities, which the geologists of the younger generation will do well to look upon. Outline maps give definite location to the routes and field of study of the earlier explorers. After chapters on what are called the Maclurean (1785-1819) and Eatonian (1820-29) eras, the chapters proceed by decades, reviewing the work and workers of State surveys up to 1869, and of the national surveys in later years. Four peculiarly American problems are given chapters by themselves —the fossil footprints of the Connecticut Valley, in which Deane and Hitchcock are the leading figures; the Eozoon question, championed by Dawson of Canada and now a past issue; the Laramie question, on which the geologists of the Western plains and mountains were for a time divided into hostile camps; and the long-lasting Taconic question, over which the Eastern geologists have had many a battle, and concerning which many "last" words have been said and are probably still to be said. An appendix contains brief sketches of 196 American geologists, with references to fuller biographies.

Of Pope's 'Handbook of Tamil' (Oxford: Clarendon Press; New York: H. Frowde), already noticed by us as the several preceding parts have appeared, the fifth part, 'Prose Reader,' has just been published in the seventh edition. It consists of reading exercises, adapted to the Handbook and Dictionary by the same author, with specimens of classical prose and business Tamil, suited to the use of officials, together with thirty-one easy stories and some additional tales, especially intended for those studying for the Higher Proficiency Test and drawn from the Paṅca-Tanthiram. Considering the small type, the number of errata is reasonably small. For Englishmen fitting themselves for active service, this Handbook is the best, and it may be studied with profit by any one desirous of beginning Tamil.

The waves of influence from Mr. William James's 'Varieties of Religious Experience' have gone far and have touched strange shores. Perhaps the farthest and strangest is the paper by Prof. Asín y Palacios of the chair of Arabic in the University of Madrid, on the psychology of ecstasy as exemplified in the two great Muslim mystics, al-Ghazzali and Ibn Arabi, which appeared in *La Cultura Española* for February. Al-Ghazzali, for a Muslim theologian, is a comparatively well-known figure even to non-Arabists, thanks largely to Professor Asin himself. But Ibn Arabi, important as he undoubtedly is for the history of theology and philosophy in Christendom as well as Islam, has been little studied even by Arabists. Such a treatment, therefore, as we have here of the emotional psychology of Ibn Arabi can be confidently commended to those students of philosophy who still retain an interest in its history and threads of influence, to psychologists of even the latest school, and to all interested in religious phenomena. Professor Asín begius frankly with Professor James's book and the reaction which it marked and induced. A student of Muslim mysticism of some years' standing, he is interested in seeing modern philosophy come round to him, as it has done with great completeness. The pragmatists are as good Ghazzalians as al-Ghazzali himself could have asked for. But that he only touches, going on to develop with learning and skill, as an Arabist and a psychologist, the phenomena of religious ecstasy, the resultant theological conceptions and their consequences for life, as experienced and stated by Ibn Arabi especially. He also brings forward some other evidence in support of the thesis, already laid down by Professor Ribera, that Raymond Lully was under deep Muslim influence, and might be described as a Christian Sufi and an imitator of Ibn Arabi. That there was communication and influence, one way and another, betweeu the Christian and the Muslim mystics of Spain, can hardly be doubted. Some things in this paper remind strongly of visions of Santa Teresa; mystics, too, it may be remembered, are seldom fanatical.

The circle of modern Arabic dialects studied and reduced to phonetic form is steadily rounding out. For uorth Africa there are several excellent books by Stumme; for Egypt many, from Spitta down; for Damascus Oestrup, and for Beirut and its neighborhood Hartmaun; for Central Palestine Christic, and now for Jerusalem and southern Palestine Dr. Max Löhr ('Der Vulgärarabische Dialect von Jerusalem, nebst Texten und Wörterverzeichniss,' Giessen, 1905). What is left is practically Arabia proper; and Socin did something in the north and east, and Landberg is doing much in the south. The grammatical part of Dr. Löhr's investigation is full and careful, and the little Arabic-German lexicon will amply cover all ordinary usage. But, as the vocabulary is not also given reversed, the beginner in Jerusalem will have to find his way by instinct, or use some other guide, such as Hartmann's golden little book. The texts, too, are over scanty; for that, Littmann's gatherings will help out. But the grammatical treatment can stand by itself and will not need redoing.

Portable copies of the 'Divine Comedy' in the original are always in order, and the new pocket school edition (*edizione minuscola*) just issued by Hoepli in Milan will find everywhere a wider circle eager to possess it. Both publisher and editor, Prof. Raffaello Fornaciari, rightly dwell on this. The 577 pages are, by means of an opaque thin paper, reduced to half an inch in thickness; the letter, though necessarily small, is round and clear; the notes are disposed at the foot of the page. There is a prefatory word on the poet's life and the meaning of his poem. The text and mainly the notes alike are derived from Cassini, Passerini, and Scartazzini (4th edition). The covers are flexible.

It has remained for a Frenchman, Dr. Paul Mantoux, to write the first satisfactory account of the Industrial Revolution in England, 'La Révolution Industrielle au XVIIIe Siècle' (Paris: Cornély, 1905). In a solid but well-written work of 540 pages, Dr. Mantoux reviews instructively the condition of English industry in the first half of the eighteenth century, describes the great mechanical inventions which wrought the sudden transformation, traces their introduction into the several branches of manufactures, and then considers the economic and social results of the Revolution. With evident mastery of materials and clear insight into the working of complex and sometimes obscure economic causes, he has produced what should be, for a decade or more, the standard treatise upon its subject. The work is of such interest to English and American students that it should be translated as speedily as possible; to teachers of economic history, it will prove a great boon.

'L'Empire de l'Argent,' by Joseph Dubois (Paris: Guilmoto, 1906), is an elaborate study of the monetary system of China. It explains fully and clearly the existing currency system, deals with the perplexing question of exchange with gold-standard countries, and gives a detailed account of Chinese banking institutions, both native and foreign. Then, after reviewing recent experiences of certain provinces with French and Russian coins, it concludes with a vigorous attack upon the plan of monetary reform proposed by the late American Commission. M. Dubois is strongly of the opinion that the existing silver standard is so firmly established in China, and rooted so deeply in the habits and prejudices of the people, that it will long be maintained, in spite of the well-intended but uninvited advice of other nations. He thinks that the American Commissioners, "le professeur Jenks en tête," were deceived by "les sourires fallacieux de quelques mandarins," and failed to appreciate the coolness of the reception accorded their proposals. The book is one which the American student may well place on file beside the reports of the American Commission on International Exchange.

The March number of *Public Libraries* is largely devoted to matters relating to library instruction. Members of the faculties of the various library schools and training classes have contributed more or less full accounts of the history, characteristics, and ideals of the schools with which they are connected, the statement of Miss Mary W. Plummer, director of the Pratt Institute School, in many respects taking the lead, while undoubtedly that of Mr. J. I. Wyer, jr., the new vice-director of the New York State Library School at Albany, is the most significant, in that it expresses the purpose of the authorities of that institution to develop it into a real graduate school by eliminating many elementary courses and giving particular attention to bibliographical and administrative subjects. These accounts are supplemented by statements of students; among these the letter from Mr. Leon M. Solis-Cohen, a recent graduate of Albany, deserves special attention for its frank criticism.

The *Library Journal* for March opens with a thoughtful paper by Dr. E. C. Richardson on "The Library in the Community," which emphasizes the function of libraries, both private, corporate, and public, in enlarging the ideas of the members of the community. The most interesting paper in this number is certainly Miss E. D. Renninger's breezy and amusing account of her experience in "The Organization of a Library in a Small Town." She relates how she was led to believe there was a strong and active organization behind the movement, but found, when she came to the place, that it was pushed by only two persons—the chairman of the Library Department of the local Civic Club and the recently appointed librarian. Her account of her fight against ignorance and indolence and ultimate success must be read in full to be appreciated.

The Balkan question is the subject of most general interest treated in the *Annales de Géographie* for March. Professor Cvijic of the University of Belgrade states, as the result of investigations made during his travels in that region, that the great majority of Macedonian Slavs have no exclusive patriotism. They have neither a national Bulgarian nor a national Servian feeling, but could be transformed easily into either Bulgarians or Servians under the force of circumstances. Bulgaria is at present in greater evidence because of the activity of the revolutionary committees and the establishment of a national church. More than a third of the Slavs, however, have refused to abandon the foreign Greek Church for the Exarchate. In treating of the language, he says that 'Bulgarian is not an ethnographic term. It designates a man of simple laborious life, while Serb and Slav are interchangeable. Further study is needed to determine whether or not there is a distinct Southern Slav language or dialect. Light is thrown upon the present condition of Algeria in an account of the evolution of the nomads of that country, who are gradually changing their habits of life. Instead of the tribes following their flocks to their different pasturages, they now abide in one place, and trust their flocks, as is done in Europe, to the care of shepherds. Lieut. Desplagnes gives a brief but encouraging account of the development of the rich basin of the Middle Niger. The peaceful conditions established by the French are inducing the people who sought refuge in the mountains from the raiding nomads, to come down to the plain and cultivate it. This paper and one on the geology and physical geography of Morocco are illustrated by some beautiful reproductions of photographs.

Alexander Lango Kielland, whose death was recently announced, was born in Stavanger, Norway, February 18, 1849. He studied law in Christiania, but never practised, preferring to devote himself to business. With the exception of some time spent in Copenhagen and Paris, Kielland lived in Norway, most of the time in Stavanger. His earliest publications, two volumes of novelettes (1879-1880), one of which was translated into English, show the marked influence of Daudet; but his novels, which appeared between 1880 and 1891, belong to the modern Scandinavian school of realistic fiction, with some direct indebtedness to Zola. Among the best of these eight volumes are 'Garman and Worse,' containing many autobiographical touches, 'Working People' and 'Skipper Worse,' somewhat in the style of Jonas Lie. 'Jacob,' the last of the novels, is a brilliant but unpersuasive study of a business man who, like the patriarch, bases a brilliantly successful life upon a fraud. Kielland's chief merit as a writer is the extreme elegance and finish of his style. Most of his novels have been translated into German and Swedish, and several into English. In 1891 Kielland was appointed burgomaster of his native town, and was later promoted to the position of *Amtmand*, or sheriff of the district. The last fifteen years of his life were practically without literary output.

The former Liberal Prime Minister of Norway, Johannes Steen, whose second term of office extended from 1898 to 1902, died April 1, at the age of seventy-eight.

—A week ago to-day we received from Dr. Richard Garnett a letter, not in his own hand, dated London, April 2. In it he spoke of suffering from an affection of his eyes, which had prevented his executing a certain review for the *Nation*, but he looked forward to a somewhat tedious recovery. On the day following the receipt, namely, April 13, he passed away, in consequence (as the cable reported) of a hemorrhage; and at this writing we know no more. Dr. Garnett was a library product if there ever was one. His father, whose name he repeated, a clergyman, was Assistant-Keeper of Printed Books in the British Museum, and he himself, becoming an employee of that institution at an early age (he was born in 1835), rose to be Keeper of the same department (1890-1899). As such he was well and graciously known to all Americans having need to profit by his official position. It was in the year of his retirement, when recreation by "change of occupation, *dolce far niente*," was his aim, that he voluntarily entered into relations with this journal, and latterly became a highly valued reviewer for it: his prodigious habit of work could not be repressed. His list of published works is extensive. He was a poet and the biographer and editor of poets—Shakspere, Milton, Dryden, Shelley, Blake, Emerson; a poetic translator from the German and the Italian, an historian of Italian literature; an encyclopædist for collaboration with the Britannica and the Dictionary of National Biography; editor with Mr. Gosse of the splendidly "Illustrated Record" of 'English Literature' concluded two years ago. But we need enumerate no further. As genial bookman and gifted imaginative writer and learned maker of books, Dr. Garnett lived the ideal life of the scholar spirit. He gave as freely as he absorbed, and directed and will continue to direct a multitude of students in the paths of literature, English and foreign. His death, at seventy-one, must be thought untimely, and he will be greatly missed.

—It is several years since the late Gaetano Negri published his well-known work on 'Julian the Apostate,' but until now this interesting essay in criticism has not been available for those who read English only. The present translation (Scribners) is from the hand of the Duchess Letta-Visconti-Arese, and appears with a delightful introduction by Professor Villari. The facts of Negri's career as here recited throw much light upon his personal attitude towards Julian, and have also a pathetic interest of their own. We do not refer merely to the accident which cost the author his life when we suggest that there is an element of pathos in the details narrated by Professor Villari. Negri was a man of great eloquence, attractiveness and versatility, who, either through force of circumstances or excess of talent, failed to do the one central thing that posterity looks for as the hall-mark of eminence. Perhaps his main achievement was the upbuilding of Milan, where for the years 1886-1889 he was Syndic or Mayor. We have at least Professor Villari's word for it that during this tenure of office "he achieved notable results in the material, moral, and commercial transformation of Milan, for he was one of the first to see its coming prosperity and importance." Dispossessed eventually by the Socialists, Negri turned his energies to historical and literary pursuits. Among modern writers George Eliot aroused his greatest enthusiasm, and he considered that his own best work was to be found in the criticism of her novels, which he published after a long and analytical study of them. Towards the close of his life, he was turning more and more to historical subjects, and particularly to those problems of Church and State which emerged during the latter part of the fourth century. Though as a philosopher he was a pure rationalist, he felt drawn by a strong impulse to the personality of St. Augustine, while on the eve of his tragic death he was collecting materials for a book on St. Ambrose.

—We condense these facts from the pages of Professor Villari because they will be new to most of our readers, and because they furnish us with Negri's point of departure in approaching the saints and philosophers of the later Roman Empire. He was not a specialist in the minuter points of erudition, but yet a scholar who had read the principal sources for his period and reflected deeply upon them. Perhaps no one in modern times has so completely identified himself with the thoughts of Julian and reproduced them in his own experience. He maintains truly enough that his book is neither an attack nor a panegyric. "My aim in writing this book has been purely objective, and it will require a large dose of good, or I shall rather say bad, will to construe it otherwise. He who possesses a critical temperament regards moral phenomena with the same absolute impartiality with which the chemist analyzes a substance or the astronomer determines the orbit of a celestial body." The claim to impartiality thus made is not unwarranted by the tone of the book; and if Negri is drawn to what is best in Julian's Hellenism, he is by no means blind to those curious oddities of mind and temper upon which Glover has laid so much stress. Some slips will be found in these two volumes, and one rather large error—the acceptance as genuine of Julian's letters to Iamblichus. But, with whatever limitations, the work deserves on the score of eloquence and talent to find a large circle of English readers.

—Negri's rationalism, however blended with a genuine interest in the subject-matter of theology, leads him at times to pass frank criticism upon both the Church of the fourth century and Christianity. But his temper in this respect is gentle and sympathetic when compared with the positive animosity of Mr. W. G. Holmes. Justinian and Theodora have been dealt with in a great variety of ways and by authors who differ as widely as Ludewig and Sardou, but biographies of them remain scarce. For many years the hope was entertained that Mr. Bryce might publish a life of Justinian, prompted thereto by the nature of his Oxford professorship. Whether he will ever find time for such an undertaking may well be doubted. Meanwhile we have from Mr. Holmes the first volume of a history entitled 'The Age of Justinian and Theodora' (Bell). A biography in any limited sense of the word this does not promise to be. The author's motive, so far as it can be briefly indicated, seems to be expressed by the following sentence: "When Grecian science and philosophy seemed to stand on the threshold of modern enlightenment, the pall of despotism and superstition descended on the earth and stifled every impulse of progress for more than fifteen centuries." These words, while they refer to the first century of the Christian era, indicate with sufficient clearness Mr. Holmes's attitude towards "the disintegrating and moribund Byzantine Empire." As for his dislike of Christianity, we can best convey its nature and extent by one or two quotations: "The Yggdrasil of Christian superstition spread its roots throughout the Roman Empire, strangling alike the nascent ethics of Christendom and the germinating science of the ancient world." In modern times "an intelligent hypothesis of existence has been deduced from observation and experiment, idealism and dogma have been recognized as the offspring of phantasy and fallacy, and the mystical elements of Christianity have been dismissed to that limbo of folly which long ago engulfed the theogonies of Greece and Rome. The sapless trunk of revelation lies rotting on the ground, but the undiscerning masses, too credulous to inquire, too careless to think, have allowed it to become invested with the weeds of superstition and ignorance; and the progeny of hierophants who once sheltered beneath the green and flourishing tree, still find a cover in the rank growth." Mr. Holmes has collected a good deal of curious information, or rather his book discloses solid erudition. At the same time he has not kept his text free from small inaccuracies, like placing the Vandal conquest of Africa in 439, nor from as large a one as placing the desertion of Britain by the Romans in 446. His gibes at Chris-

tianity are expressed in such form as to remind one of the question which Elizabeth Bennet addresses to her father after hearing Mr. Darcy's first letter: "Can he be a sensible man, Sir?" Finally, Note 1 on page 340 (and it does not stand alone) reminds us of the French sarcasm regarding "l'obscénité froide et érudite de Gibbon."

—Count Paul Hatzfeldt was an able and distinguished Prussian diplomatist who, after the usual training in subordinate positions, became successively ambassador at Madrid, at Constantinople, and at London, where he died in 1885. From 1868 to 1874 he worked in immediate association with Bismarck in the Foreign Office, and during the war of 1870-71 he was with the Chancellor in France. He married in 1863 an American wife, the daughter of a Mr. Moulton, who had become a resident of Paris. During the whole French campaign Count Hatzfeldt wrote to the Countess in Berlin almost daily letters. These have been translated from the French, in which they were written, into smooth and idiomatic English, by Mr. J. L. Bashford, of Trinity College, Cambridge; and they are now published, with a brief preface by the Countess Hatzfeldt, under the title of 'The Hatzfeldt Letters, 1870-71' (E. P. Dutton & Co.). They are eminently conjugal letters, full of affection and of little domestic solicitudes. A letter from Saarbrücken, August 10, 1870, is a fair sample of the rest. It begins with a description of Spicheren heights and the evidences of the hard fighting a few days before; gives rumors of French discouragement; asks the Countess to send his frock-coat; complains that he has had no letter "either yesterday or today," which "is very annoying"; and closes (as printed): "Tell me how you have arranged your household and how much you spend on it per month." The hardships of the Moultons, shut up in Paris; the exposed situation of their summer residence outside in the zone of siege operations; and the expectation and advent of a daughter, born while the Count was at Versailles—these matters naturally bulk much bigger than the military and political events of the year. There is occasionally a bit of interesting description, and we get side lights on historic events and personages; but there are no "revelations." Careful foot-notes give all the necessary information concerning the persons mentioned in the letters, and there is an inadequate index.

RECENT POETRY.

We have come to know pretty well what to expect in a new "tragedy" by Mr. Stephen Phillips. In "Herod," "Ulysses," and "The Sin of David" the poetic promise of "Paolo and Francesca" was decreasingly fulfilled; a growth in the skilful management of melodramatic spectacle kept pace with a loosening grip on tragic structure and a lessening ability in the handling of dramatic verse. His latest play, "Nero" (Macmillan), has little in it to defeat this discouraged expectation. The old Marlowesque world-straining of phrase, that for a time held critics spellbound, is still there. In the very first line is "the dazzling doom of kings," and within the space of a few pages we find such characteristic touches as "the windy chair of the world," "the deep heart of the mighty world," "this pulsing world his theatre," and "O wine of the world, the odor and gold of it." Nor do we have to read very far before finding passages of that mellow charm, that mannered, somewhat wistful, beauty that made his "Marpessa" so lovely and so memorable. Take this of Poppæa:

> "Yet hath none fairer strayed into the world
> Or wandered in more witchery through the air
> Since she who drew the dreaming keels of Greece
> After her over the Ionian foam."

This is pleasant in its reminiscential suggestion and in its musical suavity, pitched, as is habitual with Mr. Phillips in his purple patches, in the key of "w"; but it is put into the mouth of Acte, Poppæa's unsuccessful rival in Nero's regard, and, like most of Mr. Phillips's more striking passages, it is conspicuously void of dramatic propriety.

The conception of Nero's character and the construction of the fable show a similar defect of dramatic instinct. If we mistake not, Mr. Phillips has made a most careful study of Mr. Bernard W. Henderson's recent learned and (to use a wearying word in an unhackneyed connection) sympathetic volume on 'The Life and Principate of the Emperor Nero.' Something of Mr. Phillips's understanding of the melancholy æstheticism of Nero's temperament, as well as several pieces of business, seem to be derived from this source. Yet there is a firmer *dramatic* structure, a more moving liberation of pity and terror, in Mr. Henderson's historical study than in Mr. Phillips's play. He has oddly chosen to conclude his piece in four acts with the burning of Rome—following hard upon the death of Poppæa—which Nero takes as a kind of atonement for the murder of Agrippina.

This is the spectacular ending of the play as it stands:

> *Nero.* Blaze! Rage! Blaze!
>
> [*The flame flashes up more fervently.*]
> For now I am free of thy blood,
> I have appeased and atoned,
> Have atoned with cries, with crashings, and with flaming.
> Thy blood is no more on my head;
> I am purged, I am cleansed,
> I have given flaming Rome for the hed of thy death! O Agrippina!
> [*He falls in a swoon. Acte runs towards him.*]

In "The Sin of David" the chief source of dramatic weakness was, as we took occasion at the time of its publication to point out, too soft and slight an expiation of a tragical sin. The defect in "Nero" is almost precisely the same. The lines above, uttered by Nero in his ranting delusion, would have made an admirable conclusion to a fourth act, provided there was to have been a grim, ironic fifth act in which Otho should have had the "innings" which history (for once more philosophic than poetry) conceded him, and Nero should have atoned in the only way that has ever proved permanently impressive in tragedy, by his death, for his tragical sins against Agrippina, against Otho, and against the inexorable order of the world. Such an ending added to the piece exactly as it now stands might almost have persuaded us that Mr. Phillips is a dramatist. As it is, however, it proves him more conclusively than his previous plays did a talented writer of elegiac verse, an expert composer of cycloramic spectacle, who thinks habitually rather in terms of poetic phrase than, as has been the way of the true dramatist, in terms of character, of concerted situation, of human destiny as it is shaped from the clashing, fatal actions of men.

The second part of "The Dynasts" (Macmillan), Mr. Thomas Hardy's "drama of the Napoleonic Wars in three parts, nineteen acts and one hundred and thirty scenes," prevails a little over the regret that we expressed at the publication of the first part that so fine a faculty as Mr. Hardy's should be employed in so uncouth and monstrous a production. There is a greater proportionate amount of prose in this part, and Mr. Hardy's prose is always more readable than his rough-hewn, unmelodious verse. There is, too, here rather less of unconvincing, supernatural machinery, while of the hundred speaking parts of terrestrial personages all are vividly actualized. The gift of panoramic vision over the face of the historied globe which constituted the chief element of imaginative force in the first part, persists throughout the second, and Mr. Hardy's pessimistic philosophy of history as the operation of

> "Unmaliced, unimpassioned, nescient Will,"

becomes still clearer. We hesitate to commit ourselves to an opinion of the final meaning and achievement of "The Dynasts" before the publication of the third and last part. In the meantime, from the curious assortment of lyrical interludes, in metres ranging from Sapphics to *terza rima*, wherewith Mr. Hardy has chosen to adorn his colossal enterprise, we may select this fine bit of "aerial music" as a specimen of his poetic vein at its best:

> "They come, beset by riddling hail;
> They sway like sedges in a gale;
> They fail, and win, and win, and fail. Alhuera!
>
> They gain the ground there, yard by yard,
> Their brows and hair and lashes charred,
> Their blackened teeth set firm and hard.
>
> Their mad assailants rave and reel,
> And face, as men who scorn to feel,
> The close-lined, three-edged prongs of steel,
>
> Till faintness follows closing-in,
> When, faltering headlong down, they spin
> Like leaves. But those pay well who win Alhuera.
>
> Out of six thousand souls that sware
> To hold the mount or pass elsewhere,
> But eighteen hundred muster there.
>
> Pale Colonels, Captains, ranksmen lie,
> Facing the earth or facing sky;—
> They strove to live, they stretch to die.
>
> Friends, foemen, mingle; heap and heap.—
> Hide their hacked bones, Earth!—deep, deep, deep,
> Where harmless worms caress and creep.
>
> Hide their hacked bones, Earth!—deep, deep, deep,
> Where harmless worms caress and creep.—
> What man can grieve? what woman weep?
> Better than waking is to sleep! Alhuera!"

The 'Last Poems' of "Laurence Hope" (The John Lane Co.) is the ultimate record of a fervid life lately brought to a tragic close. Mrs. Nicholson, it may be said now with regretful candor, kept too closely to her favorite theme of "Love's supreme surrender," too rarely varied the sombre monochord of unresisted passion, for her work ever to achieve quite the position that her very remarkable abilities promised. To a Sapphic intensity of devotion to youth and the lure of youth, she added at times a note

of frank savagery, as in these stanzas of "Atavism":

"Deep in the jungle vast and dim,
That knew not a white man's feet,
I smelt the odor of sun-warmed fur,
Musky, savage, and sweet.

Scent of fur and color of blood:—
And the long dead instincts rose,
I followed the lure of my season's mate,—
And flew, bare-fanged, at my foes."

At other times, as in the following lines, her Sapphic mood dissolved in visionary whimsies that yet found expression as vivid and fragrant as Blake's:

"My paramour was loneliness
And lying by the sea,
Soft songs of sorrow and distress
He did beget in me.

Later another lover came
More meet for my desire.
'Radiant Beauty' was his name;
His sons had wings of fire!"

Yet such variety was not habitual with her. In the long run she was an Anglo-Indian "poetess of passion," whose lyric torrent of words and gift of throbbing metre never quite availed to idealize the Oriental provocation of her themes. Her "Translations from the Book of Indian Love," as the present volume is styled in its sub-title, are likely to stand rather as a slightly dubious "human document" than as an addition to the true poetry of passion. Nevertheless, there are in it many pieces of unalloyed poetry. It is pleasant to take leave of her with such a pure and plaintive, and in a way symbolic, melody as this of "Kristna and his Flute":

"Be still, my heart, and listen,
For sweet and yet acute
I hear the wistful music
Of Kristna and his flute.
Across the cool, blue evenings,
Throughout the burning days,
Persuasive and beguiling,
He plays and plays and plays.

Ah, none may hear such music
Resistant to its charms,
The household work grows weary,
And cold the husband's arms.
I must arise and follow,
To seek, in vain pursuit,
The blueness and the distance,
The sweetness of that flute!

In linked and liquid sequence,
The plaintive notes dissolve
Divinely tender secrets
That none but he can solve.
Oh, Kristna, I am coming,
I can no more delay.
'My heart has flown to join thee,'
How shall my footsteps stay?"

Mr. Andrew Lang, the variously delightful and invariably readable, is never more delightful and readable than when he turns for a little while from Anthropology, or Scottish History, or psychic phenomena, or the literary gossip of London, to meditate the poetic muse. His 'New Collected Rhymes' (Longmans) have the metrical facility and grace, the urbane humor, that make his 'Ballads of Books' of such pleasant memory. The variety of the collection, however, is rather unexpected. There is a series of Jacobite lyrics, a handful of cricket rhymes, some parodic Jubilee Poems, a group of Folk Songs, and three ballads written, as Mr. Lang tells us in his preface, "in competition with the street minstrels of the close of the sixteenth century." All of these are spirited performances, but most of them are interesting rather archaically than æsthetically. For the amateur of poetry the most attractive pieces are those described with a touch of mockery as "Critical of Life, Art, and Literature," in which Mr. Lang exhibits his mingled aptitudes of critic, humorist, and verse writer. These stanzas from his "Rhyme of Oxford Cockney Rhymes (Exhibited in the *Oxford Magazine*)" are a fair sample of his vein at its freshest:

"Though Keats rhymed 'ear' to 'Cytherea,'
And Morris 'dawn' to 'morn,'
A worse example, it is clear,
By Oxford Dons is 'shorn.'
G——y, of Magdalen, goes beyond
These puny Cockneys far,
And to 'Magrath' rhymes—Muse despond!—
'Magrath' he rhymes to 'star'!

Yes, G——y shines the worst of all.
He needs to rhyme 'embargo';
The man had 'Margot' at his call,
He had the good ship *Argo;*
Largo he had; yet doth he seek
Further, and no embargo
Restrains him from the odious, weak,
And Cockney rhyme, 'Chicago'!

Oh, Hoxford was a pleasant place
To many a poet dear,
And Saccharissa had the grace
In Hoxford to appear.
But Waller, if to Cytherea
He prayed at any time,
Did not implore 'her friendly ear'
And think he had a rhyme."

He would be a temerarious critic who should venture to make unfavorable animadversions upon Mr. Harry Seymour Koopman's 'At the Gates of the Century' (The Everett Press), for Mr. Koopman can express his opinion of critics with pungency, if not with urbanity. In one place he writes:

"Whence comes your skill from song's vast mines
The richest ore to choose?
I simply gather up the lines
Condemned in the reviews."

In another, of Shelley's "Prometheus Unbound":

"Unbound, for who would bind it? the perplexed
And sneering critics of the poet cried,
Whose son saw English scholarship divide
Over a doubtful comma in the text."

In another:

"Always the asses in chorus denounced the poet's arrival,
Drowning the voice of his music, drowning his gathering praises,
Idle to answer them, vainer to scold them than scolding the weather,
For they will always be with us, the asses, and always be—critics."

In still another:

"The critic snarl at the Maker, what has it ever meant
But jealousy of the Potent on the part of the Impotent?"

Fortunately, there is little in Mr. Koopman's slender but pithy book to arouse any other sentiment than admiration for his gift of compact, suggestive phrase. The amenities may prevail; and we may concede the truth of his epigram:

"He riddles the mark and the neighborhood
With a Gatling gun;
I send one shot through the heart of the white,
For I have but one."

It would be unfair to Mr. Wilfred Campbell to insinuate that his poetic method is that of the Gatling gun, yet his 'Collected Poems' (Revell) would have gained in poetic value by a more rigorous standard of selection, and by the drastic pruning of some of the pieces selected. At times Mr. Campbell shows himself the master of that long unsuspected accomplishment of M. Jourdain. No American poet is more consistently stirred by the "high emotion" which, as Mr. Campbell very justly declares in his Introduction, is the essence of poetry; none is more uninterruptedly capable of decorous, sonorous phrase. Yet at the best his phrase is, if we may venture a distinction, felicitous rather than happy. Read consecutively, his 'Collected Poems' are a little lacking in vivid poetic life, a little overweighted with irreproachable moral, political, and æsthetic sentiments. Nevertheless, it is a volume admirable in its sustained idealism; and at times, as in these stanzas from an elegy upon Archibald Lampman, Mr. Campbell's poetry, touched with deep personal emotion, attains a forceful eloquence:

"Soft fall the February snows, and soft
Falls on my heart the snow of wintry pain;
For nevermore, by wood or field or croft,
Will he we knew walk with his loved again;
No more, with eyes adream and soul aloft,
In those high moods where love and beauty reign,
Greet his familiar fields, his skies without a stain. . . .

Like some rare Pan of those Old Grecian days,
Here in our hours of deeper stress reborn,
Unfortunate thrown upon life's evil ways,
His inward ear heard ever that satyr horn
From Nature's lips reverberate night and morn,
And fled from men and all their troubled maze,
Standing apart with sad, incurious gaze.

And now, untimely cut, like some sweet flower
Plucked in the early summer of its prime
Before it reached the fulness of its dower,
He withers in the morning of our time;
Leaving behind him, like a summer shower,
A fragrance of earth's beauty, and the chime
Of gentle and imperishable rhyme.

Songs in our ears of winds and flowers and buds
And gentle loves and tender memories
Of Nature's sweetest aspects, her pure moods,
Wrought from the inward truth of intimate eyes
And delicate ears of him who harks and broods,
And, nightly pondering, daily grows more wise,
And dreams and sees in mighty solitudes.

Soft fall the February snows, and soft
He sleeps in peace upon the breast of her
He loved the truest; where, by wood and croft,
The wintry silence folds in fleecy blur
About his silence, while in glooms aloft
The mighty forest fathers, without stir,
Guard well the rest of him, their rare sweet worshipper."

The 'New World Lyrics and Ballads' of Duncan Campbell Scott (Morang & Co.) are pieces of a keen poetic tang. Mr. Scott has taken imaginative possession of the cool, pine-grown, history-haunted Canadian country, and has sung of it in spare athletic verse. His poetic background is not of the broadest, his "criticism of life" not perhaps of the deepest, but he rarely fails to give his reader that delicious shock of surprise of strange and vivid beauty that is the final test of Poetry as distinguished from poetry.

The seventh edition of Mr. Theodore Watts-Dunton's 'The Coming of Love, and Other Poems' (The John Lane Co.) is described on the obverse title as "enlarged and revised." The enlargement consists chiefly of a "Dedication of the Seventh Edition," in which the coming of love is styled by Mr. Watts-Dunton, somewhat romantically for so good a critic, "the expression of the heart-thought of my life," and in the addition to the title poem of certain sections which "had been lent to friends in manuscript and mislaid," and "were not available at the moment when the material of

the book was put together for the press." Whether or not this statement is part of the artistic mystification wherewith Mr. Watts-Dunton has filled his other ample and numerous Prefatory Notes to the poem, we do not presume to say. It is certain, however, that the additions add nothing to the completeness of the story, and that, in retarding its speed they rather dull its charm. Yet, for all the clap-trap that Mr. Watts-Dunton has chosen to spread round the poem, and despite these additions, its Gypsy zest and tragic passion do not lose their potency. Among the "other poems" the only new piece is this awkward but suggestive sonnet:

NEW YEAR'S MORNING, 1867, AFTER THE LIBERATION OF VENICE.

(The poet goes to the window of his bedroom and gazes down the Grand Canal, over which the morning is glowing.)

"Man's knowledge, save before his fellow-man,
Is ignorance—his widest wisdom folly.
In Nature's eyes still gazing, dazzled wholly
By sights his own eyes make, how should he scan
Pictures like those in Nature's iris-span?
Hers show the cypress, his the melancholy,
His shine with Christmas, hers with simple holly
That knew no mirth till Yule-tide feasts began."
So Reason says; yet to my heart it seems
That yonder sun, firing the mists of morn,
Gilding each dome that scorned the Austrian's scorn,
Painting the Grand Canal with rosy gleams,
Looks conscious down on me and vanished dreams—
But—Freedom's year o'er Venice smiles new-born!

Though Mr. John Burroughs is not at his best as a poet, his little volume of nature poems, 'Bird and Bough' (Houghton, Mifflin & Co.), is pleasant reading. The freshness and precision of Mr. Burroughs's observation need no comment. He is a master of clean-drawn phrase, and, despite a tendency to lapse into sing-song, has a good gift of short-lined metre. So far as his work is poetry rather than versified nature study, it is so by virtue of a certain single-minded affectionateness of interest in Nature, as in these lines:

"I hear the wild geese honking
From out the misty night,—
A sound of moving armies
On-sweeping in their might;
The river ice is drifting
Beneath their northward flight.

I hear the bluebird plaintive
From out the morning sky,
Or see his wings a-twinkle
That with the azure vie;
No other bird more welcome,
No more prophetic cry.

I hear the sparrow's ditty
Anear my study door;
A simple song of gladness
That winter days are o'er;
My heart is singing with him,
I love him more and more.

I hear the starling fluting
His liquid "O-ka-lee";
I hear the downy drumming
His vernal reveillé;
From out the maple orchard
The nuthatch calls to me.

O, spring is surely coming,
Her couriers fill the air;
Each morn are new arrivals,
Each night her ways prepare;
I scent her fragrant garments,
Her foot is on the stair."

'Selections from the Poetry of John Payne,' made by Tracy and Lucy Robinson with an Introduction by Lucy Robinson (The John Lane Co.), is a fairly representative selection of the original work of one of the most talented and indefatigable translators of our time. We do not hold with those who believe concerning Mr. Payne that "posterity will place him between Tennyson and William Morris, side by side with Swinburne and D. G. Rossetti"; and that it is wholly "Mr. Payne's lack of acquaintance with journalists and journalism" that has kept his work in the background. The first impression made by the selection is that of a marvellous virtuosity, an amazing metrical and verbal ingenuity. There are pieces in French, pieces in Italian, and English poems of an astonishing variety and fluency of form. Of the poeticalness, so to say, of Mr. Payne's literary impulse there can be no doubt. His mind fairly brims over with poetic thoughts, poetic emotions, and the imagery of all the romantic poetry of the world. Yet there can be but one conclusion: if Mr. Payne possessed at the beginning of his literary career a poetic faculty that might have placed him beside Swinburne and Rossetti, then the facility that comes from the life-long habit of translation can only be regarded as the dissipation of it. This crucial strophe from a musical but somewhat over-long elegy for a dead girl, entitled "The Grave of All My Songs," is a fair specimen of Mr. Payne's manner:

"Could we but hope the all-engrossing earth,
That for the eternal rest
Took back her blighted beauty to its breast,
Might yet enrich our dearth
With some unknown, enchanted wonder-birth
Of blossom, brilliant as her starry eyes,
Sweet as her balmy breath,
Some flowerage of heaven, defying death,
Wherein our yearning memory might retrace
The frankness of her face,
In whose bright beauty thought might recognize
The spirit-prime of her lost loveliness,
Born as it were again
In some new earth, delivered from the press
Of mortal grossness by the purge of pain,—
Or might we deem the unresponsive air,
That bore her gentle spirit far away
And scattered it for aye
Beyond the confines of the night and day
To all the winds of being, nor would e'er
Vouchsafe to our despair
One echo of her voice's dulcet strain,
Should yet grow great with graciousness and hear
Some mystic birth of music strange and fair,
Some seraph-song of Paradisal bird,
Some melody of mortals never heard,
Wherein her silver speech
And the far memory of her voice might reach
Our longing ears and witness to our faith,
She was not all disfeatured by the scaith
Of unrespective death,
That something of her sweetness yet survives
In interstellar lands
Or in the sunset-calm of spirit-lives,
Nor was all scattered by the 'scape of breath!"

When it is observed that these lines, with their variety of image, their easy copiousness of phrase, make but a single sentence, something of Mr. Payne's ability to sling poetic ink, if the expression be allowable, begins to be perceived. Yet that they are lasting poetry is not so clear. Mr. Payne, as we are emphatically told in the Introduction, is a devoted amateur of music, and the music of the verses, as is customary in the poetry of great music-lovers (notably Sidney Lanier), is rather in the impetuous movement of the lines, in the more obvious tricks of alliteration, than in those subtler harmonies of vowelled speech which make the quenchless music of poetry. Furthermore, there is, if we mistake not, in these lines, as in all of Mr. Payne's work, and in the work of most English poets who have found in modern France their most sympathetic models, a tendency for profusion to become diffusion that is a source of weakness. But if these poems have not such stuff of immortality in them as his sponsors think they find, it is, nevertheless, not fair to Mr. Payne to dismiss him as a kind of Magico Prodigioso working his wonders from the more curious contents of the New English Dictionary. For a leisurely reader there is a certain mild Spenserian charm in his narrative poems. And signs have not been wanting that Mr. Payne, following in the path of his master, the poets' poet, is like to achieve a position of some permanency as the minor poets' poet.

LORD HOBHOUSE.

Lord Hobhouse: A Memoir. By L. T. Hobhouse and J. L. Hammond. London: Edward Arnold; New York: Longmans. 1905.

Lord Hobhouse was the incarnation of the intelligent Liberalism of 1850 to 1870. In him we see the finest characteristics and also the limitations of the Liberals who at that era represented all that was best in the public life of England. He assuredly displayed all the finest traits of the body of men to whom he belonged. He was a complete English gentleman; he was also, what many excellent gentlemen are not, a man of singular ability. Ill health, fortunately for his country and fortunately for himself, arrested his career at the bar. Had his bodily strength enabled him to stand the stress of an exciting and competitive professional career, he might probably have been a law officer of a Liberal Government. He might, if fortune had favored, have risen with general approval to the Chancellorship. He almost certainly, if he had failed to gain the highest of legal prizes, would have passed the latter part of his life as a Lord Justice of Appeal. All this he would have done if his strength had held out, and then he would have been, like other eminent judges, forgotten. He would have done excellently work that many others could do as well as he.

The misfortune which turned him away from the bar did not in reality deprive him of appropriate employment, and it enabled him to show, as no merely legal career could, his intense and absorbing devotion to public affairs and to everything that concerned the interest of the nation. It is this high, enduring, absolutely disinterested public spirit, combined with rare ability in the transaction of public business, which gives its whole color to Hobhouse's career, and this fine public spirit and devoted application of trained intelligence to the conduct of affairs are exactly the traits which lent a certain nobility to the energetic and intelligent Liberalism of the Victorian era. No doubt the virtues of a time which seems now so far removed in feeling from modern England, are represented by Hobhouse in their best and noblest form. Still, one can never for a moment forget, and his biographers do not suffer us to forget, that he was, when Liberalism was in fashion, and also when Liberalism of his type was out of fashion, essentially "a Liberal of the old school." None of the ideas he entertained can be called original, but then they are some of the best ideas of the party to

which he belonged, and Hobhouse held them with singular tenacity. He esteemed highly the new Poor Law of 1834. He distrusted, rightly enough, the effect of endowments. He fought, tooth and nail, as an Endowed School Commissioner, for the destruction of all the noxious charities which, under the pretence of furthering education, really gave effect to the bitterness, vanity, or eccentricity of some so-called pious founder. In India, as the legal member of the Government's Council, he fought hard, and probably did much to promote just legislation, and opposed with all his vigor the forward policy of Mr. Disraeli and of Lord Lytton.

Every kind of injustice, or everything which Hobhouse thought was injustice, was to him hateful. He hated war, and fully believed in the blessings of peace on almost any terms. He believed in local government, and generally adhered to the Liberal doctrine that to give men a share in local government is the way to teach them to govern wisely. Till towards the end of his life, he seems to have felt, in common with the Liberals of the day, the trust in the people which at one time was the watchword of Mr. Gladstone and his followers. To everything, again, which savored of attack on freedom of opinion he offered zealous opposition. He supported Bradlaugh in 1888, and a year later had a friendly correspondence with Holyoake; not because he agreed with their views, but because he regarded them as the defenders of free thought. Amid arduous judicial work he "found time" (to use the pompous language of his biographers) "year by year for the furtherance of many movements—London government, land reform, and even the liberation of Sunday from the trammels of the Judaic law"—trammels, by the way, which sit with extraordinary lightness on English men and women of to-day. Let no one deny—we assuredly do not deny—that these labors were in the main the work of a good man, and that Hobhouse himself left behind him something even better than his work, namely, the "example of a man who, through a long life, put the public service above personal ambition, who found in work its own reward, small and great, with equal thoroughness, because it was work and had to be done." All this is excellent, and we fully believe that a eulogy which savors somewhat of an inscription on a tombstone has the rare merit of absolute truth. Still, a critic who ought not to be a flatterer must insist upon the patent fact that the virtues, the principles, and the ideas of Lord Hobhouse, though they were his own, yet were also in a special sense the characteristics of the political school to which he belonged.

Hobhouse's own character, moreover, betrays the moral and intellectual limitations of the Old Liberals. They were men of strong common-sense. But then, common-sense is occasionally a very different thing from wisdom. "I have intimated," writes Hobhouse, "my deep distrust of *a-priori* reasoning on practical subjects." The sentiment is a sound one, but, as employed by a Liberal of 1850, it too often meant the failure of any attempt thoroughly to understand either his own principles or those of his opponents. The tendency of the day was, indeed, to mistake maxims for well-established principles. Whenever Lord Hobhouse deals with any matter which requires subtlety or even play of thought, one feels that he never gets to the bottom of it. "He held," say his biographers, "that no fundamental distinction can be drawn between the obligations of nations and those of individuals." This maxim would probably command pretty general assent, but any one who thinks over the matter at all will see that it embodies a doctrine which is far from self-evident, and can be accepted only with considerable limitations. To the confusion of maxims with axiomatic truths is due another defect which is strangely visible in every word that Lord Hobhouse utters about opponents. The men who dissent from the Liberal creed are considered by him as persons distinctly in the wrong. He cannot credit them with either genius or insight. Consider the many allusions throughout the memoir to Disraeli. In none of them is there the least recognition of the great fact that he was a man who, with all his faults, had qualities which will make him remembered when Lord Hobhouse, Lord Melbourne, Lord Cardwell, and all the good and respectable Liberals of 1850 are forgotten. Lord Beaconsfield is, in the eyes of Hobhouse and his friends, nothing but the adventurer and the charlatan which he appeared to his critics of 1852. A comparison between Lord Hobhouse's attitude towards Disraeli and Mr. Bryce's estimate of Lord Beaconsfield in 'Studies of Contemporary Biographies' displays the whole difference between the condemnation of a worthy but unintelligent opponent and the judgment of a thoughtful and impartial critic.

Lord Hobhouse, lastly, in common with the body of Old Liberals, pursued a path of which he hardly, till towards the close of his life, foresaw the end. Trust in the people is a maxim which points directly towards democracy. But the last thing perceived by Liberals who confided in the wisdom of the people was, that the people—or, in other words, the mass of the wage-earners—were little likely in the long run to accept the social or political doctrines of Liberalism. Hobhouse looked, in 1897, with grave suspicion on measures such as the Workmen's Compensation Act. He, by that time, at least, had perceived the contradiction between the dogmas of Old Liberalism and the tendencies of democratic Socialism. He felt that

> "there is nothing for the isolated thinker to do except to sit by and wonder what will come next. I guess that the next thing will be to throw all the burden of individual misfortune on 'the State,' which the wise leaders of the artisan classes teach them to look upon as an omnipotent being, existing apart from individual men and women, with an inexhaustible purse filled by some magic, and ready to remove all the ills of life. And so they cry more and more for 'State' aid, not knowing that they themselves are the State, and that payments by the State come mainly out of their own pockets and are to a large extent a device for making the industrious and thrifty pay for those who are not such."

Did it, even in 1904, dawn upon him that the day might be near when the Labor Party would destroy all that he most valued in the creed of the Old Liberals?

Cloud Studies. By Arthur W. Clayden, M.A. E. P. Dutton & Co. 1905.

Not only meteorologists, but laymen who care for the ever-changing panorama of the sky, will welcome this fine book, first published in London by John Murray. Titles of some of the subjects treated will give an idea of its scope: "Cloud Types," "Altitudes," "High Cirrus," "Formation," "Cumulus," "Influence of Hills," "Nomenclature," and the like. More than sixty excellent illustrations from photographs serve to show many forms of classified and intermediate clouds, heretofore but slightly differentiated.

Not until 1803 was there any attempt at uniformity of description. In that year Luke Howard proposed three names for three distinct varieties—cirrus, stratus, and cumulus; by combinations of these words other types were identified; and because the discharging cloud may partake somewhat of the character of all three, it was called nimbus. Mr. Clayden does not regard this as a special type, but includes it in the general stratus variety, using the word nimbus as an adjective, and only to indicate that rain is falling from a certain cloud. While some meteorologists will agree to this departure, others will probably not accept it.

What may be called the observational part of cloud study is still in its infancy, despite the fact that countless generations have viewed the sky with a general desire for information as to the weather. No common language, or system of terms, was employed, by which early experience could be accurately transmitted. A curious scarcity of cloud names occurs in all languages, and personal equation often caused existing designations to be used for quite different phenomena. Accordingly, the decisions of the International Meteorological Conference at Munich in 1891 were welcomed, even if not the most perfect of classifications. A revised scheme of nomenclature was presented by the late Hon. Ralph Abercromby and Prof. H. Hildebrand Hildebrandsson of Upsala, with the idea that such a convenient arrangement would become useful at meteorological stations and in the navy. For the sake of simplicity, only ten forms were proposed, as now given in the International Cloud Atlas. While sufficient, however, for general purposes, a great many subdivisions were of course necessary in specialized work, in cloud transformation, or the relation of types to weather. Each of these large divisions changes by varying gradations into many other sub-species, whose names should indicate their origin and characteristics.

The Atlas did not appear until 1896, and meantime the Rev. W. Clement Ley had published some excellent suggestions, which, however, came too late. Meteorologists in Germany, England, and America have attempted an extended and detailed cloud-nomenclature, and Mr. Clayden carries this excellent work forward with praiseworthy clearness and simplicity. The next world-gathering assembled to discuss these subjects will probably effect any desired changes along lines of modification rather than substitution. It is now possible, through this wide discussion and uniformity of designation, to arrive at something like precision of description, a first essential to a satisfactory system; in spite of which many pictorial illustrations must still be employed, so delicate is the gradation from one type of cloud to another. By the use of soft pastels aided by the finger-

tip in sketching cloud forms, satisfactory results can sometimes be obtained, but oil and water-colors are scarcely rapid enough to follow changes exactly. Only the most sensitive photographic plates can reproduce the infinite delicacy of detail. Some of the illustrations in Mr. Clayden's book from direct photography are exceedingly beautiful—poetic as well as scientific, and the directions given for obtaining them, in the chapter upon this method of studying forms, are of great value.

Mr. Clayden remarks pertinently that it would be well if artists of landscape would occasionally give some little study to the clouds they introduce, instead of presenting the usual vague splashes of white so generally made to do duty for pictured skies. One recalls the cry in one of Ruskin's letters: "I want to be able to draw clouds, and to understand how they go—and I can't make them stand still, nor understand them —they all go sideways. . . ."

The story of a thunder-shower is scientifically, even dramatically, told, with careful description of changes in the cumulus headquarters of the storm, and with remarkable attendant photographs. The author's views as to the causes of differing cloud forms are exceedingly probable, and the book is full of suggestiveness for further investigation. Exact personal observation forms the basis of the entire volume, which cannot be too highly recommended to students of this delightful branch of celestial research. All the varieties depicted and described have been selected from hundreds of examples, as showing differences due to conditions of formation. Diagrams and other purely technical matters are avoided, so that the book, while of great value to specialists, is hardly less interesting to the general reader, and will be immensely helpful in continued and more accurate study of this fascinating subject. Such a book is well worth an index of more than two pages.

Problems of Philosophy; or, Principles of Epistemology and Metaphysics. By Dr. James Hervey Hyslop, Ph.D., LL.D. Macmillan. Pp. xiv., 647. 1905.

Dr. Hyslop's book has an abundance of defects and lays itself open to criticism in a variety of ways. To begin with, it extends to 650 pages, and is too heavy to hold. The average length of its chapters is 50 pages, and in one case exceeds 100, without a section or a break to articulate them; and even its paragraphs not infrequently prolong themselves to three pages. It has no literary charm, and its wording is often obscure. It bears many marks of its original lecture form, which should have been eliminated. It gives no references. It contains a large number of highly dubious historical statements. In short, it is a book which a hostile or wearied critic would have ample excuse for condemning utterly.

And yet, in spite of all these serious faults, we have found Dr. Hyslop's book in some respects an impressive work. It is, in the first place, very honest. We seem to see its author sturdily wrestling with the great problems of philosophy; and even when he plainly seems to be worsted, we find ourselves reflecting that those problems have always proved too great for any man. Thus its very defects have something humanly attractive; they evoke the sympathy we naturally feel for an honest struggle against overwhelming odds. And so long as so many philosophers aim at nothing higher than mere dialectical cleverness in playing with problems which, after displaying their mental agility and (it must be added) disingenuousness, they leave pretty much where they found them, the moral atmosphere of Dr. Hyslop's work is decidedly refreshing. In the next place, Dr. Hyslop, if not startlingly original, is distinctly independent. He has the courage to swim against the stream and to ignore the fashions. Lastly, he seems to be fundamentally right about some of his main contentions, such as that idealism ought in consistency to confess to solipsism, that the antithesis between it and realism properly concerns epistemology rather than metaphysics, that the real metaphysical antithesis is between materialism and spiritualism, and that what renders it really important is that the former denies, while the latter affirms, the possibility of a future life. By "spiritualism" he means the denial that consciousness is a function of material organization, and the affirmation of the reality of soul, without, however, telling us what he precisely means by "soul." This philosophic usage easily develops an affinity for the vulgar sense of "spiritualism" when it is added that the question of the existence of a "soul" can be decided, not by philosophic speculation, but only by scientific research.

In this contention Dr. Hyslop is doubtless right; but might not the same be said of every philosophic topic? Does speculation ever do more than explore the ground before science proceeds to effect a stable occupation? In all these points Dr. Hyslop's views seem sufficiently interesting and important to sanction a regret that, instead of entangling and stifling them in masses of unessential words, he did not bethink himself of the wise old Greek adage that sometimes the half is greater than the whole.

The Life of Oliver Ellsworth. By William Garrott Brown. Macmillan. 1905. Pp. ix., 369.

It is, on the whole, surprising that Oliver Ellsworth should have had to wait so long for a biographer. The task, it must be admitted, presented some difficulties. Unlike many of his contemporaries who, with him, were making American history, Ellsworth was a singularly reticent man. His legal opinions were excessively brief. He did not indulge in "journalizing." He wrote few letters, and most of these disappeared. Of the great number of papers to which, in the course of a long and active life, he must have set his hand, few of importance have survived. His biographer, accordingly, finds a dearth of material, and is forced to rely much upon that indispensable and most dangerous faculty of the historian—imagination. Yet the career of Ellsworth, if not as a whole of first-rate significance, was nevertheless such as to give him high rank among the founders of his country. He was a lawyer of solid attainments, a clear-headed and effective judge, a forcible and convincing debater, and a skilful manager of men. As a member of the Connecticut pay-table, he largely directed the Revolutionary policy of his State. As a member of the Congress of the Confederation, he labored unceasingly to build up the federal administration. In the Federal Convention of 1787, no influence was superior to his, and some of the most important provisions of the Constitution are due mainly to him. He was admittedly the leader of the Senate so long as he was a member of it. He was a dignified and industrious chief-justice, and an astute and broad-minded representative of his country at the French court. With all, he was a New Englander and a gentleman. Yet his name and his work passed quickly out of particular remembrance, and he has waited nearly a century for some one to tell worthily the story of his life.

The reasons for this neglect are not, however, altogether obscure. The lack of literary remains has doubtless told heavily against him. Had he kept a diary, like John Adams, or copied his letters, like Jefferson, or written pamphlets and newspaper articles, like Hamilton or Madison, or elaborated his legal decisions, like Marshall, we should long since have had a limited and costly edition of his collected works, and been able thereby to measure his importance more nearly as it appeared to his contemporaries. Again, while he was a stanch advocate and able expounder of Federalism, he lacked the ability so to present his ideas as to make them seem original with him. He never, for example, rivalled Hamilton as an expositor of the theory of the Constitution, though he did rather more, on the whole, than any one else to give practical effect to Hamilton's views. Further, he lost a great opportunity in the Federal Convention to restrain the growth of slavery, and perhaps, as Mr. Brown suggests, to put an early end to the system altogether, by his attitude towards the slave trade. And, finally, he never reached an entirely sound theory of constitutional law, as appears in his contention that the United States, as well as the States, inherited the common law, and his erroneous interpretation, in *Wilson* vs. *Daniel*, of the constitutional provisions regarding the appellate jurisdiction of the Supreme Court. It is true that Ellsworth lived in a formative period, when precedents were to be made rather than quoted, and that he was far oftener right than wrong; but there were others of the time who, at these several points, builded more solidly than he, and for this reason, probably, posterity has adjudged him not altogether great.

Yet the character of Ellsworth was so lofty, his devotion to the public welfare so sincere and unselfish, and his industry so painstaking and tireless, as to win for him a high place even in a generation thickly set with great names. In his dignified bearing, his industry, frugality, and thrift, his combination of aristocratic reserve and emotional restraint with rare conversational powers, and his serious regard for religion, he was typical of the eighteenth-century New England in which he was born and bred, and whose welfare he always held dear. The public service was with him a public trust, and a long career in positions of responsibility and exaltation brought with it no taint of moral weakness or sus-

picion. His devotion to the wearisome and interminable details of administrative and judicial business, in a day when the organization of such business had as yet reached but slight development, was beyond all praise, as it was also one of the secrets of his influence. Nothing, indeed, but extraordinary physical powers and an iron will could have enabled him to do what he did. No presence save that of Washington was more imposing, no words more weighty than his, and he won alike the respect of men and the affection of children.

Mr. Brown has done his work with notable success. The materials which he has used have been widely dispersed and far from abundant, but he has gathered them industriously and employed them with skill, and has refrained from drawing upon conjecture for facts. The chapter on Ellsworth's work in the Federal Convention is especially able. Of course, the book is readable, for Mr. Brown is the happy possessor of a brilliant style; but readers who have found the author's earlier works too strikingly phrased, will note with satisfaction in this one evidences of greater maturity and restraint. As a judicious and sympathetic study of a notable American statesman and jurist, the volume is heartily to be welcomed.

China and her People. By Charles Denby. Boston: L. C. Page & Co. 1905.

The American who is thoughtful as well as patriotic does not swell with pride when he looks over the list of our envoys and plenipotentiaries in the Far East, though there are some names that shine with the permanence of the stars, while the influence of their lives rather increases than diminishes as the years roll on. Such a man was our minister to China, Charles Denby. A Virginian and ex-soldier, Colonel of the Eightieth Regiment, Indiana Volunteers, during the civil war, he was in 1885 appointed minister to Peking by President Cleveland. For thirteen years he represented his country during three administrations and part of a fourth, holding also the unbroken confidence of the Chinese authorities. As the story of Verbeck, in Japan, and Williams, in China, has demonstrated, the foreigner who asks no personal favors and has nothing to do with that marketable commodity called in America "pull," but who attends to the business on which he was sent and serves all unselfishly, can win and hold the permanent respect of men who, besides understanding the lower motives common to most mortals, have quick discernment of the proofs of moral superiority in an alien.

The present publication, edited from the deceased author's manuscripts by his son, who adds two or three additional chapters, has its special value in the fact that it is not a mere description of things seen or read about, nor is it a mere traveller's tale. It is rather the leisurely reflections, with delightful comment, spiced by wit and wisdom, of a man who saw into causes, and read human nature searchingly, but with sympathy. Apparently he laid aside those prejudices which usually mar an alien's judgment. His pen pictures of the great men of China and Japan who were his contemporaries are incisive and interpretative. His own very important part in the mediatory negotiations which brought the Chino-Japanese war of 1894-5 to an end are frankly and modestly stated. The Boxer uprising is treated with insight and sympathy. Yet we cannot find that he does justice to the behavior of the American Admiral (whose name is spelled wrongly) who upheld the American policy of non-intervention and refused to bombard the Chinese forts in time of peace. Indeed, the two statements in the author's text, on pages 191 and 200, do not correspond as to the important points of the day, the hour, and the reasons for the attack, while it is intimated that the *Monocacy* was "present" in the actual fighting, without taking part, instead of being, as she was, some distance away in shelter, the shell striking her being a spent missile. Foreign life in Peking is pleasantly described, and the criticisms of Great Britain's policy and of Russian methods are those of a man with a well-balanced mind, keen vision, and practised pen. Mr. Denby perceived clearly the underlying causes of the Russo-Japanese war. From the beginning of his work in China, he stood boldly and bravely for the policy of the open door, while with all his ability and persuasive power he protested against the partition of China. His sympathy with the missionaries and his correct and judicial attitude toward them arose from the fact that, by personal investigation and journeys in various parts of the empire, he knew exactly what they were doing, both in spirit and in method. He could thus judge them at first hand and forecast their ultimate influence.

The concluding chapter, by the editor, on the Russo-Japanese war, is bright and readable, though the Admiral Togo pictured is the junior officer, born in Echizen, and not the mighty Togo of Satsuma. It is discreditable to a respectable writer to talk about "Japs" instead of Japanese. The middle name of Commodore Matthew Perry was Calbraith, not Galbraith. These, and a few similar inaccuracies, however, are but minor blemishes in a very delightful and informing book, in two daintily clothed and easily held volumes, beautifully illustrated. While Dr. S. Wells Williams's 'The Middle Kingdom,' after a half-century of original writing and a quarter of a century of revision, still continues to be standard and in the van, 'China and her People' is perhaps the most readable work upon a country and people of whom it behooves Americans to know more.

Lirica Italiana Antica: Novissima Scelta di Rime dei Secoli xiii., xiiii., xv., illustrate con sessanta riproduzioni di pitture, miniature, sculture, incisioni e melodie del tempo e con note dichiarative. Da Eugenia Levi. Florence: Leo S. Olschkl. 1905.

Signorina Levi has already made herself known by an anthology of contemporary Italian poets under the title of 'Dai Nostri Poeti Viventi' (third edition, Florence, F. Lumachi, 1904). That book labors under the disadvantage common to its kind, in that, in attempting to pass a more or less decisive judgment on living authors and their works, it assumes a task that can be accomplished only by time. Palgrave, in the preface to the second volume of his 'Golden Treasury of Songs and Lyrics,' testifies that his second series cost him thrice the labor of the first, for the reason that "nothing is harder than to form an estimate even remotely accurate of our own contemporary artists, whatever the sphere of their art." In like manner the book now under review is better than the other, not only because it deals with the greatest period of Italian literature, but also because many authors and many poems have already been chosen from out the mass by the infallible verdict of centuries.

Mr. Gilbert Murray, in his 'History of Greek Literature,' remarks that, although by separating instrumental music from its originally chief function of accompanying the human voice, the modern world has developed music as an independent art to a perfection and power of expression unknown to the ancients, modern lyric poetry suffers by the inevitable law of compensations from a disunion with its natural partner of vocal and instrumental music. Aristotle's assertion in the 'Poetics' (I., 4) that performers on the flute and lyre employed only the elements of ἁρμονία and ῥυθμός ("music" and "rhythm"), is enough to show that independent instrumental music was known to the Greeks. But we have no evidence that the idea of polyphonic instrumentation ever occurred to them. It is indeed true that no form of Greek art, not even their painting, is so hopelessly lost to us as the art of Greek lyric poetry; and it is much to be feared that the glory and freshness of that age when the lyric poet wrote his notes along with his verses, never thinking of one without the other, when the two were in performance equally inseparable, are gone forever. But Mr. Murray might have observed that the Italians of the Middle Age possessed a lyric poetry which was almost as closely allied to music as that of ancient Greece. The poets of the thirteenth century and their successors did not, to be sure, compose music for their own songs; but these always, or nearly always, received their setting from a musician like Dante's friend Casella. Even in Elizabethan England, the same condition prevailed, though perhaps not to the same extent. Milton's thirteenth sonnet, addressed to Mr. H. Lawes, shows how much importance he attached to the skilful musical setting and performance of lyric poetry.

Therefore it was an excellent plan of Signorina Levi's to print along with her text some examples of the music to which popular poetry was sung during the three centuries from which the poems are drawn. To be sure, the melodies to which the songs of the great poets were sung have not come down to us in many instances. Signorina Levi gives us the notes of only one song by a known author who flourished earlier than the beginning of the fifteenth century, namely, the hymn of Beato Giovanni Colombini of Siena which begins, *In su quell' alto monte* (p. 130). We believe that there is no similar example from an earlier period. However, it is a well-known fact that it was the custom in Italy from very early times to sing religious hymns to popular airs. The editor tells us in her introduction (p. xxv), that in almost all the hymn-books, printed or manuscript, which she had occasion to consult, belonging to the fifteenth and early part of the

sixteentb centurles, she found above or below the text of the hymns the words *Cantasi come*, followed by the first line of a profane song. Accordingly, most of the melodies reproduced in her book go witb religious lauds of unknown authorshlp if they are early, sometimes by known authors if they are of more recent date. For example, we find the music for hymns composed by Savonarola, Lucrezia de' Medici, and Lorenzo de' Medici. And thus, although we have unbappily lost the airs to which the lyrics of the great poets of the earlier period were sung, we can at least form some notion of their character.

But lt is not only with melodies tbat Signorina Levi has illustrated her text. Since all the art of the great period was produced under the same conditions and informed with tbe same spirit, she has also introduced sixty reproductions of pictures, miniatures, sculptures, and engravings; and, in order to avoid printing the wbole book on heavy paper, sbe has caused the photographic reproductions to be pasted on separate sbeets. Under each illustration she gives the name and date of the artist when known, tbe material, subject, and present locality of the original, and a brief decriptive note, sometimes culled from Vasari and other early writers; and we can assure our readers that it is most deligbtful to read Guido delle Colonne's *Amor che lusingamente m' ai menato*, with a facsimile on the opposite page of the song in a manuscript, adorned with beautiful miniatures; Dante's *Donne ch' avete intelletto d'amore*, seeing at the same time Giotto's figure of Hope from the Capella degli Scrovegni at Padua; or Politian's *La non vuol esser più mia*, illustrated with a detail from Benozzo Gozzoli's fresco in tbe Camposanto at Pisa.

The editor has shown excellent sense and spirit in furnishing her readers with very full tables and indices. After a chronological list of writers and artists, comes an index of first lines arranged under tbe names of the poets, then indices (1) of poems arranged according to their various forms, with definitions of these forms, often quoted from famous writers, (2) of the illustrations, and (3) of the melodies, followed by a brief account of early Italian music, and notes explaining the music printed in tbe book. After the text come brief explanatory notes, and finally a bibliographical index of texts and editions cited.

We are sorry, in reviewing a book so praiseworthy in conception, to be compelled to call attention to serious lapses in its execution. Explanatory notes in such an edition must of necessity be brief; but brevity does not necessarily imply meagreness, and Signorina Levi's commentary is of tbat meagreness which seems to come of insufficient knowledge. Although English readers will always think of Shelley's translation in connection with Dante's *Guido, vorrei che tu e Lapo ed io*, it is perbaps too much to expect an Italian editor to notice it, but in any commentary worthy of the name no such obvious imitation ought to pass unmentioned as that of Horace's ode, *O Venus, regia Cnidi Paphique* (Carm. I, 30) in Lorenzo de' Medici's sonnet, *Lascia Pisola tua tanto diletta*. Again, every lover of Italian poetry will remember Guido Cavalcanti's fine sonnet to Guido Orlandi, of whicb the first quatrain runs:

> "Una figura della donna mia
> s'adora, Guido, a San Michele in Orto,
> che di belle semblanze, onesta e pia,
> de' peccatori è gran rifugio e porto."

The note on this sonnet does not tell the reader that the Guido addressed was Guido Orlandi, or that he wrote in reply a beautiful *sonetto doppio:*

> "S'avessi detto. amico, di Maria
> gratia piena e pia
> rosa vermiglia se' piantata in orto,"

in whicb be reproaches his friend for his light comparison of his mistress to tbe Virgin, and for bis irreligious contempt of the Frati Minori. In fact, in sucb an anthology, the sonnet should never have been included without its reply. In the fourth line of Cavalcanti's sonnet, Signorina Levi reads, instead of *gran rifugio e porto*, "*rifugio e conforto*," a version which we bave never seen before, and whicb is not recognized as a variant in Arnone's complete critical edition of Cavalcanti's poems (Florence: Sansoni, 1881).

The reading of the proofs must have been very carelessly done. We have discovered, quite incidentally, the following printer's errors not corrected in the errata. In heading No. 6, p. xxvi, *Gentil* should read *Umil*, and tbe page number 289 instead of 295. On page ix, line 12, read *della* instead of *lalla*, and on page 213, line 14, *una* instead of *uta*. We were surprised not to see the name of Cina da Pistoia in the combined index of authors and first lines. But, having accidentally discovered one of his sonnets in the text, we looked through the whole book and found that four of his poems are given, on pages 121, 131, 174, and 180.

Florentine Palaces and their Stories. By Janet Ross. With many illustrations by Adelaide Marchi. London: J. M. Dent; New York: E. P. Dutton & Co. 1905.

The history of the principal Florentine palaces, with that of the great families to whom they owe their origin, is full of romantic incident and adventure. Hence Miss Ross's book cannot fail to attract the reader, for she bas a special talent for choosing from severe history what is most characteristic and picturesque, and her knowledge of Italian sources of information, ancient and modern, is very extensive. She describes no less than seventy-six palaces, beginning with their architects and ending with their present owners. Of these many are comparatively unimportant, some having been much altered in reconstruction, while preserving still some notable architectural feature of their past likely to attract the careful observer of ancient buildings. Tbese would naturally have no mention in the ordinary guidebook, so that this work will be found useful for reference, besides affording good reading. It is to be regretted that tbe illustrations are neitber effective nor useful; for tbe most part they represent well-known themes in pen-and-ink outline with little sbading, wbile the text seems to demand lnnumerable cuts of archltectural detail.

In telling of the principal palaces, such as tbe Palazzo Vecchio, tbe Bargello, tbe Riccardi, tbe Strozzi, tbe Pazzi, the Pitti, etc., all tbe important and tragic scenes ln Florentlne history are very fully given from documents of the time, and Miss Ross always when it is possible translates from these original sources directly, besides quoting from old letters and other data wbich have more recently come to light. The book describes the manner of life and individual history of all the principal Florentine citizens who built palaces known to fame, beginning with tbe Acciaiuoli, in 1109, down to quite recent times. The reader will get an accurate idea of Florentine ceremonies, customs, business relations, marriage contracts, vendettas, and all tbe incidents which go to the making of life, but the volume will be found more interesting for reference tban for consecutive perusal.

Newcomer and Seward's Rhetoric in Practice

By A. G. NEWCOMER, Professor in Lelaud Stanford University, and SAMUEL S. SEWARD, Jr., Instructor in the same. 285 pp. 90c.

An entirely fresh treatment of the rudiments of rhetoric, adapted to elementary composition. There are abundant suggestive exercises supplemented and commented upon by the text. Each subject is treated as an independent unit, implying nothing that precedes, so that the order of treatment is left to the teacher. Literary topics for composition are avoided. The book is decidedly clear, interesting, and stimulating.

ISABEL GRAVES, High School, East Orange, N. J.:—Of some ten text-books in composition and rhetoric recently examined, this comes closest to my present ideals and needs. [After adoption:] The book for a month has given a month's full justification of my expectations.

Buck and Morris's Narrative Writing

By PROFESSOR GERTRUDE BUCK, of Vassar College, and ELISABETH WOODBRIDGE MORRIS. 200 pp. 12mo. 80c.

Uniform in style and method of treatment with Buck's Argumentative Writing and Buck and Woodbridge's Expository Writing.

Bronson's English Essays

Edited by PROF. W. C. BRONSON, of Brown. 404 pp. Large 12mo. $1.25 net.

Representative essays by Bacon, Milton, Browne, Dryden, Swift, Steele, Addison, Defoe, Johnson, Goldsmith, Burke, Hazlitt, Lamb, Landor, De Quincey, Carlyle, Macaulay, Thackeray, Ruskin, Newman, Arnold, Pater, and Stevenson, with brief selections from prose writers before Bacon.

CHARLES F. McCLUMPHA, Professor in the University of Minnesota:—It is quite the most useful and ably chosen set of essays to be presented to the student world.

The Lincoln-Douglas Debates

Edited by PROF. A. L. BOUTON, of New York University. 297 pp. 16mo. (English Readings.) 60c. net.

Includes Lincoln's opening speech, the Freeport and Galesburg and Alton debates entire, and Lincoln's Cooper Institute address.

Stopford Brooke On Ten Plays of Shakespeare

311 pp. 8vo. $2.25 net (by mail, $2.37).

Not so much an analysis as an appreciation of "Midsummer Night's Dream," "Winter's Tale," "Merchant of Venice," "As You Like It," "Richard II.," "Richard III.," "Macbeth," "Tempest," "Romeo and Juliet," and "Coriolanus."

Temple School Shakespeare

Each volume, 35 CENTS NET.

The Tempest. (Oliphant Smeaton.)
Macbeth. (George Smith.)
Julius Cæsar. (F. Armytage Morley.)
As You Like It. (Flora Masson.)
Hamlet. (Oliphant Smeaton.)
Richard II. (W. Keith Leask.)
The Merchant of Venice. (R. M'Williams.)
Henry V. (R. H. Case.)

AUGUSTINE THE MAN

By Amélie Rives (Princess Troubetzkoy)

Photogravure Frontispiece by Marchioness of Granby.

"The most important work Amélie Rives has done." —*N. Y. Times.*

JOHN LANE CO., 67 FIFTH AVE., N. Y.

The Nation.

NEW YORK, THURSDAY, APRIL 26, 1906.

The Week.

The unparalleled catastrophe last week at San Francisco, happily little remarkable for loss of life (though this must remain indeterminable) under the combined action of earthquake and flame, effaced in an instant the sensation caused by the destructiveness of Vesuvius. In an instant, too, it evoked the best qualities of the inhabitants for self-help, and the human sympathies of the whole American people. The worst is not so bad as appeared at the height of the excitement; the compensations, in the certain superior reconstruction and reordering of the city, are very great. Perhaps the most irreparable losses are in the collections of books and works of art—that of Alfred Sutro, in particular; we hear nothing of the Hubert Bancroft historical collection. The gravest physical and social problem is the disposition of the Chinese, whose quarter was the city's dishonor as a modern municipality, and the very foundation of local persecution and national bad faith toward that unfortunate people. Valuable lessons have been learned in respect of stable building, though not to the extent of assurance that a similar visitation could not reproduce the conflagration which lent equal horror and ruin to the scene.

The earthquake will excite a certain prejudice against San Francisco, and indeed against the northern part of California, as a place for either residence or investment. Moreover, while San Francisco is prostrated, rival ports, north and south, will secure at least a temporary advantage. These obstacles are not insuperable. The climate of California, the abundance of its fruits and vegetables, the excellence of its public schools, from the kindergarten to the State University, are irresistible attractions both to native Americans and to immigrants. Plenty of sane people will continue to regard California, with earthquakes, as better than any other place *without*. The schools and colleges may pass through a brief period of depression. The State University at Berkeley, supported in part by a tax, will feel for a few years the effect of such a vast blotting out of taxable property; but the check cannot be permanent. The development of the University must keep pace with the development of California. Leland Stanford has lost some of its buildings; but Stanford, with an income from $30,000,000, can soon restore its library, laboratories, museums, and dormitories. In fine, when the public institutions and all the other facilities for a civilized and happy life are reëstablished, and when the memory of this catastrophe has grown a little dim, San Francisco and the region about will not lack for inhabitants. Nor will San Francisco be hard put to it for capital. She has never leaned on the East as hard as Seattle, Los Angeles, and some of the cities of the Mississippi Valley. She has made her own money, and has been uncommonly independent. San Franciscans will unlock their own heaped-up treasure vaults when they want means for their enterprises.

Suspension of the tariff on structural steel and other materials needed for rebuilding the California cities is the latest measure of relief proposed in Congress. This plan, we are assured, should not disturb the most fanatical of the standpatters. But we are unable to follow that line of reasoning. If steel and lumber are to come in duty free for suffering San Franciscans, why not for Philadelphians or Bostonians who have been burned out? Are we not all equally good Americans? Do Senator Cullom and Representative Madden want to see the lumber market of San Francisco glutted with the pauper products of the British Columbia forests? Do the hearts of these statesmen no longer beat for the redwood of California and the fir and the cedar of Oregon and Washington? Ballard, close to Seattle, boasts that it makes more shingles than any other place in the world. Yet this feeble infant industry is to be strangled merely because California is in hard luck. Senators Lodge and Aldrich must see that the huge sawmills of Puget Sound are as sacred a vested interest as the Massachusetts and Rhode Island factories for cheap jewelry. Pennsylvania must rise to the defence of the steel works of Pittsburgh. The Colorado Fuel and Iron Company must cry aloud for the aid of its friends in the United States Senate.

Mr. Cullom has forgotten that a cheap coat makes a cheap man, and that a cheap house is therefore a curse to the country. It is equally obvious that expensive building material means high rents, and high rents are the prime cause of our physical and moral well-being. San Francisco and the cities of the Pacific Coast have always enjoyed an automatic protective tariff. The mere cost of transporting heavy manufactured goods across the continental divide has tended to raise prices. Speaker Cannon will explain that the resultant additional cost of living—not fertility of soil and productiveness of mines—is the real basis of California's prosperity. Clearly, then, the logical thing for the standpatters in this emergency is to apply their principles relentlessly. The Dingley tariff is a good thing, and there cannot be too much of it. Then let us show our sympathy for California, not by abolishing the Dingley duties, but by doubling them on all building material intended for the stricken city. The proposition can be supported by every argument now urged in favor of a protective tariff.

The President's special message to Congress, urging insurance legislation for the District of Columbia, marks Mr. Roosevelt's retreat from his position of last December. He then contended that "Congress has already recognized that interstate insurance may be a proper subject for Federal legislation," and he accordingly, though with much vagueness, urged that Federal control be established. A month ago this position was rendered quite untenable by the report of the House Judiciary Committee, which unanimously pronounced the argument for Federal interference with State police powers, on such a basis, "a monstrous doctrine, subversive of our dual system of government," and proved its point conclusively. What the President now recommends is merely the establishment of an insurance bureau in the Department of Labor, such bureau to supervise, on lines laid down by Congress, insurance companies hereafter doing business in the District of Columbia. The particular bill approved by Mr. Roosevelt is one drawn up by the committee named by the National Life Underwriters' Association last February; it provides, among other things, for larger facility in the use of proxies, and for the liability of directors for illegal investments. We certainly see no reason why Congress, which legislates for the District, should not make the same endeavor to improve its insurance laws as our Legislature is making for New York. As for the idea, however, that Congress should instantly set out with the idea of framing a "model insurance law" for all the States to copy, it strikes us that Congressmen, like other people, will know better what such a law should be when the new Armstrong laws have been tested in operation. This, we imagine, is the view which Congress itself will take of the proposed new legislation.

The latest argument for free alcohol, that it will render the automobile odorless, so strengthens the already strong case for the act that a Senate owing its existence to popular election could hard-

ly kill the bill passed by the House a fortnight ago. We will not ignore, however, the elaborate and careful but unavailing argument made by Mr. Young of Michigan on the day of the bill's passage. "I should be false to my duty," he said, "did I not at least protest against the passage of a measure which I believe will not only disappoint the hopes of those who favor it, but will seriously cripple, if not destroy, the wood-alcohol business and its allied industries, which, in my district alone, support not less than 15,000 people and employ nearly $20,000,000 of capital." Inferior forest lands are made valuable, he explained, because, in addition to the scattered clear timber, all the unfit and waste material can be made into charcoal, acetate of lime, and wood alcohol. "Each branch of this industry," Mr. Young explained, "is necessary to the success of the whole." He declares "chimerical" the notion that it is possible to "curb the Standard Oil Company" by distilling "potato peelings and corn-stalks," and contends that the Government should not "abolish taxes already in existence and which are needed for the support of the Government and the building of needed public improvements, for the sole and only purpose of destroying an existing industry in order that another . . . may be built upon its ruins."

This, of course, is merely the "vested interests" argument of the tariff beneficiaries applied to the internal-revenue schedules. The facts are hardly disputed. It costs very much less to make grain alcohol than wood alcohol. It is also better for most purposes than wood alcohol. Wood alcohol is used as an inferior substitute for the grain alcohol, which a tax of some $2 a gallon has made prohibitively expensive. It is, at least in its present proportions, the most artificially created of industries. And what has the compulsory substitution of wood for grain alcohol cost the consumers? According to Mr. Young's own figures, untaxed grain alcohol would sell at 38 to 40 cents a gallon, as against 50 cents for wood alcohol. As 8,000,000 gallons of the latter are used annually, this makes nearly or quite $960,000 a year taken from users of alcohol. According to the Ways and Means Committee's figures, which give 9.4 cents as the minimum cost of producing grain alcohol per gallon and 40 cents for wood, the corresponding saving would be $2,448,000 per year. That, be it remembered, is for the quantity now used. With the predicted enormous increase in the use of alcohol, the saving will be correspondingly greater. Is Michigan's wood-alcohol industry so deserving as to warrant this tribute? Answer may be deferred, as the Senate Finance Committee—Aldrich, chairman—is preparing to "investigate" the free-alcohol question so thoroughly that the House bill will certainly not be enacted until next year's session.

Politics in Mississippi seems to be a kind of family affair, as John Sharp Williams and Gov. Vardaman are discovering with regret. No cries of nepotism were raised when seven members of the family of Senator McLaurin were holding office at one time, but now that Senator Money stubbornly refuses to say whether or not he will be a candidate for reëlection, the two aspirants for his place find themselves in an annoying situation. Hernando De Soto Money is sixty-seven years old, and in bad health; and though his term does not expire until 1911, under the system of quadrennial Legislatures in Mississippi (as in Alabama), United States Senators are sometimes elected four years before they take their seats. Open competition this year between Williams and Vardaman would naturally seem reasonable, but just here is where the "family problem" confronts them. Gov. Vardaman is a first cousin of Senator Money, and Representative Williams is a first cousin of Mrs. Money. Kinship means much in the South, and an attempt to force this peculiar issue would bring the house of Money crashing down about the ears of the younger men. Dread of such a calamity may even induce Senator Money to sacrifice his health to his cousins, and go back to Washington himself.

"Lynching is a pastime, not an industry, of the Southwest," explained B. B. Paddock of Fort Worth, Texas, at the first annual convention in St. Louis of the commercial clubs and newspaper editors of that region, which has just closed. But as a pastime it is taken too seriously. On Monday, at the first session of the convention, a resolution was introduced endorsing Gov. Folk's denunciation of the Springfield lynchers. After it was read, Mr. Paddock, who has been mayor of Fort Worth and was a Texas Commissioner to the Louisiana Purchase Exposition two years ago, rose to say: "Mr. Chairman, I move to table that resolution. The people of Springfield did exactly right. They ought to do more of it." This motion was carried with hardly a dissenting voice, and the best excuse that any delegate could give for supporting it was that the introduction of the resolution was "a political move," or that the Springfield lynching was "a purely local question." Such earnestness on Mr. Paddock's part in preserving his favorite pastime from criticism would almost indicate that it was really a great industry like cattle-raising or rice-growing. The Governors of Missouri, Arkansas, Kansas, Oklahoma, New Mexico, and Arizona were guests of the St. Louis convention. It would be interesting to know to what extent they endorse the humane Texan's view of the significance of lynching.

Though an Ohio judge has decided that the legislative committee which has been looking into affairs under Boss Cox's rule in Cincinnati is without proper authority, the damage has already been done. The crude "graft" machine that was built up under Cox has been exposed in enough of its parts to show clearly the need for destroying it utterly. Since February 23, the day of the committee's first session, it has been shown that the treasurers of Hamilton County have deposited money collected as taxes in Cox's banks, and drawn interest in the form of gratuities." These the treasurers pocketed or divided. Already over $200,000 has been returned to the county treasury by three men who have held the office: "Rud." Hynicka has refunded over $58,000, John H. Gibson over $97,000, and Tilden R. French more than $50,000. A Cox grand jury has refused to indict these men, on the ground that they have been willing to return the money, and on the further ground that they "may not have been exclusive beneficiaries." As a matter of fact, they were not "exclusive beneficiaries." Hynicka swore that he received only $25,000 of the $58,000 which he turned back; and the same thing was true of Gibson and French. It has been brought out that the local courts have been ruled by Cox, and that both city and county governments have been shaped by him with the one object of yielding every possible bit of "graft." For an "illegal" body, working in the face of opposition from such high sources as Senators Foraker and Dick, the Drake committee has secured surprisingly valuable data.

Gov. Higgins did a day's mixed work on Thursday last. He spoke out promptly and sharply on the bedevilment of the insurance bill, and his attitude, combined with the volleyed protests from the press and public all over the State, led the Senate to agree to retrace its steps and strike out the vicious White amendment adopted the day before. This makes it certain that the insurance bills will all become law substantially as urged by the Armstrong Committee. Policyholders throughout the State will praise the Governor for his intervention to frustrate the malicious and futile schemers of the Senate. As to Mr. Higgins's action in vetoing the recording-tax on mortgages, opinions will differ. Republicans in this city will say that it enormously increases their difficulty in electing members of the Legislature. Up in the country, where the old superstitions about mortgage taxation die hard,

many will think that Gov. Higgins did just right. The injustice of taxing mortgages, with the privilege of using money corruptly in elections, must and shall be preserved for the blameless rural voter. Undoubtedly, the Governor succeeded in pointing out some technical flaws in the vetoed bill. Whether he would sign it with these removed, he does not make clear, but we are inclined to think he would. At all events, the Legislature should make the trial. There is time enough, and there are votes enough, to pass the bill with amendments to meet the Governor's objections. It should be done without fail.

Mr. Jerome must now see how well-advised he was in abandoning his famous brief, contending that the secret taking of insurance funds for politicians could not be larceny. He threw that away when he argued the Perkins case before Jurge Greenbaum, and maintained that larceny had, in fact, been committed by Mr. Perkins. The judge's decision on April 18 sustains this view. That is to say, Judge Greenbaum agrees with Judge O'Sullivan that the facts as described come under the definition of larceny in the Penal Code, and that the question of "intent" is to be left for the jury to decide, after hearing all the evidence. We do not know whether Mr. Jerome's friends will hail this decision as a great triumph for him. It is, at any rate, a vindication of his later opinion as against his earlier, and should lead to prompt action. Now that the District Attorney has got the decision of two judges, he can have no objection to allowing the grand jury to indict Perkins and the other "conveyors" of insurance money.

Anything to oblige, is apparently Campbell-Bannerman's standing order with regard to the Laborites. Mr. Keir Hardie announced on April 17 that the Premier had not only accepted an amendment to the Labor Disputes bill exempting the treasuries of trade unions from damage suits, but also had taken the bill from the Attorney-General and committed it to the Solicitor-General. In self-respect the Attorney-General could not continue to advocate the measure, having expressed himself unequivocally against statutory immunity for union funds. As a matter of fact, Campbell-Bannerman's surrender shows a turn-over from the old, common-sense Liberal ideal to sheer sentimentalism. The only reason for giving to trade-union funds an immunity enjoyed by the treasuries of no other association whatsoever is that the trade-unionists are poor and unequal to any financial contest with employers. The same reasoning would justify a police magistrate in declining to impose the drunk-and-disorderly fine upon any person not in comfortable circumstances. Campbell-Bannerman, in his first Parliamentary comment on the Labor Disputes bill, practically took this genial view of the situation. He desired to give the unions a lift because it hurt them more to pay than it hurt the employer to lose his property. Mr. Bernard Partridge shows in *Punch* the laboring-man offering to blind justice, instead of the scales which hang even for labor and capital, a balance in which "Trades Unions" dips appreciably. "This pair works better—for me," is the argument for substitution.

The approaching general election in France will turn very largely on religious and social questions. All competent publicists agree that tax and budgetary reform are really more pressing, but these matters were ever dull to the voters whom they most concern. The attitude of the State towards the Church, the right of Government officials to organize and strike, the practicability of old-age pensions—these are the issues that will be argued up and down the arrondissements. Unquestionably, the Socialists will stand for the right of officials to strike; the case is urgent, for many of the post-office employees have actually struck work. Similarly, the Socialists will demand a drastic enforcement of the Separation act. They will ask that Government supervision of the parishes be minute and rigid; they will, presumably, protest if the Pope freely exercises the right of appointing bishops without consulting the Government—a right which, for the first time in a century, he regains through the abrogation of the Concordat. The elections, then, will show whether the old anti-clerical sentiment remains in full force, or whether calm reflection on the implications of the Separation act and the spectacle of army officers refusing to batter down church doors, of communities in arms against the taking of church inventories, have brought about a more humane and less doctrinaire feeling.

M. Ribot, the veteran Republican, whose defection had much to do with the fall of the Rouvier Cabinet, has reviewed the entire political situation in a notable address at Roubaix. He combated the Separation bill, not as wrong in principle, but as untimely and oppressive. France is not ready, he held, to give a free rein to a Church whose feelings have been sorely outraged. He pointed out the absurdity of breaking off diplomatic relations with the Vatican when Protestant Powers find it necessary to maintain representatives at the Holy See. In pushing devout Catholics to the verge of insurrection, he insisted, a wrong had been done both to the State and to the Church. To the project for old-age pensions he objected vigorously, because no general law could be sufficiently flexible to meet the varying needs of the different occupations. Moreover, this great extra expense is to be incurred at a time when economy and tax adjustment are the crying needs. Instead of old-age pensions, he advocated encouragement of voluntary insurance, and land companies which should put the young laborer in possession either of his home or of a small farm. Finally, he condemned the use of the public service for party ends, and pleaded for a reduction of Government interference in private affairs. The address was a fine argument for genuine Republicanism, and one may well hope that such teaching will not fall unheeded. The elections will show whether the mind of France is still set principally on harrying the Church and paying Socialist doles without counting the cost, or whether leaders of Ribot's type have taught the electorate to do a certain amount of sound and comprehensive thinking concerning the republic.

Announcement that the Russian Government has now formally arranged for a $440,000,000 public loan is interesting for many reasons. This is the first "long-term loan," in the sense usually applied to public borrowings, which Russia has been able to place since the Eastern war broke out. During the first year of war she secured several loans at Paris and Berlin, running six to a dozen years; but the revolutionary outbreak of January, 1905, ended even these. Since then, Russia has been able only to borrow on Treasury notes with a year or less to run. Last October a 4 per cent. loan of $250,000,000, on the older long-term basis, had almost been arranged for when revolution broke out again. The Government now reappears in the money market with a request for nearly double that amount, and European critics seem to agree that the need for this money is imperative. Naturally, after what happened last winter, and with so largely increased a demand, terms imposed by the lenders are harsh. In October they fixed a rate of interest and a price which would have made the investment yield of the new bonds something like 4½ per cent. The loan now proposed will net the bankers more than 5½—this being the lowest rating of credit applied to any first-rate government, outside of war-time, in a generation. Paris once more bears the burden, taking half the loan. A more interesting fact is that, while Berlin takes none directly, London is expected to subscribe for $68,000,000—this in spite of the reported provision of the contract that no market shall "unload" on the Stock Exchange of another market until two years shall have elapsed. This is the "protective clause" insisted on for the benefit of Paris last October.

ATTACKING THE JUDICIARY.

Has not the President somewhat abused the immemorial privilege of a defeated litigant to "go down to the tavern and curse the court"? A private explosion of pettishness is one thing; but for the President to unbosom himself as he did on April 18 in a formal message to Congress betrays a growing and unhappy irritability on his part, along with a disregard of the proprieties. It is true that the decision of Judge Humphrey brought Mr. Roosevelt's pet plan of controlling the Trusts by means of the Bureau of Corporations tumbling about his ears in a heap of illegality; but that furnishes no excuse for his extravagant language about a "gross miscarriage of justice," and his assertion that the decision of the court had made a "farce" of an act of Congress. If the Administration's whole scheme of prosecuting the packers was blunderingly conceived, as the court held, the thing to do is to learn wisdom of the sorrowful experience and go about the job in the right way next time.

The President's hard words about Judge Humphrey will break no bones, but they do break precedent and official decency. Such railing by the Executive at a coördinate and independent branch of the Government is not only unbecoming, but mischievous. It tends to destroy that confidence in the judiciary which is of the essence of our law-abiding spirit and our civil stability. Who is this judge whom Mr. Roosevelt berates? A man of fifty-six, twenty-six years a lawyer, for four years a United States District Attorney, and since 1901 a Federal district judge. The presumption is that he knows the law at least as well as the layman in the White House who undertakes to set him right. His opinion, moreover, which has inspired such celestial rage, not only was based on precedent and authority, but pointed out precisely the blunders the Administration had made in the prosecution, and showed how it might have proceeded successfully under other statutes. It is unpleasant, of course, for the President to see his cherished handiwork knocked into a ruin, but his tilting at the courts is a very ill-considered way of revealing his pique.

With Mr. Roosevelt, we have long since passed the point of asking, "Suppose Bryan had done such a thing!" Still, people have not wholly forgotten the campaign of 1896, and the use that was then made of Mr. Bryan's language derogatory to the judiciary. "Preserve the courts from meddling by the Executive," was then the Republican cry. So in 1898 the independence and immunity of an upright judge was the frequent theme of Mr. Roosevelt's campaign speeches; and it was the issue over Judge Daly which Croker stupidly raised that did more than any other one thing to elect Roosevelt Governor of New York. Hence it is a complete and unwelcome change to find him assuming the angry and hectoring attitude of his late message. "I can hardly believe that the ruling of Judge Humphrey will be followed by other judges." Why did the President say that? Was it to give his valuable opinion on a point of law? Or is there a threat lurking in the words? One has merely to recall the fact that Federal judges are dependent upon the President for promotion, in case of vacancies occurring, to see how broad is the hint given them that they had better agree with the President if they wish to find favor. We do not assert that such was the intended meaning of Mr. Roosevelt's language; but it is at least a possible inference. It would certainly have been drawn from a similar loose utterance by Mr. Bryan.

This question of the proper attitude towards the courts enters deeply into the pending railway-rate legislation. It is not merely a dispute whether the provision for judicial review should be broad or restricted. Behind all that, lies the ill-concealed feeling of some that a judge—though he has given his days and nights to the study of jurisprudence, is removed by his position from political ambitions, and is called upon constantly to give his deliberate and conscientious opinion about the interpretation and application of the law—is no more likely to be right than the man in the street. "They are but nine," said Senator Bailey, referring to the Supreme Court; "we are ninety," meaning the Senate. Mr. Bailey is a lawyer and a respecter of courts, so that he was presently led to explain that he did not intend, by the words which he used in the heat of debate, to cast any aspersion upon the judiciary. But others are not so careful. There is a notion abroad that it would be just as well to put things to a vote hastily, and make the pottering judges keep their hands off. To such a deplorable tendency the President's unguarded language will give encouragement. If he gets his Rate bill through as he wants it, and if then the courts were to reverse a decision of the Interstate Commerce Commission, on the ground that it took property without just compensation, he would be quite capable of another outburst like that he indulged in against Judge Humphrey. "Why, this," he would exclaim, "is not at all what I intended, and the courts have made a farce of the intention of Congress." It is obvious that, on such terms, the independence and inviolability of the judiciary would soon be broken down, and that the framework of our Government would be altered out of all recognition. The authors of the Constitution surely never contemplated such a lecturing of the judges by the President; but then, it is probable that Hamilton and Madison would say that they never foresaw Roosevelt at all.

REACHING FOR INDIAN LANDS.

For a charming illustration of specious pleading, we commend the resolutions just adopted by the St. Louis convention of Southwestern editors and merchants regarding the Curtis bill, which provides for the final disposition of the affairs of Indian Territory. They recite the fact that Congress means to deny to the Indians the right to alienate their allotments of land for twenty-five years, and then assert that such a restriction will fall in with "the desires of the so-called grafters." These sharpers are pictured as speculators, who design to buy up the lands of the Indians piecemeal, by private agreements. They are, by their schemes, to retard "the industrial development of that section of the Union and the entire Southwest." What the St. Louis convention preferred would be to have the restrictions removed entirely as regards all "surplus" land—that is, all land beyond a homestead of forty acres. Just why they conclude that, in case the restrictions on the sale of land were removed, the speculator would be barred from the Territory, they do not explain. To one on the outside it would seem that the ability to secure a clear title might very materially assist the speculator; certainly, the Indians have less actual knowledge of the value of their holdings than they will have in twenty-five years.

As for the Territory's opportunity to develop industrially under the restrictions imposed by the Curtis bill, the optimistic have no reason to lose hope. We are unable to picture the Indian Territory as a wilderness, where, in the words of a vigorous opponent of restriction, "the coyote and the lobo wolf may range at will," but where "the man with the hoe may not raise a stalk of corn or cotton." The law goes quite as far as it should in liberalizing the provisions for leasing, and in ten years, if there is an unused acre of fertile land in Indian Territory, it will not remain idle because "the dead hand of Congress" has descended upon the land. The rabid objectors to the conservatism of Congress are in despair because all coal and asphalt lands in the Territory have been reserved from sale until the existing leases, some of which have twenty-five years yet to run, have expired. Here again the aggressive "friends of the Indian" argue that it is better to buy outright than to lease and wait for development operations. But the Senate was of different mind. It wisely insisted that the matter be delayed until the present craze for speculation in Indian property has passed.

Pressure at Washington to have the Indian taken into the new State on an

equal footing, so far as his tenure of land is concerned, has come mainly from Oklahoma, of course. Both Gov. Frantz and Bird S. McGuire, Delegate in Congress from that Territory, have spoken vigorously for the removal of restrictions. The Governor, who is a favorite at the White House, largely because of his enthusiasm, recently pictured the thriving new State that would shed glory on the flag—if only the people of Indian Territory insisted upon getting the restrictions removed. "The citizen of this new State shall feel no longer the humiliation of swaddling bands." Delegate McGuire, also, has expressed the prevailing Oklahoma opinion. In a speech in the House in February, he referred to the theory that the only way to civilize an Indian is to set him down between two white neighbors. But even Congress was able to see the humor of that statement as applied to Indian Territory, where only by stretching the meaning of the term can one Indian in eight be called a full-blood. The problem, therefore, is not to "civilize" the natives of Indian Territory; it is simply to insure that the tribal lands shall be held for the use and occupation of the members of the tribes. Whoever seeks to set up the plea of industrial stagnation to secure the removal of restrictions, not only is using a specious argument, but is branding himself as an ally of the exploiters of the Indians.

It was fortunate for the tribes that Senator La Follette decided to go to Washington. In the bill as originally introduced, the promoters of the country's industrial future had provided that the valuable coal and asphalt deposits in the Indian Territory should be sold to the highest bidder, and the proceeds divided among the tribes that owned the land. This was the situation: More than 300,000 acres of such land was reserved, but less than 100,000 acres had been developed, and only a small fraction of that 100,000 had been thoroughly investigated. Until Senator La Follette arose to point out the trail of the railroad serpent from St. Louis to South McAlester, it might have been supposed that the Indians were about to drive a shrewd bargain. La Follette may not have known that the railroad interests were combining to acquire, through subsidiary companies, the rich Choctaw and Chickasaw coal fields, but he soon put Senator Clapp and the sponsors of the bill on the defensive, and the provision for sale was stricken out. But even in the amended bill as passed, after specifying that sales shall not take place until existing leases expire, occurs the clause, "or until such time as may be otherwise provided by law." Though the law now stands as a triumph of those who have the future of Indian Territory at heart, the prophets of the great commercial future have not been silenced. The above clause holds out a hope to them that another Congress may heed their land hunger and their desire to open up coal mines and asphalt deposits. The hand of the land speculator is always reaching out toward the Indian holdings. Now, as always, the sympathy of the country is invoked because for the time the invaders cannot acquire title to the land and enjoy the inestimable privilege of robbing the natives under cover of the law. "American citizens deprived of the blessed right of equality" is the way the plunderers describe themselves. But Congress should remember that there is a briefer and more accurate title for them. In Alaska, they would be called "the spoilers."

AN ADEQUATE ARMY MEDICAL DEPARTMENT.

It is an old contention that the Government is morally bound to see that the soldier, who yields to it so much of his personal liberty, does not suffer unnecessarily by reason thereof. In every great war carried on by the United States this ideal has not been attained, but the very opposite has happened. Civilians, once enlisted, when clad in uniform and entrusted with firearms, have been called soldiers. As such they become subjected to unaccustomed conditions of food, shelter, and exposure, with the inevitable physical results. Similar consequences follow when the National Guard, already trained in the manual of arms and the simpler drill, goes into the field. In the very nature of the case, the newly commissioned officers of the line are not qualified to protect the rank and file from the dangers to health, because the conditions of the field, of cantonments and camps are essentially different from those of the home and the armory. The company officers have immediate oversight of the men; the regimental and general officers regulate in a wider way their vital conditions. In practice there has been no corps actually set apart to ward off disease. For a very long time the medical officers (formerly not officers, but attached civilians), who are popularly held guardians of the health of the men, were charged simply with treating those who suffered from disease, not with pointing out or neutralizing the conditions that create it.

The duty of the medical staff was supposed to begin after the man was taken on the sick list. It was a formal application to military life of the unconscious fatalism of civil life. One becomes ill, he "catches" a complaint. It is a visitation of Providence, for which the victim is no more responsible than were those upon whom fell the tower of Siloam for that catastrophe. After the illness begins, the family physician is called, or the patient goes to hospital. Formerly never, now occasionally, there is intelligent effort to prevent the spread, still more rarely to inhibit the cause of the disability. Until recently these phases of military and civil life were identical, and the misnomer "surgeon," which clings as a term of limitation, has descended from the era when the care of wounds was the only occasion for any medical attention. By very slow degrees, for military conservatism and the natural jealousy of command blocked the way, the medical officer's functions have enlarged, until suddenly in these latter days the public turns fiercely upon the Medical Department when it sees the sick-rate rising and the death-roll growing among those who offered their lives to overcome the enemy, but who are themselves overcome before they are in touch with the foe.

When Gen. Scott in Mexico lost one-third of his effectives in camp, it was accepted as inevitable. When Gen. Shafter's army staggered in the lines after the fighting at Santiago had ceased, and Camps Alger and Thomas became synonyms for fever beds, the country was outraged. Japan in a prolonged foreign campaign lowered morbidity and its consecutive mortality far below that from wounds, and thus set a standard to fall below which would be disgraceful. But such success depends upon technical qualifications and upon administrative ability and authority. There are no more inspired sanitarians than there are inspired gunners. A fleet manned by shipwrights alone will be lost no more surely than the health of an army trusted to clinicians will fast fall to pieces. Both are competent to repair damages, but neither can avoid peril. The "surgeon" does not prevent wounds; he treats them. What is wanted, besides the accomplished medical staff which the standing army possesses, is also a body of highly trained men, capable of generalizing from effects to causes, so placed in relation to control that their opinions will be both respected and acted upon.

Any one familiar with military affairs knows that official special opinion carries weight in proportion to the spokesman's rank. For as rank is taken to be an exponent of ability, opinion, unless disproved by the result, is respected in the same ratio. As a professor to a tutor, a bishop to a curate, a leader at the bar to the struggling counsel, so is a field officer, and especially one of high position, to an officer of lower grade. This question of rank is one of the most difficult for the civilian mind to appreciate, yet upon it rests the efficient workings of the whole military system. For while rank has privileges, it also has responsibilities; and, speaking generally, the bearers of high rank feel the responsibility and discharge the duty. Precisely what the Medical Department of the army now lacks is an adequate number of officers of the higher field

rank, who may be depended upon to discharge their administrative duties with credit to themselves and advantage to the service. A bill with a clause to this effect has passed the Senate and has been reported by the Military Committee of the House, but it depends upon the will of the Speaker whether it can come to a vote. After the careful and generally hostile scrutiny that such bills meet with, it would be both autocratic and damaging for the Speaker to substitute his own views and to exercise a virtual veto upon legislation which has been commended by legislators and executive alike. Public opinion should insist that the Medical Department be given the opportunity it begs, which Congress seems willing to concede if Speaker Cannon would but let it.

A CYCLE OF ART IN NEW YORK.

The death of Daniel Huntington, former president of the National Academy of Design, happened, by a curious coincidence, within twenty-four hours of the Astor House ball which revived the older New York in which he had won his fame. His death removes, we believe, the last of those painters who had made their name before the fifties. Within a few years Asher B. Durand, F. E. Church, Eastman Johnson, Albert Bierstadt, and their younger contemporary, Edward Moran, have gone. A few more years must see the last of painters to whom the founding of the National Academy and the presidency of the artist-inventor, Morse, 1826-1842, are even schoolboy memories. Already the pioneers begin to assume a legendary penumbra; they one and all give the impression of stalwart and somewhat salient personalities that never quite painted themselves out. In the case of the late Daniel Huntington, a long career of public usefulness in various artistic interests of solid esteem among the makers of modern New York outlasted the early vogue of his ideal and genre painting, and the period during the sixties when he was almost the official portrait painter of America. To him and a number of his contemporaries applies the ejaculation of a French critic upon the men of the thirties: "They were tremendous fellows."

The worthy Tuckerman, who fifty years ago was the accredited oracle of taste in America, was certainly of this opinion. He naturally overpraised the paintings of his associates; probably he did not overpraise their personalities. In any case, it is evident that men like Huntington and Eastman Johnson came up in an atmosphere of appreciation such as later painters of greater abilities have seldom enjoyed. Compare, for example, the relative obscurity of Wyant, the tardy acclaim of Inness, the bitter struggle of Homer Martin, with the popularity that so readily fell to the earliest academicians. It is certain that New York, in the thirties and forties, was in a definitely expectant and, one may say, patriotic attitude towards its artists, whereas to-day its attitude is become highly skeptical, or, worse, merely indifferent. New York, in its mellower fashion, was then experiencing a phase of that transcendental movement which quite intoxicated New England. The litterature of the times, or at least the illustrated annuals, abounded in unfavorable comparison of European with American scenery. Our landscape became a cult; Washington Irving and James Fenimore Cooper even provided it with local legends. There was a more or less conscious and resolute desire to live up to Emerson's formula and make our land "classic to ourselves." To this sentiment the romantic landscapes of Cole and the grandiose panoramas of Church contributed notably.

Huntington represented historical or religious painting—the veritable tradition of Allston and Morse—the kind that Sir Joshua Reynolds had declared to be the highest and the unfortunate Haydon had exalted into a religion. Huntington was admirably fitted by temperament for this lofty vocation. There is in his religious paintings, particularly in his several subjects from 'Pilgrim's Progress,' a purity of sentiment, a certain mystical distinction, that places them fairly on a par with the works of William Dyce or Ary Scheffer. But the time was unpropitious for the sublime in painting. For New York of the antebellum time the sublime was too often bounded by "Childe Harold" on the north and the Oriental romances of Tom Moore on the south; with perhaps the Rocky Mountains and Düsseldorf as longitudinal limits. There was in America no established repertory of noble forms upon which a painter might draw; the training received at home or at Düsseldorf or Rome was defective and even positively bad. The product, however, with all its limitations, was precisely that which New York required. There is a most interesting chapter to write some day on the position of the artist in old New York. Much may be inferred on the subject from Tuckerman's enthusiastic pages; Mr. Samuel Isham gives an excellent hint of the matter in his recent 'History of American Painting.'

The relations existing at that time between painters and society bespeak a greater leisure and capacity for comradeship on the part of the wealthy than is common to-day. The artist was much sought out as such. His pictures were bought, uncritically to be sure, but because the buyer honestly liked them. To-day one sees occasionally an old house garnished with Kensetts, Cropseys, and the like, and feels that here is something authentic. Some past proprietor has desired just this record of vacations by mountain or shore—has loved to live with these pictures, just as he enjoyed alluring their painters to his hospitable mahogany. Moreover, there appears to have been a constant association between artist and man of affairs that made it very easy to carry through any project for exhibition or building. There was, in short, a more dispersed and less specialized interest in matters artistic. Apparently, the sheer vanity, the crass desire of possession, that lies at the bottom of so many modern collections, and incidentally makes the fortune of so many unscrupulous dealers, was entirely absent.

These genial conditions could not last. When the tide set from Paris and Barbizon, it was inevitable that collectors should perceive the inferiority of their American pictures. Robust and uncritical enthusiasm gave way to a rather timid cosmopolitanism. Then came the flood of new wealth, which made picture-buying merely an expensive appanage of great place. The day of the genuine amateur was passing, and that of the dealer had come. The joint tyranny of Barbizon and of commercial collecting simply shattered the market for the American painter. Even portraiture went over to the cleverer and frequently the shallowest commercial travellers of the Paris studios. The success of any American artist for a generation past has depended upon the enlistment of a small and faithful cult of admirers. It is doubtful if this is a more salutary atmosphere than the indiscriminate admiration of sixty years ago. The present condition of art patronage is far from normal. Those who are the natural buyers of pictures are the objects of a perfect conspiracy against personal taste of any kind.

Whenever the desirable adjustment of society to the arts is reached, the condition of New York will be much more like that of the forties than it is like that of to-day. It is interesting to note that the few collectors with whom acquisition is a personal and passionate recreation, are generally the sons of those earlier art patrons who made modest savings in order to get a good landscape of the Hudson River stamp, or a fine religious piece by Huntington. Our emancipation from the dicta of the dealers and the quotations of the auction-rooms will come only from a more intimate relation between the artist and the picture buyer. The old, naïve enthusiasm at least laid the basis of courageous personal standards of taste; this as yet the prevailing cosmopolitanism has signally failed to do.

THE FATHER OF CHEAP NEWSPAPERS.

The French have the centenary habit, too, and some of them are just now

turning their thoughts to Émile de Girardin, editor of the *Voleur*, the *Presse*, the *France*, the *Petit Journal*, and heaven knows how many other newspapers. The year of his birth (upon which a stain rested) has been variously given, but his own statement is now generally accepted, though it made him out not so old as his enemies were wont to allege. The older biographical dictionaries would have him born in 1802, but Meyer sets down the birthday as June 22, 1806.

It well deserves record as an historic date for modern journalism, since Girardin may be said to have been almost the first to perceive the newspaper opportunity of cheapness multiplied by number. His earliest venture was frankly called the *Robber*, to show that it was made up of bits taken here and there from the existing daily press. To such a defiant origin do our latter-day epitomes of epitomes and digesters of the digested go back! Girardin next flung himself upon the issuing of cheap periodicals containing useful information for the masses. Here belong his *Journal des Connaissances Utiles* (1831), the *Musée des Familles* (1832), and the rest of the progeny. This suggests the corresponding work of the Chamberses and of William Knight in England. Spurred on by the success of these publications, sold at the then unheard-of price of about two cents a week, Girardin went on to his great experiments in cheap daily journalism. The *Presse* was born. Selling for half the price of other papers, it gave double the amount of printed matter. Cutting loose from the political subserviency and the cliquish support which marked the rival newspapers of the day, the *Presse* made politics play second fiddle, exalted the news features —above all, introduced the *feuilleton*. It also exceeded all others in the amount of advertisements. Furiously denounced by his competitors, one of whom, Armand Carrel of the *National*, he killed in a duel, Girardin yet pressed on to power and fortune. After the fall of Napoleon III. struck off the chains of the French press, his greatest opportunity came, and with the *Soleil* and the *Petit Journal* he achieved enormous circulations. Till the Dreyfus affair, the *Petit Journal* maintained its issue of 1,000,000 copies. Latterly, we are informed, it has somewhat declined, and the *Petit Parisien* has taken its place as the most widely read newspaper in France.

Girardin, however, was more than a journalistic sensation-monger. He had education. He had ideas. With the best intellectual life of France he was in close touch. His political convictions do not seem to have been constant. He was always ardent, always in the thick of the fighting, but it was sometimes doubtful on which side his blows would fall. Castelar reproached him for a certain vacillation, declaring that he was not "true to an ideal." He appears to have had that opportunism which is the temptation, while it is also in the very atmosphere, of the press, in an exaggerated form. He was both for and against Louis Napoleon. He was for monarchy and republic with equal zeal. This inconstancy lends an added grain of bitterness to his own melancholy reflection, at the end of his days: "The true name of the press is oblivion."

Still, if his light burned uncertainly, it was brilliant. The salons of his even more famous wife attracted the cleverest men and women in Paris. Sainte-Beuve has described the beautiful creature, Madame de Girardin, "thrown into that artist world with the literary stamp upon it, and with a certain sort of artificial air of journalism about it." Writing in the Figaro, Henry Roujon recalls a scene in the most troubled days of 1848. The witty, glancing Delphine was entertaining a roomful of poets, politicians, and ladies. Girardin had excused himself to go write one more savage article against Gen. Cavaignac. All the talk was of the perilous situation. "Who will get us out of it?" Madame Girardin lifted her hand towards heaven. "He who is above." "You mean God?" "Surely not; Émile." The latter was certainly a dashing figure. In that same 1848, his office was besieged by a furious mob, sworn to have his life. His friends were in terror. One of them went to beg him to slip out unobserved. "That is beyond my power. I said I would go at eight, and at eight I will go. You may stay and do me the honor of offering me your arm, if you like." Precisely at eight the two left the building. Passing through the first ranks of the crowd, his friend whispered in his ear: "They have not recognized you." "In that case," said Girardin aloud, "present me to these gentlemen." It was done. The mob applauded.

Girardin's appeal was frankly to the masses, but it was an intellectual appeal that he made. He believed in cheap newspapers, but not in cheap and nasty. Immense publicity was the breath of his nostrils; he boldly said that everything must be got before the people, and they left to judge of all; yet he was convinced that the energy of ideas would always overcome, in the end, both the wails of privilege and the clamors of ignorance. Hence, as Roujon asserts, we cannot afford to neglect a man who played with such sovereign power upon public opinion. "The manuals of literature may pass him by, but the history of the past century cannot be silent about him."

THE AMERICAN ORIENTAL SOCIETY AT NEW HAVEN.

NEW HAVEN, April 20, 1906.

The American Oriental Society's meeting here this year was in Easter week, but somewhat earlier in the week than usual, in order to allow those of its members who wished to attend the Franklin celebration to go to Philadelphia in time for the closing exercises there. The President of the Society, Dr. Gilman, was also the Society's delegate to this Bicentenary; and as his address formed the opening feature of the Oriental Meeting, the customary Thursday commencement was set back to Tuesday. Considering this set-back and the concurrence of the attractive celebration in Philadelphia, there was a generous supply of papers and a larger number of members present—forty-five in all—than was to have been expected. The proverbial bad weather of Quaker Meeting Week seemed to have been obviated by the change of time, and the Society had a very successful meeting in every way.

Dr. Gilman's able address was on Recent American Contributions to our Knowledge of the Orient, in which he reviewed briefly the literary and geographical work done in the last few years; the latest output of the press and of the out-of-doors explorer being impartially considered. At a later session the members passed by a rising vote a motion to express to Dr. Gilman their grateful appreciation of the zeal and devotion he has shown the Society as its president for thirteen years. Of the fifty-two papers presented, some were read by title only; the rest were read either in abstract or in full. Only the latter class can here be considered.

To begin with the Farther East, Dr. John C. Ferguson of Shanghai sent a communication likely to be of interest to a wider circle than that of professed Orientalists. The examination-system in China, by which officials used to be selected, was the subject of a paper read before the Society many years ago. Dr. Ferguson gave in his present paper the last judgment pronounced upon this system by the leading men of China. It was in the form of a Memorial presented to the Throne during the summer of 1905, together with the Imperial Edict of Sept. 2, by which this much lauded system was abolished. Both Memorial and Edict were translated in full by Dr. Ferguson, and will appear in the next volume of the Society's *Journal*. The Memorial was prepared by the Tartar General of Mukden, several viceroys, and the Governor of Hunan. It sets forth the necessity, "due to the need of national preservation," of abolishing at once the "eight-legged examination" and substituting therefor schools of lower and higher grades, after the model of Western countries. Gradual abolition as a basis of reform, the memorialists aver, would not be sufficiently effective, as it would take more than twenty years before "men of talent" could be made available. To summarize the chief points of this important document: China (it says) is ridiculed abroad on the ground that it is non-progressive; peace will soon be declared between Russia and Japan, when the affairs of China will be in a still more dangerous condition. Schools will put an end to superstition and belief in idle rumors. The people will become more intelligent and more patriotic. China will become wealthy and strong. The old examinations promoted men of no moral character and no general intelligence, while the people at large have remained unedu-

cated. Schools will result in better literature, higher civilization, greater respect abroad, and more peace at home. The new system will, however, not injure but further classical education, as well as encourage work in fresh fields left untouched by the old examination. Students should be sent to foreign normal schools to learn how to become teachers and found normal schools at home.

Other points touched upon by the memorialists are the relation of State service to the schools, the length of the course, preferment, etc. The Edict resulting from this Memorial recognizes the crisis which China is now passing through and the country's need of men of "talents and abilities," admits that a gradual change, such as that proposed in 1898, is not what is needed, and continues:

"We therefore command that, beginning from the Ping Wu (1906) Cycle, all competitive examination for literary degrees after the old style shall be henceforth abolished. . . . We also approve of the other suggestions. . . . We are certain that the official classes and gentry throughout the Empire, on learning of this, will enthusiastically set about to start as many schools as possible and thus give the blessings of modern education to every subject of the Throne."

In conclusion, directions for distributing text-books are given, and officials are urged to "make haste to establish primary schools in all towns, hamlets, and villages." This is probably the most thorough and radical change ever introduced into the educational system of any land. It completely reverses China's position, and, if carried out, will be of inestimable benefit to the country.

Papers of universal application were few in number, most of the scholars attending the meeting being specialists who were content to abide in the field of their peculiar labors. These fell in general into the two groups of Aryan, or Indo-Iranian, and Semitic studies. A few were sent by scholars physically unable to be present; among them the aged but ever-active Professor Mills, an American scholar long domiciled at Oxford, who frequently publishes a fresh text of the Yasnas, the sacred writings of the Zoroastrians, and contributed one of these on this occasion. Of the few papers presented of wider scope, Prof. Toy's "Decay of Totemism" was one to attract especial attention. It treated of the different causes, internal and external, leading to a decline in the stringency of totemic observances. Especially emphasized were the effects produced by the individual, as opposed to the clan, the establishment of *manitou* totems, the "honorific" totem, the widening of tribal relations and state organizations. Professor Toy spoke deprecatingly of the effort to prove that domestication of plants and animals arose from totemism, rightly claiming that the process represented by this theory, advocated by Jevons, inverts the order of events. Another paper of general ethnological interest was presented by Miss Margaretta Morris, who, in continuation of her studies of Borneo, recently published in the Society's *Journal*, offered an interesting description of Malay customs in an essay on "Race and Custom in the Malay Archipelago"; the inter-relation of custom and racial peculiarities being well brought out, to show that identical customs are not indicative of racial integrity. The special essays included Sanskrit, Persian, Semitic, Egyptian, and Chinese studies, mainly technical, though some might well be grouped as historical.

India was represented by several papers. A linguistic phenomenon found in all languages was shown by Prof. Lanman to have affected the reading of Vedic texts. As the surd at the end of the first word in the phrase "hoped (hōpt) to" may lead in English to an actual change of tense, when such a phrase is orally passed to a stenographer who hears it (owing to very careless enunciation) as "hope to," so in a Vedic text *tád dyám eti* is corrupted to *tád yám eti*, the missing verbal accent still indicating the loss of the consonant. The subject of Vedic corruption was also treated by Professor Bloomfield, who remarked on the Hindu notion that the holy Vedas were not to be tampered with, and contrasted with this view the opinion usually held by Western scholars, namely, that a senseless complex may legitimately be made to have a meaning if an emendation can effect this result. The Rig Veda has, of course, many passages which require emendation, and some Vedic examples were given to show how a little ingenuity may play the same part in this field of tradition as has been played by it in classic literature. Only a Brahman could object to this thesis, though doubtless it will be as impossible here as elsewhere to restrict the fanciful outflow of "emended" texts when Sanskrit scholars once begin to get busy with conjectures. As a general rule, ninety-nine emendations in a hundred convince only the ingenious emendator; but if a peck of eyes may be sacrificed to establish the correctness of one surgical operation, ninety-nine emendations may be cheerfully examined and rejected if only one passage stand out clarified.

Studies of various Sanskrit words were offered by Prof. Fay, and a special class, onomatopoetic words, was treated by Mr. J. H. Moore. Here, also, much is debatable ground, and a certain degree of probability is as much as one is likely to attain even with the greatest exercise of caution. Of historical value were the studies on the Jaiminīya Brāhmana by Prof. Oertel, the translation of the Dūtāngada, one of the Rāma cycle of plays of the thirteenth century, for the first time translated into English by Dr. Gray, and Mr. Haas's paper on the ten kinds of Sanskrit drama. Only one paper on Buddhism was presented. In this, Prof. Hopkins examined various texts to see how far the Buddhists originally went in objecting to meat as an article of food. Numerous passages from the Vinaya, Suttas, and Jātakas were cited to show that there was no rule against eating meat; the sin of injury and slaughter of animals not including the later sin of eating the flesh of an animal already killed, unless the killing took place especially to provide the eater with meat and with the latter's knowledge and consent. Present-day conditions in India were interestingly exhibited on a small scale by Miss Lucia Grieve, who brought with her the paraphernalia of a Brahman woman's domestic worship and showed the Society how the service was actually performed.

From Persia (or Russia) came a Baku temple-inscription, for the first time interpreted by Dr. Abbott of Bombay. Prof. Jackson, in his Indo-Iranian Notes, made a bridge connecting India and Persia, and presented as well a special paper on the Zoroastrians of Yezd, which was well illustrated by photographic views. Some Indo-European etymologies were suggested by Prof. Haupt, who thus again bridged the narrowing chasm between Aryan and Semite. It might, indeed, be said that in our Eastern possessions there was no longer a linguistic break of this sort, as Aryan and Semite mingle confusedly in the Philippine Islands. From this part of the world came the materials Dr. Blake has taken in charge in his Tagalog papers, "Contributions to Comparative Tagalog Grammar," and "Expression of Case by the Verb in Tagalog." Another paper by the same writer treated of the syntax of the noun in Semitic.

On the Semitic side the paper of most general interest was that of Professor Jastrow, on the question, Did the Babylonian temples have libraries? The result attained by an examination of the material at hand fails to support the view that general libraries were preserved in the temples. Another paper by Professor Jastrow, on Tabi-Utul-Bel, gave an extremely interesting parallel to the problem of human suffering as treated in Job. The writer was a King cured by prayer to the gods. In his sickness the priests of the four classes availed not. Only the gods themselves, he was at last convinced, could help him, and he sings their praises after the cure was effectual. Presumption, he seems to imply, was his sin—perhaps his own deification and exaltation of himself as a divinity. If this interpretation be correct, it would, in Professor Jastrow's opinion, point, as do other circumstances, to a great antiquity, for the deification of the King is found only in the earliest literature. Other interesting Semitic papers were those of Professor Lyon on female votaries in the days of Hammurabi, seal impressions on contracts, illustrated by slides, and abbreviated legal expressions. In regard to the first, Professor Lyon held that these "sisters of the gods" were not disreputable women, but vestal virgins. Professor Gottheil took up a more modern period, and gave an extremely attractive account of Muhammad Abdu, late Mufti of Egypt, who died last year at the age of fifty-five. Another paper of Dr. Gottheil discussed a distinguished family of Fatemide Cadis in the tenth century.

A description, by Professor Moore, of a so-called Egyptian ephod, previously supposed to be the prototype of the high priest's garment in the Old Testament, brought out the fact that the leather garment in question was not an ephod, was probably not Egyptian, and possibly was only a sham cuirass, worn by an officer of the court, somewhat as a court sword is worn. Professor Torrey illustrated the Semitic objection to disagreeable implications after the second personal pronoun. If one says, "He said you are (*i. e.*, I was) evil," the "you" must be avoided by a paraphrase, otherwise the hearer of the tale is injured. A paper by Prof. W. Max Mueller discussed the goddess of the Carthaginians. Other papers in this field were read by title or in brief abstract.

Several distinguished members of the Society, whose death during the last year was

announced by the Secretary, were commemorated in short addresses by those present at the meeting. Among those who had passed away were the venerable Jules Oppert, Friedrich von Spiegel, and President Harper. Over thirty new members were elected, an unusually large number. Professor Toy was elected president to succeed Dr. Gilman. On Wednesday the Society adjourned to meet again on April 4, 1907, in Philadelphia.

MEETING OF THE NATIONAL ACADEMY OF SCIENCES.

WASHINGTON, April 21, 1906.

Owing to the Franklin celebration at Philadelphia, the National Academy of Sciences held a session on Monday, April 16, the day before its annual statute meeting, and adjourned at the end of the following Wednesday. The papers may have been fewer than they would have been but for the exceptional circumstances of this year, yet they included four or five of capital importance. Of the sixteen communications, four related to Geology, Geognosy, and Palæontology, three to Zoölogy, one to Botany, two to General Physics, two to Heliography, one to Statistical Psychology, and one to Logic; while two were memoirs of deceased members, George P. Marsh and Admiral John Rodgers.

In respect to pertinence to the history of these days, the palm must be awarded to Major Dutton's proposed explanation of volcanic eruptions. It was more than thirty years ago that this savant submitted to the Academy evidences that the centres of volcanic actions have nothing to do with the supposed molten interior of the earth, but are, on the contrary, never more than five miles below the surface; and by the majority of students of the subject his argument has been accepted as substantial proof of this. There are some difficulties, it is true, of which the greatest has been that neither Major Dutton nor anybody else could specify any adequate cause for so enormous an evolution of heat in the upper crust of the earth. Stromboli, for example, certainly reminds one strongly of a geyser; and for many reasons it is generally believed that the more immediate cause of any volcanic eruption is the penetration of sea-water into some space where it is subjected to considerable heat and to tremendous pressure, and sets up some chemical action which suddenly liberates a titanic energy. It is very difficult to believe that sea water ever can penetrate to any considerable fraction of the radius of the spheroid of the earth, and yet it has hitherto seemed impossible to specify any probable cause for the heat requisite to kindle any great chemical action only a few miles underground. The discovery of radio-activity at once suggested the interrogation whether this might not be the cause sought. Major Dutton, in his new paper, shows that it might supply sufficient energy, not only for kindling a chemical action, but even for producing the eruption directly. It still remains to find evidence that it actually, or even that it probably, furnishes either the whole heat or the kindling heat that is required. Thus far, no known source of radium and no known product of radio-activity has been signalized in lavas or in the beds where volcanic action has its probable centre; nevertheless, there is no reason to deny the presence of radium there.

Our leading palæontologist, Prof. H. F. Osborn, read a paper by Mr. W. J. Sinclair upon the Bridger beds of Wyoming. We may mention that there is in Wyoming a basin, some two hundred and fifty miles in diameter, called the Green River Basin. Upon the floor of this there are various deposits, some of the lowest of which are known as the Bridger beds. One of the earliest operations of Clarence King's survey of the fortieth parallel was the examination of the Green River Basin. In those days microscopic petrography was not yet practised, and the parties were unsupplied with microscopes. Nevertheless, it was distinctly made out that some of the deposits in the basin were formed of débris from the erosion of the Uinta Mountains, while some other deposits were as clearly volcanic; but the provenance of the material of the Bridger beds was not ascertained. That they are largely lacustrine appeared clearly from the great numbers of fossil turtles and crocodiles found in them, and it was commonly assumed that they were composed of erosional matter. But Mr. Sinclair, in a most thorough search, could not discover the least bit of any. These beds, therefore, must be wholly volcanic, and Mr. Sinclair thinks it probable that the same conclusion may be extended to all the other Eocene basins of the Rocky Mountain region.

Professor Osborn also read a paper of his own upon the faunal and geological succession in Eocene and Oligocene basins of the Rocky Mountain region. He began by mentioning the prodigious multitude of fossils that had been collected, and the enormous amount of isolated study that had been made of the separate specimens. The time has now, he said, only just begun for putting the results together, and the present paper was understood to be merely preliminary to this further work. At the beginning of the geological age to which the paper refers, no ancestor of our present mammals was to be found on this continent, and some great change must have taken place by which these mammals were introduced. Last year, however, an armadillo was found at the bottom of the Bridger beds, and the White River basin affords a large number of new types derived from Europe.

The director of the Geological Survey, Dr. Charles D. Walcott, gave a résumé of the results obtained from the study of the collections of the Carnegie Institution expedition to China, under Messrs. Bailey Willis and Eliot Blackwelder. They brought home collections of fossils showing the faunas of the Middle Cambrian especially, but also of the Lower and of the lower part of the Upper Cambrian; the latter agreeing substantially with that of the upper Mississippi basin. The fauna of the Lower Cambrian was found to be of the same type as that of the Cambrian of the Salt Range of India, which is thus at last definitely placed. Furthermore, the fauna of the Middle Cambrian in China turns out to be altogether comparable to that of the Middle Cambrian of Mt. Stephen in British Columbia and of Utah and Nevada. And again, for the first time a species of cephalopod has been found in the Cambrian, four or five hundred feet below the top of the Cambrian limestones, and it agrees with the predictions of Hyatt, although the very simplest form which he expected has not yet been unearthed. Lantern illustrations were shown of 217 species, trilobites, brachiopods, gasteropods, and half a dozen other orders. The memoir was evidently regarded by the geologists as of unusual importance even among the works of Dr. Walcott.

The chief zoölogical paper was read by Dr. Agassiz with his inimitable hereditary charm of manner, in his own name and that of Dr. H. L. Clark. It related to the classification of certain sea-urchins called the *Cidaridæ*, of which the very same genera have subsisted from the Jurassic era down through all the ages of geological life even to this day. The spatial range of single forms is as remarkable as their duration. One form may extend from the shore to a depth of eleven or twelve hundred fathoms. The shore species are naturally more widely distributed than the deep species, because they are transported by tides and other currents. The material studied for this work of classification embraced select specimens and series of thirty-four of the sixty-four species found. The classifications hitherto proposed have rested too much upon single features, especially upon the shapes of the spines with which these creatures are covered or upon the tubercles which are only the beginnings of spines. They have, moreover, often resulted from the examination of single specimens of the different species. The consequence has been that Messrs. Agassiz and Clark would now and then find a single individual which, according to the definitions, belonged at once to two or three different genera. The new study, conducted with far fuller collections and (we may venture to say) with equally greater diligence, has brought out a classification that has none of the inconveniences of former attempts. In commenting upon this paper, the eminent naturalist and ethnologist, Dr. Edward S. Morse, in trenchant terms added the weight of his disapproval of the too common practice of basing not merely definitions of species, but even classifications, upon single characters.

A memoir on the life history of Pterophryne, by Dr. Theodore Gill, was read only by title, but perhaps we may hope to enjoy the perusal of it in the quarterly issue of the Smithsonian Collections. We were not entirely deprived of the pleasure of listening to Dr. Gill's refined and clear elocution, for he gave us a very curious account of a phenomenon found in the Sargasso Sea. It seems that this sea is full of small globular snarls of seaweed which are hollow and which contain fish-eggs. Now because these nests are so ubiquitous in that sea; and because by far the commonest of the fishes there is the so-called Sargasso fish, which is a sort of pediculate, the *Pterophryne histrio*; and further, because the eggs of these nests were believed to resemble eggs known to belong to fish allied to the Sargasso fish; and, still further, because the peculiar fins of this fish seemed adapted to building the nests, it has been unhesitatingly taken for granted by all naturalists, beginning with Louis Agassiz, who first described the balls of seaweed, and including Alexander Agassiz, who has collected and still pos-

sesses a number of them, that the eggs are those of the Sargasso fish. But Dr. Gill thinks this cannot be. Setting out from the assumption that the eggs are not fertilized before being deposited—such a phenomenon being quite unprecedented, except among ganoid fishes and their allies—he remarks that it seems quite impossible that they should be fertilized after they are thickly wrapped in the globe of seaweed. Therefore, we must suppose they were fertilized before being wrapped up. Then, because a hollow ball would be far more easily shaped by a creature inside it than by one which should be compelled to swim all over its convex surface in correcting its form, and also because the hypothesis comports better with what we know of the habits of fishes, he assumes that the ball is formed around the fertilized eggs by these eggs themselves, which are provided with long filaments that seem peculiarly fit for such work. Next, among all the fish that naturalists have remarked in the Sargasso Sea, the only one which is at all likely to have eggs like those of the nests are the *Exocetidæ*, or flying fishes, which abound round the borders of the rafts of seaweed; and Dr. Gill propounds the hypothesis that these, being surface-fishes, deposit the eggs just under the surface of the water, where they are incontinently fertilized, after which the eggs, by automatic motions of their filaments, wind themselves up in balls of seaweed. Mr. Agassiz, as was quite proper (for there is a system of advocacy even in science; only it is held in check by a genuine desire to learn the very truth), raised such objections as he could to Dr. Gill's hypothesis, urging that there were no flying-fish in the Sargasso Sea. But Dr. Gill, though he had never himself been in this unfrequented wilderness of the ocean, cited sundry authorities who named the flying-fish among the chief denizens of this region, next after the Sargasso fish itself; and among these authorities Alexander Agassiz was preëminent.

The truth perhaps is, that even exploring steamers avoid penetrating the great rafts of seaweed, that all about their borders flying fish abound, and whether there are or are not many of the nests in the middle parts of the great rafts is not known. The Sargasso Sea is a great whirlpool, as large as the United States, its centre is eleven feet lower than the surrounding sea-level, and it is in a region of calms. Consequently, it is a bad place for either a sailing vessel or for a steamer, whose screw might get all snarled up in seaweed, so as to be retarded, or stopped, or even broken.

Of the two papers on General Physics, one was by the world-renowned chemist, J. M. Crafts. It related to determinations of temperature between 100° and 350° C. After sketching the history of thermometry, beginning with an account of the Florence collection of thermometers supposed to have been made by Galileo, and coming down to the unrivalled thermometers of Baudin, *père et fils*, and to the new kinds of glass made by Schott of Jena, of which he mentioned one particular borosilicate of calcium and sodium as the most suitable for thermometers (noting by the way that glasses containing both sodium and potassium acted badly, showing not only a lag in their expansion, but, still more strangely, a lag in their expansibility), he mentioned that chemical thermometers always suffer a rise of their zero points, which sometimes amounts to twenty or more degrees of the Centigrade scale. Nevertheless, some physicists express their determinations of temperatures to thousandths of a degree, and Dr. Craft thinks that the errors can be brought within a hundredth of a degree. For that purpose, it is desirable to have as many liquids as possible, each capable of entire purification, freezing at a definite temperature, boiling at a constant temperature, and not undergoing spontaneous decomposition. Mercury and water are held to be two such substances. The only others that Dr. Crafts has been able to find are naphthalene and benzophenone. In order to use these, it is necessary to know their boiling-points under all pressures, or, what is the same thing, their vapor densities or tensions at all temperatures, or say at five-degree intervals from their freezing-points to the point of softening of glass. In the course of his own well-known researches, Dr. Crafts did this for himself. But methods have since been improved, and glass has been greatly improved, and it is more than desirable that the work should now be done by some bureau of standards. The other physical paper was by Professor Pupin, who, in a narrative of entrancing interest, carried us through the whole course of mathematical reasonings, of experiments, trials, and exercises, by which he finally attained success in getting his coils for cables made and adjusted without highly expert workmen.

The two papers on heliography were by the two chief masters of that subject, Hale the former, and Campbell the present, director of the Yerkes Observatory. Dr. Hale's spectro-heliograph has already been briefly explained in this journal, showing how he photographs the sun at different levels of its atmosphere. He has now mounted on Mt. Wilson, California, a five-foot spectro-heliograph, such as could of course never be carried on any equatorial telescope, and has obtained new and most surprising photographs, which were thrown upon the screen; but you could not afford the space for any description of them or of this most ingenious and superb instrument. The paper of Dr. Campbell, who availed himself of the collaboration of Dr. C. D. Perrine, related to observations of the solar corona by an exceedingly interesting and ingenious method, the description of which must likewise be postponed. One very interesting result is, that the matter of the fibres of the solar corona are at rest relatively to the sun, or at any rate have no motion greater than one kilometre per second.

Of the two remaining papers, one, by Professor Cattell, on the distribution of the thousand American Men of Science given in his just published volume bearing that title can hardly be said to have been read, so very brief was the time allotted for it. The other was a long paper by Mr. C. S. Peirce, on the Method of Existential Graphs, by means of which he showed that this system gives a sort of diagram of the mind in reasoning, and also that there is, strictly speaking, but one way in which the different logical elements of any concept or judgment are combined; namely, by each being indefinite or indeterminate in some respect in which another element renders it determinate.

Correspondence.

INTELLECTUAL ALLIANCE BETWEEN ITALY AND THE UNITED STATES.

To the Editor of The Nation:

Sir: I desire to inform the American public through your columns of a plan which, if put into effect, as we who are engaged in it are now encouraged confidently to hope, ought to have far-reaching consequences for good in the development of American culture. This plan contemplates nothing less than a formal intellectual alliance between Italy and the United States, the object of which shall be to bring the citizens of these countries into as close a relation as possible, more especially on the side of their higher intellectual life. It will be observed that the scheme is somewhat similar, though wider in scope, to that of the Alliance Française. It embraces five principal objects, to wit:

(1.) The exchange of popular lectures between Italy and the United States. Since the intention is to reach as wide a public as possible, some of the lectures in the United States would be in English, and some of those in Italy in Italian.

(2.) The establishment of Italian professorships in American universities and of American professorships in Italian universities. This would mean both permanent chairs in the higher institutions of each country and the temporary residence of Italian professors in America and of American professors in Italy. Since, of course, Italian studies are already recognized in America, and English studies in Italy, one of the chief ends to be secured by this arrangement would be instruction, for America in Italian literature in the Italian language, and for Italy in English literature in the English language. The interchange of professors would also enable the teachers of each country to study and profit by the educational methods of the other.

(3.) The establishment in every part of the United States of clubs for the cultivation of Italian literature and art. Besides literary and musical gatherings of a more popular nature, vacation studies of the sort already familiar to Americans from "Chautauqua" and similar organizations, and free Italian circulating libraries, this part of the enterprise would include the systematic study of the Italian language and literature by those who have leisure and inclination to take them up, thus giving paid employment to native Italian teachers.

(4.) The exchange of students between Italian and American universities in such wise as would enable a student of either country to pursue courses in the institutions of the other, which, when properly certificated, should be recognized by the faculties at home. It is also desired that younger students be sent from one country to the other, and find homes in private families. This plan has already been tried with success between various countries of

the Continent of Europe. Such exchange of younger students would be under the control of an international committee of ladies. Competitive scholarships would also be established for indigent and deserving students.

(5.) The establishment of an Italo-American literary review, to be printed chiefly in English, but also partly in Italian. This periodical would endeavor to promote the interests of the Alleanza Italo-Americana, and to keep all its members informed of the progress of the work. It would also aim to inform all English-speaking peoples in regard to the intellectual and material progress of modern Italy, and to increase among them the knowledge of Italian literature and art, both ancient and modern, by means of original articles and book reviews.

The prime mover in this enterprise is our countryman, Prof. Joseph Spencer Kennard, D.C.L., Litt.D., well known as a writer in both the English and Italian languages on subjects connected with Italian literary history. During a visit to Rome last December, he was received in audience by the King, who expressed warm interest in a project whose object is to bring his people into close social and intellectual relations with the United States. Nothing else, indeed, was to be expected from so enlightened a monarch as Victor Emanuel III. Dr. Kennard also had interviews with other gentlemen distinguished in literary, official, and educational circles, all of whom expressed their keen interest and promised their active assistance, which they have already begun to lend; while reports and articles in the daily press have elicited warm approval from the Italian public generally. Active negotiations are now in progress in both countries, and it is hoped that their successful conclusion can soon be announced.

H. Edmiston.

Rome, April 7, 1906.

LITERATURE VERSUS PHILOLOGY.

To the Editor of The Nation:

Sir: I sincerely wish that our college authorities could be induced to take to heart the excellent suggestions contained in your editorial on the "Teaching of Literature in Colleges." The scientific method, when applied to literature, is a miserable perversion of a principle that is excellent when employed in its place. Some years ago I was discussing with a university president the qualifications of a certain candidate for an instructorship in the French language and literature. One of his first questions was: "Has he made his Ph.D.?" My reply was: "No; but he has lived some years in France; has read French literature under several noted professors whose certificate of proficiency he holds, and speaks and writes the language with a correctness that is unusual with a foreigner. I consider him ten times better fitted for the work he would have to do than if he had made his Ph.D. by a dissertation on the vocabulary of Rabelais, or something similar, without having read anything else, without having set foot on French soil, and without being able to pronounce correctly three French words in succession." Recently I was called upon to look over some recommendations of a candidate for a professorship of English literature. They laid stress upon the fact that said candidate had spent some years in Berlin in the study of Anglo-Saxon, Middle English, etc. I said I would not give a bawbee for all this. Besides, I did not consider a German university the place in which to make preparation for teaching English literature.

I believe if we were to select the score of persons who are now doing most for the cause of English letters, either by way of production or elucidation, not one of them would be found qualified for the degree of Doctor of Philosophy. A taste for literature and the capacity to appreciate its beauties cannot be acquired by the minute study of a single author, especially if it be one of little merit, to the exclusion of all others. A distaste can. The Greeks knew better, as is evinced, among other things, by the custom of requiring boys to learn the Homeric Poems by heart. In the Alexandrian era, when the philological method came into vogue, literature had passed into a decline. The more these epigones dissected and analyzed the works of their predecessors, the worse became their own productions. There is no evidence that any of these grammarians and philologists produced anything worthy to be classed as literature. When some one upbraided George Buchanan for making a pedant of his royal pupil, he replied that it was the best he could do with him. In like manner, it is perhaps to be said in extenuation of these Alexandrian critics and their modern successors that they did, and are still doing, the best they can. That England and France have, during the last two centuries, contributed so much more to the sum of the world's literary product than Germany, is doubtless due in no small measure to the conditions that in those countries the philological or scientific method of studying the ancient classics never gained the upper hand to the extent it did beyond the Rhine. It is to be hoped and expected that when the young Americans who, in increasing numbers, are studying in France and England, shall make their influence felt in their native land, a more rational method of teaching literature, whether ancient or modern, will gradually come into vogue.

Athens, O., April 14, 1906.

ON NIETZSCHE TRANSLATIONS.

To the Editor of The Nation:

Sir: It is quite pathetic to watch the conscientious perseverance with which some of your correspondents are berating the English-reading public for its moral turpitude and intellectual degradation in steadfastly declining to buy certain translations of that distinguished immoralist, Nietzsche; and it has occurred to me that it is time something were said in behalf of the incriminated public.

In the first place, has the thought never suggested itself—if not to the translators, at least to the publishers—that the public may have perceived that these translations were *bad*, and even in one case (Zarathustra) almost grotesque?

In the second place, may not the public have detected that the author was *mad*, and have stupidly regarded this as a drawback to the serious study of his works? For the Anglo-Saxon world certainly does not seem to feel the reverential awe for the divine madness of genius which is common further East. And so far from letting brilliance atone for lack of sanity, it is positively terrified by the union of these qualities. It likes, moreover, to take its morals very seriously, and without corruption by epigrams. It prosaically judges Nietzsche to be nonsense, and does not see how suggestive and funny he is. Not that it does not like nonsense, but that Nietzsche's is not the kind of nonsense that it likes. It prefers Mrs. Eddy's 'Christian Science,' and Lear's nonsense rhymes, and Lewis Carroll. And yet I dare be sworn that none of these works, if translated into German, would take the public fancy.

The fact is that there are national differences of taste, and it is a mistake to make them into occasions for international recrimination. It is by no means safe, therefore, to anticipate the literary success of an English translation of a book which has been widely read in Germany or France. For example, Weininger's 'Sex and Character' contains apparently just the right mixture of craziness and contempt for woman with pseudo-philosophy to please the popular taste in Germany, where it has in consequence run through six editions. But I should not like to be financially interested in its success with English readers. Ninety-nine out of every hundred it will probably disgust and bore. The hundredth will perceive how screamingly funny it is, but will find it much too long. Not that Nietzsche is to be compared with Weininger. He was a great stylist, who worked wonders with the stiffest German idioms. But, for this very reason, he loses greatly even by a good translation.

It seems permissible, lastly, to doubt whether in the end all the more theatrical of Nietzsche's ideas, the "Superman," the "Blonde Wild Beast," and the "Slave Morality," etc., are not quite as nonsensical as they seem to the Anglo-Saxon philistine. The profound truth, on the other hand, contained in Nietzsche's conception of the "translation" of values, he probably does not perceive. But if he did, it would annoy him very much. For what could be more exasperating than to have to recognize that our stablest notions are forever undergoing transformation? In this the philistine is probably mistaken. But it is by no means clear that he is equally wrong in thinking that Nietzsche had best be read in German.

BEACHCOMBER.

To the Editor of The Nation:

Sir: In the *Nation* of April 5, your reviewer of Miss Laut's 'Vikings of the Pacific' takes exception to the author's use of "beachcomber" for a wave instead of a person. Permit me to call attention to the respectable support Miss Laut has in this use of the word. The Standard Dictionary defines beachcomber as "1. [U. S.] A long wave rolling up on the beach. 2. An idle or vicious vagrant about wharves and beaches at seaports." Substantially the

same definitions are given in Webster's International and the Century.

The word is occasionally heard in both senses in this region, especially on the shores of Puget Sound. The shores of the Sound and of the Pacific are frequently strewn with logs cut for lumber, shingle-bolts, and sawn lumber carried up and left by the tide. Dwellers along the beaches sometimes gather these and use them in constructing their houses, or tow them to neighboring mills and dispose of them. The act is called beachcombing, and the man who lives by it, especially if not over-nice about what he appropriates, is called a beachcomber. A long rolling wave that comes in and sweeps a beach clean of such deposits, either by carrying them high up on the beach or out again to the sea, is also sometimes called a beachcomber. The term used in this connection does not seem altogether unfitting. J. R. WILSON.

PORTLAND, ORE., April 14, 1906.

[The only authority for the use of "beachcomber" in the sense of 'breaker' is Bartlett, in his Dictionary of Americanisms. He gives no authority for his definition, and no citation from literature. Other dictionaries have merely copied Bartlett, without instances. Twenty years' intimate acquaintance with seamen, fishermen, sealers, and whalers on the Pacific has not afforded a single instance of its oral use, in that sense, to the reviewer. The use referred to by Mr. Wilson seems derivative from the use of the term in the sense of scraping or carrying away from the beach, applicable to the marine hobo, as previously indicated by the reviewer.—ED. NATION.]

A MISREPRESENTATION.

TO THE EDITOR OF THE NATION:

SIR: The New York Publishing Society (sometime the Century History Company and the Publishing Society of Wisconsin) has recently issued a work in four volumes entitled 'Wisconsin in Three Centuries.' I have not yet seen the publication in its entirety, but am credibly informed that I am blazoned on the title-page thereof as being "chairman" of its "board of editors." My sole connection with this enterprise is the fact that I wrote the brief introduction, purely as a matter of friendly courtesy to the author, Mr. Henry Colin Campbell, managing editor of the Milwaukee *Journal*, he having shown me the proof of his first volume, and his monographic work in connection with the Parkman Club publications being well and favorably known to me. This act of courtesy did not make me an "editor" of the work, much less the chairman of any so-called "board of editors" thereof. My several vigorous protests to the publishers against this unwarranted use of my name have proved unavailing, and all that appears possible now to do is to request my fellow-librarians not to catalogue the work under my name. Whatever merits or demerits it may possess, should in justice be attributed wholly to Mr. Campbell, who, I am glad to be able to say, appears to have been in no way responsible for the peculiar advertising methods of his publishers. Librarians would confer a still further service by pasting a clipping of this disavowal within the work itself, so that investigators may be informed as to the facts in the case.

REUBEN G. THWAITES.

MADISON, WIS., April 18, 1906.

A REJOINDER.

TO THE EDITOR OF THE NATION:

SIR: In your issue of April 5, you print a letter from Prof. F. H. Dixon, of Dartmouth College, which states that Prof. H. R. Meyer, "under cover of an apparent erudition, is quite superficial, and that he is in many places guilty either of deliberate misrepresentation or of inexcusable ignorance." That statement Professor Dixon makes on the strength of a review of 'Government Regulation of Railway Rates,' written by Privy Councilor v. d. Leyen, who since 1880 has been an officer in the Prussian Ministry of Public Works.

I shall not ask you to allow me to use your newspaper for the purpose of replying to gentlemen who charge me with dishonesty and charlatanry but refrain completely from seeking to overthrow the propositions set forth in 'Government Regulation of Railway Rates.' In justice, not to myself, but to the public policy which I advocate, I shall, however, ask you to publish this letter, which shall close with the statement that in the *Journal of Political Economy* for April, 1906, issued by the University of Chicago, I shall reply at length to the criticisms upon 'Government Regulation of Railway Rates.'

I am, your obedient servant,

HUGO R. MEYER.

DENVER, April 19, 1906.

SANCTA SIMPLICITAS.

TO THE EDITOR OF THE NATION:

SIR: The Simplified Spelling Board does not advocate any scheme of "fonetic reform," nor does it desire any radical change of any kind. It believes in Sainte-Beuve's suggestion that "orthography is like society: it will never be entirely reformed, but we can at least make it less vicious." Therefore the Board wishes, first of all, to awaken attention to the unfortunate condition of our spelling; and, second, to encourage the tendency toward simplification by the omission of useless letters —a tendency which has been at work from the beginning, and which has made it possible for the *Nation* now to spell *honor, wagon, music, almanac, comedy,* and *fantasy,* instead of *honour, waggon, musicke, almanack, comœdy, phantasie.* The Board would like also to restore certain older spellings, which are better than the later perverted forms—*rime,* for example, and *sovran* and *iland.*

A fuller statement of its aims can be had by sending a postal card of inquiry to the Simplified Spelling Board, No. 1 Madison Avenue, New York.

BRANDER MATTHEWS.

COLUMBIA UNIVERSITY, April 21, 1906.

Notes.

Houghton, Mifflin & Co. announce 'Science and Idealism,' by Prof. Hugo Münsterberg of Harvard.

'Notes on the History and Political Institutions of the Old World,' by Edward Preissig, will shortly be issued by G. P. Putnam's Sons.

A work in five volumes, illustrated by photogravure, entitled 'America and her Insular Possessions,' by Joel Cook and C. H. Forbes-Lindsay, is in the press of the John C. Winston Co., Philadelphia.

Perennial charm of subject combined with literary skill has kept 'A Memoir of Jane Austen,' by her nephew, J. E. Austen Leigh, in steady request since its original appearance in 1869. Meanwhile it has been enlarged, particularly by some inedited tales and fragments of tales, and deserves a place beside the novelist's complete works. The present 16mo edition, in Macmillan's "Eversley Series," is all that could be desired for beauty and handiness.

The edition of Beaumont and Fletcher, in the series of "Cambridge English Classics" (Macmillan Co.), which was begun by Mr. Arnold Glover and is now, since his death, being continued by Mr. A. R. Waller, does not seem to us to possess any advantage over the Variorum edition which is appearing under the general direction of Mr. A. H. Bullen, except that of greater cheapness. It is more limited in scope, being practically a reprint of the Second Folio (1679), without explanatory notes or discussion of sources, etc. It seems a pity that two editions of these plays should be issued concurrently, but, if such was to be the case, the edition which is published under the auspices of the University of Cambridge and which was apparently planned to satisfy the requirements of professional scholars, might surely have been better arranged to attain that object. Why should the editors elect to give us the text of the Second Folio invariably, even in the case of plays of which contemporary Quartos exist? To be sure, the variant readings of the Quartos are recorded at the end of the volume, but a proper editorial method would seem to demand that the readings of this Second Folio, published many years after the authors' deaths by men who had no access to the original manuscripts, should be relegated to this place. For the same reason, moreover, we see no advantage in adhering slavishly to the punctuation of this Folio when the result is so often irritating, as it is in our editors' printed text. Even if we ascribe a sacredness to the blunders of the chance compositor who set up the text, the editor is at liberty to punctuate correctly and then record the blunder in a note. The Early English Text Society, in its handling of mediæval texts, has always been considered justly a model of conservatism in these minor matters of the law, but the editors of the Cambridge English Classics, dealing with periods in which such things are manifestly of secondary importance, threaten far to outdo that society. The first volume of the present edition bears date 1905; two more volumes have been promised for the present month.

It is difficult for the American teacher to imagine to himself exactly the class of

pupils who would profit by Mr. Percy Simpson's 'Scenes from Old Playbooks' (Oxford: Clarendon Press; New York: H. Frowde). In the main the book is made up of familiar extracts from Shakspere's plays—for instance, the quarrel scene between Brutus and Cassius in "Julius Cæsar." Added to these, however, we have a few selections from plays dealing (nearly all) with British history by Marlowe, Ford, and others. Mr. Simpson says that "the book has been edited solely with an eye to young readers." We believe, however, that teachers are hardly likely to depart from the prevailing practice of confining the reading in the Elizabethan drama of pupils at this stage of preparation to the plays of Shakspere, and, moreover, that they will continue to find it more profitable to read with their classes single plays in something like their entirety rather than brief, disconnected extracts such as we have here. It seems to us, indeed, a pity that the Delegates of the Clarendon Press should lend the influence of their authority to such a work as this. The introduction contains an adequate account of the English theatre in Shakspere's day, and the book concludes with a glossary and index of names.

The vexed question of why we are ourselves, or at least wherein we resemble and wherein we differ from other people, is discussed, under the guise of 'The Principles of Heredity,' by G. A. Reid, M.B., etc. (E. P. Dutton & Co.). Physiology, psychology, ontology itself, are pressed into the service in a way better appreciated by the medical philosopher than by the casual reader. It is held that "all the inborn characters of an individual take origin in the germ-plasm whence he sprang" (p. 61), and these characteristics, sometimes separated by thousands of generations, lie ready to be evolved according to conditions. Reversion is held to be an arrest of development, and as a rule "every variation is unstable in proportion to its newness," which is discouraging for Mr. Burbank's plant-breeding. Acquirements are supposed not to be transmissible, and as a concrete example there is denial of inherited gout, just as the mutilated tails of terriers fail to initiate tailless dogs. "The drink-craving," to use another instance, "is an acquirement, and as such is never inherited. But the inborn tendency to acquire it is certainly inborn and inherited" (p. 345). "Conditions adverse to the individual do not tend to cause racial deterioration, beneficial conditions do." "Country blood does not strengthen city blood. It weakens it, for it has been less thoroughly purged of weak elements" (pp. 336-7). These apparent paradoxes depend for their explanation upon the force of "acquirement" and of "habituation." If true at all, the reasoning is in advance of our general knowledge.

Among recent editions of law books which have stood the test of some years' use, we have received the second edition of William Wirt Howe's 'Studies in the Civil Law,' a third edition of John Wilder May's 'Law of Crimes,' edited by Harry Augustus Bigelow, and a second edition of George F. Tucker's 'Manual of Mercantile and Manufacturing Corporations' (Boston: Little, Brown & Co.).

'The American Law Relating to Income and Principal,' by Edwin A. Howes, jr., (Little, Brown & Co.), is the title of an excellent little manual on a subject full of difficulty for lawyers and trustees. Bonds, bought at a premium, are held in trust for life-tenant and remainderman; must the trustees create a sinking fund to replace the depreciation in face-value if the bonds are held until maturity? A corporation makes an extra dividend in cash to the trustees; does it belong to principal or income? Is the rule the same in the case of a stock dividend? To whom do "rights" belong? These and other questions like them have occupied the attention of the courts of this country a great deal during the past thirty or forty years. and are, of course, discussed in books on Trusts and Trustees, and Executors and Administrators. But they require treatment in considerable detail, and with very careful discrimination between the conflicting rules laid down in different jurisdictions. Mr. Howes has done this compactly and clearly, and his hand-book will be found very useful.

Lemcke & Buechner send us a new one-volume 'Deutschland' in the Baedeker German series. For the convenience of tourists working on broad lines, whether automobilists or others, and not wishing to be cumbered with detail, it has been carefully made up from the five handbooks into which the original 'Deutschland' of 1842 has by degrees expanded. It is rich in maps which are fairly available for the highroad. The publishers show how it can be dismembered for the various sections.

From the same house comes a vastly useful and convenient addition to the "Manueli Hoepli" of Milan, 'Cronologia e Calendario Perpetuo,' by A. (Adriano?) Capelli. It has no table of contents, and this we will try to supply as a sufficient recommendation of so great a labor. In order, then, we have (1) the chronological series of Roman consuls; (2) parallel chronological tables of the Christian era to 2000 A.D., the Byzantine and Spanish eras, with Easter date for each year, keeping step with the successive Roman emperors and their modern Continental successors (France, Germany, Italy), and Popes; (3) Easter recurrences in the Julian calendar from 1583 to 2000; (4) Index to the emperors and kings recorded in (2), with their ruling dates; (5) ancient Roman calendar; (6) perpetual Julian and Gregorian calendar, each double-page table furnishing the type for all the years indicated above, introduced by the same Easter date; (7) glossary of the principal feast days; (8) alphabetical list of the chief saints and *beati*; (9) wanting; (10) the hegira, paralleled by our Christian reckoning; (11) era of the French Republic; (12) chronological table of the principal European sovereigns under geographical alphabetical arrangement—a very important section for ready reference (thus, one may see at a glance all the presidents of the Swiss Confederacy, with their dates). The typography of this little volume is excellent, and the figures clear.

The April Pilot Chart of the North Atlantic, sent out by the Hydrographic Office, is of more than general interest. Suggestions for the use of oil at sea during storms, to prevent the breaking of heavy seas over the deck, are brief and to the point, and are illustrated by many diagrams. Rules of practical application are taken from the prize essay submitted to the Hamburg Nautical Union by Capt. R. Karlowa of the Hamburg-American Steamship Company. By means of arrows and flowing lines, drawn in connection with a ship's hull, to show the direction of wind and sea and spreading oil, most contingencies seem to be provided for, such as "scudding before a gale," "steaming into a heavy head sea," "hove to for a pilot," "drifting in the trough," and the like. In each case the method and place of emitting the oil to best advantage are indicated. It is mentioned, too, that other uses of oil are beneficial, as in lowering and hoisting boats, riding to a sea anchor, and crossing surf on a bar. Raw petroleum gives better results than the refined product, and thick, heavy oils are best, animal or vegetable being generally preferable to mineral; but as cocoanut and certain kinds of fish oils congeal in cold weather, they are not available for this use. Quotations from the masters of numerous steamers and sailing craft employing this means of calming rough seas show an overwhelming array of testimony to its efficacy. The amount of oil required seems to vary from half a gallon per hour to about two gallons and over, though one (only) vessel reports using as much as three gallons.

Very impressive is the second instalment of titles of genealogies in preparation given in the *New England Historical and Genealogical Register* for April, with a third to follow. At page 211, the Society's Committee on English Research invites support for a revival of investigation concerning the English ancestry of the pioneers of New England, which has pretty much lapsed since Mr. Waters's retirement. "Clues, not generally known, as to the origin of several early emigrants, have come into the committee's hands," and the secretary, Mr. Joseph Gardner Bartlett, "will be glad to give information to any one who may desire to make investigations."

The Semitic origin and great antiquity of the Rhodesian ruins are denied by Mr. D. R. MacIver in a paper read before the Royal Geographical Society and published, together with the lengthy discussion upon it, in the *Geographical Journal* for April. From personal examination of seven sites, including the Great Zimbabwe, he comes to the conclusion that the ruins belong to one period, mediæval and post-mediæval, and were constructed by a negroid race closely akin to the present dwellers in the country. The majority of speakers at the Society's meeting, mostly experts, disagreed with these conclusions, which were stated with great positiveness and scant courtesy for those who held the commonly-accepted views. The great interest in the subject which was aroused by the paper, and the discussion, may lead to the organization of a Rhodesian Exploration Fund for the scientific investigation of the ruins. If to this work could be joined the examination of the ruins in Arabia, facts of great ethnological and historical value might be brought to light. A journey through the almost unknown interior of Newfoundland, the second made by a white man from the south to the east coast, is described by Mr. J. G. Millais. The director of the New Zealand Geological Survey, Mr. J. M. Bell, gives

an account of the present condition of the great Tarawera volcanic rift, which is illustrated by some interesting pictures of geysers in action. Dr. Seligmann concludes his narrative of the recent anthropo-geographical investigations in British New Guinea. Its interest, when read before the Society, was greatly increased by biographic films of native life, and the suggestion was made that other travellers be urged to use them as advantageous to the study of anthropology.

The principal articles in *Petermann's Mitteilungen*, No. 2, are the conclusion of Dr. Steinmann's account of his expedition in Bolivia, with a table of the heights determined; and a description of the thermic anomalies of the earth's surface, illustrated by twelve monthly charts, by Dr. F. Hopfner. This writer sums them up in the general statement that the southern hemisphere has a definite summer aspect —the land is too warm, the sea too cold— while the northern hemisphere exhibits a tendency to wintry conditions. A similar distinction is to be observed between the eastern and western hemispheres—the one having a mean October, the other an April, climate. An appeal is made by R. Tronnier for facts in regard to changes in the earth's surface. As an illustration of what he desires, he gives instances of changes in 1905, as the disappearance of islands, fall of coast cliffs, avalanches of earth; and man's work, *e. g.*, the removal of a hill in Germany by a railroad company. L. Mylius-Erichsen gives a sketch of what he hopes to accomplish in his "Denmark" expedition to the north coast of Greenland. It will consist of twenty-six men, including three natives of Greenland, six Iceland ponies, and one hundred dogs, and is to start from Copenhagen at the end of next June, and to return at the end of September, 1908.

A Tartar *Times*, a semi-weekly newspaper, published in Orenburg, Russia, and having a circulation in the southern part of that country and in Asia as far as eastern Turkestan, is a fact almost startling to those to whom the word Tartar simply suggests a raiding nomad. Its editor, says Arminius Vámbéry, in a communication to the London *Times*, is a highly educated Tartar gentleman, Mohammed Fatih by name, whose aim is to win over his countrymen to modern civilization and to prepare them for liberty and constitutional rights. It is not the only Tartar newspaper published in Russia, but it is the most southern, and its Asiatic circulation leads Vámbéry to think that it may be the forerunner of a Sarts *Times* to be published in Tashkend.

Shakspere's popularity in Germany, both on the stage and in the universities, is worthy of notice. Professor Schick of Munich, in a recent lecture in London, said that, in 1905, Shakspere's plays were given in 146 theatres, thus surpassing the performances of the works of any other dramatist, the next in order being Wagner, Schiller, Goethe, and Mozart. In Munich there were one or more performances every week, and in some places there were special Shakspere stages. The study of his works has been greatly stimulated by the marked increase in the students of the English language during the past ten years. In the University of Munich there are now six professors of Shakspere, each lecturing from different standpoints, and the Shaksperian lectures draw the largest audiences. In view of these facts, it is not difficult to accept Professor Schick's assertion that no poet of any nation, not excepting Homer, had ever influenced another nation so much as Shakspere had influenced the Germans.

The organization of a Leopold von Ranke Verein has been effected, the purpose being to establish a Ranke Museum in the house in Wiehe where the great historian was born. Publishers and representatives of the universities, and historians from various sections in Germany, constitute the committee of arrangements, Dr. von Boetticher being the chairman. An appeal recently published for Ranke articles suitable for such a museum has brought out an unexpected abundance of material.

The Cultus Ministerium of Bavaria has arranged, in conjunction with that of Hesse, for an archæological object-lesson journey for gymnasium teachers, to be carried out during the Easter recess. The first part of the programme consists of an examination and study of the archæological collections of the University of Würzburg, the superintendent of which, Prof. Paul Wolters, will act as instructor. From here the participants go to Aschaffenburg, to the *Limes* in Odenwald, and then to Erbach, and perhaps by way of Heidelberg to Speyer and its rich museum. The expedition will reach its conclusion in Mainz with study in the Roman and Germanic Museum, where Professor Dragendorf, of the Archæological Institute of Frankfort, will act as instructor, devoting special attention to the ceramic finds of the Roman period. The Speyer Museum, because of its proximity to Rheinzabern, where the greatest Roman pottery north of the Alps was stationed, is especially rich in material for these researches.

As decided upon at the Fourteenth Congress, which was held at Stuttgart, in August, 1904, the Fifteenth Congress of Americanists will be held at Quebec this year under the patronage of the Governor-General of Canada. Dr. Robert Bell, Director of the Geological Survey of Canada, is President of the Committee of Organization; Dr. N. E. Dionne, Librarian of the Legislative Assembly of Quebec, is the General Secretary; and Mr. Alphonse Gagnon, of the Department of Public Works, Quebec, is the Treasurer. The meeting of the Congress will take place in the Legislative Building at Quebec; and the session will be opened on Monday, the 10th, and continue to Saturday, the 15th, of September. The work will have reference to (a) the native races of America, their origin, geographical distribution, history, physical and mental characteristics, languages, civilization, mythology, religions, and habits; (b) the indigenous monuments and archæology of America; (c) the history of the discovery and European occupancy of the New World. There will be social entertainments of the kind customary in connection with similar gatherings; and it is probable that at the close of the session an excursion to Lake St. John, including a visit to a camp of Montagnais Indians of the region, will be organized. Among the promoters of the coming Congress are Prof. A. F. Chamberlain, of Worcester, Mass., and Dr. Franz Boas, New York. In accordance with previous usage, the accepted languages will be French, English, German, Spanish, and Italian.

The International Congress for the Historical Sciences, which was to meet during the present year, will not convene until the summer of 1908, and then in Berlin. The programme is to be sent out during the coming year. This will be the fourth united convention of the representatives of historical research from all civilized lands. Its significance is signalized by the fact that the committee of arrangements consists of three of the most famous specialists in this line in Germany, namely, Dr. Reinhold Koser, the director-in-chief of the Prussian Archives, and the two famous Berlin University professors, Ulrich von Wilamowitz-Moellendorff and Eduard Meyer.

A mining engineer writes to us from Nevada: "In your review of Prof. Shaler's 'Man and Earth,' you state that the accessible coal deposits of the world have a life of 300 years. This is an absurdly low estimate. The coal fields of eastern Shansi are soon to be accessible through the railways of the Pekin Syndicate. This is an anthracite coalfield containing some 600,000,000,000 tons of coal, or enough for the world's supply for 700 years. In western Shansi there is a larger field of bituminous coal, and there are enormous deposits in Honan and in Kansu, all of which will be accessible long before the 300 years has passed."

—The latest volume of the Transactions of the Royal Historical Society contains a paper upon "English Ships in the Reign of James I.," communicated by Mr. R. G. Marsden, whose two volumes of 'Select Pleas in the Court of Admiralty' were published by the Selden Society. The paper in question should be noted by those who are in quest of details as to the early colonial period of American history, for, hidden away among the seldom examined records of the High Court of Admiralty, are statements made by persons who actually visited the colonies in their infantile state. No doubt, to any but enthusiasts, it would be dry work to pore over such documents as "Libels, Examinations, Acts, Warrant Books, Miscellanea, Oyer and Terminer, Interrogatories, and Exemplifications," which form the records of court. But sometimes one is well rewarded. Thus, in connection with the *Discovery* (or *Hopewell*, or *Good Hope*), which was Hudson's ship on his last voyage, and in which Baffin also sailed, Mr. Marsden tells us that particulars of the trial, on January 25, 1611, of some of the crew for the murder of Hudson, will be found in *Examination* 42. Mr. Marsden has discovered no documents relating to the voyage of the Pilgrims, in 1620, in the *Mayflower*, but he gives several references to documents containing facts about that vessel from 1609 to 1624, or perhaps 1626. He has encountered many references to the *Susan Constant*, or *Susan Constance;* but, sad to say, he gives no details. Was not this the flagship of Capt. Newport's little squadron, which, in 1607, carried the first settlers to Jamestown? There are papers telling of a charge of piracy against the *Trial*, bound to Virginia, in 1607; of the *Gift of God* sent forth by Sir John Popham to Virginia, in 1608; and the *Garland*, lost at Bermuda on a voy-

age to Virginia, in 1619. In this last case, among the papers are the commission to William Wye, her master, and a letter from the Virginia Company to Sir George Yardley. A claim for wages by two of the crew of the *Little James*, which relieved the Plymouth Colony in 1623, discloses a letter of William Bradford and Isaac Allerton. Of the *Destiny*, Sir Walter Raleigh's ship on his last voyage to Guiana, the records of the High Court of Admiralty have much to tell. Mr. Marsden notes that this vessel was taken into the Royal Navy, when her name was changed to the *Converse* or *Convertine*.

—'Americans of 1776' (Dodd, Mead & Co.) is an elaboration of the lectures delivered by Mr. James Schouler at the Johns Hopkins University during the years 1901-1905. They form a study of the life and manners of the Revolutionary period, based on an examination of newspapers, magazines, pamphlets, letters, and diaries. Crime and Disorders; Births, Marriages, and Deaths; The Casualties of Life; Dress and Diet; Philanthropy and Disease; Religious Influences, are some of the chapter-titles. Detailed facts in abundance are presented, loosely strung together by rather obvious comments. The separate chapters bear little or no necessary relation to each other, each one being measurably complete in itself. The author, indeed, makes no claim to originality of treatment, and if there is from first to last no observation of a profound or illuminating character, we have observed few misleading or erroneous statements. If the colonial assemblies vied with each other in "voting heroic statues to George III." (p. 7) for the repeal of the Stamp Act, they were less ready to indemnify the sufferers from the Stamp-Act riots. The laws for the relief of debtors were due quite as much, perhaps, to the financial stringency resulting from the Sugar Act as to growing humanitarianism (p. 30). There was in New York, after all, only one estate forty miles square (p. 49), and that one was not originally granted by the English Crown. The tavern where Washington said farewell to his officers is better known as Fraunces', the name which it bore at that time (p. 78). The self-denial of the colonists in refusing to drink the East India Company's tea was not excessive, since there remained the Holland tea (p. 100). The New York liberty pole was cut down by the soldiers in January, 1770 (p. 266). If New York "broke down" in 1770 under the burden of the Non-Importation agreement, it was precisely because New York was the only colony which enforced that agreement with sufficient strictness to make it a burden (p. 101).

—'Mary Stuart,' by Florence A. Maccunn (Dutton), is a book which comes into the world without a second title, without a preface, and without any need of an apology. Moreover, in making this statement, we speak as a rather jaded reader of Marian literature. What we have enjoyed specially in the volume is its directness. Among a host of technical and controversial monographs, it stands out a simple, lively narrative of the remarkable adventures through which Mary Stuart passed. No amount of argument about the Kirk o' Field or the Casket Letters can excite the same interest which is elicited by a well-told story of the authentic incidents in that strange career. Most writers on this subject are so preoccupied with their own theories upon doubtful points that they make their books mere pieces of dialectic. The first volume of Dr. Hay Fleming's *magnum opus* has recently been styled by another expert in Marian questions "a notable example of biographic spadework." Doubtless spadework must be done, but at times it is really delightful to turn from researches conducted by the historical detective to the broad facts about which there can be no disputes. Miss Maccunn believes that Mary was in the plot against Darnley, sees clearly enough how infatuated she became over Bothwell, and does not forget her lack of humanity towards Bothwell's wife. Of the three main strains which met in her—Stuart, Guise, and Tudor—the last is held responsible for the sensual impulse which once at least got the better of her clearheadedness, her conscience, and her abundant good nature. But when all the worst has been said, there remain for our author the natural kindliness of disposition, the queenly instincts, the unstinted generosity, the charm of manner, and the willingness to sacrifice herself though she sacrificed others. The essential crudeness and vulgarity of Bothwell, the shiftiness of the Lord James, the cowardice of Maitland, and the rapacity of the ordinary Scottish noble are always the foils which serve to place Mary's finer qualities in high relief, and the contrast is cleverly indicated in these pages. Knox and the Presbyterian conscience come in for a certain amount of attention, and while the *dramatis personæ* belong to court circles rather than to the bourgeoisie, Miss Maccunn reaches the chief fact in the history of the reign when she says: "The bulk of serious burghers and their wives listened week after week with sour satisfaction to Knox denouncing from the pulpit her 'dancing and skipping' and the 'stinking pride' of her 'targetted tails.' For Mary, full of ambitions—Spanish marriage, English succession—or possessed by her more fatal dream of love and happiness, these sober-suited people hardly existed; yet they and their crude, sincere instinct of conduct proved to be the unregarded stone which, falling on her, was to grind her to powder."

—M. George Moreau, whose verdict on America ('L'Envers des États-Unis') comes to us from the Plon-Nourrit press of Paris, sees but a gloomy outlook for the future. Not believing in the settlement of so important a question "entre la poire et le fromage," as the manner of some is, he has taken time and pains to go to the bottom of things—deeply enough, in fact, to unearth some matters of which we on this side were ignorant, such as the arrival of William Penn on the *Mayflower*, the invincible horror for colored people in the Northern States, and the favorable eye with which the Southern districts regard marriage between whites and mulattoes, thus opening the door to an amalgamation which threatens a dangerous weakening of American energy. Then, too, a very great majority of American women are addicted to excessive indulgence in alcoholic drinks. This is all bad enough, but we are essentially a nation of mere bluffers anyhow, materially successful so far, it must be admitted, but desperately ignorant and hypocritically feigning an interest in art, music, and all that sort of stuff, merely to keep up appearances. But the handwriting is already on the wall. With the evils always inherent in increasing density of population, added to degeneracy from race mixture and alcoholism, will come strifes and bickerings over conflicting local interests; large States here and there will gather their smaller neighbors around them in warring groups, the tie that now binds will be broken, and Europe (has M. Moreau been reading Tacitus?) will look on with a sigh of relief as her enemy works its own ruin. Have we possibly a key to our critic's almost unbroken pessimism in his statement that "en général la cuisine est détestable"? A man with a pain to nurse on that score must have exceptional self-control to take an accurate and wholesome view of other things. Any well-informed American could have pointed out to him many very serious faults which he seems not to have noticed at all, as well as a few items on the opposite side of the balance-sheet.

—From the same press we get a healthful corrective to M. Moreau's acidity in 'Impressions d'une Française en Amérique,' by Mlle. Thérèse Vianzone, who spent some months on this side the water in 1903-1904, lecturing before various schools and other organizations and studying certain phases of American life, chiefly in our large cities east of the Alleghanies, with a short trip to Chicago and a few weeks in Toronto and Montreal. Mlle. Vianzone's previous acquaintance, gained in European diplomatic circles largely, was such as to bring her here with exceptional opportunities for seeing certain of the more attractive features of American life. Naturally, this gave a more roseate color to her visit than would otherwise have been possible. She is too wise to take a partial view as sufficient basis for dogmatic judgment upon the whole, however, and that is just the difference between her and M. Moreau. Her general impression is that a nation having in itself such powerful agencies for good as she discovered, has no adquate reason to despair of its future. She goes into scores of American homes, and finds there mothers thoroughly devoted to their children, guiding them intelligently into the development of responsible and self-respecting manhood and womanhood; she meets everywhere young women of great wealth and high social position forgetful of self and devoting means and energy unostentatiously to the good of others. Is not the frivolous, characterless woman here too? Yes, but not as a characteristic American institution. Europe knew her before America was discovered, and knows her still. The separation of colored people from white, which the Frenchwoman saw on a trip to Mount Vernon by car, calls forth the cry, "O égalité!" The day before, she had found herself the only white person in a car well filled with negroes, and had felt no concern whatever. At Boston she had the privilege of forming a close acquaintance with Mrs. Julia Ward Howe, and was very deeply impressed with the personality and achievements of the veteran reformer. A fine photograph of Mrs. Howe graces the book, with others of Cardinal Gibbons, Secretary Bonaparte,

the President and his family, and Sir Wilfrid Laurier. The orthography of English words and phrases used in quotation has given some trouble (brikchurch, Harward, the for hundred, John Hopkins, Peobody, etc.), and the service of some proofreader capable of correcting such blemishes should have been called in.

SOUTHERN HISTORY IN TWO STYLES.

The Brothers' War. By John C. Reed. Boston: Little, Brown & Co. 1905.

Civil War and Reconstruction in Alabama. By Walter L. Fleming, Ph.D. The Columbia University Press (Macmillan Co.). 1905.

"Bebra," quoth the Quaker, "everybody is queer except thee and me, and thee is a little queer." The ante-bellum South seems less queer to us since reading 'The Brothers' War,' in which Mr. Reed expounds some wise theories and makes many philosophical observations. His antecedents add interest to his opinions. From incidental remarks in the book we learn that he was born about seventy years ago in northeastern Georgia, the son of a Presbyterian clergyman who owned less than a score of slaves; that he was educated at Princeton, and had been practising law a few years when Lincoln was elected; that then secession seemed to him to be the only patriotic course, and that he engaged in the first battle of Bull Run, and continued to hazard everything until he surrendered at Appomattox. Since 1865 he has pursued his profession, first in his native county, and latterly in Atlanta. Hence he knew the old order of things, and works and writes as a part of the energetic new South. It would be less than fair not to add, that he has rid his mind of all cant, and has at least endeavored to slough off all prejudices. Being so open-minded himself, he is sure to be a mind-opener to others.

His main thesis is that economic interest, not principle or derivation, made two distinct and antagonistic peoples in the United States. Originally the North and the South were "homogeneous in origin, race, language, religion, institutions and customs." His argument advances along that well-known main-travelled road of the "economic contrast." The "nationalization of the South" began, he says, before the formation of the Federal Constitution, and could have been arrested in but one way, "by the extirpation of slavery, which was both its germ and active principle." After the cotton gin, the "cotton States" soon came into existence; and after they "had really developed their industry, the Southern Confederacy was inevitable." In this nationalization "the doctrine of State sovereignty was really nothing but its instrument, nurse, and organ" (p. 59). Each side grasped the weapon that promised to be most serviceable. Strict construction and State sovereignty suited the South most of the time, just as the opposites were more useful to the North. Our author might have added with equal truth that the leaders again and again exchanged positions and weapons, for aggressive strategy or the needs of defence. "The economic interest of the South in slavery was so great that it commanded her to sacrifice all the advantages of the Union to preserve slavery, if it should be necessary." The favorable was right, morally and politically, and *vice versa*. If you dispute it, kindly explain how "all the churches, accepting the same Christ and worshipping the same God, were at last divided; the Northern churches impugning and the Southern churches defending slavery" (p. 86). Long before 1860, property in slaves had "supplanted or made dependent on itself all other property, and became the solitary foundation of every kind of production and mode of making a living." The returns from slave labor depended on soil, crops, and management, and varied from a loss to a great profit; but what might easily be made "the greatest profit of all was what the master thought of and talked of all the day long—the natural increase of his slaves, as he called it. His negroes were far more to him than his land. . . . Quickly exhausting his newly cleared fields, he looked elsewhere for other virgin soil to wear out" (p. 49). So great was the increase in the value and number of slaves that slavery might still be highly profitable although the soil was poor and its cultivation slovenly. If the slaves raised enough to supply the bare necessaries for their master and themselves, there was often a good percentage of gain even in the annual compound of principal and interest, if no slaves were sold. Elsewhere the author likens the ease and advantage of slave-breeding to a self-managing and remunerative orchard, where "the trees plant and tend themselves, gather and store the fruit, set out other orchards, and do all else necessary to care for the property and keep it steadily growing" (p. 48). "Really the leading industry of the South was slave rearing. The profit was in keeping the slaves healthy and rapidly multiplying" (p. 156).

Lest any one should wonder how the Southerners could believe that they were champions of liberty when slaveholding was their great concern, he reminds us that their idol was Greece, both slaveholding and liberty-loving. Nor were they incredibly dull and obtuse in not abandoning slavery when they saw that the economic, political, moral, and intellectual forces of the world were against them; they acted only as human beings always act. "Note how people dwell near overflowing rivers, or a sea of tidal waves, or live volcanoes, or in earthquake districts, or near a tribe of scalping redskins, where they, their wives and children, keep merry as the day is long until the calamity comes." In fact, Mr. Reed never knew but one man who showed by his actions that he foresaw the early fall of slavery (p. 43). He might have said with equal truth that nineteen persons out of twenty, especially among the educated and rich, were absolutely confident that all the rest of the world was wrong, and slavery was a great civilizer and the only true solution of the conflict between labor and capital. Moreover, he gives a living illustration of old illusions and of how tenaciously intelligent persons may adhere to them, by arguing at great length that slavery was a blessing to the negro, and that since emancipation the negro has depreciated.

Mr. Reed discusses different periods and influences in the evolution of the conflict, in chapters on such subjects as "Root-and-branch Abolitionists and Fire-eaters," Calhoun, Webster, 'Uncle Tom's Cabin,' Toombs, and Davis. Webster and Calhoun are, of course, given their usual rôles. If Calhoun did not really love the Union, he at least loved to think he loved it. Some of Mr. Reed's opinions regarding Calhoun seem very extravagant. He is doubtless correct in saying that Calhoun chose the absurd ground of nullification because he foresaw that "secession meant internecine war between the sections"; and, after nullification had been both successful and peaceful, he strove to "exalt peaceful nullification above bloody secession" (p. 125). While he lived, he nominally cherished the Union, and slavery continued mainly on the defensive. Toombs was cast in a totally different mould. To his logical and clear mind, slavery and free labor were obviously mortal enemies, and hatred of the Union was already beginning to burn in his heart when, in June, 1850, he proclaimed in the House, that, unless the Territories should be divided or slavery should be allowed to go into all of them, "I will, if I can, bring my children and my constituents to the altar of liberty [!], and, like Hamilcar, swear them to eternal hostility to your foul dominion." That was typical of the temper of the coming period. So when the South took the aggressive, and, by the Ostend manifesto, prepared to obtain more slave territory abroad, as by the Kansas-Nebraska act more was opened up to her at home, Toombs became, in many respects, the truest representative of the Southern cause.

Mr. Reed, long an intimate acquaintance of Toombs and often his colleague or opponent in court, probably would not accept this characterization, but compares him with Webster as a lawyer, and claims that he was the successor of Calhoun and the great Southern leader for about a decade before the Confederacy was founded; he even argues that if Toombs instead of Davis had been chosen President, the result might have been more favorable. The author's frankness in admitting Toombs's drunkenness, unbridled temper and boasting conceit is characteristic. Undoubtedly, Toombs had rare natural talent, some great qualities as a lawyer, political debater, and Senator. He possessed a few statesmanlike traits. Moreover, his defences of slavery were the most effective, his logic was the most ruthless, his audacity the most daring. He could not imagine himself or his cause being wrong, or that any civilization was equal to one founded on servitude. To reject his demands or to check the growth of slavery was to subject the South to "foul dominion." Until statesmanship shall be defined as the art of precipitating revolution and acting with violent indiscretion, Toombs is not likely to rise above the rank of a powerful but unsuccessful revolutionist. Therefore, that Davis instead of Toombs was chosen for the head of the Confederacy, showed that the Montgomery convention knew its right hand from its left. But Mr. Reed, seeing that Toombs's career inspires less and less respect, has reëxamined and described it in the hope of making it appear that of a true statesman. Our zealous searcher for four-

leafed clover goes so far afield that he entirely loses his bearings, and we are solemnly assured (on evidence that would have convinced Colonel Sellers or Cy Prime) that if Toombs had been President, he would early have rushed cotton to Europe, for which ships could have been obtained, which, in turn would have broken the blockade, etc., etc. (pp. 286-92). "King Cotton"—so soon forgotten! In 1860 and 1861 every Southerner believed that cotton was so absolute and immediate a necessity to Great Britain and France that, long before the blockade could injure the Confederacy, those nations would have to come and break that blockade, or be thrown into commercial panic that would threaten millions with starvation. Late in 1862, after the blockade became effective and the foreign ships came not, the changeful Stephens and other impractical critics discovered that *Davis* had made an awful mistake!

We pass over other erroneous assumptions; some serious, but common, misconceptions about the Abolitionists; many blemishes in style; and here and there some special pleading. There also seems to us to be much more sentiment and jugglery about "equally patriotic," "brothers all," "glad we fought" and "glad we lost," or similar phrases, than is called for by the author's arguments that slavery was the cause of the war, and that slavery was a curse to the white population. But perhaps such a pill would not be taken if there were less sugar-coating. "He and I can agree about everything on earth until we get to our sable population, I do believe," said Toombs of his hard-hitting opponent, Senator Wade; and so, with few exceptions, we can say of Mr. Reed.

Professor Fleming and his 'Civil War and Reconstruction in Alabama' are strikingly different from the author and the book just noticed. Presumably Professor Fleming was not born until after the end of Reconstruction; but, before he came North to study history, he had the advantage of living among the survivors of the periods and events which he describes. His opportunities have therefore been exceptionally good. An older and experienced writer would be expected to use them so as to produce a picturesque, philosophical, scholarly, and unbiassed history, and especially one giving clear representations of all the controlling impulses working in the different races, classes, and conditions of men. So much should not be looked for in a mere beginner; but a professor of history and a Ph.D., who has had such opportunities and presents the results in more than 800 large octavo pages, has serious responsibilities. In any case, two qualities are prerequisites to a large degree of success—scholarly industry and impartiality. Of industry, Professor Fleming has given an exhibition that is truly phenomenal. No possible field of information which he has desired to acquire seems to have been left unexplored.

The scope of his work is far-reaching; it extends to almost every important phase in Alabama life, from about 1860 to the end of Reconstruction. Even an abbreviation of the subjects of leading chapters will show this: Sectional Controversy, Secession, Military and Political Events, Economic and Social Conditions, Social and Economic Disorder, Confiscation and Cotton Tax, Temper of the People, Provisional Administrations, Military Government, Wards of the Nation, Military Government Under the Reconstruction Acts, Campaign of 1867, "Reconstruction" Convention, "Reconstruction" Completed, Union League, Taxation and Public Debt, Railroad Legislation and Frauds, Reconstruction in Schools and Churches, Ku-Klux, Industrial Reorganization, Political and Social Conditions in Reconstruction, The Overthrow of Reconstruction. The subdivisions would still more clearly show that there is here no room for criticism. It is when we come to consider the construction of the narrative that imperfections begin to appear. Many of Professor Fleming's chapters must be called monographic, if not monographs, for they pursue a special subject through a certain period, perhaps several years. Then another subject is taken up, and the same years are gone over again. Each of the monographic chapters is stuffed with superfluous facts and details; and, as most of the subjects are kindred as well as synchronous, the repetitions are innumerable and fatiguing. This method makes it necessary to separate causes and effects when, as is often the case, they lie in different fields. Most of all in a time of wild disorder like that of Reconstruction, when scores of forces are acting and reacting, it is the duty of an historian to keep the results within sight of the causes. Shall he, then, write of all things at once? No. But he should so write of the things that are related as to be able to see and to describe the relationship. How is that possible? It is quite impossible, unless one has what in a figure may be called a good historical digestion—the capacity to transform raw facts into history. Facts and history are almost as different as are a cow's feed and her milk. With such a method as Mr. Fleming has adopted, a fluent narrative is quite impossible. The style seldom either rises much above a respectable commonplace or (what is considerable praise for a work of this abnormal size) falls much below it. Professor Fleming seems to be untrained in the art of expression, or even in the art of arranging facts so that they shall be interesting if not picturesque; but now and then we see evidence that, if he should cultivate a taste for quality and care less for quantity, he might greatly improve.

The author's point of view and the purely intellectual part of his task are of the greatest moment. Olmsted once made some remark to an ante-bellum planter, who answered to this effect: "I don't know, but if it's anything unfriendly to slavery I know it isn't true." That was the state of mind. Slavery had been so violently attacked by all the rest of the world that Southerners felt compelled to defend as much of it as possible, and studiously to conceal, ignore, or misrepresent the rest. A part of the method was continually to say and to believe that no one but a Southerner knew or could learn anything about the South, especially slavery—unless his opinion should be wholly favorable, and then it was conclusive. It became second nature to champion and glorify everything Southern, and the re-echo of this glorification is the tradition that has come down to the present generation. Incredible as it may seem, this tradition is the steel frame of a large part of the structure Professor Fleming has built.

We said that our author had explored every available field where there was information that he desired to acquire. Instinctively feeling that everything Southern was wholly right, he often instinctively avoided or failed to perceive unfavorable evidence. However, sooner or later the inveterate fact-hunter must discover some unwelcome phenomena—*quasi*-evidence or troublesome evidence. During the last four years before the civil war a wild craze for reopening the African slave-trade swept over the South below the border slave States and North Carolina. It was prompted by both economic and political interests, and perfectly illustrates Mr. Reed's theory of the economic interest controlling ideas of morals. With the destruction of slavery the South soon acquired the normal view that the African slave-trade was horrible. Therefore, tradition makes no mention of that midsummer madness. So, when Professor Fleming finds Yancey advocating the repeal of the prohibition of that trade, he is naturally a little puzzled. He consults the recollection of Judge Roger A. Pryor—who disagreed with Yancey at the Montgomery Commercial Convention of 1858—and informs us that "no one understood that there was any desire on the part of Yancey and others to reopen the slave trade." That suffices to do away with the *quasi*-evidence; for the talk of reopening the slave-trade was only Yancey's little subterfuge to split the Democratic party as a means of hastening secession. The late, most amiable Dr. Curry wrote two books largely to demonstrate that the causes of the civil war were wholly matters of constitutional interpretation, and that slavery had nothing to do with it. Subsequently he discovered, to his utter amazement, that the speeches he had made advocating secession gave not the slightest hint of any cause except slavery. If the venerable judge and our author will turn to the reports of that Commercial Convention (24 *DeBow's Review*, 473ff., 579ff.) and, along with the other records, will read the speech by one Roger A. Pryor, then of Virginia, they will learn something important for them to know.

The troublesome evidence conflicting with tradition is eliminated more summarily. After the manner of criminal lawyers, Professor Fleming boldly attempts to throw out such evidence by insisting that the witness is either *non compos* or a disreputable character, and sometimes both. Thus, the non-slaveholder hated the negroes, and consequently dreaded emancipation more than the slaveholders; therefore, they could not honestly have been Unionists. (Don't suggest that it was possible both to fear negro equality and also to believe that Lincoln's administration would not interfere with slavery.) Hence, for secession, directly or indirectly, there was practical unanimity, and all went into the cause. When, as the war advanced, many show signs of opposition, desert, etc., our author so covers them with one or more of several epithets that their criticisms are discredited, and every genuine traditionist will forever consider them outlawed and disreputable. So the traditional perfection of the secessionists and Confederates is demonstrated; and the

presumption of this perfection becomes cumulative as we advance towards reconstruction. The "surrender" meant "quits"; the South expected to forget and forgive, and the best portion (by which understand all) of the population, was in favor of educating the negro, and even giving him the right to vote. (Evidence and details are strangely meagre on these points.) Hence, if the South had been left to herself, peace and prosperity would soon have returned even to Warsaw. All Southern witnesses to the contrary straightway become "scalawags," or worse. Likewise, every Northerner or foreigner found in the South during or after the war, and in disagreement with the perfectionists then or the traditionists now, is *prima facie* both *non compos* and disreputable, first, because only Southerners can understand the negro and the South, and, secondly, because they were opposing and thwarting the only true Reconstruction, which the perfectionists would otherwise have carried out. Gen. Carl Schurz is put down as doubly *non compos*, because, in addition to being a Northerner, he was also of German birth, and doubly disreputable, because, when in the South in 1865, he obtained some of his information from Northern officers stationed there (p. 312). Mr. Godkin, on account of his ante-bellum and post-bellum travels in the South, has heretofore been counted a high authority. But he was not, we are told, above getting his information from loafers on the street corners and in the bar-rooms. Of course every Northerner that settled in Alabama is loathed as a carpet-bagger. Excepting only Gen. Swayne, who is occasionally allowed a few moments of respectability, so that he may testify on the Southern side, we are unable to recall another instance where any one of all the thousands of civil or military officers, teachers, or preachers, of any degree, is not spoken of with something like contempt, on the assumption that he or she (although in many instances engaged in highly Christian and philanthropic work) was an absurd, if not also a base creature. Just the reverse is true of all persons and things our author considers typically Southern. Any Ku-Klux is better than any Northern teacher, missionary, or preacher. A more complete separation of the sheep from the goats, or, rather, the angels from the devils, it would be difficult to find in any 800-page history. And yet there are persons who deny that history is a science! Professor Fleming's method, for scientific precision and efficiency, could hardly be surpassed, even by a guillotine.

Nevertheless, we consider this volume a very important contribution to the history of its period. Several chapters or sections, on account of their subjects, are entirely free from the objectionable features that have been noticed. The best of these is the one about economic and social conditions during the war. Some others are excellent in most respects. Even where the author has been the victim of his own bias, his references and collections of facts, good or bad, are so extensive that this volume will be of immense value *pour servir*.

WILKINS'S MRS. FITZHERBERT.

Mrs. Fitzherbert and George IV. By W. H. Wilkins. Longmans. 1905.

The story of the amours of George IV. and Maria Fitzherbert is interesting if not edifying. At the age of twenty-one, the eldest son of George III. fell very desperately in love with this young widow, six years his senior. She was well born and bred, spotless in reputation, sweet, and equable in temperament, and, according to eighteenth-century canons, beautiful. The sentiments of the Prince were not reciprocated. The lady did her best to escape from her suitor, and this led to the beginning of a series of unusual and dramatic incidents. George was, to put it plainly, a very dreadful person, probably not quite so bad as Thackeray painted him, but certainly not so amiable and virtuous as Mr. Wilkins would have us believe. He could, to be sure, bow better than any man in Europe, and make himself popular with kitchen maids, but alongside of that he was a profligate and drunkard, with a bad heart, a lying tongue, and a deficient sense of honor. The best defence that can be offered for him (one that Mr. Wilkins has not put in) is that he had inherited a strain of his father's lunacy. His lies were often carried to the point of delusion—for instance, his famous one that he had taken part in the battle of Waterloo. This idea, that he had been at Waterloo, became so rooted in his mind that he appealed to Wellington to confirm it, which provoked the Duke's dry retort: "I have heard your Majesty say so before." Such was the man who had fallen very genuinely in love with a lady far too good for him, and who would have none of him.

In despair at his rebuffs, George feigned an attempt to commit suicide. Mrs. Fitzherbert was dragged to his bedside, and, at the sight of the royal blood, nearly fainted. A ring was forced on her hand, and she was declared bound to the Prince. This desperate comedy failed to achieve George's purpose, for Mrs. Fitzherbert, to escape him, now fled to the Continent. Unable to see her, he bombarded her with letters (one of them was of no less than 37 pages), and, under this heavy fire, she began to weaken. Finally she surrendered, but on honorable terms. She consented to marry the Prince. The marriage took place under conditions of the greatest secrecy—of such secrecy, in fact, that it has never been strictly authenticated until the publication of Mr. Wilkins's book. The reason for secrecy was twofold. Under the law as it then stood, George could not contract a marriage without his father's consent, and to ask for it in this case would have been hopeless. Again, under the Act of Settlement, a marriage with a Catholic excluded the Prince so marrying from the succession, and Mrs. Fitzherbert was a Catholic. So the marriage had to be kept secret. It was valid in the eyes of the Church of Rome and of the Church of England, but by the civil law it was invalid, and politically, it was folly.

The apparently wedded life that the Prince now began to lead with this well-known Catholic lady raised a Protestant storm about his ears. Rumors of the marriage got about. George was in financial distress; would the King and Pitt relieve his wants? His friends worked for him in the House of Commons, and, to win the day, Fox rose and declared, on the express authority of the Prince, that there was no foundation for the report that he was married. This is one of the few points at which serious exception may be taken to Mr. Wilkins's statements. He tries to mitigate the circumstances by exaggerating the importance of the letter of the 11th of December, 1785; there may have been later letters that have disappeared, or unrecorded conversations. There can be no reasonable doubt that Fox knew the facts, that he lied deliberately, and that he did so by arrangement with the Prince. It was a great shock to Mrs. Fitzherbert, and Fox she never forgave.

There was a momentary estrangement over this public affront, but with this exception the Prince and Mrs. Fitzherbert lived happily together from 1785 to 1794, mostly at Brighton. In the latter year, without any warning, he suddenly threw her over, having been paid by the King to marry the Princess Caroline of Brunswick. George did not take kindly to his new wife, and was soon back at the feet of his old love, but it was not till 1799 that she reluctantly consented to resume their former relations. Once more they lived together, until the summer of 1809, when the Prince turned definitely away from his amiable and long-suffering wife for younger women, Lady Hertford and later Lady Coningham. During the Regency, and after he ascended the throne as George IV., she rarely met him, and, when she did see him at some social function, treated him with cool disdain. But when, in 1830, he lay on his deathbed at Windsor, she wrote in affectionate and dutiful words to ask that she might soothe his last hours. The letter came too late, but the King had charged the Duke of Wellington that he should be buried with a locket around his neck; and when, after his death, the Duke looked at the locket, he found that it contained a portrait of Mrs. Fitzherbert. William IV. ordered his brother's widow to assume the royal livery and wear mourning, and all the royal family treated her with marked consideration and respect. She survived her husband some years, dying in 1837 at the age of eighty, leaving, apparently, no descendants.

Mr. Wilkins's book is so good that his readers ought to know that the author, who makes no allusion to the fact, had to produce it under conditions of physical disablement so distressing as nearly to disarm the critic, and which have since ended in death. At the same time it is a duty to point out its failings. Firstly, it must be said that Mr. Wilkins, though a conscientious searcher and worker, is here rather an apologist than an historian; he is so anxious that the good points of George IV. shall not escape us, that he finally leaves only a very unsatisfactory outline. Again, he is not a psychologist, and his Mrs. Fitzherbert is little more than a lay figure. The forces that got her into the marriage were evidently very mixed and very subtle; to say that she "loved" the Prince might do for a fairy tale, but is hardly adequate here. Mr. Wilkins rather misses the significance of the religious factor in Mrs. Fitzherbert's life, especially at the crises; these suggest

very decidedly a strong hand behind her; was it the Rev. William Nassau? Another point that is rather obscured is her love of social pleasures; at eighty she was still dining out, at seventy-eight she was thinking of taking singing lessons.

A few slips and mistakes here and there may also be noted. *Plombiers* is given in several places for Plombières. Fox's argument (p. 53) as to the possibility of Mrs. Fitzherbert being Queen is perfectly sound, and does not require the note appended, for, writing as he did before the marriage (unless this was an antedated letter, which Mr. Wilkins does not suggest), he was bound to consider it possible that she might abjure Catholicism and marry as a member of the Church of England. For *style* of Epicurus (p. 108) one would expect sty. In Chapters X. and XI. it would appear that Mr. Wilkins misreads the whole situation; it is safe to assume both the Prince and Fox capable of direct lying, while it is not safe to assume that the date of Fox's letter is genuine. In the matter of the lunacy of George III. (p. 164), it was clearly the object of Pitt to gain time, but the delay caused by the examination of the doctors by the House of Commons proceeded not from Pitt, but from Fox. Willis was more than an "ex-clergyman"; he was also a doctor of medicine. The terms on which the Prince was offered the Regency (p. 167) are not fairly stated; when the bill was in the Commons, Pitt proposed that all restrictions should cease after three years. It was not in August, 1815, that the Princess Caroline left England (p. 331), but in 1814 George Dawson, who married Mrs. Fitzherbert's ward (p. 359), was not the second, but the third son of the Earl of Portarlington.

The Life and Letters of Peter Ilich Tchaikovsky. By Modiste Tchaikovsky. John Lane Co.

A few years ago the Russian publisher Jurgenson issued Modiste Tchaikovsky's Life and Letters of his brother, the famous composer, in three volumes. A German version, by Paul Juon, promptly followed; the first volume of this was reviewed at length in these columns. Juon reduced the three Russian volumes to two in German, and now we have an English version by Rosa Newmarch in one volume. While agreeing with Carlyle that "mankind takes an unspeakable delight in biography," Mrs. Newmarch wisely recognized the necessity of further condensation; and so, in place of the 2,000 pages of the original edition, we have 782 of the English version. This is probably quite as much as even the most ardent admirers of the great Russian will care to read about him when they purchase this volume. After perusal, to be sure, many of them will wish there was more, for a book of more absorbing human as well as artistic interest has seldom been written.

In the earlier chapters there is a considerable amount of biographic narrative; but, as the volume progresses, nearly the whole story is told in the letters of Tchaikovsky, of which there were about 3,000 to choose from, and which are often as *intimes* and unreserved as Wagner's letters to Liszt and to Frau Wesendonck. This is true, especially, of those addressed to his benefactress, Frau von Meck, who, in granting him a liberal annuity on the understanding that they were never to meet personally, was in all probability actuated in part by the desire thus to draw him out in his letters. He is constantly answering her questions regarding his plans, his method of work, his opinions on music and musicians; and thus the world owes her a large debt of gratitude. For thirteen years their correspondence lasted. Then, like a bolt from the sky, came her announcement that she could no longer pay him the 6,000 rubles yearly, because of her pecuniary embarrassment. "Do not forget," she added, "and think of me sometimes." What hurt Tchaikovsky most was the implication of these words that he would now cease writing to her. "I may say without exaggeration that you saved me," he replied. "I should certainly have gone out of my mind and come to an untimely end but for your friendship and sympathy, as well as for the material assistance (then my safety anchor) which enabled me to rally my forces and take up once more my chosen vocation." To his great distress, Mme. von Meck never replied. Her financial difficulties blew over, and the composer concluded that she had simply wanted to get rid of him. As a matter of fact, her strange conduct was the consequence of a terrible nervous disease, to which she succumbed a few months after Tchaikovsky's death.

Thanks to the success of two of his operas, "Eugene Onegin" and "Pique Dame," the composer was not in the least incommoded by the loss of his annuity; but it was only three years before his end that he thus secured financial independence. Russian music lovers had been slow to acknowledge his genius, and foreigners slower still, with the exception of Hans von Bülow and a few other leaders of thought. It seemed like the irony of fate that success should come to him principally through his operas, for he rather looked down on the opera and felt that he was not at his best in this field. But it was only in Russia that his operas became popular; elsewhere they failed, for the same reason as Rubinstein's: both these Russians disliked Wagner and refused to learn from him. Tchaikovsky had little use for Wagner after "Lohengrin." "The Nibelung's Ring" at Bayreuth and "Tristan" in Berlin bored him—almost as much as Brahms bored him. Nor did he care for Bach or Beethoven; his sympathies were narrow; Mozart was his idol, and he admired his French contemporaries. He felt uneasy about his own works. "I have not attained to the rank of a master," he wrote four years before his death.

Such utterances, to be sure, were largely inspired by his moods, which were as variable and as extreme as Wagner's. Emotionalism is the keynote of his letters, as of his musical works. "To make the fair sex faint is the highest triumph to which any composer can attain," was one of his mottoes. "An hour ago I was in the millet field which lies beyond the garden, and so great was my ecstasy that I fell upon my knees and thanked God for the profound joy I experienced." Paintings used to bore him; but the time came when he could write: "To-day I went on foot to the Vatican and sat a long while in the Sistine Chapel. Here a miracle was worked. I felt—almost for the first time in my life—an artistic ecstasy for painting." Massenet's oratorio, "Mary Magdalen," moved him deeply. "I was so touched by the emotionalism of the music in which Massenet has reflected the eternal compassion of Christ that I shed many tears. Wonderful tears!" And, to give only one more sample, from the same letter:

"I took up 'Les Travailleurs de la Mer'; I read, and read, and grew more and more irritated by his grimaces and buffoonery. Finally, after a whole series of short, unmeaning phrases, consisting of exclamations, antitheses, and asterisks, I lost my temper, spat upon the book, tore it to pieces, stamped upon it, and wound up by throwing it out of the window. From that moment I cannot bear the mention of Victor Hugo!"

Memoirs of Archbishop Temple. By Seven Friends. Edited by E. G. Sandford, Archdeacon of Exeter. With photogravures and other illustrations. 2 vols. Macmillan. 1906.

These volumes set forth in full detail a career far more familiar to Englishmen than to Americans. Born in the Ionian Islands in 1821 and educated at Oxford, Dr. Temple was a fellow and tutor of Balliol 1842-48, was employed in the Education Office 1848-57, became headmaster of Rugby 1857, Bishop of Exeter 1869, Bishop of London 1885, Archbishop of Canterbury 1896, and died in 1902. In all these posts his ability, activity, and success were notable. His official acts, etc., arrayed in order by several of his associates, and largely supplemented by the editor, fill near 1,400 octavo pages. This wilderness of facts can hardly create in Americans an interest hitherto lacking, if one may judge by the few dry lines vouchsafed to Dr. Temple in our books of reference; yet the man was worth remembering. Works of edification, however valuable, offer to history matter less attractive than ideas; and Temple, though mainly a worker, has his place as a widener of the British mental horizon, if not as a reformer of religious thought. The salient feature of his record is his connection with 'Essays and Reviews' (1860), and what came thereof. That episode brought on him a deal of trouble, and most of his friends regarded it as the blot on his scutcheon.

The essay on "The Education of the World" seems obvious and harmless now, but it stood first in a book which excited general horror, and was itself, though not directly theological, tinctured with the odious spirit of free inquiry. Eminent divines and pious mothers, then and long after, were shocked by the idea that pagan Greeks and Romans, as well as Hebrews, had an allotted part in educating the world. Temple told his Sixth Form that he thought the publication of the book was right, since "it contains opinions that had long been lurking in corners: it was time they were dragged to light and faced. We, the essayists, knew who was going to write, but not what each was going to write about." He said he disagreed with some things in the book, and had done his part of it before he thought of coming to Rugby; "to have written in that book as headmaster of Rugby would have been a blunder." One of the boys wrote to his alarmed parent: "Tem-

pie's all right; hut if he turns Mahometan, all the school will turn too."

The tocsin rang with increased fury when he was named for Exeter. Dr. Pusey protested against "the horrible scandal of the recommendation of the editor of the 'Essays and Reviews' to he a Christian bishop." He was not the editor, and the book had plainly stated that each writer was responsihle for his own work only; hut at least he was in such had company as Jowett, Pattison, and Baden Powell. He refused to make any public explanation or defence.

As a prelate he lived down obloquy and opposition, made friends of foes, and was regarded as a conservative and a strict disciplinarian. Any seeming opposition between the two parts of his career is easily explicable. He was no trimmer, but a very manly Englishman—"granite on fire." As schoolmaster he was a Gladstonian; as bishop he ahstained from politics in Church or State. His views and principles never changed materially; first and last he held to the right of private judgment. But he was a practical man as well as a thinker and scholar, and saw that high office imposes duties and restraints, and this from a larger view than that of mere personal prudence. The impression he made was that of principle and character, and those nearest him honored and loved him deeply.

One lack he had, curious in so successful a career—that of affability, surface geniality. Not that he was "a delightful man with his friends, but shy with strangers"; but that strangers and friends alike were liable to find him curt, blunt, even sharp. He did not suffer fools gladly; like Mr. Bailey of Texas, he had not the gift of heing pleasant under all circumstances. To a disgruntled parson who taxed him with rough and unsympathetic harshness he confessed with deep humility that he had prayed and striven in vain to cure the fault. In vain it was; but some of the samples of his manner are less painful at long range than they probably were to the first auditors. Thus, to one asking if he believed in Providential interference: "That depends on what you mean hy it." "Well, my aunt was suddenly prevented from going a voyage in a ship that went down. Would you call that a case of Providential interference?" "Can't tell; didn't know your aunt." And to a vicar pointing to a dissenting chapel and saying, "That is where all the people go, my Lord": "WHY?" At worst, the scholhoy's verdict may stand: "Temple is a heast but he is a just heast." His hoys, after their first term, and the British public in later years, forgave the heast and respected the justness.

International Law as Interpreted during the Russo-Japanese War. By F. E. Smith and N. W. Sibley. The Boston Book Co. 1905.

This volume is designed to give an account of the international questions raised by the Japanese war in such a way as to enforce the conclusion that Russia showed throughout the war very little respect for the rights of neutrals. "The undiscriminating comprehensiveness of her list of contrahand articles, her repudiation of the distinction between conditional and unconditional contraband, her claim to destroy neutral vessels upon provocation so extremely slight, and finally her bold contention as to the status of the volunteer cruisers," are given as instances to be contrasted with the hehavior of Japan—so entirely civilized and legal (except in the cutting out of the *Rishitelni* from the neutral harhor of Chifu) from beginning to end of the conflict. This is perfectly true. Nothing was more remarkable from the first than the fact (conspicuous in all the diplomatic correspondence and public acts of the Japanese Government) that Japan had taken the Law of Nations of Grotius and Wheaton as a living guide, while Russia had failed wholly to grasp the fundamental modern notion that belligerent rights, as against neutrals, are substantially only such as arise *ex necessitate*, and not such as belligerents may be ready to claim. In saying this, it is, of course, to be admitted that there was a great disregard, on hoth sides, of the territorial rights of China and Korea, but this was in large measure because those States were not actually regarded or feared as equals. The International Law even of the most highly civilized nations has not yet become hospitahle or "correct" enough to include within the "family of nations" members of that family who do not vigorously defend themselves against fraternal aggression.

We are inclined, however, to think that the great contrihution of the war to International Law is not the mere fact that Russia made an extreme attempt to advance helligerent rights (in which she was pretty uniformly unsuccessful), or even that Japan gave to the world the wonderful spectacle of an Oriental nation at war, just emerged from the pre-scientific Asiatic night, exhihiting the very devotion to law and civilization in which its enemy (the armed champion of universal peace) was entirely deficient. The event of the war which seems to us most likely to he significant in future, and to tell most as a precedent, was the formation of the Court of Inquiry, under The Hague Convention, into the dispute which arose between England and Russia over the attack by the Russian fleet in the North Sea on the trawlers. This was not a court of arhitration, hut a court to inquire into and settle facts. As the authors point out, it is at this point that International Law has been hitherto remarkably weak. When a dispute arises between nations, each side puts forward its own version of the facts; hitherto no machinery has existed for the ascertainment of facts hy an impartial trihunal. The consequence is that when, in the heat and stress of a great war, a neutral complains of an outrage hy a helligerent, each side puts forward and insists on its own version of the facts. Before The Hague Convention, an impartial international inquest was indeed possihle, through a special arrangement with this end in view, but lamentably unlikely to be resorted to. The Hague Convention puts such an inquiry among the natural and simple means of settlement, and this first use of it is a novel and memorahle historical precedent.

The hook discusses all the questions which arose during the war and a great many more, hut can hardly he regarded as a work of authority, as it is hastily and looseiy written. The chapter on Espionage and Wireless Telegraphy, for instance, presents, to our mind, no clear case for consideration. Chapter VI., on the case of the *Hatsuse* (hlown up by a mine ten miles from land), contains no new light on the subject of mines and balloons in war; the discussion is discursive and hypothetical. The book has a long chapter on international arbitration, which gives "some account of recent international arbitrations." A little more than a page is devoted to the *Alabama* arbitration; this is so condensed as to be valueless.

Mount Desert: A History. By George E. Street. Edited by Samuel A. Eliot, with a memorial introduction by Wilbert L. Anderson. Boston: Houghton, Mifflin & Co. 1905. Pp. xv., 361.

The three-hundredth anniversary of the discovery of Mount Desert was celebrated in September, 1904. Dr. Street intended to publish, in time for this celebration, an arrangement of numerous historical notes and papers that he had long been gathering, but his illness and death intervened. These, so edited as to be a continuous story, now constitute the present volume, issued as a memorial of Dr. Street. It is of specific value as a local history, but it includes much that is beyond the range of its title. In 1604, Champlain found and named the island, and in 1618 some Jesuits attempted to establish a colony at the entrance of what is known as Somes Sound. The colony was destroyed by English enemies of France almost as soon as it was begun. These incidents gave occasion to the historian to elaborate, through the first part of the volume, a description of the romantic and tragic adventures of French voyageurs on the American northeast coasts during the seventeenth and eighteenth centuries. Most of this interesting and instructive detail is irrelevant here. Also, the discussion (pp. 46-50) of the career and character of Sir Samuel Argall, who destroyed the Saint Sauveur colony, would more fittingly find place elsewhere.

The history of Mount Desert, connecting past and present in a continuous sequence of events, begins properly with the happenings that make up the fourth chapter on "The Tory and Refugee Proprietors." After the dispersion of the Jesuit colonists there is a hlank in the records for ahout a hundred and fifty years. But then, with the close of the conflict between France and England over the possession of northeastern America, large migrations eastward of adventurers from the older settlements of New England took place. From that time, the mountain-island of Maine was occupied hy permanent settlers, and the development of the communities now there begun. The annals of "The Mount Desert Plantation" for the next hundred years tell of a sturdy, plain, frugal folk whose life was suhjected to the most cramping and harren hardships in their struggle with an ungenerous environment. It is a memorahle story, sympathetically, graphically told. The incident at Norwood's Cove in 1814, when some of the islanders defended their property successfully against the attacks of a British warship, possesses more than a merely local interest.

Within the last forty years Mount Desert has attracted wide-spread interest, and, in some relations, has become a place of national importance. Dr. Street's history acquires a distinctive character among New England local histories from its chapter on "The Summer Colonies." Here is an important record of the beginnings and growth of the island's modern era, from the years when "its beautiful scenery and refreshing air" and simple, unconventional ways of living drew to it "a few artists and seaside loungers," to the present day, when "the whole social life and atmosphere have been transformed" by the presence of hundreds of families from afar, resident in luxurious homes, and hosts of tourists, who bring with them the conventional fashions and some of the follies of metropolitan centres.

The copious "Bibliographical Notes" exhibit the many guide-books and historical sketches, much verse, voluminous art works and scientific studies that have been published regarding Mount Desert. Thirty-three pictures, illustrating the history and scenery of the island, ornament the volume.

With Walt Whitman in Camden. By Horace Traubel. Boston: Small, Maynard & Co. 1906.

This is yet another of those merciless books by which the immediate circle of Whitman's personal friends have done what they could to check his widening fame. In this case the remorselessness is peculiarly thorough, since it finds itself justified by Whitman's own words, taken as a motto and given in large type: "Be sure to write about me honest: whatever you do, do not prettify me: include all the hells and damns." It does not appear in what temporary mood of illness or depression this candid counsel may have been given, but there is no doubt that the instruction is well fulfilled in this book. All the familiar group of intimate friends take a part in the effort, and they show themselves ready for constant reproduction even of the coarsest words.

With this appears, also, on Whitman's part, a constant attitude of superiority to the world's people. The New York literary men, or those whom the world knows as such, come in for habitual contempt. "They are mainly a sad crowd," Whitman says; "take the whole raft of them—Stoddard, Fawcett, the rest—what are they saying or doing that is in the least degree significant?" (p. 55). "Stedman is cute, but hardly more than cute" (p. 56). "The New York crowd of scrawlers" they are elsewhere called (p. 61). The Bostonians fare even less well. "There was a time," Whitman says, "when New England culture made me sick, mad, rebellious" (p. 392). "Whittier," he reports, "started to read the 'Leaves,' and when he came to what are called the indelicate passages threw the book into the fire" (p. 127). Of Hawthorne he says condescendingly that he "was a man of talent, even genius. . . . Still, I think he is monotonous, he wears me out; I do not read him with pleasure." Moreover, he speaks of "Hawthorne, in whom there is a morbid streak to which I can never accommodate myself. I call this thing in modern literature delirium tremens" (p. 111). The only man whom Whitman praises cordially and manfully is Emerson, of whom he always speaks with a certain reverence, even while strangely convincing himself that Emerson's objections to what Whitman calls "the outcast passages" in 'Leaves of Grass' were "neither moral nor literary, but were," as he says, "given with an eye to my worldly success" (p. 50). To those who recall the frankness with which Emerson at that very time used to express himself on what he called the "priapism" of the book, this remark will seem curiously incongruous.

The greater part of this thick volume is taken up with familiar gossip and letters, bearing less upon Whitman himself than on the intimate circle of rather second-rate men who clung close to him at all times and gave him good-night kisses (pp. 116, 147, 296, 304, 337). There are many portraits of these admirers; and yet, though the book itself is well arranged and beautifully printed, it leaves the reader in a somewhat dreary wonder whether it faithfully records even the declining and enfeebled years of the poet who once wrote "Captain, my Captain" and "Joy, shipmate, joy."

Studies in Socialism

By JEAN JAURÈS

Translated, with an Introduction, by Mildred Minturn

Crown 8vo. Net, $1.00.

According to the English *Speaker*, the personality of M. Jaurès serves at the present moment as the point on which all the political controversy of to-day in France appears to concentrate itself. His socialism is a religion, and he presents the inspiring spectacle of a good man working out his own salvation in the face of innumerable difficulties.

D. VAN NOSTRAND COMPANY'S

Recent Publications

ANNUAL REPORTS on the Progress of Chemistry for 1904. Vol. I. Issued by the Chemical Society. 8vo, cloth, 280 pp. ....*net*, $2.00

BERTIN, L. E. Marine Boilers; Their Construction and Working, dealing more especially with Tubulous Boilers. Translated by Leslie S Robertson, Assoc. M. Inst., C.E., M.I. Mech. E., M.I.N.A,. containing upward of 250 illustrations. Preface by Sir William White, K.C.B., F.R.S., Director of Naval Construction to the Admiralty, and Assistant Controller of the Navy. *New and revised edition.* 8vo, cloth, illustrated ....*net*, $5.00

BOWSER, E. A., Prof. Elementary Treatise on the Differential and Integral Calculus. *Twenty-first edition*, with 640 additional Examples. 12mo, cloth. 450 pages, illustrated $2.25

CAIN, WM. Prof. Theory of Steel-Concrete Arches and of Vaulted Structures. *New edition, revised ond enlarged.* 16mo, cloth, illustrated (Van Nostrand Science Series) ....50 cents

DEITE, Dr. C. Manual of Soapmaking, including medicated soaps, stain-removing soaps, metal-polishing soaps, soap powders and detergents. With a treatise on perfumes for scented soaps, and their production and tests for purity and strength. Edited from the text of numerous experts. Translated from the original by S. I. King, F.C.S. With figures, 4to, cloth, illustrated, 147 pp ....*net*, $5.00

HALL, C. H. Chemistry of Paints and Paint Vehicles. 8vo, cloth ....*net*, $2.50

HUMPHREYS, A. C. (Stevens Institute). Lecture Notes on some of the Business Features of Engineering Practice. 8vo, cloth with supplement ....*net*, $1.25

JEPSON, G. Cams, and the Principles of their Construction. With figures, half-tones, full page and folding plates. 8vo, cloth, illustrated, 59 pp. $1.50

JOCKIN, WM. Arithmetic of the Gold and Silversmith. Prepared for the use of Jewelers, Founders, Merchants, etc., especially for those engaged in the conversion and alloying of gold or other metals, the mixing of various substances, etc. With numerous examples. 12mo, cloth ....*net*, $1.00

KENNEDY, F. Modern Engines and Power Generators. A practical work on Prime Movers, and the Transmission of Power: Steam, Electric and Hot Air. 4to, cloth, illustrated, 6 volumes $15.00
Single volumes ....*each*, $3.00

LUCKE, C. E. Power Plant Papers. Form I. The Steam Power Plant. Pamphlet, (8x13). 140 pp. *net*, $1.50

LUQUER. L. McI.—Minerals in Rock Sections. The practical methods of identifying minerals in rock sections with the microscope. Especially arranged for students in technical and scientific schools. *Revised edition.* With numerous figures and diagrams. 8vo, cloth, illustrated. 147 pp ....*net*, $1.50

PATTON, H. B. Lecture Notes on Crystallography, *Revised edition, largely rewritten.* Prepared for use of the students at the Colorado School of Mines. With blank pages for note-taking. 8vo, cloth. 47 pp. ....*net*, $1.25

PHIN, J. Seven Follies of Science. A Popular Account of the most famous scientific impossibilities and the attempts which have been made to solve them; to which is added a small Budget of Interesting Paradoxes, Illusions and Marvels. With numerous illustrations. 8vo, cloth. Illustrated ....*net* $1.25

RAUTENSTRAUCH, PROF. W. Syllabus of Lectures and Notes on the Elements of Machine Design. With blank pages for note-taking. 8vo, cloth, illustrated.

RAYMOND, E. B. Alternating Current Engineering, Practically Treated. With many figures and diagrams. *Second Edition, Revised*, 8vo, cloth ....*net*, $2.50

ROBINSON, S. W. Practical Treatise on the Teeth of Wheels, with the Theory and the use of Robinson's Odontograph. *Third Edition, Revised, with additions*, 16mo, cloth, illustrated. (Van Nostrand's Science Series)..50 cents

SCHWEIZER, V. Distillation of Resins, Resinate Lakes and Pigments; Carbon Pigments and Pigments for Typewriting Machines, Manifolders, etc. A description of the proper methods of distilling resin-oils, the manufacture of resinates, resin-varnishes, resin pigments, and enamel paints, the preparation of all kinds of carbon pigments, and printers' ink, lithographic inks and chalks, and also inks for typewriters, manifolders and rubber stamps. With tables and 68 figures and diagrams. 8vo. cloth, illustrated, 183 pp ....*net*, $3.50

SNOW, W. G., and NOLAN T. Ventilation of Buildings. 16mo, cloth. (Van Nostrand's Science Series) ....50 cents

STODOLA, DR. A. Steam Turbines. With an appendix on Gas Turbines, and the future of Heat Engines. Authorized translation by Dr. Louis C. Loewenstein (Lehigh University). With 241 cuts and 3 lithographed tables. *Second Edition, Revised and Enlarged*, 8vo, cloth, illustrated ....*net* $4.50

TRINKS, W., and HOUSUM, C. Shaft Governors, 16mo, cloth, Illustrated. (Van Nostrand's Science Series) ....50 cents

THURSO, J. W. Modern Turbine Practice and Water-Power Plants. With eighty-eight figures and diagrams. 8vo, cloth, illustrated. 236 pp ....*net*, $4.00

WARREN, F. D. Handbook on Reinforced Concrete. 16mo, cloth, 271 pp., illustrated ....*net*, $2.50

WRIGHT, PROF. T. W. and HAYFORD, J. F. Adjustment of Observations by the Method of Least Squares, with applications to Geodetic Work. *Second edition rewritten.* 8vo, cloth, illustrated, 298 pp ....*net*, $3.00

The Nation.

NEW YORK, THURSDAY, MAY 3, 1906.

The Week.

Representative John Sharp Williams has so many times shown himself a master of the tariff question that it was no surprise to see him rise and rend the Republicans in the House on Friday. In addition to a thorough grounding in economic principle, Mr. Williams has a large practical knowledge, which makes him a peculiarly ugly customer for the standpatters to wake up. Moreover, he has the fine consistency which leads him to denounce tariff plunder even when it seems to be flowing towards his own pocket. Hence the discomfiture of those who sought to trap him by asking him if he, himself a cotton planter, was not in favor of a protective tariff on his own product. "Why should I want to rob carpenters and bricklayers and blacksmiths," asked Mr. Williams, "by making them pay an artificial price for my cotton?" This is a much stronger position than that taken by Senator Tillman when he admitted that the tariff was but so much stealing, but declared that, so long as it was going on, he was bound to get South Carolina's share of the booty. Mr. Williams, too, fairly left the Republicans terror-stricken when he asked what they would do with the tariff-revision message which the President was sure to send in before a twelvemonth had passed.

The Constitutional doubt about remitting duties on building materials for San Francisco will not bear examination. The proposition is simply to exempt from duty certain goods imported for certain specified purposes. Such exceptions have been frequent. In fact, they exist to-day under the Dingley law, which grants to institutions of learning, for instance, the free importation of certain classes of books upon which others are required to pay a burdensome duty. Works of art, too, may be imported free of duty for public galleries. A rebate of duty is allowed on raw materials when the manufactured articles into which they are wrought are exported for sale abroad. In all these cases, Congress has assumed the right under the Constitution to allow the free importation for specified purposes of certain articles otherwise dutiable. The exception has been based upon the ground that some public interest would thereby be promoted, though in every case the immediate gain falls to comparatively few. No exercise of the supposed right by Congress has ever encountered an adverse decision of the courts. Republicans who have sustained the hitherto unprecedented breadth of interpretation put upon the Constitution under the McKinley and Roosevelt Administrations will merely excite derision by pleading Constitutional scruples against this sorely needed and readily available means of succoring the fallen city.

Ex-Mayor Phelan's reported proposal to the San Francisco municipal finance committee, that the Federal Government be asked to endorse a loan to be raised by that city, will very probably go no further than suggestion; but it would raise some interesting questions. Mr. Phelan is quoted as saying that for such endorsement precedent exists in the loan of the United States to the Pacific railways during the sixties, and, more recently, in its railway loan to the Philippines. What will occur to the practical reader, however, is not only that circumstances were so peculiar in both these cases as to provide no real precedent, but that the nature of the Government aid differed radically from that now suggested in the case of San Francisco. If the Union Pacific had defaulted outright on its interest due the Government, the United States possessed the right of foreclosure. If the Philippine railway concessionaires were to fall back on the Philippine Commission for its guarantee of interest on their bonds, a similar lien would exist. Even in the case of the bonds issued by the United States last March to help the construction of public works in the Philippines, it was stipulated that we should possess a lien on the lands bought from the Philippine religious orders. The railways and the lands were at least rational security for the Federal Government to deal with; but it is somewhat difficult to imagine the Federal Government foreclosing on the San Francisco public-utility systems and the city hall.

Although relief in the shape of tariff reduction has been withheld from the Philippines, the present Congress has granted one boon to the unhappy islands. It has just postponed until April 11, 1909, the application of the coastwise shipping laws to trade between our ports and the Philippines. Otherwise, American bottoms would have been granted a monopoly of this carrying trade after July 1 of this year. Just how much higher freight rates this restriction would have brought about is very naturally disputed—the Philippine Commission says 50 per cent.; but there is no doubt that it would raise very materially the cost of bringing to this country the Philippine products, which already have to pay 75 per cent. of the Dingley tariff rates. The Philippines, of course, are foreign territory whenever it is to the interest of the sugar or tobacco men to have them so, but for the purpose of benefiting ship-owners they were to be made domestic territory. Nevertheless, there has been a singular reluctance to apply these coastwise laws. The Philippine act of 1902 put off their application till 1904. Then, a few months before the expiration of the period thus set, Senator Lodge's Philippine Committee brought in a bill exempting the inter-island trade entirely, but leaving the date as it was. On the floor of the Senate, the bill was amended to make 1905 the date for the shipping monopoly. The House made it July 1, 1906, and in that form it was passed. There were then two years and three months in which shipbuilders and shipowners might get ready for the new traffic which Congress had delivered into their hands. The sponsors of the bill in both houses of Congress ridiculed the idea that there would not be enough and more than enough tonnage by 1906 to carry every pound of hemp or other products the Filipinos could dream of producing.

And what has been the result? Here is a colloquy that occurred on the floor of the House two weeks ago:

> "Mr. Stafford—I would like to ask the gentleman whether . . . there has been any extension in the shipping interests in view of giving to the American-made vessels a monopoly of the Philippine tariff?
>
> "Mr. Crumpacker—I think there has been none at all.
>
> "Mr. Stafford—Then I would like to ask the gentleman whether he thinks that by postponing for three years, until April 11, 1909, there will be any additional American ships built by reason of that prospective monopoly we were going to create for the Philippine trade?
>
> "Mr. Crumpacker—I hardly know how to answer that question, because any answer I could make would be purely conjectural. I believe this, that in the meantime we will probably abolish the custom duties upon Philippine products, and if we had free trade now with the islands, they could probably get along if the coastwise laws applied to their shipping."

There is the policy expressed in one sentence. We were to relieve the distress of the Philippines by removing the tariff, and then compel them to pay over part of their gain to the American ship-owners. Give their industries a chance to get on their feet, and they at once become fair game for another set of selfish interests. All but a very few men in Congress, however, stopped short at demanding that this tribute be demanded from the Philippines at the same time that we refuse them the means for paying it by marketing their products.

Following the Senate's careful and in-

telligent scrutiny of the Indian Appropriation bill, the Indian Rights Association is now asking Congress to avert what is called "a menace to the reindeer industry" of Alaska. Here are two illustrations of the changed attitude of the public toward the native Americans. Ten years ago the pamphlet issued by the Association to call attention to the danger of transferring the control of some 13,000 head of reindeer from the United States Bureau of Education to the Governor's office, would have been regarded as about as important as the minutes of a tatting club. But now the protest is taken seriously. It is to be classed with such questions of morals as the continuance of prohibition in Indian Territory, the provision of home work for reservation dwellers who have farms and families, the investigation of forest-reserve operations on Indian lands in the Northwest, and the Government's solicitude as to the "square deal" on the part of the agent to the Umatillas in Oregon. It is worth while to consider the case of the native Alaskans. They seem to be amenable to the law without enjoying the law's protection. They are discriminated against in the schools, and now it is feared that if the control of the fifteen reindeer herds that were started in 1892 to provide for the self-support of the natives is placed in the Governor's hands, the old tale of the Indian spoilers will be repeated.

Secretary Bonaparte explains to his fellow-members of the National Municipal League that the Government service is kept in a state of comparative inefficiency because of our insistence upon the theory that "all men of right ought to be, and therefore should be made and kept, precisely equal." In other words, we refuse to admit that an Elihu Root can be more valuable to the country than a Cortelyou, or a Taft more indispensable than a Metcalf. The Government bestows the title of "secretary" upon nine citizens of the United States, chosen from every part of the country, and pays each of them $8,000 a year. It regards a colonel as a colonel, worth at the best $4,500 a year, while it is notorious that a score of banking houses in New York will gladly pay ten times as much for the services of a "captain," or even an efficient "lieutenant," of industry. Of course, no one imagines that a responsible civil officer of the Government thinks himself properly paid; he must inevitably count upon the advertising value of his office in reference to future private employment. Our cities, lacking this power of bestowing prestige upon their servants, pay far higher salaries than are paid at Washington. While Secretary Taft, for example, must go on directing both the army and the Panama Canal for $8,000 a year, New York's superintendent of schools convinces the Board of Education that his pay should be increased from $8,000 to $10,000 a year.

To the annoyance of many citizens of the West, Secretary Hitchcock keeps pegging away at the land frauds. Information laid before the Federal Grand Jury at Sioux Falls, S. D., a few days ago, tending to implicate C. I. Crawford, a "reform" candidate for Governor, has drawn from that gentleman a curious and spirited comment. In effect, he declares that the filing of charges against him is a deep conspiracy between the Republican machine of South Dakota and the Government at Washington to ruin his career. But the ordinary observer of Mr. Hitchcock's activity in the past two years will doubt Mr. Crawford's statement, in so far as it implies that an innocent man is being "persecuted." Nobody believes that Senator Mitchell and Representatives Hermann and Williamson were made victims of an ambitious State machine; the Rev. Mr. Ware of the Black Hills had no vindictive political enemies; John Q. Anderson, a Republican Presidential elector in 1904, who is under indictment in Sioux Falls, had no quarrel with his party organization; Royal B. Stearns of Fort Pierre is under an eighteen months' sentence, in spite of his prominence; and the State organization did not prevent the indictment of Thomas H. Ayres, a former private secretary of ex-Gov. Lee. Mr. Crawford has yet to learn what the people of Nebraska, Kansas, and Oregon have had impressed upon them, that the moral "spasm" suffered by the Interior Department at Washington is really something chronic.

The effect of Secretary Root's assumption of control over the Department of State has already become apparent in a number of ways. The executive order of last November required an examination for new appointees to all posts in the consular service above as well as below $2,500 per year. At the same time, consuls were informed that a system of efficiency records had been instituted whereby they were to be rated according to the value of their commercial reports and their display of ability in the performance of other duties, with a view to consideration in connection with the opportunities for promotion. Those who are in the service know that this matter is being taken seriously in the Department, witness numberless little evidences in dispatches, circulars, etc. One result has been that consuls of long standing who have hitherto done little or nothing in the way of making commercial reports (men who knew to what influence they owed their appointment, and who have felt secure in paying no attention to the making of reports or even to the study of commercial conditions in their districts), are suddenly displaying some activity in this matter. All the consuls have noted, too, that circulars, customs rulings, etc., are sent out from Washington regularly as they appear, and not weeks after; that circulars are fewer and more carefully drawn, and do not so often contradict or else correct their predecessors; that accounts are passed upon promptly, instead of only after weeks, or even months. In these and other ways they note that some of the dry-rot is being shaken out of the old State Department by an organizer's hand. Consuls who have kept their records and performed their duties carefully, and have tried to promote their country's interests in their districts, now fairly expect that the Department will somehow, sometime, discover these facts. They also hope that the new inspecting agents whom the Department will employ to this end, will know enough to see such things when they do inspect, and will not merely perform their duties in a perfunctory way, or treat their supervisory functions as an opportunity to display to the consular service or to people abroad their own magnificence.

Harry H. Bender, State Fiscal Supervisor of Charities, must submit to an investigation by the Civil Service Commission. The case in brief is this: Bender, whom 'twere gross flattery to call a cheap politician, tried in 1904 to have a campaign contribution collected from one of his subordinates. The man refused, and was dropped from office. Then the New York Civil Service Reform Association filed charges against Bender, and the Commission started to investigate. But Bender, who knew that he had flagrantly violated the law, has resorted to every legal quibble and trick in order to escape from the clutches of the Commission. His efforts, however, have been vain, for the Court of Appeals has finally decided that the Commission has jurisdiction. This evasion and delay would have been impossible had Governor Higgins possessed courage enough to discipline Bender; but Higgins, as usual, has been afraid of Bender's powerful friends. The Civil Service Commission can, we believe, be trusted to push this case to the bitter end. Whether the result will be the removal of Bender, is doubtful. That he richly deserves to be kicked out of an office which he disgraces, no one can deny.

We read with pain that the deadly millionaire is being warmed and nourished in the very bosom of the national capital. Congressman Gillett of the subcommittee on appropriations for the District of Columbia tells us that Washington has become a veritable paradise for

tax-dodgers. The tax-rate is fixed by law arbitrarily at $15 the thousand, and the valuations at 66 per cent. of market prices. But the personal tax amounts to practically nothing at all. Household effects above a certain value are taxed, it is true, but stocks, bonds, and other securities are allowed to escape altogether. The national Government pays half of the cost of local administration. This is a standing invitation to persons of great wealth to flock to Washington, with their resources in tin boxes, which the assessors cannot lawfully invade. This looks bad for Congressmen on the way to face their constituents, and it also has a serious aspect for President Roosevelt. Just as he is maturing his plans for drawing the fangs of the golden serpent, wealth lifts an immune head under the very shadow of the White House.

Next to its opposition to the Chamberlain fiscal programme, the strongest appeal which the Liberal party was able to make to the so-called "City" interests was a promise to set the public finances in order. The Tory Government had not handled them successfully. Sir Michael Hicks-Beach brought a trained experience to the task of financing the Boer war itself, but it is now quite generally agreed that he tried too many experiments. At one time he would issue a war loan distinct in form from outstanding consols; at another he would issue consols with a prior allotment to foreign banking syndicates; then both plans would be suddenly abandoned, and the old practice of selling consols direct to the public be resumed. The effect was to upset the market for British Government securities more than was necessary, and to force the Exchequer constantly into short-term, piecemeal borrowings when it felt doubtful about trusting the money market for subscription at satisfactory prices to a new consolidated loan. Mr. Ritchie, who succeeded Sir Michael Hicks-Beach in 1902, was driven to drawing on the sinking-fund; his successor, Mr. Austen Chamberlain, resorted, two years after the war was over, to an increase of one penny in the pound in the income tax. With all this, the Government's floating debt—"exchequer bonds" running three to five years, and "treasury bills" for still shorter periods—continued in such unwieldy volume that, as against the $40,000,000 of 1899, before the Boer war, its present total is $278,750,000.

Mr. Asquith, the Chancellor of the Exchequer, declares his purpose to stop this heaping-up of unclassed debt. The most serious charge against the late Tory Government's financial policy was that of unthrift in constantly adding to this floating debt to provide for its naval and military construction. Mr. Asquith correctly pointed out, in his budget speech on Monday, that the mere existence of so huge an indebtedness of the sort was a burden to trade and financial enterprise; for the reason that, whereas the general investing public takes an issue of consols, these short-term bonds and Government notes have to be cared for by the banks, where they absorb the capital which should remain at the money market's service. Pursuance of expensive public policies on the basis of casual borrowing of this sort is a most demoralizing practice. Under it a government slips from one outlay to another, without ever being brought to the reckoning which a large public loan, with its measuring of the public credit, must involve. Mr. Asquith announces that the main expedient towards rectifying this evil should be rigid economy; the $17,300,000 surplus of the fiscal year ending with March is chiefly devoted to reducing or repealing some of the Tory Government's import taxes. The budget speech was on the whole a distinct pledge that the free-handed committing to extravagant undertakings will not, under this Ministry, be encouraged.

The Trade Disputes bill, which exempts trade-union funds from legal attachment, has passed second reading in the Commons without opposition. Mr. Balfour gave notice that the matter would be threshed out in committee. The unchecked course of this flagrant bit of class legislation in Parliament is almost equally discreditable to Government and Opposition. If it is deplorable to see a Liberal Ministry in abject surrender to a group of Laborite members, it is no less unfortunate to find a compact and ably led Opposition silent on a bill of capital importance. Except for a rather futile hour of heckling the Ministry for changing its mind over night, the Unionist leaders have let the bill alone. The matter of principle and fair play, which is obviously all-important, has been thoroughly discussed only by the Attorney-General, whose argument the Government straightway repudiated. It is clear that Mr. Chamberlain has reasons for not attacking this vicious act. He is groping about for a future composite majority that is to include the Laborites. Mr. Balfour, however, is not struck dumb by solicitude for his future prospects. What would his political godfather, the late Lord Salisbury, have said to waiving an issue of principle on a bill of revolutionary tendency, and making up by haggling over details in the committee stage? The impotence of the Unionists on an issue peculiarly their own shows how far the disintegration of the historic parties has gone. Gladstone and Disraeli, should their shades return to Westminster, would feel equally out of place to right or to left of the Speaker.

Very interesting is Lord Cromer's suggestion, in his latest blue-book, for a radical change in the legislative control of Egypt. The British protectorate is still conducted under the old "Capitulations," which require the unanimous consent of the European concert for any change in Egyptian law. Justified when Egypt was actually an international concern, the protocol is only an embarrassment now. It gives large obstructive powers to nations that have no real interest in the administration of Egypt. Practically, the European concert does nothing helpful in the premises; potentially, one disaffected nation might make a great deal of trouble. Lord Cromer's proposal is for a permanent council, which, representing the signatory Powers, will actually supervise the making of Egyptian law. In this way the principle of internationalism will be not only preserved, but made more effectual. The proposal is accompanied by a clear and convincing statement of England's duty as a trustee for civilization—a profession that gains all credit from the facts of Lord Cromer's administration. Since the Anglo-French agreement contained an express disavowal of the especial claims of France in Egypt, and no other nation except England has just standing-ground there, the way seems easy to such a readjustment of the Capitulations as is outlined above.

The Sinai peninsula is perhaps less worth a quarrel than any equal area on the globe, and one need expect no serious results from the friction between Turkey and Egypt regarding the possession of Akabah. This fort is on the pilgrim route to Mecca. For nearly seventy years the Khedive occupied it in the interest of the Egyptian pilgrims, and the garrison was withdrawn only after the land route had been practically abandoned. For a matter of fourteen years the boundary between Egypt and Syria has remained in dispute, and the Turks have made advances towards what is regarded as Egyptian territory. Primarily a problem in cartography, the Turkish garrisons have practically made the border dispute unpleasant for Egyptian travellers. Egypt has now demanded that the Turkish garrisons be withdrawn from the debatable region and the *status quo* restored. Earl Grey's statement that the Egyptian contingent is being increased at Lord Cromer's request, shows that the British Government stands ready to support the Khedive's contention. The matter is intrinsically of little importance, but requires settlement, because it affords an opportunity for schemers at Constantinople to keep up a slight irritation between the Sublime Porte and Downing Street. Such an exchange of pin-pricks is no unwelcome spectacle, perhaps, in certain non-Muslim capitals of Europe.

OUR INHUMAN TARIFF.

It was not logic but the appeals of starving men which gave England free trade. The failure of the potato crop of Ireland in 1845 did what Cobden's speeches and Bright's eloquence had not been able to accomplish. It compelled Sir Robert Peel and the Duke of Wellington—that Iron Duke whom Cobden reminded that, despite all his victories, he had "never yet entered into a contest with Englishmen in which he was not beaten"—to repeal the Corn laws. Privilege and party and an historic policy had all to go by the board when humanity asserted itself against them. There might be various alleviations of Irish distress, the Prime Minister wrote, but "the only effectual remedy is the removal of impediments to import."

Protection in this country is now facing a similar crisis. Devastated San Francisco is looking about for the material wherewith to rebuild, and finds the tariff prepared to exact the uttermost farthing frem her even in her extremity. She needs lumber, and the vast stores of British Columbia are ready to pour in upon her, but the Dingley tariff thrusts itself between and says: "First pay the extra $2 a thousand." San Francisco needs steel and iron beams and girders, to make sure that the future city shall be so far as possible earthquake-proof; but the dead hand of protection first demands its payment of ½ cent a pound. Cement will be required in great quantities, but before San Francisco can get a barrel of it, the tariff tribute must be paid of "eight cents per one hundred pounds, including weight of barrel or package." In these and other ways does the tariff Apollyon straddle the path along which San Francisco would walk to recovery.

The resulting sense of inhumanity is plainly fluttering the dovecotes of the standpatters at Washington. The protected interests are preparing to make a grudging concession to the humane instincts. The steel men and the lumber men and the cement men are willing to remove the duty on building materials destined for use in San Francisco, but "only for a specific period." This they could put up with, but what they "fear" is a "tariff debate," and, above all, they "dread the striking object-lesson which must result from such legislation." Indeed, they see troubles swelling ahead of them immediately, since they consider it "doubtful if exemption of Trust-controlled building material from a removal of the duty would be tolerated at this time, in the present temper of the people and a portion of Congress toward tariff revision."

This gives the whole case away delightfully. Greed and monopoly, intrenched in the law, are willing to remit a portion of their plunder temporarily, for the sake of aiding people in exceptional distress—or, rather, they dare not refuse to do this—but they serve notice on every other subject American that there will be no let-up on him whatsoever. For the time being, they may even be as kind to the residents of San Francisco as they are to foreigners; may sell to them at 30 per cent. under what they extort from sheeplike consumers of their own, their native land; may even consent, if they find they cannot, on account of a glut of orders, produce in time the steel and lumber and cement needed, to allow commerce to flow into the Golden Gate unvexed for a year by artificial hindrances; but they want it clearly understood that this relaxation of their grip on the country is only provisional and fleeting, and that they mean to go on taxing all other Americans without a particle of mercy or remorse.

What is the dreaded "object-lesson"? It is the demonstration, first of all, that the pretence of protectionists that "the foreigner pays the tax" is a hoary old fraud. We saw it for what it is when Congress made exemptions for burned Portland in the sixties and for burned Chicago in the seventies; but never did it appear more of a hideous absurdity than now, when even a protection-ridden Congress is preparing to relieve the native from paying the tax simply because he is destitute and it would be inhuman to make him pay it. The object-lesson next goes on to show exactly what is the power which the protected interests exercise under the forms of law. It is the power of taxation. Taxes levied by the Government for the public are a necessary evil, often grievous to be borne; but a right of taxation corruptly acquired by private interests and ruthlessly insisted upon throughout the whole country is an outrage which only needs to be uncovered to be hated. Tariff exemption for San Francisco does uncover the whole unjust system, and hence the fear and trembling of its beneficiaries. The teacher of the object-lesson will also not fail to point out that the alliance of protection with politics sends to Washington men who represent particular interests, not the people. Look at the all-powerful Senator Aldrich at this moment. It is to his tender mercies, as chairman of the Finance Committee, that the San Franciscans have to appeal. He will decide just what duties and for how long will be graciously remitted by the tariff Trusts. But on the question of free alcohol, be it noted, Aldrich is firm. The bill which passed the House by a great majority, he is going to hold up for this session. He needs to "investigate" it. But it does not require much investigating to show that the Standard Oil Company is opposed to the free-alcohol bill, and that Aldrich is doing the bidding of his masters. It is such aspects of tariff corruption that we hope the Democrats in Congress will not fail to emphasize when the bills repealing duties for the benefit of San Francisco are put upon their passage.

Meanwhile, the philanthropists of the steel trade are geting together against the bill to admit structural steel duty free, for the rebuilding of San Francisco. The *Iron Age* kindly explains: "It always takes time to rebuild, and the somewhat hysterical fears that the mills of this country, busy as they are now, could not cover the demand, are utterly unjustified." The obvious inference is that under such circumstances Congress would be guilty of a crime if it encouraged San Francisco to buy steel of the malignant foreigner. The *Iron Trade Review* declares frankly that the manufacturers will oppose the free admission of structural material. The Steel Corporation will give preference to the orders from San Francisco, so as to "prevent the necessity of calling on foreign plants to help in this emergency." The attitude of the protected monopoly is admirably reflected by the *Iron Trade Review*. That journal is moved to deep enthusiasm over "the wonderful courage, public spirit, and home devotion of the people of the stricken city." This is a very pretty statement of the sentimental aspect of the case; but in cold practice this glow of sympathy finds expression in that altruistic precept, "Line your pockets."

CONSERVATIVE WESTERN DEMOCRATS.

In nominating ex-Senator W. A. Harris for Governor, the Democrats of Kansas have chosen the strongest available politician in the State. Once leader of the Populists and classified as a "typical Kansas statesman," Mr. Harris at sixty-five is perhaps a more conservative man than Governor Hoch, who, it is expected, will be his opponent in November. The rest of the ticket is excellent. The campaign will be a serious one, upon clear issues; and, if the judgment of local observers is to be trusted, the party has an even chance of winning. What is promised in Kansas is perhaps typical of the new style of Democratic strategy, in the West at any rate. Out there the false gods have had their day of adoration, and now the party is returning to what they call in Nebraska "the J. Sterling Morton brand of democracy." Ultra-radicalism is, by the political law which decrees that new things shall come out of the West and penetrate the East in from five to ten years, now pretty much confined to the Hearst stripe of Democrats in New York and to the "Socialist-Democrats" of New England.

The Kansas Democrats, instead of calling for a repeal of the prohibitory law,

on the ground that, as it works in Kansas, it is a mere sham, call for the law's rigid enforcement. Writing before last week's convention met, a Topeka Democrat declared that the campaign would be made on the law-enforcement issue, on the proposal to secure a two-cents-a-mile passenger fare on the railways of the State, and on the anti-pass issue. These, be it noted, are all good Republican articles of faith in Kansas. It comes to a question which party can convince the greater number of voters of its ability to carry out its programme. According to tradition, the Democrats have a prior claim, and with one of the Populist old guard at the head of the party in Kansas, that State may show the way to what may amount to a general rolling back of the "Roosevelt tidal wave" of two years ago. Governors are to be chosen in California, Idaho, Colorado, Kansas, Nebraska, Minnesota, Wisconsin, and North Dakota of the Western group of States; in Alabama, Georgia, Kentucky, South Carolina, Tennessee, and Texas of the Southern group; and in Maine, New Hampshire, Michigan, New York, and Pennsylvania in the East. Besides, the general Congressional elections will serve to register the strength of this new, conservative element in the party.

Nebraska used to refer to "that grand old Democratic doxology,"

> "We want the offices—
> We don't care who the candidate or what the platform is."

From the time of Bryan's rise to a position of control in that State, however, this taunt has seldom been heard. It is significant that it has been revived by a Republican newspaper—but with the object of attempting to show that, on account of factional fights in the party, it does not now apply. As a matter of fact, the Democrats of Nebraska have come nearer to raising a live issue—the election of Senators by the people—than for a long time past. In Wisconsin, too, where the Democratic State Committee has just met, it is proposed to agitate for a party convention on the ground that under the primary law there is no opportunity for the formulation of an acceptable party platform. Candidates make the issues, while the party is left voiceless. In California, Democratic leaders have recently met to map out the campaign and to repair the blunders of four years ago that resulted in the defeat of their candidate for Governor.

In such widely separated States as Minnesota, Pennsylvania, and Rhode Island, a hopeful spirit is shown by the Democratic party guides. Under Governor Johnson it is said that the old Hanna Republican machine in Minnesota has been broken down. Senators Nelson and Clapp are charged with losing to the State a disproportionate amount of Federal patronage. They are urged by the Republicans to "get in line at the White House." An old Hanna worker recently said: "When the Republican President, in a message to Congress, lauds the Democratic Governor of Minnesota, and the latter responds in a letter lavish with personal admiration and adulation, the wheel-horses of the old Republican party may well wonder what will come next." This is a concrete illustration of the success of the new leaders of Democracy in the ancient seats of Populism in getting hold good campaign material.

There is a growing belief in Washington that in the next Congress far fewer Republican Representatives will have seats. The solid Republican delegations of such States as California, Nebraska, and Minnesota seem certain to be broken, while Illinois will send more than one Democrat to bear Rainey company. Some of Missouri's freshmen Republicans will retire. In Indiana it is expected that the Democrats will profit by Republican factional quarrels. The situation in the Eighth District is suggestive. Here Representative Cromer has just won a renomination, but after a fight that put heart into the Democrats, who say that "we have never said as mean things about the Republicans as they have said about each other."

While Pennsylvania Democrats are hopeful of electing a successor to Gov. Pennypacker and are taking stock of the strong points of State Treasurer Berry, whom they elected last year at the height of the "reform" movement, such accidental breaks in the ranks are not counted upon. In the West it is recognized that a man like Hearst might be seated in the Governor's chair at Albany, but such a "Democratic" victory would not deceive the party out there. The need for keeping sane is felt. With Western Republicans emphasizing old Democratic doctrine, such as tariff reform, State railroad regulation, and the popular election of Senators, it is felt that a "Democratic year" is due. If the avoidance of radicalism will help to gather the fruits of the movement toward Democratic principles, the party leaders in the West are prepared to resist the radicals.

CLERICAL VERACITY.

The ecclesiastical court before which the trial of the Rev. Dr. Crapsey for heresy has just terminated, declined on Thursday to allow any witnesses to qualify as "experts in doctrine." This seems proper enough. The question of doctrinal soundness is the very thing upon which the court itself has to pass. And if even clerical outsiders are not allowed to advise the court on points of theology, laymen must *à fortiori* keep silent. But there are certain moral aspects of the matter in which we are all interested, and upon which any man of good understanding and clear conscience is entitled to be heard. Moreover, on this point we have at hand a qualified expert. The late Prof. Henry Sidgwick, in his two essays on "The Ethics of Religious Conformity" and "Clerical Veracity," discussed the moral bearings of the question at issue in the Crapsey prosecution, with a directness as great as if the case itself had been laid before him. He took up precisely the instance of a clergyman who ceases to believe in the virgin birth of Jesus, and yet clings to the ministry in a church which compels him solemnly to avow such a belief every Sunday; and discussed it with a liberality, a large reason, and a moral earnestness which leave little for one to do except glean after him.

Professor Sidgwick was neither bigot, skeptic, nor indifferentist. He was a man who keenly sympathized with the liberalizing movement in the church, as everywhere else. He would grant you all the arguments for the need of revivifying outworn creeds by fresh interpretation. He was for the utmost possible freedom for clergymen. Phrases in the historic creeds which are tacitly abandoned, in their literal sense, by Christendom—such as the resurrection of the actual physical body, the descent into hell, or the ascription of bodily parts to the Deity—he would concede that they might continue to use, in a non-natural sense, since no one, or, at least, no intelligent person, is any longer deceived thereby. But Professor Sidgwick found an insurmountable moral difficulty in the explicit assertion by a clergyman, in the solemn worship of Almighty God, of belief in a plain and unambiguous statement of fact in which, in reality, he had abandoned belief. As if with his eye precisely on Dr. Crapsey, he wrote:

> "My contention is simply that the widest license of variation that can be reasonably claimed must stop short of the permission to utter a hard, flat, unmistakable falsehood; and this is what a clergyman does who says solemnly—in the recital of the Apostles' Creed—'I believe in Jesus Christ, . . . who was conceived by the Holy Ghost, born of the Virgin Mary,' when he really believes that Jesus was, like other human beings, the son of two human parents."

This, of course, goes quite beyond the usual debate about the established formularies of the church and the obligation of ordination vows. It is solely the question of the clergyman's own moral position upon which Professor Sidgwick fixes his penetrating gaze. The right of growth and the duty to change with new light, he fully admits. Tacit changes in the common understanding of the creeds he recognizes as freeing a clergyman from the charge of untruthfulness in using the old language. There is also the matter of "good faith" with his ecclesiastical superiors. He may frankly go to his bishop, admit that his views about certain doctrines

have changed, and obtain assurances that he is still within the permitted liberties of the church. Or, in the interest of theological advance and of relief for troubled consciences, he may publicly acknowledge his heresy, and ask the courts of his church to try him in order to determine whether it may be tolerated. That seems to be very much the attitude of Dr. Crapsey. A great deal is to be said for it. It is undoubtedly one of the ways in which theology may be liberalized. But behind all that lies the question of "truth in the inward parts." What is the moral attitude of a clergyman who, with or without the permission or acquiescence of his superiors, stands up before the great congregation and declares in the presence of God, "I believe"—a certain clear assertion of historic fact which he does not really believe? Professor Sidgwick was replied to by the Rev. Mr. Rashdall of Oxford, who argued against a pedantic insistence upon "technical veracity" in dealing with church symbols prescribed for repetition in public services. But Sidgwick rejoined:

"My complaint is that, instead of stating and applying these considerations with the care and delicacy of distinction required for helpfulness, so as to show how the essence of veracity may be realized under peculiar and somewhat perplexing conditions, he rather uses them to suggest the depressing and demoralizing conclusion that no clergyman can possibly speak the truth in the sense in which a plain layman understands truth-speaking; so that any clergyman may lie without scruple in the cause of religious progress, with a view to aiding popular education in the new theology, and still feel that he is as veracious as his profession allows him to be. Or, perhaps, I should rather say that Mr. Rashdall's conception of substantial veracity is what grammarians call *proleptic*; the duty of truth-speaking is, he thinks, adequately performed by a Postnatalist [one denying the miraculous birth] if he may reasonably hope that the falsehood he now utters will before long cease to deceive through the spread of a common understanding that he does not mean what he says."

What, then, is a progressive clergyman to do? Let him stick to his work, if his heart is in it, and if his departures from the faith as his church "hath received the same" do not compel him to a living lie. But if his divergence from accepted doctrine be such that he cannot stand up and repeat the prescribed creeds without intellectual stultification and moral ignominy, then his place is elsewhere; and all the arguments from usefulness and "spiritual importance" but make his position the more untenable. He may lead a movement to change a creed which has become impossible to him, but he cannot go on repeating it when to do so is of the essence of falsehood. This may be said with a sympathy as full as Professor Sidgwick's for the men who are trying to rid inherited creeds of their "thaumatological elements." Of such men we may, with him, highly approve, and say that they are "engaged on a good work and profitable for these times"; but we shall be compelled to add that it is "not a work that can properly be done within the pale of the Anglican ministry."

LUXURIOUS TAXERS OF LUXURY.

Before the President's deliverance about the need of limiting fortunes by legislation is completely dismissed as "only one of Teddy's breaks," it may be asked just why the outgiving caused so much surprise, coming from him. Every one seems to have felt a certain incongruity about it. This has been variously defined. Some have found the misfit to be simply that of time and place. Why did Mr. Roosevelt throw his hand grenade, and then declare that he had no intention of waiting to see the effect of the explosion, or of following it up? Others have felt that the trouble lay in the President's looking at the matter solely as a measure of social reform, not of public revenue. For others, the offence appeared in a Republican President taking up a doctrine of the Populists. Could he ever have been elected if we had known that he was such a radical?

In our opinion, however, the inconsistency goes deeper than any of these things. It is inherent in the case of a luxurious man attacking luxury; of the chief of a lavish nation denouncing inordinate expenditure. An Italian writer, Guglielmo Ferrero, dealt some months ago with this moral "antinomy," as the philosophers might call it. He pointed out the essential contradiction between the proclaimed ideals of rulers like the Emperor William and President Roosevelt, and the net result of their practice. They exalt the austere virtues, but encourage luxurious habits. They denounce ostentation, but promote it. We may translate a part of what Signor Ferrero wrote about Mr. Roosevelt, to show how near the white he struck:

"Not long ago, Mr. Roosevelt reëdited for the Yankees, as Augustus did for the Romans, the old treatise of Metellus Macedonicus, *De prole augenda*. He repeated to the great republic, softened by wealth and pleasures, the severe discourse which Augustus once addressed to the nobles of Rome. Celibacy he deplored, with the infertility of marriages, the frequency of divorce, and all the vices and selfishness of an over-rich civilization. He endeavored to oppose, again like Augustus, rising luxury with the simple life. There followed much discussion, many exclamations, great admiration—but what did it all amount to? The apostle of simplicity is going, none the less, to cut the Panama Canal and in other ways do all he can to double American commerce, the wealth of the cities, the luxury of the higher classes, and to overwhelm the finer traditions of his country, so dear to the President, with a flood of gold."

This is, in sober truth, to put the finger very near the essence of the puzzled feeling we all have over President Roosevelt's sudden appearance as the enemy of luxury. Publicly, at any rate, he has consistently advocated measures to make this nation the most luxurious going. He has never made a stand for economy. All his recommendations are for larger and larger national outlay, accompanying an ever-increasing extension of the functions of the general Government. He nearly rivals Capt. Hobson in his repeated clamor for a tremendous navy. All military expense he would see pushed up. In addition to tariff largesses from the national Treasury, he would have bounties handed over to shipowners, to aid them to become so "unhealthily" rich that he can begin to tax them to the quick. In a word, he quite lives up to Ferrero's description of him as a public man most lavish in all his policy, yet most denunciatory of the inevitable results of a lavish policy.

One dislikes to refer to the personal aspect of the matter, yet it is necessary to do so if full exhibition is to be made of the contradictories displayed by President Roosevelt in his unexpected dread of great fortunes. In many ways, his private attitude towards money-making has been laudable. He has never shown any of that passion for the speedy acquisition of great wealth which ruined Blaine. We can scarcely imagine an appeal to go into some scheme to get rich making any impression on him. It may be said that this is because he inherited a competence, but that does not matter; the main thing is that, in a time when the pecuniary motive has been far too strong with too many public men, Mr. Roosevelt has been singularly indifferent to it. In this respect, his example has been most wholesome. But this does not make his appearance in the rôle of an austere prophet the less disconcerting, for his manner of life has been, after all, what the average man would call luxurious. He consorts freely with the richest men of the day. This may be only a part of his large and free democracy, which sets millionaire cheek by jowl with cowboy; but it leads to some queer contrasts. The list of guests at the recent White House ceremony was telegraphed abroad as representing more accumulated millions than were ever assembled under one roof. All this is a matter of taste, and wholly within Mr. Roosevelt's rights; but it goes ill with his taking up his parable against great wealth. For such a work we naturally expect a man to be differently equipped; we do not look for one living delicately, but for a prophet clad in camel's hair and coming out of the wilderness; a Jacobin, a revolutionary, with the fire of class hatred burning in his heart; a child of labor, rising to political leadership through consistent attacks on privilege and wealth. True, we have had to see a good deal of outcry against riches by men enjoying all the comforts of wealth; but we think that the incongruity is so peculiarly marked in the President's case as part-

ly to account for the general astonishment at his desire to cut off the heads of the tallest poppies.

No doubt, the President merely typifies, in all this, a common state of mind. Most of us betray the same divided counsels, if not the same inconsistencies. Of our civilization, too, it may be said that we can endure neither our vices nor their remedies. That is one reason why luxurious taxers of luxury will never make much headway.

MODERNIZING SPAIN.

As the past "glories" of our little war with Spain are more and more forgotten in the presence of the continuing and thankless burdens which it left us, American interest in the affairs of the Peninsula has declined. Our flurry of attention to Spanish developments has subsided, though they are really of a sort to concern us and the whole world. The President recalls our accomplished and acceptable Minister in Madrid, Mr. Hardy, cutting short his diplomatic career to make room for a personal friend; but the act excites no remark. Even when he gives a consolation prize in the shape of a special embassy at King Alfonso's wedding, the interest kindled is but languid. We have ceased to be either Hispanophobes or Hispanophils. Even the translated Spanish novel has gone out of vogue among us.

Spanish politics, it must be confessed, does not offer an inspiriting study. Prime Ministers succeed each other with even greater frequency than in France, and with less apparent reason. Villaverde yields to Montero Rios, and he to Moret, without one being able to perceive adequate cause, either partisan or personal, for the substitutions. The explanation which the most detached observers, whether Spanish or foreign, give of this rather dreary succession of political changes which change nothing, is the dominance of the boss system in Spain. What the group system does in French politics, powerful and unscrupulous bosses, local or provincial, do in Spain. It is the voracious "cacique," with his insatiable demands for patronage, who makes the lives of Ministers both precarious and miserable. This is an old complaint in Spain; but it has been renewed of late with especial emphasis, as it has been freshly illustrated in the otherwise meaningless and, in any case, ignoble course of public affairs.

Commercially and industrially, Spain has given many signs of having taken to heart the bitter lessons of 1898. She is exemplifying the advantages of "intensive" farming, as against the loose and wasteful system. With the artificial colonial market cut off, the manufacturers of Catalonia have been driven to improve their methods and to depend upon their own skill. In the result, they have fully held their own. Barcelona was never more flourishing, and is now the largest and most progressive, as it is in many respects the finest, city of Spain. Similar if smaller improvements are registered in other parts of the country. The disastrous failure of crops in Andalusia last year was, after all, only a temporary check to the progress towards better conditions. Public finance has been comparatively well handled, the steady decline in exchange—or the price of gold—being a sure sign of this; and in many branches of enterprise and investment Spain is making bids for foreign capital. There has been a great demand for electrical apparatus of all kinds. In the northwest, important concessions for developing electrical power from the "white coal" of the Pyrenees, on a scale comparable to that attempted in the south of France, are in the way of being worked. Even in railroad building, where Spain has long been backward, there is new activity. A straight line from Madrid to the French frontier has been chartered by the Government, and will bring with it important commercial and agricultural gains.

It is, however, in the realm of ideas that the Spaniards are revealing the greatest change and the strongest purpose to keep abreast with the modern world. One phase of the movement is dwelt upon by Ernest Martinenche in the last number of the *Revue des Deux Mondes*. He is writing of the dramas of Galdós, who may now be described as the chief literary figure of the Spain of to-day, and shows what is the marked difference between his plays, together with the work of the school of younger dramatists in general, and those which immediately preceded them. It is that they are devoted subtly to the inculcation of the new ideas which have come into the world during the past fifty years, but to which Spain has been singularly and steadily inhospitable. What has given to the dramas of Galdós—which he began to produce only in 1892, after twenty years of novel-writing—their peculiar fame and won them their great influence, is their break with the old tradition. The impact of the modern scientific spirit, the stirring of the dry bones of ecclesiasticism, the struggles of the brain and conscience of Spain to escape from a dead past—these are Galdós's favorite dramatic themes. As Martinenche sums up his review:

> "This Spain, not official but real, Galdós has penetrated to the very bottom of its soul. He has not thought it his duty to hide its weaknesses and imperfections. Nor could he render it a better service. It was shutting itself up and vegetating in barren regrets over past glories. Galdós, with more of filial piety than revolutionary zeal, has shaken off the dust which covered that Spain, and taught her the salutary remedy of walking in the open air by the light of to-day."

Fully as significant is one of the most widely read of recent Spanish novels; we mean 'La Catedral,' by Vicente Blasco Ibañez. Reaching a sale and provoking a discussion almost unexampled in Spain, this story is devoted to impressing the same need of readjustment to modern conditions which Galdós enforces. The book is, in reality, a huge tract for the times. Under the guise of a romance, it is truly a propaganda. The larger part of its 356 pages is taken up with arguments for Spain's coming out of her shell. With the utmost boldness, Señor Ibañez sets himself against the traditional view. The expulsion of the Moors was a great calamity. They would have kept Spain in the stream of modern culture, out of which she drifted. Pride in the colonies was misplaced. They are better gone. Dreams of military power are childish. What Spain lacks is education, suffusion with the scientific spirit. So the author goes on, with much learning and great eloquence and daring; and the fact that his teachings have had so wide an echo, shows that we are in the presence of a Spanish awakening, even if we cannot yet be sure of the achievements to follow.

JAPAN'S IMMEDIATE SOURCES OF WAR-COSTS PAYMENT.

Tokio, March 31, 1906.

The fury of the war-storm in the East has passed. It shook an earth made small by wire and rail and steam. It brought new chaos to the world. Politically, commercially, financially, the face of the earth is changed. Old marks and bonds are gone. New ties are knit and knitting. New grooves are cut for trade. Great blocks of Japanese securities have been carried away to Europe and America. The ramifications of finance have been extended, enlarged, and complicated. Excitement turned the world's gaze on Japan, interest must partly keep it there. The state of Japan's finances, her industries, her trade, the doings of her Diet, the thoughts and plans of her Government and people, now concern Americans and Europeans.

The first post-bellum Diet is a sort of mirror which shows Japan in many phases, under many lights. Reflected from this mirror in towering proportions are costs of war and the present state of finances. The most careful scrutiny of these two main objects cannot yet trace all minor lines. The Finance Minister himself said that, since the war, some ships have not yet touched home ports, and the exact costs of repair cannot be stated. Although a special War Account is kept, some minor payments have been made from the regular budget and are not easily traceable. Plans for military readjustments and for other enterprises born of the war are not yet shaped. The Ministry said it hoped to have them ready for the next session of the Diet. Hence the ultimate effect of the war on Japan's finances cannot yet be wholly seen. Still, the newly enacted Budget enables us to see approximately the costs of the war to Japan, and also the immediate effects on her finances.

Omitting some minor items which are not

yet clear, and including interest on war debt till March 31, 1906, the total costs to Japan of her war with Russia were about 2,204 million yen (dollars). From this deduct the balance receivable from Russia for maintenance of prisoners, now unofficially stated to be about 80 millions. The immediate means of payment were:

	Million yen.	Million yen.
New and increased taxes and monopoly (tobacco and salt) profits, 1904-06 (March 31)	212.6	...
Economies in normal budget	96.4	309
Funds borrowed from "special accounts"		63
Voluntary contributions and miscellaneous		2
Total paid from current revenues and capital funds		374
Balance paid from proceeds of loans to the amount of		*1,830

*As all bonds were issued under par, actual proceeds were much less. Some explanation of the items in this statement will make it clear.

The new and increased taxes and monopoly profits were created by two schemes for providing war revenues. The first scheme (March, 1904) yielded in the first fiscal year (April 1, 1904—March 31, 1905) about 62.2 million yen. It continued with a somewhat larger yield during 1905-1906. The main features of that scheme appear in a previous letter of mine to the *Nation* (May 5, 1904). The second scheme of new and increased taxes (December, 1904) added to yearly revenues about 67.2 million yen. The new taxes were: a progressive succession tax, to yield 4.3 millions; a passenger transportation tax—on railways, tramways, omnibuses, waterways—to yield 3.2 millions; a 1C per cent. consumption tax on silk and cotton goods (woollens being already taxed at 15 per cent.), to yield 7.7 millions; a one sen (½ cent) stamp tax on bank-checks; a placer-mining tax. New import duties were fixed, on cocoons at 10 per cent. and on imported rice at 15 per cent. Textile consumption taxes apply to home products, and also to imports—in the latter case being distinct from and additional to customs duties. A salt monopoly was created to yield 16.2 millions. New sources of revenue thus created yield about one-half the whole new increment of revenues. The remaining half was drawn by increasing the yield from already existing sources. These additions were mainly: land tax, 11.5 millions; income tax, 7 millions; business tax, 6.5 millions; sugar tax, 2.2 millions; stamp duties, 11.5 millions (but this includes *new* textile and bank-check taxes); customs duties, 4.45 millions (including the *new* duties on rice and cocoons, some 2½ millions).

The land tax shows these changes:

	Original rate. Per ct.	*1st inc. Per ct.	†2d inc. Per ct.	Whole rate. Per ct.
Urban building lands	2.5	5.5	12	20
Rural building lands	2.5	3.5	8	14
Other lands	2.5	1.8	1.2	5.5

*March, 1904. †December, 1904.

As shown in my former letter, the first increase gave a rate but little higher than was really paid during the years before the war (1899-1903). The second increase is net addition. The whole rate of 5.5 to 20 per cent., resting on a low cadastral value, is relatively less burdensome than income, business, and some other taxes. The Government had proposed 8 per cent. more on urban building, 6 per cent. more on "other" lands, and 1 per cent. less on rural building lands. The overwhelming influence of the landed interests in the Diet refused to draw from land all that the Government wished. The urban interests opposed the great disparity of rates proposed by the Government for urban and for building lands. The outcome was compromise and the rates above given.

Income taxes are assessed under three classes. Class I. includes income of legal persons, *i. e.*, joint-stock and other companies and partnerships. Class II. includes incomes from public and corporation bonds. Class III. includes all other incomes, *i. e.*, salaries, wages, earnings, allowances, pensions, interests on loans to individuals. The tax on Class II. remains throughout the same as before the war, viz., 2 per cent., while the later issues of home war bonds were exempted from taxation. Incomes under Class I. are divided into two groups. (1) Where the number of shareholders or partners exceeds 21—the original rate being 2.5 per cent.—the war increase is (.7+.8) 1½ times the original rate, making a total rate of 6.25 per cent.; (2) where there are less than 21 shareholders or partners—the original rate being 2.5 per cent.—the war increase was progressive, making a total rate of 4½, 6, 7½, 9½, 11½, 13½, 17, 20¼ per cent. on incomes of 5, 10, 15, 20, 30, 50, 100, and over 100 thousand yen respectively.

The changes brought by the war in Class III. are best shown thus:

Amt. of income. Yen.	Rate before the war.	Proportion of rate before the war. 1st inc.	2d inc.	Whole rate.
300 to 500	1	.7	.3	2
500 to 1,000	1.2	.7	.4	2.52
1,000 to 2,000	1.5	.7	.4	3.45
2,000 to 3,000	1.7	.7	.4	3.91
3,000 to 5,000	2	.7	.4	4.60
5,000 to 10,000	2.5	.7	.6	6
10,000 to 15,000	3	.7	.7	7.50
15,000 to 20,000	3.5	.7	.8	9.45
20,000 to 30,000	4	.7	1.0	11.50
30,000 to 50,000	4.5	.7	1.2	13.95
50,000 to 100,000	5	.7	1.4	17
100,000	5.5	.7	1.7	18.70
Over 100,000	5.5	.7	2.0	20.35

The whole rate here given is national tax. To this, urban and prefectural taxes may be added within the limit of .3-10 of the rate before the war. (The actual rate so added in Tokyo this year is about 25-100 of that before the war.) Few salaries in Japan exceed ten thousand yen. Relatively few incomes are in the grades above twenty thousand yen, and probably none are taxable in the two highest grades. Hence the great mass of incomes are taxable in the grades which, including local additions, range from 2¼ to 10 2-5 per cent.

The business tax applies to profits earned in trade, transportation, banking, insurance, manufactures, inn-keeping, and such like enterprises. The tax is assessed on a complicated basis. Its weight and increment of increase closely correspond with those of the income tax.

The new succession tax distinguishes between property used to perpetuate the family estate (property going to the new head of a family) and property passing to others than a new family head. In each case, the tax is graded (a) according to the degree of kinship or to the nature of legal relationship, and (b) according to the value of the property inherited. The rates of the tax range from 1.2 to 6.5 per cent. The peers, who specially feel this tax, wished to avoid or change it; but, on learning that the Lower House would brook no important change in the war budget, the peers gracefully bowed the unwelcome tax into being. The proposals for a salt monopoly and a rice duty called forth from a part of the press and public sharp criticism. The Government asked for a 15 per cent. tax on silk and cotton goods. The Lower House made it 10 per cent., payable in stamps. Both industries concerned strongly, but vainly, opposed the tax and still more the method of collection.

In the second scheme of war taxes, all changes noted and a few of less importance were made by compromise with the Government in the Lower House Budget Committee. Afterwards, patriotic zeal, impatient of criticism or discussion, and wishing to show a united nation, quickly carried them intact through both houses. A provision that all special war taxes (but not succession tax and monopolies) should end within the next year after that in which the war ended, smoothed the way.

The remaining items which contributed to war expenses may be more briefly explained. "Economies in the normal budget" came from certain peace expenses of army and navy, from the suspension of various public works of a continuing nature, from curtailment of ordinary administrative expenses. Sums thus saved were used for war. The "funds borrowed from 'special' accounts" are those which had been created for special purposes, viz., naval maintenance, public relief in times of national calamity, education, redemption of Formosan public-works loans, improvement of State forests. Other items were patriotic gifts and small miscellaneous receipts.

The great part of the war expenses was paid from proceeds of loans. War loans were placed thus:

	Yen.	Per ct.
At home	280,000,000	@ 5
	200,000,000	@ 6
In foreign countries	220,000,000	@ 6
	600,000,000	@ 4½
	100,000,000	@ 4

Last November the Government contracted for a foreign loan of 500 millions at 4 per cent. The net proceeds of that loan (half now in hand) are ear-marked to redeem the home 6 per cents (conversion now in process) and the foreign 6 per cents, and otherwise to balance the war budget. Again, the new budget provides for the issue of 350 millions of additional bonds to square war accounts. Of these, 200 millions at 5 per cent. have just been floated at home. Another 150 millions are to pay pensions, rewards, etc., to army and navy. They will be home 5 per cents, and they are, so far as practicable, to be issued direct to the beneficiaries. Then, after using the 500 millions foreign 4 per cents and the 350 millions home 5 per cents as explained, the war debt will take this form:

	Yen.
Home bonds at 5 per cent (280+350)	630,000,000
Foreign bonds at 4½ per cent	600,000,000
Foreign bonds at 4 per cent	600,000,000
Total	1,830,000,000

It thus appears that, after deducting the balance receivable from Russia for maintenance of prisoners (now unofficially re-

ported at about 80 millions), Japan's war with Russia has cost her something over 2,124 million yen. Of this sum she has paid (March 31, 1906), out of increased revenues, economies in administration, sums diverted from other uses and patriotic gifts, together, about 311 millions. If she were now to borrow money and restore the capital taken from her permanent funds (this has not yet been done), the addition to her debt made by the war would be about 1,893 million yen. The resultant changes in national expenditures and the way taken to meet them will be shown in a later letter on the recently adopted budget.

E. H. VICKERS.

THE WINDSOR WHISTLERS.

LONDON, April 15, 1906.

The English have of late seen so many pictures and other works of art, after long years in the country, leave it, chiefly for Germany and the United States, that the few whose business it is to take charge of such matters are becoming alarmed. There has been something like a panic among directors of galleries and writers on art. A national art collections fund has been established, with a view to eking out the beggarly pittance for purchases allowed to its galleries and museums by the self-styled richest nation in the world. Various schemes are being suggested to prevent a repetition of recent losses. Some would-be authorities incline to a system of cataloguing all the old pictures in private houses throughout the United Kingdom; others, to a commission—as far as I can understand it—to keep an eye on them; or else, to a stamp act, a stamp tax on every picture, of any date or school, sold—which would make the dealers incontinently shut up shop, and societies of artists bring their exhibitions to an end forevermore. The leading reviews have found space for the subject; the papers that extend their attention to art have been full of it. To read the numerous articles, to follow the animated controversy, is to imagine Great Britain in as violent a state of agitation over its pictures as over its Trade-unions and Education bills. And this is the moment in the midst of the clamor—as if to remind a common-sense public that he has no sympathy with such nonsense—chosen by the King to sell the Whistler etchings which, with the Holbein drawings and the miniatures, were the great glory of the Royal Library at Windsor Castle. Moreover, to emphasize his indifference as to whether or no great works of art remain in the country, he has, as everybody now knows, allowed the royal prints to become the property of a New York print-dealer. It is the first time on record that a King of England has stooped to so "unroyal" a transaction.

The circumstances make it seem all the worse. The etchings were collected during the last reign, though nothing could be less in keeping with the manner of art that usually appealed to Victorian taste and received Victorian patronage. But Sir (then Mr.) Richard Holmes, the librarian at the time, had the intelligence to appreciate Whistler when hardly anybody else did in England, and to foresee the day when the prints would be valued as the masterpieces they are. Gradually the collection increased in number until it included many of the early French and London prints, the Venetian and Dutch sets, some of the later prints, the Naval Review set, which collectors now find so difficult, if not impossible, to complete. Among all these are several very rare prints and states, many very beautiful impressions. The Naval Review series has, moreover, a personal interest, for it was presented to the Queen by Whistler in commemoration of a great royal occasion. The plates were his record, made during the day of the Review at Spithead in 1887, the year of the first jubilee. Permission to present them was asked in a stately letter, afterwards presented at Windsor, to the late Right Hon. W. H. Smith, then in the Cabinet; the gift was accepted by the Queen, and Whistler, with his characteristic respect for the ceremonial of life, did everything to increase its distiuction, arranging the prints with every care in a portfolio specially designed by himself. It may be a question whether Queen Victoria (who had the misfortune to dabble in etching) ever looked at the Whistlers more than once, if, indeed, she looked once; whether they interested her in the least; whether she remembered their existence and her gracious approval of them for her library. But, anyway, there they were, the most splendid addition to that library during the Victorian period, and, if left undisturbed, they would have been forever after associated with her uame as the Holbeins are with the name of Henry VIII., as so many of the finest pictures in the royal collections are with the names of Charles I. and Oliver Cromwell. There was, too, the immediate personal note in the Naval Review set, commemorative, as it was, of one of the most important events of her reign, presented by the artist who, if not an Englishman any more than Holbein or Van Dyck or the other distinguished foreigners England now delights to claim, was the greatest master at work in the country during the long years when she was Queen.

These are the etchings the King has thought it expedient to sell, in order—so the reports put it with a seriousness that in any other country might be mistaken for humor—in order that the Library, of which they were one of the chief treasures, may be improved! A few years ago, the sale might not have struck one as quite so preposterous and unroyal. It was known only here and there, by a keen collector or by a casual visitor to the Library, that any Whistlers were at Windsor. The Royal Family would, the chances are, have been the last to discover them unaided. But, after the past two years, the King, if he would, could not help knowing something of their actual importance, though it must have come as a surprise when loyal subjects began to compliment him on his Whistlers with scarcely less warmth than on his prize cattle and race horses, which he could understand without the assistance of anybody.

The fact was, loyal subjects were themselves beginning to hear a great deal about the royal Whistlers; they heard about them, first of all, when a representative showing of Whistler was proposed in Edinburgh two winters ago, and it happened that Sir James Guthrie, on the advice of an artist who is an authority in these matters, appealed to Windsor for the loan of some of the etchings there, with the result that the fine Venetian series had a place in the exhibition. Then came the Whistler Memorial Show, arranged by the International Society of Sculptors, Painters, and Gravers, in London last winter, to which all the Windsor Whistlers were lent, including those in the Princess Victoria's apartments. No one who saw can easily forget the beauty of the court, where they covered the white walls, and of the balcony above, where the Venetian prints were hung. The King was not denied the privilege of seeing this beauty, for he and the Queen visited the exhibition. Apparently, he was impressed in his own royal fashion, though not even the delightful stories of the visit that went the rounds of London afterwards invented anything as hard to believe as the use to which he was to turn his impressions. It will be remembered that, at the close of the London show, some of the Windsor Whistlers went to the Whistler exhibition at the Beaux-Arts in Paris. The French were loud in their praise of the King's generosity and his fine judgment as a collector. Really, in Paris, Edward VII. began to figure as quite a patron of the Fine Arts, a worthy successor to the Stuarts and Tudors. As for the English papers, they were jubilant. What? cried the critics, Whistler not recognized in England, his work not accorded that most practical of all appreciation, a place in one of the country's great collections? What misrepresentation! Look at the Windsor etchings!

Well, no one again can look at the Windsor etchings at Windsor. As soon as the King found out that they had a value and that this value was financial as well as artistic—Sir Richard Holmes having been superseded by another librarian—he sold them. With the exception of several on the walls of Princess Victoria's rooms, they have all gone—early French and London prints, Venetian, Dutch, and the Naval Review, the very portfolios prepared specially for the Queen. Only the letter has been suppressed. There is just a suspicion that somebody connected with the transaction had the grace to be ashamed—perhaps the English dealer who was the King's agent on the occasion; for not until the collection was in the hands of the New York firm was the fact of the sale actually known in London. That the King, like a wise collector, was getting rid of duplicates, principally of his mezzotints, was the first story. Then followed vague references to the Whistlers. Then silence. But the transaction is completed now. An American firm of print-sellers have had the good sense to prize what the King disdains, there is no reason for them to keep silent, and no doubt, before much longer, the Windsor Whistlers will be seen in New York.

That the collection should go out of the country must be the most unfortunate feature of the whole business to those who are quick to lament the lack of patriotism whenever a less exalted Englishman sells any masterpieces in his possession to the foreigner. In the course of the recent excitement over the Rokeby Velasquez, that point was made very clear. Then, however, the public was offered the opportunity to prevent such a catastrophe by putting its hand in its pocket. That the picture was

for sale was widely advertised; that a smaller sum would be accepted if it were bought for the nation was also announced. But that was a different matter, for, according to rumor—a rumor never denied—the Velasquez was being managed by a little syndicate of art critics who expected to make their profit out of public patriotism: which they doubtless did, unless the scandal was too great to warrant the risk, or unless the whole story was a fabrication—for the "Venus" is now in the National Gallery. When I saw it some years ago at the Old Masters', I remember being very much impressed by it. Whether because of the cleaning it is said to have suffered, or some unrecorded accident, or some uncalled-for repainting, I cannot say, but certainly it fails to impress me in the same way now it hangs with the Velasquez group in the Spanish Room at the National Gallery. I have even heard artists question if Velasquez ever touched it. However, it has been secured for the nation, after months of loud talk about it, diligent collecting for it, much scandal over it; while a foreigner has been allowed to buy the fine collection of Whistlers from the Library of Windsor Castle without one word of protest or one word of regret, to my knowledge, having been uttered. The Englishman who is the rare exception and cares for art, must ask with anxiety if it is the turn of the Holbeins next, and if they too must go in the royal endeavor to improve the Royal Library. N. N.

Correspondence.

COMING HOME TO ROOST.

To the Editor of The Nation:

Sir: The comment of President Roosevelt on the decision of Judge Humphrey in the Beef Trust cases may be subject to just criticism for its lack of propriety. The intimation of the President that the judge did not know the law, or at least did not follow it, reflects sharply on his qualifications for his office. It would be well for President Roosevelt to go back further and consider the part he himself may have played in what he regards as a miscarriage of justice. Judge Humphrey's intellectual abilities are moderate; he would scarcely be equal to the grasp of any large proposition. Prior to his elevation to the bench, he had greater fame as a politician than as a lawyer. He had been for many years the political factotum of Senator Cullom in southern Illinois. At the time of his appointment he had never manifested high judicial qualities. The President did not appoint him because he supposed he had them; nor did he care to inquire. He simply permitted Senator Cullom to make the appointment, and the Senator spent no time seeking for the best man for the office. The President treated the appointment as he treats all judicial appointments, as one of the "places" which "belong" to Senators. Judgeships are not distinguished by him from the offices of postmaster, marshal, or Indian agent.

Prior to McKinley, most of the Presidents withheld the judiciary from the scope of Senatorial patronage. This desirable custom, unfortunately, has not been in vogue under Roosevelt. He has appointed four judges now sitting in this circuit, none of whom had any distinction at the bar, or any substantial recommendations for their judicial appointments, except those of Senators Cullom and Hopkins. The result is a Federal judiciary not only not comparable to their predecessors, who included Drummond and Blodgett, but below the average even of the State judges. If the judges whom Mr. Roosevelt has thus selected "make a farce of the law," as he declares in his message, a large share of the responsibility is his. John A. Woodruff.

Chicago, April 23, 1906.

LORD GRANVILLE'S STATECRAFT.

To the Editor of The Nation:

Sir: One who has closely followed the career of Lord Granville is much pleased with your reviewer's estimate of Lord Fitzmaurice's work (*Nation*, March 15), with its fairness and ability. One observation, however, might be controverted, namely, that Lord Granville's name would never be connected with any great and memorable fact in foreign policy. This is not quite the case. Apart from the marked help which he gave to the cause of United Italy during his short first tenure of the Foreign Office, in 1852, his name will be connected with at least three events of very great importance in political history.

(1.) When Foreign Secretary in 1870, Lord Granville notified both belligerents, upon the outbreak of the Franco-German war, that, if either violated Belgian territory, England would at once join the other side. This bold step was wholly successful.

(2.) When Foreign Secretary for the third time, in 1880, he carried through a European naval demonstration organized by himself—the fulfilment of the stipulations enforced two years before by the Berlin Congress upon the Turks, which the Sultan had hitherto evaded.

(3.) Although the outset of the policy was clouded by checks and disasters, Lord Granville initiated the policy of the "policing" of Egypt by England, in 1882, which has ultimately proved so beneficial to both countries and to the world at large.

It may, of course, be said that in these instances he was guided by Mr. Gladstone's influence, but this was not so at the time of the Danish war. Then he assisted the late Queen against Lord Palmerston and Lord Russell, and at first against Mr. Gladstone himself, who subsequently came around to Lord Granville's views, to keep the peace with Germany instead of joining in that conflict. F. H. R. Poole.

April 25, 1906.

Notes.

Brentano's announce for early publication 'Italian Romance Writers,' being essentially a translation of Dr. Joseph Spencer Kennard's 'Romanzi e Romanzieri Italiani,' published in Florence two years ago.

We read in the *Library Journal* for April that the Carnegie Institution of Washington has in mind the completion of the late Joseph Sabin's 'Bibliotheca Americana,' which Mr. Wilberforce Eames carried on as far as John Smith; a desideratum indeed.

Ever since the early days of the London Bibliographical Society, plans for a complete bibliography of English literature have been discussed at its meetings, and the Society has just taken steps to collect material for a catalogue of all English books printed up to the end of 1640. Under the general editorship of its honorary secretary, Mr. A. W. Pollard, a collection of lists of books coming within this scope and preserved in college and cathedral libraries and similar collections has begun to be issued. First to be published is a catalogue of the books in Archbishop Marsh's Library in Dublin of earlier date than 1641, prepared by Dr. Newport J. D. White, Marsh's librarian. It is a volume of ninety pages, enumerating not far from 1,500 titles, chiefly of historical and theological works. The Bibliographical Society stands ready to defray the cost, as far as its funds and the claims of its regular publications will permit, of paper and printing for such other lists of this kind as may be prepared.

Americans of Welsh descent will find much to interest them in the facsimile reproduction of the MSS. of 'The Taylors Cussion' by George Owen (*circa* 1552-1613), to be issued this month with a short biography of the author by Emily M. Pritchard (Olwen Powys). George Owen, Lord of Kemeys, was the only Lord Marcher left in Britain in the time of Elizabeth. He was a noted scholar and antiquary, and, judging from the title-page, a man of quaint humor. Just as "the Taylors cussion made of shreedes of divers peeces hath a snatch," in the same way (so runs the assurance) "he that all this volume reedes of divers thynges will find a snatch." Among the said snatches are rules to shoot great ordnance; to score sheep; to know the full sea at Tenby and Milford; verses to find the books of the Bible as they now are placed; a pithye description of the persons of the Trinity; lists of the Deputy Lieutenants of every shire in Wales and the Marches, of all the shires in England and Wales, and the number of parishes, cities, and boroughs in each shire—of all the bishops that have been in St. Davids—of the fairs and markets in every shire in Wales, with many other matters, notes on antiquities, etc., etc. The book will be put out by subscription by Messrs. Blades, East & Blades, No. 23 Abchurch Lane, London, E. C.

A little handbook for 'Genealogical Research in England, Scotland, and Ireland,' by J. Henry Lea, merits the attention of all serious American searchers for ancestors beyond seas. Besides general preliminary guidance, the main features to be noticed are a list of Probate Jurisdictions for every county, with the location of each and the earliest date of wills (pp. 11-46); an index of Will Registers in the Prerogative Court of Canterbury, according to their respective dates (pp. 47-49); the same, alphabetically arranged (pp. 50-52); indexes of Will Registers in the Consistory and Commissary Courts of London (pp. 53-54); a list of Marriage Licenses by dioceses (pp. 57-63); a list of Herald's Visitations (pp. 70-86); a table of the names and jurisdictional scope of the Commissariat Courts of Scotland (pp. 91-95); lists of the Counties of Ireland and their diocesan jurisdiction, and of the Will Indices in the Public Record Office, Dublin (pp. 100-103); and, finally, lists of Probate and Diocesan Re-

gistries in England, with hours open and of closing (pp. 106-112). The rear is brought up by a folded map on linen, showing the Probate Districts of England and Wales. The author is his own publisher, at South Freeport, Maine (London: Mitchell, Hughes & Clarke), and the price is $1.50 (or, interleaved, $2.50).

Miss H. A. Guerber's 'How to Prepare for Europe' (Dodd, Mead & Co.) is a new and highly ambitious kind of guide-book. It consists of something over five hundred pages, and is a handbook of "historical, literary, and artistic data." First comes the preparation of the mind, in 486 pages. This includes short histories, from the earliest times, of all the European countries, Asia Minor and North Africa, with excellent maps and illustrations (nearly one hundred in number) of places and famous pictures; all clear and well reproduced. For each country there are bibliographies and tables of dates. The wonder grows how one small book can carry all this. But when one observes, on closer scrutiny, that the four pages of "Greek History" contain no single name or date, one marvels less. Miss Guerber, however, is detailed enough, in all conscience, in her table of Greek chronology, and we feel that the unwary reader should be warned that if he accepts 1198 as the precise date when Paris kidnapped Helen, or 1213 for that first abduction by Theseus, he must not suppose that he is hacked by the pundits of to-day. Let him, however, digest as he may all those thirty-four imaginary dates in the table down to the eighth century B. C., provided only that he does not follow the authoress in her statement on page 49 that the Long Walls of Athens were pulled down in 411; for, as a fact, that devoted city preserved her cherished walls to the Peiræus until 404. We observe in a note by the author that, had space permitted, she would have included a Comparative Chronological Table "from the dawn of history to date," and that this will be published separately. If facts were all, the reader of this little book would be sufficiently equipped; no brain could carry more. The page on Vesuvius is now unhappily out of date. The phraseology is usually correct, but here and there is evidence that for Miss Guerber English is an acquired language. One does not speak of "herds" of geese and ducks (p. 117), nor can one allude to a Vandal Invasion as a "mode of death" (p. 22). Torquay is disguised as Torquai (p. 117); Mure, not Muir, is the name of the historian of Greek literature (p. 51); on the same page Shuckburgh is misspelt Shuckburg. These are slight blemishes on a useful little book that need not be depreciated as over-ambitious, since it is light in the hand and most compact and clearly printed.

We have received two more volumes (III. and IV.) of the "Gettysburg Edition" of Nicolay and Hay's 'Complete Works of Abraham Lincoln' made more complete as we have already specified (New York: Francis D. Tandy Co.). The portraits continue to present an interesting variety.

Two years ago, Mr. J. R. Tutin, of Hull, England, ventured a series of paper-bound "Orinda Booklets," an anthology of seventeenth-century English verse, which he has now followed up with a second series, but in the orthography of the original editions, with a minimum of editing. The four in hand include Katherine Phillips, Robert Heath, Henry Reynolds, and Thomas Flatman. In the same style but somewhat bulkier is a new set of "Pembroke Booklets," "for the general lover of our great Elizabethan, Jacobean and Carolinian Literature." Both issues are praiseworthy as selection, and typographically attractive.

The 'Ainu-English-Japanese Dictionary and Grammar' (pp. 525+159) of the Rev. John Batchelor, for over twenty-five years a resident in Yezo among the Ainu, and author of three other books on these aboriginal people of the Japanese archipelago, is issued in a second edition, greatly enlarged and with both Chinese characters and *kana* added to the Romanized Ainu and English (Tokio: Methodist Publishing House; London: Kegan Paul, Trench & Co.). To the dictionary and grammar proper he adds a discriminating chapter on "Ancient Japanese and Ainu Compared," and a most suggestive list, with commentary, of place-names in the archipelago. This English scholar expresses his regret that, in view of the desirability of criticism, so few persons are interested in Ainu. Besides making a book of the highest scientific value to students of Japanese and the Turanian or agglutinative languages, Mr. Batchelor argues for an Aryan origin of the Ainu tongue. He demonstrates to completion what Chamberlain had already in large measure pointed out, that the Chinese characters with which place-names in Japan are expressed are wholly misleading, and that the names of rivers and mountains and other landmarks in Japan are as surely Ainu (we may add) as are those in the United States Iroquois or Algonquin. It is creditable to note, by the way, that all official Japanese documents have dropped the old "Aino," popularly suggesting canine or at least brute origin, and now use the term Ainu (men). It is conclusively proved that the Ainu language has no general affinity with the Japanese. In the Turanian tongues (*e. g.*, Japanese) the root suffers no change. In Aryan, the change in the root is perhaps the most characteristic fact, and the Ainu grammar reveals in this respect a close affinity with Aryan morphology. A reading of the Dictionary discovers not only the narrow range of ideas of the Ainu, but at many points interesting similarities and differences. The argument in this book, on the linguistic side at least, shows that the basic stock of the people of Japan is a white or Aryan race.

In the 'Life of General Sir Andrew Clarke' (E. P. Dutton & Co.) we have a memoir of one who served the British Empire in the highest posts at home and abroad—Surveyor-General in Victoria with a seat on the Legislative Council, later Colonial Secretary; Director of Works at the Admiralty; Governor of the Straits Settlements; member of Council of the Viceroy of India; Inspector-General of Fortifications, etc. The book, which contains some interesting portraits, illustrations, and maps, is full of information as to persons, places, and events; but is wanting in individual human interest. It is rather a record than a well-digested biography. This is the more to be regretted in that Sir Andrew was at the centre of affairs in Tasmania during convict times; in Australia during the gold discovery; and in the Straits Settlements during reconstruction. He was evidently an able, high-minded, conscientious man of independent character, and with broad views of life and government. In reading this volume we have been reminded of the power of literature before other pursuits to give prominence to a name. Here is a man who governed provinces and left his impress on States, yet to most the name of Clarke recalls his cousin Marcus, the author of 'For the Term of his Natural Life.' A passage in Col. Clarke's interesting preface goes far to clear Mr. Gladstone of any blame regarding the fate of Gen. Gordon.

Under the title of 'Old Tales from Rome,' Miss Alice Zimmern has put into readable form for children a volume of legendary lore from Virgil and Livy, covering the ground of the Æneid and the period of the Kingship (Chicago: A. C. McClurg & Co.). The author would have done better, we think, to have kept her book free from any dependence upon the previous reading of her 'Old Tales from Greece.' At the end of the book she has placed a few adaptations from the Metamorphoses of Ovid, interesting enough in themselves, but damaging to the unity which her stories otherwise possess. We fear that not many eyes will be offended by her own (or the proof-reader's) metamorphosis of Typhō-eus into Typhœ-us. The successful efforts to make the book attractive to the eye in other ways should have been seconded by a little more care in the inking, which is somewhat uneven.

Though the Byzantine Empire of the eighth and ninth centuries stood somewhat apart from the more easily recognized currents of world development, yet, with plot and counterplot, iconoclast and anti-iconoclast, orthodoxy and heterodoxy seething within, and such ogres as Chumn the Bulgarian without, ready to make a drinking-bowl out of an emperor's skull if occasion offered, life in Eastern Europe in those days was anything but an unbroken round of dull monotony. Around the personality of Theodore of Studium, who figured in the iconoclastic controversy as an ardent and persistent advocate of the use of the sacred images, Miss Alice Gardner has constructed a very interesting and informing picture of the life of the time under the title of her hero (London: Edward Arnold).

In lighter and more popular form we have also from Armand Colin, Paris, a volume of biographical sketches by M. Charles Diehl, entitled 'Figures Byzantines.' M. Diehl covers about six centuries in his choice of subjects, touching Miss Gardner's period in but two cases, those of the Empress Irene and of Theoctista, the mother of Theodore of Studium. Readers of M. Diehl's 'Excursions Archéologiques en Grèce,' either in the original or in the English version, will not need to be assured that these sketches are at once scholarly and entertaining. The man who will teach English and American scholars the secret by which so many French prose writers pack so much lucid and interesting thought into so small a compass, will have effected a saving far beyond anything to be hoped for from our subsidized spelling-reformers.

Nothing daunted by adverse criticisms of his 'Government Regulation of Railway Rates,' Prof. H. R. Meyer offers "the second of a series of four books" on public regulation of industry. 'Municipal Ownership in Great Britain' (Macmillan) arraigns public management of transporta-

tion and electric light and power. There is also a short chapter upon municipal gas plants, which should have been allotted more space, inasmuch as it is popularly supposed that British municipal trading has been especially successful in this field. Scorning "birds of passage who study problems on the spot," the author presents a purely objective study of official evidence. His work consists largely of quotations judiciously selected. His opponents may complain that the selection has been too discriminating, but whether he has presented more or less than half the story can be ascertained only after some one of a different attitude of mind has made as thorough a study of the same sources of information. With respect to the injurious Tramways act of 1870 and the inadequate Light Railways act of 1896, the author's conclusions will receive fairly general assent. The controversy over fares, however, is a long-standing one, and, even if Mr. Meyer's figures are unchallenged, his interpretation of them is sure to be questioned. The probabilities are that uniform fares would have relieved the congestion of British towns to a somewhat greater extent than graded fares have done, but the author seems not to realize that the problem is so complicated that there are intelligent as well as honest differences of opinion. It is unfortunate that skilful bargaining on the part of companies is characterized as "enlightened self-interest," while equal vigilance on behalf of the towns is persistently ascribed to the "greed" and "stupidity" of the "municipal politician." But if intellectual tolerance is not one of the merits of the book, moral earnestness is; and the work is one that cannot be lightly answered.

The latest addition to the literature of monetary problems is Joseph French Johnson's 'Money and Currency' (Ginn & Co.). Written for "practical men as well as students in high schools and colleges," the book avoids the pedantry and needless technical terminology that disfigure many works upon the subject. Within the moderate compass of 398 pages, and in simple and direct language, the author presents the essential facts and principles of money and credit. Long study of his subject, from a practical as well as a pedagogical point of view, has fitted him well for his task, and he has produced what should prove the best text in its field. Particularly to be commended are the careful analysis of the demand for money, the discussion of "fiat" money, and the treatment of the difficult subject of credit.

"The Home Library of Law," by Albert S. Bolles (Doubleday, Page & Co.), in six small volumes, is one of those courageous attempts at popularizing law in which enterprising publishers and authors display the perennial optimism that no experience of failure in this field ever entirely kills. There never has been written any popular law book, that we can remember, since Blackstone, and the reason lies on the surface—law is not popular, and genius alone can make it readable; even Blackstone is not popular except with students of law and government. Nevertheless, a new Blackstone may be born, and, if now living, it is the business of publishers to search for him and set him to work. It is small blame to Mr. Bolles if he does not turn out to be one. His qualifications for his task are inadequate, and his "Home Library of Law" cannot be recommended as anything more than one of many labored compendiums.

Not since Herder in his 'Kritische Wälder' attacked the validity of the conclusions as to the relation between poetry and art reached in Lessing's 'Laokoon,' has there appeared a more trenchant or original criticism of Lessing's æsthetic principles than that contained in Prof. Frank Egbert Bryant's treatise 'On the Limits of Descriptive Writing' (The Ann Arbor Press). The treatise, which forms number six of the "Contributions to Rhetorical Theory," edited by Prof. F. N. Scott of the University of Michigan, is remarkable not so much for learning—although the author's reading is wide and varied—as for the fresh and unbiassed manner in which he approaches subjects that to the great majority of scholars have seemed to be settled once for all. He certainly proves his point that the Homeric poems contain many descriptions of coexisting objects which it is in no way difficult for our imagination to conceive of as a whole; so that Lessing's insistence on the necessity of the poet's transforming coexisting objects into consecutive action in order to bring them clearly before our mind's eye, is shown to be without support from the very poet on whose alleged practice Lessing's theory is largely founded. Professor Bryant's treatise will be a most welcome help to college teachers who interpret and discuss Lessing's 'Laokoon' in the classroom.

"Our Plant Immigrants" is the title of the leading article in the *National Geographic Magazine* for April, in which Mr. David G. Fairchild describes, in a most instructive and interesting way, one of the means by which the Department of Agriculture is increasing the agricultural wealth of the country. After a too brief reference to his own six years' experience as an agricultural explorer in most of the promising plant-growing regions of the world, he tells how the great plant industries of the country, as the wheat, rice, and fig, are being changed or bettered by the introduction of new plants. Nearly twenty different varieties are being tested at the Government stations or by carefully chosen farmers. Among the problems now in process of solution are the finding of paying crops for the abandoned rice farms of the Carolinas, the introducing of hardy fruits into the Northwest, the improvement of the arctic agriculture of Alaska, and the substituting of a valuable for a worthless cane in the cane brakes of the South. Mr. Walter Wellman gives a description of the new airship or aeronef, now being constructed in France. It will have a carrying power of eight tons, with two motors, one of 50 the other of 25 horsepower, and will be maintained in the air from 20 to 25 days and travel at a speed of 12 miles an hour. There will, further, be a motor sledge. An interesting feature of the expedition is the plan to establish a wireless station at Hammerfest, Norway, another at the headquarters in Spitzbergen, 600 miles distant, and a third on the airship, by which it is believed that messages can be sent from the neighborhood of the Pole itself to the outer world. Mr. Wellman treats at length of his proposed methods of navigation, and gives some elaborate tables of wind velocities in the Arctic Ocean from *Fram* records. The expedition, which is financed by Mr. Victor Lawson, is planned to sail for Spitzbergen in June, where the headquarters for a two years' campaign will be established. The Board of Managers of the National Geographic Society have recorded their conviction that Mr. Wellman's plans "for reaching the North Pole are carefully and thoroughly considered, and give good promise of success." Major Henry E. Hersey has been appointed as a representative of the Society to accompany the expedition.

Our compatriot, the Rev. William Hayes Ward, makes in the last *Athenæum* a gallant attempt to explain once more and finally Milton's "two-handed engine at the door" in 'Lycidas,' which most commentators pass over in silence. He follows his predecessors in seeking the source of a Biblical allusion, and finds it in Ezekiel viii., ix. The "slaughter-weapon" of ix., 1 is the "engine" in question, whether translated maul or battle-axe. We shall offer no opinion as to the conclusiveness of this view. Dr. Ward finds the "smite once, and smite no more" clearly reminiscent of the words of Abishai to David in the presence of the sleeping and unguarded Saul.

—Gardens and gardening is the accentuated feature of the May *Century*. Frances Duncan describes the gardens of the group of artists and literary folk who have taken up their abodes at Cornish, New Hampshire, beginning with Augustus Saint-Gaudens, who set the pattern twenty years ago. Francis E. Leupp writes of the old Washington garden, at Mount Vernon, and, from the evidence of Washington's letters and diaries, almost exclusively negative, he is inclined to give the credit of it to Mrs. Washington. A plan of it, dated 1787, is shown at page 159. Ten years later Latrobe describes it in his Journal as "a neat flower garden, laid out in squares and boxed with great precision. . . . For the first time since I left Germany I saw here a parterre stripped and trimmed with infinite care into the form of a richly flourished fleur-de-lis, the expiring groan, I hope, of our grandfathers' pedantry." Another old garden, at Sharon, Connecticut, is described by Helen Evertson Smith, great-grandaughter of Mrs. John Cotton Smith, by whom the garden was developed into its permanent form in the years following the close of the Revolution. George W. Cable takes up the problem which always confronts the would-be gardener at the gate, "where to plant what." Luther D. Burbank jumps the hedge between botany and anthropology, and writes of "The Training of the Human Plant," contending that as marked and persistent improvements as he has succeeded in securing in plant life can be effected in human life by analogous methods. Under the title of "Reflex Light from Africa," Charles Francis Adams expresses some very positive views with reference to the condition and capacity of the negro race, and the treatment it should receive where subject to our jurisdiction. His views challenge discussion at almost every point, but, as a corrective of his pessimistic attitude toward the negro's inherent capacity for improvement, we need only refer the reader to the evidence which the editor has supplied in "Topics of the Time," from recent scientific studies of the

negro in Africa by Prof. Franz Boas, published in the *Ethical Record* of March, 1904, and to the three works on the African race reviewed on another page.

—The April bill of fare of the Oxford English Dictionary (H. Frowde), as presented by Mr. Henry Bradley—Matter-Mesnalty—will richly reward scrutiny. The claim of this work to be compiled "on historical principles" lurks subtly in the sudden blossoming out of the word Melodrama, first quoted from Southey in 1809. In the breathing-space of the Napoleonic wars afforded by the Peace of Amiens (1802), the British flocked in multitudes to Paris, and made acquaintance with this form of spectacle (from which the melodic element has by our time quite evaporated). Hence the immediate invasion of English literature by the name and its derivatives. The *form* was restored to that of the Greek component parts, and the French accent discarded. Similarly, Memoir was anglicized without the accent and the final *e*, and fully naturalized, yet in pronunciation the best English usage retains the French sound of *w* before the *oir*—as Mr. Bradley suggests, because this termination is unfamiliar in English. The foreign origin asserts itself again in Mélange, taken over as early as 1653, and indifferently written with or without the accent; its outlandishness continues to be felt. It is not much otherwise with Mêlée (1648), which displaced Mellay, Melling, and Melly, somewhat to our loss. Ménage tends to cling to its accented vowel; Menagerie appears never to have cumbered itself with it. The throes of naturalization or assimilation are often very prolonged. We may notice the process in Debris and Plebiscit and Proletariat beside the perhaps more common French aspects, and in the wavering pronunciation of Menu. To clear our deck of French notes, Mazarine (a dish) is dubiously ascribed either to Cardinal Mazarin, who died in 1662, or to the Duchesse de Mazarin, who died at Chelsea in 1699, with the local weight of derivation in her favor. The dish (1673) somewhat antedates the blue color (1686). Finally, we owe our use of Mentor rather to Fénelon through 'Télémaque' than to Homer and the Odyssey direct; and our application of it to things as well as persons finds a warrant in Rousseau as cited by Littré.

—History is embalmed in a quotation from Lord Salisbury (1897): "A common intellectual complaint . . . which I may name (as I see Mr. Gladstone has consecrated the word) Megalomania—the passion for big things simply because they are big"—a definition which has hardly maintained itself beside 'overweening self-conceit.' Mr. Gladstone's "consecration" does not appear to have been picked up for the Dictionary; but he did not invent the term, as Bentham did Meliorability (1811-1831), which fell on stony ground, though a useful vocable and ready to anybody's hand who chooses to revive it, albeit in this age of the white man's burden we hear less of capacity for improvement and the perfectibility of man. George Eliot (1877) ventured the term Meliorism for the doctrine that the world may be made better by rightly directed human effort; and in the same year she wrote: "I don't know that I ever heard anybody use the word Meliorist except myself." Nevertheless, Dr. John Brown, in his 'Horæ Subsecivæ' (1858), proclaimed himself a Meliorist. These cross-quotations, introduced side by side chronologically, are entertaining. Mr. Bradley himself holds "to make mention of" "to be now slightly archaic and literary;" yet his first definition of the verb Mention is 'to make mention of.' Again, in illustrating the idiomatic use of Mend, he says, "We do not speak of mending a house"—although we might? And shortly, in the sense of 'improve,' Tennyson is quoted:

"How mend the dwellings of the poor."

Mend, by the way, is aphetic from Amend, but, oddly enough, the abbreviated form is encountered before the full.

—Words have their fates, and curious it is to think of Mensk, 'humanity, honor, dignity, reverence,' with numerous derivatives, flourishing from the 13th to the 16th centuries and then dropping quite out of sight—"rugged names" that ceased, perhaps, to be "sleek" to British mouths grown less rugged. We have lost, further, Memorous in favor of Memorable; and the poets, those dainty scavengers of speech, have not cared to save J. Semple's Melancounterous, 'ill-timed.' Nor has Crabbe, on the other hand, caused to prevail his penultimate accentuation of Mercan'tile (not noticed by Mr. Bradley), or his monosyllabic rhyming of Mayor. Dr. Johnson has been more potent in sustaining the dissyllabic pronunciation of Medicine (med'sn), which mounts to the fourteenth century at least; for the less common trisyllabic pronunciation is in England "by many objected to as either pedantic or vulgar," whereas it predominates in Scotland and in the United States. We conclude with some interesting reading to be found under the verb May: "Like other past subjunctives, *might* is frequently used in a sense which differs from that of the present form not temporally, but modally. . . . The fact that *might* thus admits of three different meanings is sometimes productive of ambiguity, which has to be avoided by recourse to some different form of expression." "In poetry, *might* was sometimes nearly equivalent to 'did.' This use is strikingly characteristic of the style of Gibbon." "In the eighteenth century it was common to use *might be* or *do* in the sense of 'perhaps was' or 'did.'"

—In 1903 appeared the fifth volume of Prof. Paul Fredericq's monumental 'Corpus Documentorum Inquisitionis Hæreticæ Pravitatis Neerlandicæ,' carrying the series down to 1528, and now, in 1906, we have the third volume, which is devoted to completing the first and second, with 146 additional documents, ranging from 1236 to 1513 (Ghent: J. Vuylsteke). The work of research is never ending, and though, if the whole mass of material in these first three volumes could have been fused into a single series, it would be more convenient to students, the author who should wait until he had gathered everything before printing would never begin to print, for he could never feel sure that his task was completed. Moreover, Professor Fredericq has reduced to a minimum the inconvenience of his method by furnishing in this volume a complete chronological list of the 690 documents contained in the three, together with an extended index to the whole, occupying more than 200 pages. As in the previous issues, a very generous definition of the word heresy enables him to bring together a number of most interesting documents, gathered not only from printed sources but from the archives and MSS. of the Netherlands, of Paris, and of the Vatican. Such a collection as this illustrates emphatically the modern spirit in which history is studied and written, neglecting no detail and requiring exhaustive research into the original sources, in order to verify, by documentary evidence, everything that can be verified. Professor Fredericq has thus accomplished so much in his chosen field that all students of the period will await with impatience the continuation of his labors through the reigns of Charles V. and Philip II., when the annals of the Netherlands were written in characters of fire and blood.

—Fogazzaro's last novel, 'Il Santo,' noticed at length in these columns, has finally been put upon the Index. The fact, taken in connection with other recent incidents, is of great interest as showing the policy likely to be followed by the present Pope. Hitherto he has seemed to hesitate and vacillate, but the path he has now entered upon is that of intolerance. As the *Corriere della Sera* says: "We return to the times of Pius IX., with the bad distinction, however, that between Pius IX. and Pius X. there came the pontificate of Leo XIII., which marked a period of progress and comparative liberty, and that in the last thirty years ideas have gone ahead." The condemnation of 'Il Santo' follows close upon the incident of Bishop Bonomelli, who, it is now asserted, owed it to the intervention of a friend high in power that he was not cited before the Holy Inquisition. It is known, too, that, in the entourage of the Pope, whoever is suspected of broad and liberal views is sure to fall into disfavor, so that it is not doubtful that the censure of Fogazzaro's book is a blow directed at the whole party of progress in the Church. It includes, of course, such Catholics as Brunetière, who had just finished the publication of the French version of 'Il Santo' in the *Revue des Deux Mondes*, and the editor of the German Catholic review, *Hochland*, which, besides translating the book, has published a series of articles highly laudatory of its author. Of course, even a Pope is but a feeble obstacle against the current of modern thought; at the same time, it is a keen disappointment to the better part of the faithful that a Pope of the gentle and kindly character of Pio X. should decide to throw his weight on the side of *intransigenza*.

—"Das Blumenboot" ("The Flower Boat"), a four-act drama written in thirteen months, is the last play by Hermann Sudermann since his "Stein unter Steinen," and shows in general the recent tendencies of the author. Baroness Erfflingen, daughter of a banker and wife of a reckless spendthrift, has enjoyed the forbidden pleasures of the world for years, drawing her income from the toil of a plebeian son-in-law, once a clerk and now manager in the banking establishment, to whom she has given her elder daughter, Raffaela, in marriage; and now she counsels the younger child, Thea, whose hand is sought by the impecunious Count Sperner, to marry

the Count for his social position, but to hold her affections free for others, that she may finally "become what she *is*." According to provisions made by the founders of the banking-house, a family council is held to approve the match, and the plodding son-in-law, Brösemann, seeing additional drains on the bank that his resources cannot meet, interposes such a spirited objection that he thwarts the plan of the Baroness, and the engagement is not concluded. A dare-devil cousin, Fred, recently installed in the bank, steps in the breach and wins the hand of the girl. They are no sooner married, however, than they are face to face with a dramatic situation: Fred has promised Thea, before he knew that he would marry her, to take her on her wedding night to a low dive in town, to meet there, as she expects, various actors of the city theatre. The young wife demands the fulfilment of the promise, and the excursion is made; champagne, song and smoke upset her reason; she falls, glass in hand, ere her husband can persuade her to leave, and finally returns to her new home, dimly conscious of the scars that can never be effaced. Raffaela commenced her married life true to prosaical Brösemann, and was inclined to flee from the attentions of Doctor von Schwerthe, who crossed her path; she even besought her husband to give up his business and take her away, but he saw in her request only a desire to travel. Thea, meanwhile, citing the mother's example, urges her into the liaison, and later, when a great flower-festival is held in the evening at the country seat, begs Raffaela in vain not to keep her appointment at midnight with her unlawful lover. Raffaela promises to retire; but while Fred and Thea are in passionate dispute—he asserting his wish to throw aside the trashy pleasures of life and be a man, and she declaring her purpose to continue on the downward course to which he has impelled her, but to continue alone, on her own responsibility—a woman's cry is heard in the park. Brösemann has returned home unexpectedly, to meet and shoot the wrecker of his home on the river bank. Blood-stained, he enters the house a moment after Raffaela has rushed to her room, takes cool leave of the terrified Baroness, whose first thought is to cover the crime, and, with a word of farewell, transfers the banking business to Fred; and in their hour of common shame and need, Fred and Thea feel for the first time the passion of worthy love.

THREE WORKS ON AFRICAN RACES.

The Native Races of South Africa: A History of the Intrusion of the Hottentots and Bantu into the Hunting-grounds of the Bushmen, the Aborigines of the Country. With numerous illustrations. By George W. Stowe, F.G.S., F.R.G.S. Edited by George McCall Theall, Litt.D., LL.D., Formerly Keeper of the Archives of the Cape Colony, etc., etc. London: Swan Sonnenschein & Co.; New York: The Macmillan Co. 1905. Pp. xvi., 618.

The East Africa Protectorate. By Sir Charles Eliot, K.C.M.G., Late H.M. Commissioner for the Protectorate. With illustrations and maps. London: Edward Arnold. 1905. Pp. xii., 334.

The Masai, their Language and Folk-Lore. By A. C. Hollis. With introduction by Sir Charles Eliot. Oxford: Clarendon Press; New York: H. Frowde. 1905. Pp. xxviii., 359.

These three books represent as many different points of view and as many aspects of book-making. The first is the compilation (since edited by another and abler hand) of a settler of long and varied experience, a geologist, but without exact scientific method in ethnology. The labor of the editor (the chaptering, paragraphing, and index are his) in getting the original unwieldy mass into some sort of order must have been very great. The second is the work of an administrator, who gives, in untechnical language, an account of the peoples and policies with which he has been concerned for several years. The third is a valuable contribution to anthropological science by one who has come into close individual contact with the uncivilized race of which it treats.

Mr. Stow's book was compiled before 1880, the date of his preface, and after the author's death the MS. was purchased from the widow by Miss Lucy C. Lloyd, said to be "the greatest living authority upon the Bushmen," and by her entrusted to Dr. Theall to edit for publication. As printed, it contains a mass of valuable and interesting information accumulated by the author during the years 1843-1880. The photographs of Bushmen were added from Miss Lloyd's excellent collection. In the lapse of twenty-five years, however, not a little of the text has naturally become merely auxiliary, or even antiquated. This does not affect much that is Mr. Stow's personal contribution to our knowledge of the South African aborigines. The twenty-six chapters, into which the volume is divided, discuss the following topics: The Bushmen and their antiquity, their habits, weapons and implements, methods of hunting, and fishing, social customs, modes of burial, various tribal groups, struggle for existence; encroachment of the stronger races; tribes of the West Coast; the Koranas, the Griquas, the Baastards (and Barend Barends, their original chief); the Bechuana and Basutu; the Mantatees, Baralong, and Bakuena. The tale of the progressive extermination of the Bushmen by the European colonists, and, before them, by the Hottentot and Bantu invaders, is the familiar story of the oppression of the weak by the strong, and the author makes it the main point of his book. First Bushmen, then Hottentot, then Bantu, would appear to have been the general southward movement of the races; the last, apparently, had not crossed the Orange River until the Dutch had long been settled in South Africa. Mr. Stow fixes, without particular proof, the immigration of the Hottentots at "about the end of the fourteenth century" (p. 249). The age of the oldest Bushman painting is thought to be about four hundred years (p. 26), while to the older rock-"sculptures," with no very accurate determination of geologic and other conditions, an antiquity of twelve centuries is assigned (p. 30), *e. g.*, to the great eland of the Riverton Island of the Vaal. The cave-paintings and the chipped outlines of animal figures Mr. Stow attributes to two entirely different branches of the Bushman race, the "sculptors," or kopje-dwellers, and the "painters," or cave-dwellers, who arrived by separate migratory routes. But there is no real reason for such a view, which is both untenable and unnecessary. Change of habitat and local conditions account well enough for such divergent forms of primitive art-activity.

The descent of the Hottentots and Bushmen from a common stock is a view somewhat favored by Mr. Stow, although he ultimately styles the latter a race apart from all others. It may be mentioned here that, at the meeting of the British Association for the Advancement of Science at Cape Town in 1905, Prof. F. von Luschan, the well-known German anthropologist, advanced the opinion that the Hottentots are the result of a Hamitic-Bushman intermixture. Hamitic, or, as some hold, Semitic blood may also be traceable in the Bantu, who are hardly a pure Negro race in the belief of many authorities. The Mongolian affinities suggested on page 16 may be ruled out of court. Primitive as are the Bushmen, in many respects, we are assured (p. 60) that "they had several modes of cooking, viz., boiling, roasting or broiling, and baking." The suggestion (p. 83) that the custom of representing deities with the heads and coverings of birds and animals goes back to the use of such disguises as the Bushmen employ in hunting, is worth noting. A tendency toward monogamy among the Bushmen is said to be due to the "extreme jealousy and passionate disposition of the women." Instances of Bushman influence upon other peoples are seen in the clicks of the Hottentots and the spread of the game known as "Bushman cards." The symbiosis of the Hottentots and the Bushmen in the seventeenth century is an interesting sociological phenomenon comparable to the similar state of affairs existing between some of the pygmy tribes farther north and their neighbors of larger stature and greater power. The Griquas, who bear the name of an ancient Hottentot clan, are really a race of mixed-bloods, the result of the intercourse of the old Dutch colonists with Hottentot (and also Bushman) women. To these half-breeds was attached the term "Bastaards," which did not carry in Africa the stigma it has in Europe. Very interesting indeed is the story of these Griquas and their semi-European chiefs, of whose lives and exploits some account is given. The Basuto and related tribes, who have a love for agriculture, and a certain social system enabling them to survive in considerable strength through the ages (a political combination in the early part of the nineteenth century laid the sure foundations of their later growth), are one of the virile elements in South Africa, and are, apparently (under the ægis of British protection), building up a state that may illustrate the virtues and capacities of the Bantu race in a permanent and convincing fashion. But one needs to add to the data in Mr. Stow's book the results of inquiry and investigation during the period 1880-1906, and then he has a tale of Bushmen-extermination and of Basuto development that must excite alike the pity and the admiration of mankind.

Sir Charles Eliot, the author of 'The East Africa Protectorate,' was H. M. Commissioner from January, 1901, to June, 1904 ("these were perhaps the happiest and most interesting years of my life"), re-

signing his office on account of disagreement with the policy of the Foreign Office. He took this step "because I was ordered to cancel grants made by me to private persons in conformity with my general instructions, and to cancel them in a way which seemed to me wholly unjust and liable to accusations of favoritism, for I was at the same time directed to give the East Africa Syndicate a grant of ten times the size of the others, and in the same district, on unusually favorable terms, which were in themselves disadvantageous to the general interests of the Protectorate." The excuse of the Government was that the area in question was intended as a native reserve, and private grants would interfere with the rights of the aborigines. But the East Africa Syndicate received its grant of 500 square miles, such rights notwithstanding. While Sir Charles does not make this book a personal polemic, he points out clearly some of the defects (and worse) of the British administration of this region. The disproportionate expenditure on the Uganda railway contrasts sharply with the parsimony exercised in all other departments. The "absolute lack of administrative organization" makes the land question (the part of the country best adapted for Europeans has been declared a native reserve) a matter of the gravest concern. To this part of the world, indeed, may betake themselves some of the American criminals whom a recent treaty excludes from San Marino, for we are told (p. 185) that "it is held that the sovereign rights of the Crown over a Protectorate are not sufficient to justify extradition." The arrangement with the Sultan of Zanzibar shows that the British negotiators were less cunning, or less worldly-wise, than the Germans.

Besides geographical and historical information and a discussion of the administration of the Protectorate (past, present, and to come), there are several chapters devoted to "East Africa as a European Colony," and to the various native tribes (Swahilis, Somalis, and other Bantu-speaking peoples, Masai Suk, Nandi, etc.). Sir Charles Eliot is of opinion that there is "no considerable difference between pure negroes and the Bantu races," and there is certainly ground for the belief that such differences have been exaggerated by some authorities. Less tenable, however, is his dictum (p. 101) as to "the absence of any feeling for art in the African." The religiosity of some of these African peoples is probably underestimated, and the author is rather unduly exercised about their nudity. Some of the statements concerning the native tribes of East Africa are of more than usual interest. Of the Baganda, whom Sir Charles considers "incomparably the most intelligent and progressive of the natives of Eastern Africa," we are informed further (p. 99): "If they continue to advance at their present rate, they will rival the Japanese in their power of assimilating European culture, and become a factor of the highest importance in the future history of the African continent." This statement ought to give some of our American negrophobes pause. The possibility of an overwhelming of the nascent intellect in adult (racial) arrest is suggested for these negroes, as it has also been put forward for the Japanese, with no proofs as yet forthcoming. The Somalis are very intelligent, but lack some of the good qualities of the Baganda. The Masai have long been "perhaps the most interesting and important race in the country"; they are mostly warlike nomads, with a social system based on military ideals, and behind them a history of raids and depredations. The L-Oikop, however, are a section of the Masai who have settled down and become agriculturists. The future of the Masai proper is one of the great difficulties of the situation in East Africa; the author remarks (p. 143): "They resemble the lion and the leopard, strong and beautiful beasts of prey, that please the artistic sense, but are never of any use, and often a serious danger." The hope is that they may ultimately imitate their less warlike and nomadic kinsmen and take to agriculture. The Akikuyu have been influenced by Masai blood, but the adoption of their language by the incomers proves once more the remarkable power of expansion and survival evidenced by Bantu speech. The Wakamba are said to lag behind the Kikuyu people in vigor and intelligence, although one of the largest and most important tribes of East Africa.

As a matter of general principle, Sir Charles Eliot is "opposed to the creation in this Protectorate of native reserves, meaning by that name not plots of land kept here and there to meet the needs of natives, but territories in which natives are segregated and left to themselves." Such reserves "tend to perpetuate bad customs and to retard civilization and missionary work." Improvement of the East African races, according to the author, will come best from "encouraging mixed breeds —not, of course, between Europeans and natives, but between the various tribes." A good blend may be obtained from the Masai-Somali and the Wanyika-Wakamba. Unlike Uganda, which is thickly populated by black men, the thinly inhabited East Africa Protectorate, with much of its territory suitable for European colonization, is destined to be "a white man's country," or, rather, if the ideas of Sir Charles (he deprecates the establishment of both Jewish and East Indian colonists) be adopted, an Anglo-Saxon's country. This view, in an extreme form, is advocated by A. Johnston, in a recent article in the *Journal* of the African Society, where the demand is made for "a 'British first' policy for this healthy territory," with "administration for a time in water-tight compartments" for the rest of the population. The Englishman and the Babu get along together no better in East Africa than in Hindustan, and Sir Charles Eliot is unable to agree with Sir Harry Johnston's declaration that "East Africa ought to be the America of India." The Jews, he argues, have no real agricultural sense, and East Africa "would seem to be a country rather for those who have hereditary and personal experiences of agriculture than for those who are new to the pursuit" (p. 178). So much for the country in general, but in a cosmopolitan seaport like Mombasa, the point of customs-levy for East Africa, "the intermixture of races does not much matter." The trolley-system of this city consisted of "small carriages running on rails and pushed by native boys." Mombasa has at least three racial and social strata, "the Arab-Swahili, the Indian, and the European," and it has bad, indeed, a checkered history. Cosmopolitan Mombasa and East Africa as a "white man's land" will be fertile subjects for the future student of the race-problems of the Dark Continent.

Mr. Hollis, whose volume on the language and folk-lore of the Masai is a very creditable performance, was Chief Secretary to the Administration of the East Africa Protectorate, and, like Sir Charles Eliot, his superior, a good friend of the missionaries, to whose labors both give unstinted praise. The author had at his services a Christian convert, one Olomeni, an Oikop, or Lumbwa Masai, from whom was obtained a good deal of the material here published. This consists of a sketch of the grammar of the language (pages 1-102) and collection of Masai stories, proverbs and legends, enigmas, myths and traditions, with interlinear and free translations, besides the description in Masai and English (parallel columns) of a large number of native customs, etc. (pp. 282-356). This mass of authoritative data will be welcomed heartily by the philologist and the folk-lorist, who so rarely get material as well suited to their common needs. The closest affinities of the Masai language appear to be with Latuka, then with Bari, and more remotely with Dinka, the Nandi-Lumbwa and Suk-Turkana groups, etc. The animal tales of the Masai include many of the "Uncle Remus" type, the cunning and mischievous hare corresponding often to "Br'er Rabbit"; the story of the hare and the elephants (p. 107) is characteristic. As an example of African humor may serve the tale of the caterpillar and the wild animals (p. 184). The proverbs and sayings, of which seventy-five are given, reflect, in interesting fashion, the environment and experiences of the Masai. To our "Don't count your chickens before they are hatched," corresponds "Don't make a cloth for carrying a child in before the child is born"; to our "The last shall be first, and the first last," corresponds, quite in line with the warlike history of the Masai, "The slayer of the enemy has become a coward, and the poltroon has become a brave man." Very expressive also are the following: "The night has ears," "A bull cannot bellow in two places at once," "Do not repair another man's fence until you have seen to your own." The myths and legends of the Masai are consistent with long residence in East Africa, and there is no real proof for the theory advocated by Merker, in his 'Die Masai' (Berlin, 1904), that the cosmogonic traditions, religious ideas, etc., of this people belong to the primitive *fond* of the ancient Hebrews and Babylonians, and are as old as these. But such close resemblances as may exist are rather to be accounted for by more recent Arab and Christian sources.

The following story, included among the "myths and traditions" (p. 278), deserves citation in its entirety, as an example of primitive statement of the relativity of things as they are: "When it rains, the goats say, 'The enemy have beaten us,' and they run away and hide themselves; but the sheep say, 'Mother has oiled us,' and they remain out in the rain. When the sun burns fiercely, the sheep say, 'The enemy have beaten us,' and go and hide themselves in the shade; but the goats say, 'Mother has oiled us,' and stay in the sun." The love of the Masai for their cattle, and the important part these animals

play in the life of the people, are fully illustrated in the customs recorded. Their saying runs, "God gave us cattle and grass; we do not separate the things which God has given us." The Masai are said to possess the most definite religious beliefs of all the tribes of the East Africa Protectorate, and a point of comparison with even Anglo-Saxon practices is revealed by the observation on page 344: "The Masai women often pray twice daily. Men and children usually only pray in time of drought, or when a cattle plague is raging." Woman, therefore, has had poetic justice done to her when the commonest word for "God" in the language, *Eng-ai*, is a substantive with a *feminine* article.

If one reads together the books of Sir Charles Eliot and Mr. Hollis, one will get a good general and scientific account of a people as interesting, perhaps, as any in all Africa, and be informed to protest against the inhuman spirit of militarism, which seeks to drive the native to the wall all over the globe, instead of preparing him to enjoy more fully the land that has been his from time immemorial.

DE GUERVILLE'S NEW EGYPT.

New Egypt. By A. B. De Guerville. E. P. Dutton & Co.

A Frenchman's story of English rule in Egypt, for such is the Egypt of to-day, attracts us, and as we proceed to read it. De Guerville's treatment of the delicate subject excites our admiration for his candor. His book is not conspicuously interesting as a description of the scenery or the antiquities of the Nile, but these can be read in any Guide and in a host of treatises by Egyptologists, or in innumerable sketches by casual travellers. Its shortcomings, therefore, in these respects can be forgiven in consideration of the statements and opinions from rulers, statesmen, and leading financiers which he professes to give at first hand, on all the intricate political and industrial subjects which have made the Egyptian question one of the puzzles of modern diplomacy. Appearing, as it did, just when the Morocco Conference was trying to decide one of the side issues of the Egyptian problem, it helps us to appreciate the tenacity with which France is fighting for supremacy in Northwestern Africa. Through vacillation and timidity during the Arabi rebellion she lost her position in Egypt, which England assumed, and which subsequently, through a chain of circumstances that no one could possibly have foreseen, England was obliged, at first against her honest intentions, but now most willingly, to maintain. By the recent treaty between England and France, which was intended to settle the Newfoundland, the Egyptian, and other of their international complications, France recognized England's rights in Egypt, and England agreed that, as far as she was concerned, France should control Morocco.

Following the graphic story of the suicidal extravagance of Ismail Pasha, which plunged Egypt into bankruptcy and made her the slave of the financiers of Europe, and our author's views of the mistaken attitude of France during and after the Arabi rebellion, one of the most interesting chapters describes the simple domestic and the busy official life of the young Khedive, Abbas Halmi. He is fostering, by his own exertions and with his own capital, the agricultural and industrial interests of Egypt, and actually governing his country wisely and with a certain degree of initiative, under the suggestion and the protection of England, which really thwarts him less arbitrarily than a refractory legislative body sometimes hampers a restless and independent constitutional ruler or president. Abbas Halmi, when he ascended the throne in 1892 as a youth of eighteen, on the abdication of his extravagant grandfather, was impelled by his own inclinations and the advice of officious friends to cross swords with the English representative. M. de Guerville tells the result in his own explicit manner.

"A certain number of the *entourage*, along with several foreigners, more or less connected with friendly governments, all fishers in troubled waters, took advantage of this state of affairs to urge the young sovereign, then without experience, to a complete rupture with England, assuring him that, on the day of the struggle, French bayonets and Russian Cossacks would be there to back him up. Very brave, very sure of himself, the Khedive one day took the great step and showed England the door; then, looking round for his backers, he found . . . space. Those even who had most strongly persuaded him had quietly disappeared."

He soon came to appreciate England's sincere desire to help him to regenerate his country, and since that youthful ebullition he has recognized in Lord Cromer his best friend and his stanchest ally.

Unlike his forefathers, he is satisfied and happy with one wife, whose five children make a charming group of chubby boys and girls. In addition to punctual attention to the duties of state, he has reclaimed from the desert a large tract on the Ismailia Canal, whose cultivation he himself superintends; and out of his own resources he is building a shore line, the Mariut Railroad, from Alexandria to the border of Tripoli. Our author had the pleasure of accompanying the Khedive on a tour of inspection over this railroad, where

"charming little villages, constructed by his Highness, replace here and there the wretched tents in which the Bedouins lived; there is no doubt that the inhabitants of this lost and forgotten land are only too pleased that the Khedive has come to call them to another and a better existence. If at first they were somewhat shy, to-day they have become quite friendly, and they await with impatience the time when the line shall be completed, and a regular and paying trade established between the rich country of Tripoli and the markets of Alexandria and Cairo."

He adds:

"We had our refreshment at the actual terminus, in the doorway of a small house, simple as the tent of a soldier, in which the Khedive resides occasionally when inspecting the works, and from which we could hear the Bedouins, under the direction of his Highness's officers, singing at their task of completing the two hundred miles which still separates them from the frontier of Tripoli."

The glimpses of the Khedival activity certainly falsify the popular impressions of the home life and the occupations of an Oriental ruler, but it may be doubted whether they are duplicated in any Eastern court between the Mediterranean and the Sea of Japan.

All through the book the presence of England is almost obtrusively forced upon the reader. When the author first arrives in Alexandria in the Grand Square, he admires, "superb on his horse of bronze, the statue of Mohammed Ali Pasha, the founder of the reigning house."

"Some few steps further on," he says, "another statue, this time a living one, caught my eye. On a beautiful well-groomed half-bred, an Egyptian cavalryman, erect and unmoving, stiff in his sombre uniform, mounted guard. A finer soldier one could not wish to see. His bronzed skin, black moustache, dark eyes, slender body, straight and supple, made up the ideal of a cavalry soldier. It was with men such as these that the great Pasha made of Egypt a Power. My thoughts are quickly disturbed. Across the square, with the dull tread of marching feet, comes a company of English soldiers. They are boys, beardless boys, almost delicate-looking, clad in unbecoming khaki, and their childish faces almost swallowed up in immense helmets. Can it be that these youths are the conquerors of this dark and warlike figure seated unmoved on his lovely steed?"

When our author reaches the end of his travels in the Sudan, the English are still in evidence, and though his regret that the French do not occupy their place can hardly be disguised, the regret does not degenerate into acrid jealousy or into unfair criticism. He tells in this connection that

"Lord Kitchener, who, seventeen years later, was to vanquish the Dervishes and reconquer the Sudan, was on board Admiral Seymour's flagship during the bombardment of Alexandria as a simple spectator. Immediately after the bombardment, which opened Egypt to the English, he landed with Mr. John Ross, and, going to his house, indulged in a brandy and soda, just as he drank another with Capt. Marchand at Fashoda on the morrow of the events which definitely assured the supremacy of England in the valley of the Nile. The bombardment was the first act, as Fashoda was the last, marking the decline of French influence, the decline which began on that memorable day when the French fleet disappeared on the horizon, and, abandoning Alexandria to the English cannon, carried with it the last hope of those who dreamt of an Egypt, great, strong, and prosperous, under the guiding hand of France."

For what happened during these seventeen years and in the Sudan during the subsequent seven years, he gives the English full credit, but he does not arrogate too much for the French when he claims that the most important works lately executed in Egypt were suggested and often begun by Frenchmen. The *barrage*, for instance, the first dam thrown across the Nile at the head of the Delta, was actually built by French engineers. And he approves the stricture of a correspondent who claims that Cromer, in his reports, "would not have detracted a whit from the glory of England if he had stated that the work already accomplished by the French had served as a point of departure for all the important improvements which they have been able to accomplish." Still, he does not flatter himself or his countrymen with any hope of the renewal of French influence, and he reproves M. de Freycinet for unjustly interpreting England's motives at the time of the occupation.

"She had," he admits, "no desire to enter, *manu militari*, into Egypt, she did everything which lay in her power to avoid doing so, but, forced to do so, she sought to have France with her. I will add that the same 'combination of unheard-of circumstances' which led to the decline of French influence forced England to remain in Egypt. Neither this French decline nor this English ascendancy is 'temporary.' The

time of dreams is passed. It must now be recognized that English influence in Egypt is so deeply rooted that she has nothing to fear, and that, politically speaking, French influence has ceased to exist. I say politically, for the Egyptian, who formerly had two countries, 'his own and Paris,' will always have for France feelings of friendship and affection such as he will never have for any other people. In his character, his tastes, his ideas, and his inclinations, he approaches much nearer to the French than to the English. He can become a sincere and devoted friend to the former, *who treats him as an equal*, but never to the latter, who, on every occasion, asserts his superiority and treats him as an inferior. The Egyptian appreciates what England has done for his country; he is grateful, but coldly, and without enthusiasm. Lord Cromer is feared, respected, admired, but not loved; he is the savior and the judge in whom he has absolute confidence, but he is also the man who, while saving him, has left on his skin the marks of a strong hand."

The Fashoda incident is as inexplicable to De Guerville in its motive as it is to other spectators with fewer means of information. He absolves Marchand from the charge of cowardice or pusillanimity, and accords him all the praise due him for his wonderful march across the Bahr-el-Ghazal to the Nile; nor does he blame the Government of France for rectifying some one's grievous mistake by the only retreat possible, that of accepting England's offer to extend every hospitality to Capt. Marchand and his brave companions. The resurrection of the Sudan, and its new life, which M. de Guerville grows eloquent in describing, would have been arrested had the two great Powers which are, each in its own way, trying to civilize northern Africa, gone to war instead of exchanging compliments over the incident. Only on two remote and improbable contingencies can the Marchand adventure be feebly justified.

"Supposing Kitchener, instead of being victorious over the Dervishes, had been beaten, as Hicks, Gordon, and others had been. The thing was not impossible. Now, supposing again that a large Abyssinian army had joined Marchand, and that under his leadership they had fallen on the Dervishes from the rear and crushed them, he would have reconquered Khartum. The situation in that case would have been different, and France would have been in reality mistress of the Sudan."

With this quotation we must close a book as readable by reason of its style as by its intrinsic merit.

The Story of My Life. By Father George Gapon. With illustrations. E. P. Dutton & Co. 1906.

This autobiography of the Russian priest who for a short time filled the public eye as leader of the demonstration ending in "Bloody Sunday" (January 26, 1905), in St. Petersburg, is now accessible in book form, having originally appeared as a serial. The opportunity thus furnished for the study of a curious character has considerable value, from a psychological point of view. A creature of moods, earnest, enthusiastic, fickle, illogical, critical of others, convinced that he is a grand exception to the ordinary rule of mankind, he ingenuously writes himself down as fast-bound within the limits of that rule in virtue of the narrowness of his experience, which seemed to him original. He is not universal, in the sense applied to the great writers of the world; but he is commonplace, in a variation of that sense. For example, his generalizations about the "ignorant and greedy clergy" of Russia in all probability have been uttered with equal justice and injustice of the clergy in every land, Christian or heathen, where ecclesiastics have existed. The same is true regarding the accusation of Pharisaism, neglect of opportunities, and so forth. Had he, as a schoolboy in any other land, neglected his studies and indulged in outspoken criticism of things and people, he would equally have been reprimanded. When he records the "sad fact" that all the best pupils of the Ecclesiastical Seminary became laymen, leaving only the "ignorant, incapable, or depraved" for the Church, he forgets to mention that such seminaries do not aim to educate exclusively for the priesthood (any more than does Trinity School); and is, evidently, unaware of that familiar English saying, "The fool of the family is put into the Church," which brilliant and noble ecclesiastics have proven false, as abundant similar examples in his own land have falsified his rash condemnation. Had he known of the existence of the whipping-post in Delaware, a fine paragraph would have been spoiled; and had he ever been present at great devotional gatherings (such as camp-meetings) in other lands, he might have collected instances of practical solicitude as to material things which would have paralleled his mother's wide-awakeness to the pigs in the garden during her prayers (compare George Sand's 'Winter in Majorca'), and, incidentally, established the disconcerting fact that devoutness is a question of individuals, not of ecclesiastical organizations. He criticises the monks and clergy at a monastery for "mimicking the Metropolitan." All present, including himself, were, undoubtedly, following the prescribed forms.

His description of certain police and factory methods which he regards as unusual will not appear so here, after our own experiences; neither will his account of the Russian equivalent of our friend the "walking delegate," who, himself formerly a workman, lived in luxurious apartments and kept Father Gapon waiting long for an audience.

That Father Gapon must be a man of parts and of attractive personality is evident from the favors he received at the hands of highly-placed persons, and from his career in general. But his instability of mind, the regularity of his oscillations between extremes (in his views of his priestly office, for instance) eventually weary the reader, as do his constant attribution of jealous motives to every one who opposes him, and his self-laudation as to motives and preaching. He announces as his original programme the diversion of the workingman's mind from political ideas; then reprobates it as an invention of the secret police, and brands it as "a pretence of a struggle for economic concessions." When he preaches honest labor, sobriety, and mutual help to the workmen, they go wild with enthusiasm, while the same doctrine from the lips of the rector of the academy produces "disgust," if we are to trust his statements. He acknowledges that he added political aims to his teaching; a little later on denies it; later still, in marshalling the famous procession to see the Emperor at the Winter Palace, he narrates that he ordered religious banners, crosses, and holy pictures to be borne in order to impart the aspect of a religious movement, chronicles the initial reverence of the police for these emblems, and seems surprised that the authorities should, later in the day, have been so mean as to suspect the manifestants of guile, even after his imperious epistle to the Emperor and his admission of having advised the presence of women and children as shields. In fact, the history of that famous demonstration and the incidents which led up to and accompanied it, is manifestly not to be accepted from this book as truthful without collating it with accounts from other sources.

The author relates one amusing and characteristic story of Mr. (now Count) Witte's acumen. Zubatoff, the *agent provocateur* of the police, asked Father Gapon to write a certain report for presentation to Mr. Witte, about labor organizations, and as if emanating from the men themselves. Father Gapon, with the aim of making a tool of Zubatoff, agreed, wrote the report, and a delegation of the workmen presented it to Mr. Witte. The latter read the report through, then calmly asked: "Did you write this, gentlemen?" "Yes," they answered. "Then you ought to become journalists," Mr. Witte replied; and with these words he dismissed them. The illustrations of Father Gapon's parents and comfortable village home, and of himself at different periods of his life, add much to the interest of the book.

Euripides and the Spirit of his Dramas. By Paul Decharme. Translated by James Loeb. The Macmillan Co. 1906.

The late Prof. Paul Decharme's 'Euripide et l'Esprit de son Théâtre,' published in 1893, is on the whole the most satisfactory and the most useful book on Euripides that has so far been produced for the general reader. The scholar will, of course, find what is more peculiarly to his address in Wilamowitz-Moellendorff's long and illuminating introduction to his edition of the "Heracles," and there will be those to soothe their souls with Mr. Gilbert Murray's emotional handling of Euripides, regarded as the Greek Ibsen; or Mr. Verrall's airy conjectures may stimulate those who think that the plays are a series of enigmas, in which the poet's meaning is anything you please, only decidedly not what he seems to say. But it is usually a Frenchman who, in the end, takes the middle road, and, neither yielding to caprice nor plunging aside into the dusty depths of speculative philology, draws after him those who yearn for the safe, the settled, and, above all, the comprehensive view.

This study of Euripides does, then, for the Greek dramatist what Couat did for Aristophanes, and Hauvette for Herodotus and Archilochus. This is precisely the sort of book that should be translated for the sake of the many who do not read Greek at all now, whatever they may have done at college, and who might be balked if not put off altogether by the French of the original work, even assuming that, untranslated, it ever comes under their notice. Mr. Loeb has reduced the number

Burlingame Public Library

of pages from 555 to 378, not, of course, by omissions, but by the use of a type which is fully as legible as, though smaller than, that of the original. He has replaced the numerous translations from the plays in French prose by the metrical translations of Mr. Way, whose version of the plays of Euripides is not likely to be surpassed, at any rate in our day, though no doubt Euripides, like Homer, will need to be retranslated every century or so, and readapted to the changing fashions of the English language. As M. Decharme wrote hardly a page without quoting from the plays, the reader profits vastly by Mr. Loeb's judicious inclusion of Mr. Way.

To Decharme's foot-notes the translator has added several which will be of use to the English reader. Mr. Loeb's style is good, and, though it is almost impossible to make such a translation without letting the original idiom show through, Mr. Loeb has escaped the danger of over-literalness, and has lost nothing of the lucidity of Decharme's French. The illustrations are few, as in the original work. The bust of Euripides (from that in the Brunswick Museum) deserves special notice because it has been specially engraved for Mr. Loeb's volume by Kruell. The book, we need not say, is attractively got up. It should be in the hands of all students of the drama.

The England and Holland of the Puritans. By the late Henry Martyn Dexter, D.D., LL.D., and his son, Morton Dexter. Houghton, Mifflin & Co. 1905.

This detailed and learned work represents effort put forth by three members of the Dexter family, for, besides those whose names stand on the title-page, Dr. Franklin B. Dexter of Yale has had a certain share in the preparation of the text. Most of the materials were collected by Dr. H. M. Dexter, who, having exhausted the sources of information available in America, pursued his studies among the archives of England and Holland. Not only did he gather the data, but nearly completed the first rough draft of the volume. The task of revision has fallen chiefly to Mr. Morton Dexter, who, like his father, supplemented his studies by travel before issuing the narrative in its present form. Every chapter abounds with proofs of exhaustive research, and we doubt whether any resources of real moment have been overlooked by the three writers concerned.

The six books under which the contents are arranged may most fitly be grouped under two main sections. The first of these is occupied with an account of general conditions, embracing also an historical sketch of Scrooby; the second follows the fortunes of the Scrooby congregation from the days when William Brewster first became prominent until the moment when Robinson preached his farewell sermon to the Pilgrim Fathers. For most readers, in New England at least, the second section, with its minute analysis of the Scrooby church members, may well seem the essential part of the work. The first two books, however, are indispensable to a right understanding of the Calvinistic exodus, and contain much rare information digested in systematic form. They are entitled "The England of Our Fathers" and "The Protestantism of Our Fathers." The nature of the environment having first been described, the Scrooby congregation is treated as an organism, whether resident in Notts, in Amsterdam, or in Leyden.

The idea that God sifted a whole nation to send choice grain into the American wilderness, was seldom absent from the consciousness of those who founded the New England colonies; and the same notion seems to have been well grasped by the authors of the present work. The unregenerate condition of England on the eve of the breach with Rome, the incompleteness of the prelatical Reformation, the intolerance of the bishops in their dealing with sectaries—all these are motives which, though not unduly obtruded, never disappear from view. At the close of a chapter entitled "The Shadows in the Picture" may be found the following passage:

> "It is not to be inferred that England was given over wholly to rudeness, ignorance, superstition, and even vice. There were many earnest men and women, and doubtless among all classes, of right life, fine character, and ennobling influence. . . . There had been before, and there was to be again, conscientious, determined effort towards a nobler life, alike personal and national. But, nevertheless, it was a time of mental and moral darkness. To such changes from this old order of things as already had begun to be wrought by Nonconformity and Separation, allusion will be made more particularly hereafter."

Here, for example, it is pretty clearly indicated that in Nonconformity or Separation rather than in the Establishment will be found the uplifting, transforming force. Cartwright and Browne, not Parker and Hooker, are looked upon in this volume as the evangelists who possessed the true light.

The topography and annals of Scrooby are discussed with much fulness, and no consideration is left untouched which can help to explain why men like Brewster, Bradford, and Robinson are made to stand out with especial clearness from the plain and sober background of these recalcitrants; but, with the exception of a few leaders, the details of personal development are held in strict subordination to the religious issues around which the lives of the Scrooby people turned. For them the controversy over the nature of the true Church obliterated all professional and selfish interests. The individual withers in the presence of an overshadowing cause.

While the English portion of the subject bulks more largely than the portion which is devoted to Holland, we have found greater novelty in the chapters devoted to the life of the Pilgrims at Amsterdam and Leyden. At this stage the personal element grows more intimate than before, and we are enabled to see how, by a process of natural selection, the emigrants of the *Mayflower* were singled out from the rank and file of the English refugees in the Low Countries. The relations of the exiles with their Dutch co-religionaries are brought out in strong relief, to incidental demonstration of the fact that, even in the seventeenth century, the sympathy kindled by a common Calvinism could not obliterate national prejudices and the business instinct altogether.

Lightness of touch this volume does not possess in an eminent degree, but it contains a large amount of information which has been digested with affectionate and conscientious care.

Burma: Painted and Described by R. Talbot Kelly, R.B.A., F.R.G.S., Commander of the Medjidieh. London: Adam & Charles Black; New York: The Macmillan Co. 1905.

A People at School. By H. Fielding Hall. Macmillan. 1906.

'Burma' is a book of paintings first and text last, as the title indicates. There are seventy-five colored plates, presumably reproductions of Mr. Kelly's pictures, against two hundred and fifty pages of description. But the palm goes to the paintings. They are faithful counterparts of marvellous colors, such as only Burmese forests and costumes can show; delicately blended, despite the gorgeousness of the whole. Only an art critic could essay the task of passing judgment on this, the more fascinating side, of Mr. Kelly's book, which is, in sum, a fit companion to the same author-artist's 'Egypt.' To the lay reader it is a sensuous delight to wander here from one gay scene to another, from the glowing shrine of the Shwe Dagon to the banks of the Irrawaddy, the tangled glade, the street in Nyaung-u, vivid with green, pink, and purple of gown and foliage alike, and so to close the book without reading anything! But this is scarcely fair to the author, who shares honors with the artist. Only, in writing, Mr. Kelly has more competitors and is perhaps not unrivalled. So personally we prefer his colors to his black and white.

Nevertheless, there are passages in the rambling account of personal experiences which attract attention, and one learns much of the Burmese themselves, that happy, lazy folk, whose women are so much better than the men that they have taken to marrying only foreigners, in disgust at the apathy of their own males. The latter sit at home (while the women keep shop) and tend the babies, but still have the hardihood to pray for "health, more money, and lots of children." The description of native drama is interesting. The stage has no scenery, and when the actors are not busy with their part they sit down (still on the stage) and smoke. Mr. Kelly had some excitements in travelling and some amusing adventures. At one station, being unable to buy any food, he hired a policeman to steal it for him, which pacified the natives, who seemed quite content to be robbed first and paid afterwards. The spontaneous ignition of the forests is attributed to the "rubbing together of the silica-coated bamboo-stems as they sway in the breeze." This is certainly the explanation given by the ancient Hindus, who assert that the bamboo ignites itself.

The promise contained in Mr. Hall's 'Soul of a People' is not quite fulfilled in his latest work, but it is difficult to keep the day-school at the same spiritual level as the Sunday-school, or to discuss the body as airily as the soul. We said, in discussing Mr. Hall's former book, that it contained gross historical errors, while it fascinated by style and subject. In 'A People at School' we have a sketch partly biographical (Mr. Hall is a Burmese

official of twenty years' standing), partly historical, and partly descriptive of present-day conditions. Here and there the author repeats himself, as on pages 29 and 262, but most of the matter is well ordered. It is divided into two parts, the chief divisions being the author's experience and the results of his experience (as interpretation). The "Oriental Mind," he thinks, does not exist, the mental difference between West and East is all humbug; and he is inclined to ascribe Burmese endurance of petty ills and great calamities to the religion, rather than the endurance of their religion to their (Oriental) nature. This is a too sweeping denial, and could easily be disproved if it were worth while. So strong is the influence of this "feminine religion" on the author himself that he talks of a she Fate. Even "Providence" appears as *she:* "Providence has her own ways, she acts," etc. (p. 10). Strangely enough, Mr. Hall, in 'The People at School,' comes out as a veritable Jingo. Buddhism, with its "feminine ideals," prohibits war, but it is well for the Burmese that they were conquered by a better people, who know that formal religion must step back and take a second place, as compared with the religion of Necessity and war. "Religion was made for man, not man for religion." Apparently there will be no religion left in Burma shortly, for the monks and laity are repudiating their own spiritual discipline and—listen, all missionary societies—"there have been no conversions" (to Christianity). "Amongst the Burmese, Christianity makes no headway at all. It has, in fact, in many places actually declined. To the Burman the Christian theory and the Christian priest has [*sic*] no attraction" (p. 255).

Mr. Hall's English is not impeccable. "Never before have we taken over a complete people like we did in Upper Burma, never before have we had to subdue a country as we had it"—is incorrect in more ways than one; but, despite such slips, and even despite graver errors of fact and judgment and the decline in style as compared with the previous volume, there is an honesty in Mr. Hall which makes his studies attractive, and it is always refreshing to get a first-hand impression. Sometimes the author puts historical changes in a single clear statement that could not be surpassed, as when he closes his discussion of the position of the village headman with these words: "He is no longer the representative of the village to the Government, but the representative of Government to the village." His pet idea seems to be that the Burmese people are all children, a young nation, as exemplified by the fact that men and women are almost indistinguishable in dress (!) and figure up to the age of twenty. It will be news to most people that these Burmese Buddhists all eat meat, even the monks—a good sign, in the author's opinion, that they are giving up religion for real life, *à la* the English, who are too virile to forego meat, hunting, and war.

Shelburne Essays. By Paul Elmer More. Third Series. G. P. Putnam's Sons. 1906.

In the ceaseless procession of books about books that files and must forever file before the reviewer, there are those, the majority, whose eye, as it were, he had rather not catch, because he knows without a second glance that they will merely irritate him with their superficial æstheticism. But then, again, there are for his consolation the true and tried, the friends who have blood in them while the rest flit like shadows. Such are the collected essays of Mr. Churton Collins, or the late R. H. Hutton, which, though usually in form reviews of some reprint or new edition of an author, are genuine guides, written at leisure, and always adding fresh information or a fresh point of view. The "Shelburne Essays" have proved their right to be placed in the same category. In this the latest volume, Mr. More has collected ten Essays and a "Note" on Don Juan, which are fully up to the standard of the two earlier books. About half of these studies were inspired by the appearance of a new edition of the works of the author discussed, Swinburne, Christina Rossetti, Sterne, Mr. Thomas Wright's 'Correspondence of Cowper,' and the 'Life and Letters of J. Henry Shorthouse.' Others, like that on "The Centenary of Sainte-Beuve," perhaps the best in the volume, are independent essays. But none of them has the characteristics of the mere book review. They all range far beyond the immediate theme.

In the Shorthouse essay, for example, we have no mere description of the obscure career of the writer of 'John Inglesant,' that fascinating and too little read romance of the life of discipline, but a lucid account of the state of the religious parties in England at the time when Shorthouse was slowly composing the work in the hard-earned leisure of his profession as a manufacturing chemist; a born mystic for whom the sunshine on the grass was a sacrament and the whole of life to be envisaged as a divine drama. Two great visionaries, Newman and Shorthouse, if we may bracket them for the moment, ended their days in Birmingham, that most prosaic of modern cities. But the incongruity of this setting surprises the more in the novelist's case, because he had known no other, and never even visited the Italy of which he gives so vivid an impression in 'John Inglesant.' Shorthouse was a Neo-Platonist in soul, made of the same stuff as Plotinus, a curious and isolated figure that defied its environment. Mr. More does not speak of a paper contributed to *Macmillan's Magazine* after he had become "John Inglesant" to the English world of letters, but it is interesting because it shows the preoccupation of the man. The paper was called "The Humorous in Literature," and in it Shorthouse maintained that for humor, since it touches the deepest springs of human nature, one must necessarily turn to the Gospels, to such a parable as the Prodigal Son, which will furnish the most striking transitions from joy to sorrow and back to joy. This was indeed a visionary's conception of humor.

The last essay in the volume is purely philosophical, and was written some years ago, we are told, by Mr. More's brother. It is an interesting historical sketch of that attempt to find a resting-place in the flux of things which has occupied all philosophers and many scientific men since the day of Heracleitus of Ephesus. It is aimed, like M. Poincaré's 'La Valeur de la Science' or his 'La Science et l'Hypothèse,' at the intelligent reader who is not an expert though his general training gives him a right to judge—a type of mind first recognized and respected by Aristotle. In his essay on Swinburne Mr. More has analyzed acutely the causes of the weariness, chiefly of the ear, that besets in the end the most ardent of Swinburne's admirers—provided, of course, that he has an ear to be wearied.

International Law; A Treatise. By L. Oppenheim. 2 vols. Longmans, Green & Co. 1905.

These volumes, the author modestly says in his preface, are intended to be an elementary treatise for beginners in International Law. The author has taught the subject, both on the Continent, as a Continental, and in England—a rare qualification—and we are inclined to think that others than beginners will find his survey of the field useful. The lists of treatises and monographs printed at the commencement of each topic give a bibliography probably not accessible in any other English treatise. The only recent work with which it can be compared is Hall's 'International Law,' a book not elementary, and, from want of proper editing since the author's death, not quite as useful as formerly.

Of course, any book designed as a compendium of International Law must, in the main, be a repetition of what is to be found in other books. Even the general basis of treatment—Questions Arising in a State of Peace, Questions Arising or Resulting in a State of War, Neutrality, Prize—is essentially fixed. Mr. Oppenheim, however, has managed to give a new turn to the enquiry, by making a separate title, though too short a one, of the Responsibility of States. The idea of responsibility runs through the whole subject, but generally this is rather assumed than explicitly taught. It is an idea which might be found capable of great development in aid of exposition.

The author has a system which underlies his analysis; the best and most important part of his system is his rule of giving his readers the law as it is, and not as it ought to be. This, combined with his natural international impartiality, makes his book an extremely fair and rational one. The national or patriotic bias which runs through most writing on this subject, he has escaped. He seems even capable of keeping the scales balanced as between neutrals and belligerents. The "three rules" of the Treaty of Washington, though not yet International Law, he recognizes as embodying an important principle, while on the other hand he inclines to think that the *Bundesrath* case in the South African war has settled the rule that the old doctrine of continuous voyage can be applied to contraband, though shipped from one neutral port to another; from the Russo-Japanese war he thinks the rule established that belligerent men-of-war seeking asylum in neutral ports must be dismantled and detained with their crews until the termination of the war, if more than a temporary asylum is requisite. The *Reshitelni* cutting-out case, about which so much has been written, he dismisses in a few words

as an obvious violation of neutral territory.

BOOKS OF THE WEEK.

Addison's Essays. Imported by Scribners. $1.25 net.
Bibliography of the Sanskrit Drama. Edited by Montgomery Schuyler. Macmillan Co. $1.50.

Wisconsin Historical Collections. Edited by Reuben G. Thwaites. Vol. XVII. Madison: Published by the Society.
Young O'Briens. John Lane Co.

Henry Holt and Company have just published a delightful, humorous novel by *Sydney Preston*, author of "*The Abandoned Farmer*," entitled ON COMMON GROUND. An idyll in both treatment and subject, it is the story of a gentle bachelor who retires to a small farm to raise chickens. The chickens wander into a neighbor's garden and the idyll begins. It is all told with Mr. Preston's characteristic charm and humor. $1.50.

WHAT WE ARE DOING FOR LIBRARIANS.

We now have the most efficient department for the handling of Library orders.

1. A tremendous miscellaneous stock,
2. Greatly increased facilities for the importation of English publications.
3. Competent bookmen to price lists and collect books.

All of this means prompt and complete shipments and right prices.

Ready May 7th
From a College Window
By ARTHUR C. BENSON
Fellow of Magdalene College, Cambridge.
Crown 8vo. $1.25 net.
A collection of familiar essays, in which the reader is brought under the spell of a singularly interesting and attractive personality. The book is a frank outpouring of the author's intimate thoughts, a frank expression of what he prizes in life and what he expects from life. Mr. Benson's papers are characterized by the intimacy of self-revelation and allusiveness and sense of overflow that belong to the familiar essay at its best.
Send for New Illustrated Catalogue.
G. P. Putnam's Sons, 27 & 29 West 23d St., N. Y.

Sally Wister's Journal
This famous book, the real diary of a real girl of 1777, gives us a new view of the Revolutionary war. Her flirtations with Washington's officers are told to her girl friend with the most charming freedom. Beautifully illustrated. A capital gift book. $2 postpaid, or at bookstores.
FERRIS & LEACH, Pubs., Phila.

Travel.
EUROPE
THERE are a few vacancies in a limited party for a delightful European tour, sailing June 21, by triple screw, turbine steamship Victorian, from Montreal, returning from Austria via Sicily, Italy, and Gibraltar, by Cunard Line, and due in New York September 10. High-class arrangements, ideal route and moderate price. Application for place in party must be made at once. THE COLLYER TOURS COMPANY, 368 Boylston St., Boston, Mass.

FOREIGN TRAVEL.
A university graduate and experienced teacher of wide acquaintance with European life and travel, would like to take charge of a few boys or accompany a small party of adults wishing to spend the summer abroad. For further information or references address A. M., P. O. Box 1217, Providence, R. I.

The Nation.

NEW YORK, THURSDAY, MAY 10, 1906.

The Week.

"No coal strike" is good news to every man, woman, and child in the region where anthracite is the common fuel, as well as to the country at large. The decision of the miners to continue work under the award of the Strike Commission is evidently prompted by a desire to let well alone. Throughout the negotiations John Mitchell and his committee have been desirous of avoiding a strike. Very early they receded from one or two demands which were manifestly absurd; and then they made a plausible offer to submit the whole controversy to the original Strike Commission. Whatever be the facts as to the relative increase in cost of living and in wages, the miners must be fairly well off. Mitchell admits that his reason for yielding was fear that the miners would not back him up. That means, of course, that under present conditions the miners are so comfortable that by a strike they would lose far more than they would gain. Had the operators acceded to the blanket request for arbitration, and had the Commission discovered that the former award was still fair and that the miners had no grievance, popular sympathy would have been with the operators, on the general ground that the miners had kicked up a row about nothing.

Eighty per cent. of the tonnage on the Great Lakes is tied up by the strike ordered by the Lake Pilots' Protective Association for recognition by the vessel owners. No question of wages or of hours is involved. The issue is single: Shall the union or the owners control the pilots? The strike is almost exactly a repetition of the unsuccessful one of two years ago, when the lake captains went out because their affiliation with a union was regarded by the owners as inimical to the success of the fleet. Now, the owners say that the captains and the pilots, who are really mates, are the only representatives they have on the vessels who are not subject to the orders of a labor union. They see no reason why these men should not continue to look out first for their employers' interests. They declare that not more than 10 per cent. of the mates are in the union, and that they are not the real instigators of the strike. Back of the pilots' union stands the International 'Longshoremen, Marine, and Transport Workers' Association, whose members, as well as the ore and freight-handlers and grain scoopers, are out on a sympathetic strike. The settlement of the dispute seems to depend mainly upon the urgency of the Steel Trust's need for keeping its ore boats going, since its fleet is the largest on the lakes, and any agreement it made would be likely to govern.

The message of President Roosevelt and the report of Commissioner Garfield on the relations between the Standard Oil Company and the railways are documents which may well have an important effect upon politics. As the President and the Commissioner of Corporations sum it up, "the Standard Oil Company has benefited enormously up almost to the present moment by secret rates"; the shipments of the Standard Oil have been "falsely way-billed" and "blind-billed"; many of the discriminations have been "clearly in violation of the Interstate Commerce law"; and most of the railroads, when discovered, have promptly stopped their illegal practices. The President urges that, in view of this notable case, "the only way by which the discriminations can be cured is by conferring upon the Interstate Commerce Commission the power to take quick and effective action in regulating the rates." We cannot see, however, that Mr. Garfield's report, or fifty like it, however much they may inflame popular feeling, could alter the necessity for a carefully drawn clause under which the rate-making power of the Commission shall be subject to full review by the courts. In the meantime, the President has a strong weapon in the existing statute. The penalty for violation of the Interstate Commerce law can be enforced against both railway and shipper—a fine of $5,000 for each offence and imprisonment for two years. If prosecution of the law-breakers against whom the President declaims with such fervor were pressed to the bitter end by the Department of Justice, we should have a wholesome recognition of the rights of the small shipper, even without new legal machinery.

The debate as to whether the President has "surrendered" in accepting the so-called Allison amendment to the Railway-rate bill, is purely academic. Consistency has never been President Roosevelt's ruling passion. His motto has always been that a wise man changes his mind as often as may be desirable. To-day he declares roundly, "I am standing in my original position." In that case his original plan was to give the courts broad powers in reviewing the decisions of the Interstate Commerce Commission; and those spokesmen who thought he was for "limited review" have been mistaken. They took his words in a narrow, literal sense, whereas he, like certain theologians, has been using language in a large, spiritual, or even allegorical signification. The main thing is that the Allison amendment removes the last doubt as to the constitutionality of the Rate bill. The advocates of "limited review" have obviously been trying to come as near as they could to beating the Constitution in order to "soak it to the railroads"; but this amusing enterprise they have finally abandoned as impracticable. The President heartily applauds. "No genuine friend of the bill," he writes, "can object to it [the Allison amendment] without stultifying himself." And, we may add, no genuine friend of Constitutional government can object to it without stultifying himself.

The amendment upon which the Republican Senators have come together reads as follows:

> "The venue of suits brought in any of the circuit courts of the United States against the Interstate Commerce Commission to enjoin, set aside, annul, or suspend any order or requirement of the Commission shall be in the district where the carrier against whom such order or requirement may have been made has its principal operating office; and jurisdiction to hear and determine such suit is hereby vested in such courts."

This clause, on the face of it, allows the court to suspend any ruling of the Interstate Commerce Commission until the reasonableness of such an order shall have been determined. This would seem to be a "broad review" in any proper sense of that term. "The power to take quick and effective action," which the President wishes to have conferred on the Interstate Commerce Commission, may be somewhat curtailed by the courts; but this very clause providing for a judicial review will in the long run be the protection of the small and independent shipper. In complex matters involving nice questions of law, the race is not always to the swift. A law which might prove unconstitutional and therefore impracticable in operation, could never be quick and effective. A provision which safeguards all interests, even those of an oppressive railway or an extortionate monopoly, is, after all, the strongest bulwark of the feeble and the downtrodden.

Whether Senator Tillman's remarks in Congress on the Federal judiciary on Thursday will or will not give to President Roosevelt a sense of gratification because his own angry denunciation of Judge Humphrey's decision is bearing fruit, we do not pretend to know. People at all familiar with American public affairs will not, however, be surprised to see the attack of the President on a

Federal judge so promptly echoed, with additional emphasis and broader application, by radical agitators. If assaults on the judiciary reappear later on, in the platforms of parties appealing to social unrest and class prejudice, there will be still less occasion for surprise. Mr. Tillman's speech appears to have been made up, for the most part, of country newspaper clippings telling of judges who travelled with railway lobbyists, shot game in defiance of State laws, and appeared on the bench in a state of intoxication. We do not happen to know whether these specific allegations are true or not, and we doubt if Senator Tillman does. If they are true, the Constitution and the law provide adequate means of dealing with them. But that a collection of alleged incidents of the sort should be brought forward in Congressional speeches, with the obvious inference that Federal courts cannot be relied upon for honesty, is something which, we imagine, sober-minded citizens will hardly enjoy. There are those who will say that, in the present state of the public mind, such insinuations are a spark in a powder-magazine. Who is responsible for it? Coming from Senator Tillman alone, whose attitude towards the Federal courts was familiar as far back as his Governorship of South Carolina, comment on his speech would probably be that he must not be taken too seriously. Following a formal message to Congress by the President of the United States, in which a Federal judge was accused of "making a farce of the law," with the added declaration that "I can hardly believe that the ruling of Judge Humphrey will be followed by other judges," the Tillman diatribe at once gets a very different sort of hearing.

If Senator Aldrich kills the bill admitting denaturized alcohol free of duty, he will rouse much resentment, and thus do not a little to strengthen the movement for general revision of the tariff. The correspondent of such an orthodox Republican paper as the *Tribune* asserts that, although a majority of the Senate Committee on Finance will vote for a favorable report, nevertheless the measure is to be referred to a sub-committee. This action is nominally intended to provide what Senator Aldrich calls "certain safeguards," but it may postpone the matter to another session. In the meantime, the members of the House of Representatives are much disturbed by the threats against a bill which they passed almost unanimously. The entire Illinois delegation has taken pains to go to the Senate and urge the extreme necessities of the case. Their arguments are substantially those which the editor of the *American Agriculturist* brings forward in an open letter to Senator Aldrich. The *Agriculturist* flatly asks the Senator from Rhode Island whether he fears that the proposed legislation "may interfere with the Standard Oil Company's monopoly of gasolene, naphtha, etc.," or may "destroy the wood-alcohol industry." Both the Standard Oil Company and the manufacturers of wood alcohol are, in the opinion of the *Agriculturist*, able to look out for themselves. On the other hand, the denaturized alcohol will supply farmers and all other classes of the community with cheap light, heat, and power.

The "Patent-Medicine bill" failed of passage this year by the action of some of its critical friends who insisted on amendments at a time when any amendments whatever meant the failure of the measure. The eleventh-hour amendments were "exemptions." That is to say, it was sought to permit the sale of certain specific drugs, regarded by the sponsors of the bill as dangerous, without giving any warning to the purchaser. It is urged that certain of the drugs named in the bill as first drawn, while poisonous, were not "habit-forming." This might be an excellent argument against a law that should seek to prohibit the sale of these ingredients entirely. But the Stevens-Wainwright bill did nothing of the sort. It merely insisted that the buyer of these patent remedies should know what he was buying. It may plausibly be argued that all ingredients of proprietary medicines, poisonous or not, should be honestly published. We retain our former confidence that the passage of this bill, or one like it, is only a question of time. Meanwhile, there is another year of grace for the nostrum-makers.

Reed Smoot was first brought before the Senate Committee on Privileges and Elections in March, 1903. Now, in May, 1906, the committee resolves that he is not entitled to his seat as a Senator of the United States from the State of Utah. In the three years of his trial one Senator, Hoar of Massachusetts, has died; another, McComas of Maryland, has retired from the Senate; and a third, Clarke of Arkansas, has refused to serve and been displaced by Patterson of Colorado. It has been freely said that the committee was not at all anxious to come to any agreement during Smoot's term, but pressure from the anti-Mormon element in Utah, Idaho, and the Pacific slope has finally forced this 8-to-5 vote for expulsion. Three of the Senator's six years of service in Washington have passed, and the general feeling is that he has been a useful, hard-working member. His committee assignments have included membership in the Forest Reservations, Pensions, and Public Lands committees of the Senate. There has been no charge of polygamous practices brought against him. The case rested on the implication that his oath of allegiance to the Mormon Church prevented him from giving complete allegiance to the United States. In ten days the Senate will be asked to vote on the resolution of the committee proposed by Senator Heyburn.

The bulky 'Report on Inspection of United States Consulates in the Orient,' which has been sent by the President to Congress, embodies chiefly the confidential report of Herbert H. D. Peirce, who visited these Far Eastern consulates in 1904. Mr. Peirce found that there was no difficulty in locating the trans-Suez thirst. Consul-General McWade at Canton had been overcome by it. Vice-Consul-General Colegrove appears in the report as the Ulysses of a dipsomaniac Odyssey in the China Seas. The consular thirst, it appears, is not merely raised, but reasonably gratified. In perusing the records of Consul-General Williams of Singapore, McWade of Canton, and Goodnow of Shanghai—in considering the mass of accusation and recrimination between these corrupt officials and the commercial *canaille* with which they dwelt—one has a very striking commentary on Mr. Kipling's theory of the equivalence of the best and worst. O. F. Williams's case is a mild one. He merely carried on a debt-collecting business against the Sultan of Lingga and Rhio, to whom he was not accredited, in behalf of Chinese and other creditors. The dunning of the Sultan must count among the finer international pleasantries. Consul Williams "hesitates to take official action" (in the matter of a Chinese claim), but makes a "friendly request" for answer "by return mail." After allowing the Sultan three weeks, Williams writes, concerning the claim of $9,091.76, "in which I have an interest," that, since his Majesty is "a ruler of vast wealth, you must have failed to get my letter." Again Williams requests "reply by return mail," and concludes in the most amicable spirit: "It will be much pleasanter and better to settle the matter at once, as we are each busy men."

The charges against McWade are made by persons more or less suspect themselves, but this much is certain: that he employed as consular clerk an ex-convict, Tony de Silva, who had served three years at Hongkong for larceny, and that he was in correspondence with an agent, Charles E. Richardson, concerning the fraudulent issue of passports to Chinese laborers in transit for the Philippine Islands. Goodnow's foible was "unofficial fees"—petty items that could be tacked on, or, complaint arising, taken off from the legal schedule. Eighty-two charges against him were made in all, varying in seriousness from petty "unofficial" extortions and legal fees asked for services not

rendered, to issuing false passports and fraudulent registration of five Chinese steamers under the American flag. Characteristic of Goodnow's methods is the charge of $85.75 for probating the will of Frank Reid, deceased (Report, page 272). On complaint, the fees were reduced to $52.75. The reduced bill still contained about $17.50 of illegal charges, which indicated to Inspector Peirce that "the consul-general or some one in his office is acting as an attorney before his own court and collecting the fees as official court fees."

The belated attack of the "hyena politicians" on Gov. Hoch of Kansas made it certain that he would be renominated by the Republicans. It used to be understood in the West that an attack on the private character of a candidate, in order to have any effect, must be made on the very day of the convention. Twenty-four hours of reflection was judged to be sufficient time for a reaction against the "slanderers" to set in. The Marion editor is the logical choice of the party, and, with the exception of W. R. Stubbs, the strongest candidate that could have been named, yet his backers are undeniably nervous. The newspapers of Topeka and Kansas City have been pointing to the strong Democratic ticket headed by ex-Senator Harris, and suggesting that the Republicans come out with a platform as clear on State issues as that adopted by the Democrats. Two definite questions have been raised by the Democrats—strict enforcement of prohibition and the reform of the State Board of Railroad Commissioners. At Topeka last week the Republicans met these issues by denouncing the Steel Trust and agreeing that President Roosevelt should be encouraged in his fight for rate regulation. There is every prospect of an unusually lively campaign, with the Republicans, for the first time in years, on the defensive.

Our eight prize-winners at Athens deserve heartiest congratulations. To win is agreeable under any circumstances; to win under the shadow of the Acropolis must pass for the fine flower of athletic triumph. The victory of the American team is all the more welcome that its personnel was on the whole of a merely average sort. Only two or three of the strongest men were able to make the trip. Accordingly, the Olympian honors so easily won are really a tribute to the average excellence of our athletes. On the other hand, the difficulty of securing strong teams for games so remote makes the first place more or less a matter of chance. For example, the loss of Ewry or Sheridan, winners in such specialties as the standing jumps and the weights, would have pared down our victory by a third. An international honor, however, like a gift horse, should not be scrutinized too closely. The present one does very well. Considering the games more broadly, one is tempted, of course, to emphasize the fact that they are a revival—to imagine them as like the ancient meetings as possible. A very little study of the events provokes, on the contrary, a lively sense of the differences. What would the Greeks of the Olympiads have said to rowing—then the work of slaves—rifle and pistol shooting, shot-gun practice, and lawn tennis? That they would have regarded these unspectacular sports with keen curiosity at least is certain, but it is no wonder that the modern Athenians reserve the enthusiasm for the Marathon race—an event that, besides its historical association, goes back to the elemental conception of the hero athlete. The Canadian winner may not in the ancient fashion receive the award of a statue; the cable reports, however, that, if he desires a running mate for life, he may at least have his choice of Galateas.

The tendency of the Irishman to be "agin the government" is illustrated anew at Westminster in the case of the Education bill. John Redmond's Nationalists cannot and will not support it. The decision is surprising because Mr. Birrell's very contentious measure applies merely to England and Wales, and the natural attitude of the Irish members would have been one of complete disinterestedness. This is, however, a pose impossibly difficult for any Celt to maintain, and one may assume that Mr. Redmond's group is merely entering a protest in behalf of the few Roman Catholic "voluntary schools" that are to pass out of the hands of the Church or else lose their subsidies. There is a curious rumor afloat that some of Keir Hardie's Laborites will oppose the bill because it is still too favorable to the religious denominations. As an old-time Calvinist, Mr. Birrell is accustomed to face without wincing the formula, "You'll be damned if you do; you'll be damned if you don't." He will apparently have every opportunity to practise the resignation that should come from living under such an alternative. A defection of votes, which may roughly be estimated at one hundred, is fairly serious, because many of the Liberals are very shaky in their allegiance to non-sectarian public schools. Meantime, the wonder grows that the alignment on so important an educational measure should be made on issues that have next to nothing to do with the actualities of education.

The French election returns on May 6 may be somewhat affected by revoting next Sunday in *arrondissements* in which there was no choice; but the results indicate that the Ministry has made slight gains. Its estimated majority is 100. A curious habit of the discontented French voter—that of simple abstention from the polls—has prevented the Socialist protest against recent repression from becoming effective. Such abstention in most cases merely cuts down the Ministerial majority or postpones the election of the Government candidate. It is not a practical sort of opposition. The old personages—the Abbé Gayraud and Vicomte de Mun of the Right; Ribot and Bourgeois of the Moderate groups of the Centre; the present Ministers, Jaurès, Doumer, and Delcassé—are all to return to the Chamber. The country has spoken emphatically in favor of the Separation Act, and as clearly stands behind the paternalistic policies of the Sarrien Government. The virulence of Nationalism was spent some time ago, and it is no surprise that Habert and Marchand have failed in the first elections. Even the picturesque Déroulède must try the luck of a second ballot. Clearly, the times are hard for the "League of Patriots" that made such a stir in the piping Dreyfus days. The elections pretty well illustrate the absurdity of turning out Premier Rouvier at the culmination of his Moroccan triumph. All the policies that have prevailed are his, and it is doubly fortunate that Sarrien has much of his predecessor's judicial and conciliatory spirit. Since the "Red" Socialists have made so small a showing, it is probable that the composite Radical-Socialist majority may hold together for several sessions.

The reasons for M. Witte's retirement are still merely inferential, though something may be gathered from the character of his successor. M. Goremykin, some ten years ago, was Minister of the Interior, and made it his chief duty to keep all disagreeable news from the Czar. For such suppression of the truth he was exposed and virtually dismissed by M. Witte. Goremykin's revenge came in 1903, when the reactionary cabal of Plehve drove Witte out of office, only to suffer prompt shipwreck itself between the political uprising at home and the military disasters in the Far East. The new Premier, then, must be regarded as the firm friend of the reactionaries. It is most unfortunate that the Czar is put in an attitude of suspicion towards the Duma at the moment of changing prime ministers, thus playing into the hands of the radicals, and making doubly difficult the task of conciliation and compromise undertaken by the moderate reformers. Witte's sympathy with the new movement was defective, but he was at least an unprejudiced observer of the political situation, and willing to make any needful concession. The accession of Goremykin means, we fear, the opposite.

REPUBLICAN DANGER SIGNALS.

The announcement that E. Rosewater, editor of the Omaha *Bee*, is a candidate to succeed Millard in the United States Senate is merely a formal acknowledgment of a long-held ambition. It is taken seriously, however, and the Omaha journalist's career as a rabid enemy of the railroads is likely to give him a great advantage over the conservative Millard Whatever Nebraska Republicans may have said about Rosewater in the past as a peevish meddler in politics and an anti-railroad ranter, they must admit now that he comes nearer to representing party sentiment than any one else in the State. And yet, from his own point of view, the Democrats are stronger and more consistent in their opposition to corporate influences, whether in the form of railways or tariff-protected Trusts. As in Nebraska, so it is in Kansas and Minnesota, where in the coming State elections the railroads are to play important parts. The Republican leaders morning and afternoon are being admonished that their only hope lies in stealing Democratic anti-corporation thunder. In such widely separated States as Massachusetts and California the Congressional delegations are preparing to assure their constituents that, while they are strong for tariff revision and are deadly enemies of the Steel Trust, the Speaker is such a tyrannical old fogy that he won't tolerate this "Democratic doctrine" in the House.

The Minneapolis *Journal*, a Republican organ, notes an unusual apathy among the voters of Minnesota concerning the coming gubernatorial election. This apathy, it says, is "unfortunate for the party's prospects." Here is a State that has a normal Republican plurality of 100,000, that has a Democratic Governor, and is apparently not yearning to get back into the Republican fold. The *Journal* explains it in this way: "The army of Republicans who helped to elect Gov. Johnson got a taste of independence, and, unless they feel a personal interest in the Republican nominee this year, they will be hard to hold in line." Gov. Johnson and the Democratic platform, in fact, come nearer to pleasing the voters of Minnesota than any patchwork declaration likely to be put forward by Republicans. What is written of the party leaders in that State—"They recognize the danger, and for the most part are anxious to learn what the voters want, if they can only find out"—is more or less true in other States. The Republicans are trying to adjust their declarations and choose their candidates in accordance with the new demands.

How successfully the party which is commonly regarded as friendly to the hunted corporations has itself turned hunter, remains to be seen. Last week, at the Kansas Republican State convention, the chairman, William Roscoe Stubbs, called upon the party, not only to rescue the State from the grip of the railroads, but also to reach out and grapple with the Steel Trust. That, considering popular temper in Kansas, was good advice, but there is no general belief that it will be taken. The Kansas City *Star* declares that "it will suit the [Republican] machine crowd in Kansas a mighty lot better to see the Democrats capture the State with Harris than it would suit them to see Stubbs succeed in his movement to protect the Government of Kansas against the special interests that have laid out their plans to capture the next Administration at Topeka, with Hoch as its figurehead." William Allen White's paper, the Emporia *Gazette*, put the matter tersely the day before the convention met: "If the Lord doesn't send the Kansas Republicans a Moses, and send him by express prepaid, before to-morrow night, it will be a great day for the Democracy!"

As the conventions and primaries are held in the Congressional districts, this difficulty in bringing "Bourbonized" Republicans around to a successful advocacy of the old Democratic doctrines becomes more evident. We may recall Representative Mudd's promise to work for tariff revision if he is reëlected by the Republicans of the Fifth Maryland District. In Massachusetts, also, the Tariff Reform League, formed among the business men of the State, is sure to have something to say about the make-up of the delegation in the Sixtieth Congress. Ex-Gov. Douglas, who is active in the work of the League, promises the people of the State a change from a system under which "our industries have to pay duty on raw materials or buy them of domestic producers who will sell only at tariff-made prices." Moreover, just how the California delegation is to explain the burial of the Madden resolution to admit free of duty structural steel needed to rebuild San Francisco, we shall be interested to learn.

In the eyes of the standpatters of Iowa, Gov. Cummins is a radical. Some have called him a Populist. But in his campaign for control of the Republicans of the State against George D. Perkins, a Shaw standpatter, he has shown unexpected strength. The Governor's friends point to his success as a warning to the party to rouse itself to the fact that new issues are being raised that have to be met. This year, it must be remembered, there is no Roosevelt to head a national ticket and set a "tidal wave" of Republicanism in motion. In the Congressional districts, and in the score of States that are to choose Governors, the candidates will have to stand on their own merits. If they meet the issues of tariff revision and corporation control less skilfully than the Democrats, there will be some great "rescue" work for the Republican managers in 1908.

"THAT" TARIFF SPEECH.

"I think," said a Republican member of Congress after Mr. John Sharp Williams had concluded his speech of Saturday week, "I may justly congratulate the gentleman upon *that* speech, because in the last seven years that I have been a member of this House each and every time the gentleman has delivered *that* speech, I think I have been able to note a decided improvement. . . ." This sally, of course, elicited the customary "[Laughter.]". Whether it should be a serious reproach to a parliamentary leader to have a speech which, after seven years' use against adroit and resourceful opponents, is still in working order, may be open to question. But while it is true enough that the fundamental arguments against the protective principle and the existing tariff schedules remain substantially as unaltered as the Ten Commandments, nothing is clearer than that a new and abundant collection of illustrative examples and applications to details will be ready for use in this year's Congressional campaign. Particular duties which may have been only a little too high from the standpoint of the logical protectionist in 1897, can now be proved ridiculously unnecessary. The facts regarding the practice of American manufacturers who sell their goods at substantially lower prices abroad than at home, of which the Democrats found it so difficult to secure the categorical proof they wanted in the last off-year campaign, are now hardly to be disputed. If the speeches of Mr. Williams and other Democrats are to be taken as the "keynotes" which we expect about this time in the even-numbered years, the tariff discussion will be, of all things, concrete, and concerned with conditions as they are to-day.

The leading case, thus far, seems to be that of the reimported American watches sold on lower Broadway at prices below what other retailers were permitted to charge. After Mr. Rainey of Illinois had given the details of the transaction, including the story of the detention of 2,300 American watches in the custom-house on the plea that they had been "increased in value" abroad by the addition of Swiss dials costing 4 cents each, his Republican colleague, Mr. Boutell, made a speech in answer. By extensive use of affidavits, he undertook to show that certain of the watches offered on "lower Broadway" were not bargains, while others were of varieties of which the factory records showed that practically none had ever been bought "for export." Mr. Williams's reply, however, went directly to the heart of the matter. "The first fact is," he said, "that there were a lot of these

watches sent over to England, and a lot more of these watches were later contracted to be sent over to England, and the watches were not delivered; and when suit was brought to enforce delivery, the plea of the defence was that a man had bought the watches *to sell in France*, and that they, the defendants, had found out he wanted them really to sell in the United States. Horrible duplicity!"

This rejoinder by the minority leader itself brought out a fact hitherto unnoted in the discussion:

"Mr. Rainey—Mr. Chairman, I should like to state that I neglected to say the other day in my argument that this suit was settled. It did not go to a conclusion. The Keystone company paid on behalf of the Elgin company and themselves £500 rather than keep this contract.

"Mr. Williams—Yes; rather than keep this contract or continue their own suit, they paid £500—$2,500—and why? Oh, 'gentle shepherd, tell me why.' [Applause on the Democratic side.] Suppose I sell 300 bales of cotton to a man in Liverpool, and he tells me he wants to make goods out of it in England and send the goods to Bombay. I then find out afterwards, lo and behold! that he wants to ship the goods back to Charleston; that he finds it profitable to himself to do so. I should be arrested as a roving lunatic if I made any objection, because I am nothing but a cotton planter. . . . There was an interest somewhere involved in keeping up one price in the American market, regardless of the profit to the purchaser in other markets."

Now the conditions which may or may not prevail in the watch trade make relatively very little difference in the cost of living. Watches compose about one-twentieth of one per cent. of the product of our manufactures, a little more than flavoring extracts or matches, a little less than paper-bags or buttons. But if the same line of demonstration is extended to more and more important products, there is bound to come a critical time when it will no longer be possible from the sincere protectionist standpoint to make even a plausible defence of the tariff as it is. "I am wondering and sometimes dreaming," said Mr. Williams near his peroration, "what will happen to the gentleman from Iowa [Mr. Hepburn], the gentleman from Pennsylvania [Mr. Dalzell], the gentleman from New York [Mr. Payne], and the gentleman from Indiana [Mr. Charles B. Landis], and all the other leaders of the cohorts of 'standpattism,' when, toward the tail-end of this session or during the next session of this Congress, the man in the White House—who carried your party to victory, rather than the party carried him—shall send a message to this House to revise and reduce the tariff! It is in the air that he wanted to do it before this. . . . Let me tell you something: You have got to revise this tariff. If you don't, we will. Because our common masters, the people of America, have made up their minds that it shall be revised."

THE STAMPING OUT OF PEONAGE.

The recent pardon by President Roosevelt of John W. Pace of Tallapoosa County, Ala., the chief offender in the Southern peonage cases uncovered by the authorities some three years ago, furnishes occasion for reviewing the results actually secured from the remarkable series of prosecutions then begun under a law of which some offenders had never even heard, and which had been passed to prevent a dissimilar practice in a far-distant part of the country. Pace, the so-called "father of peonage," made his defence substantially on the ground that, whatever might be the methods of obtaining compulsory labor from negro criminals, the word "peon" had never been current in Alabama, and that the local practices bore no relationship to the Mexican institution of peonage which the Federal statutes had long ago made a crime in order to keep it out of Arizona and New Mexico.

The change in Southern sentiment which has come about since the first denunciations of "Federal interference," may be shown by the statement of Judge Jones, himself a Southern man, who, after leading the unpopular fight against peonage in the State, and severely reprimanding a jury which had refused to convict in his court, joined in the recommendation of clemency for Pace, who was practically a dying man at the time of his sentence. "Public sentiment," said the judge, as quoted by a correspondent of the Boston *Transcript*, "temporarily misled at the outset, came to the support of the authorities, by outspoken approval of the prosecutions, as soon as the conditions which called for the enforcement of the law became known. The State press, the pulpit, the bar, and good citizens in all walks of life built up an aggressive public sentiment which, in a few weeks, crystallized into an earnest determination to prevent any future violations of the law. The sentiment thus aroused has continued in unbroken force, and there is not now a State in the Union where violations of this law are less likely to occur than in Alabama, and especially in Tallapoosa County, where Pace lives and whose people now ask his pardon."

The transplanted peonage system, this "new slavery," like all such elaborate systems of crime or oppression, was not a sudden invention, but a growth. It is even said by some that it grew out of the benevolent practice of the white men who would volunteer to pay the fines of negroes convicted of minor crimes, and thus get them out of jail. The next step was to assure, by physical restraint, the working out of the debts thus incurred. Lastly came the co-operation of justices, constables, and other officials in providing a supply of this forced labor. As the *Transcript* correspondent remarks, some of the whites had not outgrown "the idea that in some way they were entitled to the labor of the negro, and were justified in getting it at as small an outlay as possible." Planters even agreed to take the entire output of criminals from some minor rural courts. The laws of most States define a good many petty crimes which practically are never heard of. In Alabama, negroes were taken up in numbers for such offences as "swearing before females," shooting across a public road, carrying razors, stealing a ride on the train, letting a master's mule bite some other man's corn, and the like. Then it was a question of going to jail or working out the fine, which some interested white man stood ready to pay if the convicted person would "touch the pen" to a contract that was practically a consent to slavery.

While the cases in the Alabama back counties were the first to attract national attention, the test case in which the United States Supreme Court a year ago affirmed the application of the old peonage law to the Southern forcing of negro labor, was brought in Georgia. This was a case in which two negroes were brought from Florida to work for a turpentine manufacturer on alleged debts of $8 and $13 respectively, which the employer was perfectly willing to pay for them. On the decision in that case, as Attorney-General Moody said in his brief, hung "the liberty of thousands of persons . . . who are now being held in a condition of involuntary servitude, in many cases worse than slavery itself, by unlawful acts of individuals." As soon as the Supreme Court decided this Georgia case, Pace, in Alabama, admitted his guilt on all the eleven charges in his indictment of two years previous; and the hundred or more of similar prosecutions which the Government had begun in various parts of the South must have been greatly aided. Among these were some cases of white men, Italians, who were forced to labor in a phosphate mine in South Carolina. This instance furnishes another illustration of the old truth that, when unjust repressive measures have been applied to the negro, the white man himself is, on occasion, in danger of the same treatment.

CONSULS AND THE SENATE.

In spite of the Executive orders providing examinations, a man's chances of being appointed to the consular service unless he can get at least one Senator to work actively in his behalf, are in almost all cases slim indeed—how very small, regardless of the number or quality of disinterested recommendations from citizens not within the charmed circle of the Senate, the general public has little idea. This is especially true of the *best* posts of the consular service, for which the most influential Senators

are sure to apply. And again, the chances of promotion for a man already in the service, unless he has powerful and very active Senatorial and political backing at Washington, are likewise very slim. A great many promotions from lower to higher consulates have been made in the past few years; our pleasure in the fact is dulled if, on inquiry into the individual cases, it is discovered that in almost all of them the men promoted had this very sort of active political backing (as well as, in very many cases at least, a good record).

This is the natural result of the system which has grown up among us of so interpreting the phrase "by and with the consent of the Senate" as virtually to constitute the Senators referees of Federal appointments within their States. Now there is a seeming justification for this practice in the case of Federal offices, such as those of the revenue service, which lie within the territory of the several States, and the duties of which have to do chiefly or wholly with the citizens of a particular State in any given case. But what applicability has this rule of practice to offices abroad, of which the duties have no special concern with the citizens of any particular State of our Union, but are performed for the nation itself and, in a representative capacity, before the citizens and sometimes the governments of foreign countries? Why should the cry be raised that this or that State has a "claim" upon a given consular office, and, when one of its citizens withdraws, that its Senators should have the privilege of naming another for the place? Of course, a consular post abroad "belongs" to the nation as a whole, not to any particular State, but the practice has grown up of letting one State's Senators continue to name, year after year, the incumbents of a particular consular post, partly on the theory of an equitable distribution of these favors, and partly because it is thus made possible for the President to avoid some of the pressure exerted upon him by erecting against the Senators of one State the barrier of a "claim" to a vacancy by the Senators of another State. The practice has never been recognized as a fixed rule, by either Presidents or Senators, but it has gained considerable sanctity as usage; and among the more influential Senators "Senatorial courtesy" in a considerable degree prevails in this particular, keeping them off each other's "preserves."

The theory of "equitable distribution" certainly does not seem to work well in practice. There have been, until the slight reorganization brought about by the new law, 274 consular offices whose principals receive salaries and are not allowed to engage in business (except at Auckland and Vladivostok). Of these 274 principal officers (9 of the offices being vacant in the last official list), 72 were appointed from the four Middle States of New York, Pennsylvania, New Jersey, and West Virginia, as compared with 94 from that immense "yeomen's empire," the heart of our country, denominated the Middle West, and stretching from the Rockies to the Alleghenies between Canada and the Ohio River (including Missouri and Kansas). More striking as a comparison, though it will surprise no one who knows how consular appointments are made and reflects that the Republican party has been in power since 1897, there are 47 of these salaried officers from New England as against only 9 from the South (excluding Maryland, Kentucky, and Missouri). Little West Virginia, with Elkins and Scott for Senators, has 6 posts, with an average salary of over $2,500, while the old commonwealth of Virginia supplies one man, and for a $1,500 post at Guadalupe, W. I. The States of Alabama, Arkansas, Georgia, Mississippi, and South Carolina are not represented at all. The Rocky Mountain States have but 8 of these principal salaried officers, nearly all from the two Dakotas, while Connecticut alone has 9, only one of whom is in a post paying less than $2,000. The entire Pacific Coast has but 4, the same number as little Rhode Island with its Senator Aldrich. New Hampshire has 6 and Vermont 5, and the latter State holds two of the best posts in the service. No one will deny the capacity of Massachusetts to furnish good men for the service, but, as one looks over the list of her 16 officers with an average salary of $2,275 (more men, and a better salary average, than all the consuls taken together from the States which have lately gone Democratic in the Presidential election), he is inclined to question their having been appointed solely because of merit.

Five States, with 33 per cent. of the total population, have 44 per cent. of these offices. These are New York, with 38 offices; Ohio, 29; Pennsylvania, 19; Illinois, 17; and Massachusetts, 16—States which had in the census of 1900 a total population of 25,355,450. The comparison with the sections of the country which are more barren in their production of consuls grows more striking if we add Indiana with 10 offices, Iowa and New Jersey with 9 each, West Virginia and New Hampshire with 6 each, Vermont with 5, and Rhode Island with 4; then twelve States having 44.6 per cent. of the population are found to have furnished 61 per cent. of the consuls sent abroad. But the personal influence of the Senators themselves enters into the equation, too, and there are other interesting indications of how partisan considerations have often governed. One is not surprised to learn, such is the tradition about their office-seeking qualities, that the Ohioans have "landed" one consular post for every 143,000 of their citizens, while New York has to be content with one per 191,000. These two States have been equally successful in picking higher posts, so that the average salary for Ohio and New York consuls is brought up to $2,375. Pennsylvania has managed to get only one consul for every 332,000 citizens, but her Senators have been nicely discriminating, and have so effectively gone for the good posts that their men's salaries average almost $2,600. The West Virginia Senators have had the same success in getting the higher-salaried places. Ohio has, it will be observed from the above figures, beaten Illinois almost as badly as she has Pennsylvania in the race for number of places. Iowa seems strangely modest with 9 posts, but their average salary is above $2,700. Indiana, which has been a doubtful State, does still better, with an average of $2,900 for her 10 posts. Michigan has been unfailingly loyal to the G. O. P., and has as her reward only 7 places, with a salary average of less than $1,800, not holding a single office of any importance. One wonders if possession of an influential Senator, or if party contests, give Wisconsin, less populous than Michigan, several of the best plums in the service and an average of $2,700 for her 8 officers. Poor unduly partisan Michigan has not even her *per capita* average of consuls as compared with the country as a whole, and makes a sorry showing in this political contest by the side of little Connecticut and West Virginia.

It is true that there are men accredited to particular States in whose appointment political considerations played little or no part, but they do not form any considerable proportion of the list analyzed above. It is true, also, that, among the consuls, quite a number are not credited to any particular State at all, but were appointed from a residence in the District of Columbia, often being newspaper men or men who had demonstrated capacity in the public service. Still, not a few of the District of Columbia residents are really "Senators' men" or men who had "acquired merit" by labors for the party organization.

The fact is, and no law will alter it, that the whole question of consular reform rests primarily with the President. Appointments and promotions are in his hands, under the Constitution, and he has had, and has, the power to effect the most thorough-going reform of the service without a line being written into the statutes. We insist that, while nomination may not become appointment until the advice and consent of the Senate is had upon it, neither the Constitution nor public opinion requires that this advice and consent, extended in the first instance solely by individual Senators and resting upon "Senatorial cour-

tesy" for the acquiescence therein of the whole body, shall, with regard to all appointments at least, *precede* the nomination of a given man. As regards consuls, there are many special reasons why this previous consultation should not be recognized as at all a rule; but no President has yet challenged the usage which makes it a rule.

CARACAS ON THE DAY OF THE INDEPENDENCIA.

CARACAS, April 19, 1906.

A turn of traveller's good fortune has brought me to the Venezuelan capital on the day which commemorates the founding of the republic. April 19, to use the words of the *Constitucional* of this morning, is *dia santo entre los dias del mundo*, and the municipal council has decreed its observance *con toda solemnidad* and in a manner befitting the traditions of a liberty-loving people. The "Proclamation of Caracas" and the field of Ayacucho are to be burned into history in a blaze of illumination, and the Plaza Bolívar will be fairy-land shortly after the setting of the sun. President Castro, having temporarily relinquished the cares of state to his lieutenant, Gómez, has withdrawn in seclusion to his favorite Los Teques, going to the railway station, as one of the journals remarks, unattended by either soldiery or servants, buying his own ticket, and taking a seat in the railway coach in the manner of his own loyal subjects.

The day is in itself sufficiently dreary. There is a fair exhibition of the brilliant Venezuelan bunting, but, apart from this and the stringers of colored globes and lanterns that have been drawn across the Plaza Bolívar, there is little to show that anything is being celebrated. A scattering of Venezolanos may be seen wandering about the Salón Elíptico of the national capitol, gazing wondrously at its vast ceiling-painting of booming cannon or into the framed *Acta de la Independencia* and the *proclama* of the "Paladín de los Andes" of December 9, 1902; but there is no display of military in the streets, and no martial music falls upon the ear. The deserted national palace of "Miraflores" looks silently over the dusty plain that runs out to the lofty Silla de Caracas, but its walls carry no decoration of any kind, and its extensive chambers are as silent as are the halls of the University. There are no student demonstrations and no processions of religious orders. In the cathedral a single devout spirit was seen to move about the illumined interior; and, in the national pantheon at the time of my visit, no native gazed upon the gilt sarcophagus that covers the remains of the illustrious Bolívar. This is Caracas shortly before the hour of noon on its Independence Day—untidy and unkempt, with a sufficiently large representation of the sterner sex occupying its dusty street-ways and narrow sidewalks, but with nothing beyond its own mountain sunshine to impart joyousness to a festive occasion. The city is undemonstrative and unsympathetic, making its strongest appeal, perhaps, to the turkey buzzards that wheel in great circles overhead.

The air may be full of rumors, but the stranger hears little of them. The nation is assumed to have emerged triumphantly from its latest foreign complication, and the journals are loud in extolling the virtues of the "Restaurador," and give free space to the publication of panegyrics extracted from other sections of the South American press. It may be that from this success has grown a spirit of magnanimity which has helped to remove some of the restrictions that have been imposed upon the stranger visiting the country. I had been told, on what appeared to be good authority, that as a traveller *in transitu* it would be impossible for me to obtain at this time the required permit to visit the capital city, and that I should even be barred the soil of La Guaira. This was everyday experience; it touched everybody of low and high degree alike, and there was no reason to hope for anything different. But the unexpected happened. My personal card, after a moment's introduction and without the formality of the presentation of a passport (which I lacked), brought out a prompt permit from the genial prefect of police, and before nine o'clock I was speeding up the remarkable railway which zigzags the wall of the outer Andes. La Guaira lay below me and a heavy bank of clouds above.

One formality, unique in my experience of travelling, has to be complied with before the passenger is permitted to take a seat in the railway coach: his name must be inscribed in the conductor's memorandum-book. A request for this inscription, however wanting in legibility it may be, is made three times in the course of the journey between La Guaira and Caracas. The attack upon the mountain buttress of the coast is daring in the extreme, and the traveller is charmed and bewildered by the abrupt views of mountain and ocean which the numerous turns and twists disclose. There are no such grandly inspiring views as one obtains from the Boca del Monte or across Maltrata and the gorge of the Infiernillo on the line connecting the City of Mexico with Vera Cruz; but where Nature asserts herself so forcibly as she does here it is perhaps unnecessary to seek for comparisons. There is enough to keep the traveller occupied. The mountain slopes are at this season of the year largely bared, and stand out to particular advantage in their brilliant coloring of reds and grays; but a few weeks hence the naked branches of the small trees and bushes which, with numerous acacias and a few palms, form their scattering vegetation, will be clothed with verdure, and a soft green, except where rugged crags intrude upon the flowing contours, will rise to the sky-line. The road traverses no forest, and there are but few patches of woodland to suggest the glories of the tropics.

My first impression of Caracas, which we reached after a journey of somewhat more than two hours, was a disappointing one, and this impression did not wear off. I had hoped, even in the present condition of the nation's unrest, to see a city of stately pretence, cared for in a way so as at least remotely to suggest that it may at one time have justified a claim to being considered one of the most attractive cities of the western world. The "Little Paris in the Andes," indeed, sounds very fine, and is well adapted for use in steamship folders; but, alas, how little is there to warrant this designation! There are many cities in the outer world that are or have been likened to Paris, but a goodly proportion of these have no more right to such a comparison than has Caracas, and some of them less. A few fine shops that surprise the stranger by their presence, at rather remote intervals, in the Venezuelan capital, are sufficient to suggest Paris; at other times it may be the sight alone of smartly groomed persons or of stately equipages, with or without a supporting background. The good Père Labat, who visited Barbados in the early part of the eighteenth century, speaks of the jewellers' and silversmiths' shops of Bridgetown as having the brilliancy of those of the Paris boulevards, and many Barbadians of to-day seem to believe in the continued existence of this similarity; but a historian so partial to almost everything British (except political conditions) in the West Indies as was Froude, and who, in place of this assumed Parisian splendor, saw "only *stores* on the American pattern, for the most part American goods, bad in quality and extravagantly dear," could not discover it. The spirit of this characterization might, indeed, almost be applied to the Venezuelan capital.

True, the city is not wholly devoid of stately buildings, and the square containing the famous equestrian statue of Bolívar might by some be considered to breathe an air of subdued grandeur; but there are no avenues to open up receding vistas, nothing to give perspective to the ill-sorted walls of stucco which bound the thoroughfares and give store-fronts of varied degrees of unattractiveness and color. Even the principal hotels are barely distinguishable by external characters. Some of the side streets, indeed, recall to mind the streets of Córdova, in Spain, and one hopes among the interior courts to obtain glimpses of the house-gardens of Seville; but the eye searches in vain for the flower-draped balconies, in vain for those bits of grilled scenery which are the sunshine of the Andalusian home. Dirt-heaps and dirt stare at one plentifully, but some say that this is a newly acquired characteristic. To have seen Caracas in the days of Blanco! This city, like most cities nowadays, is illumined by electric light, but it has not yet risen to the dignity of having electric tram cars. The mule-tram does its service as of old, and the type of construction adhered to is, I believe, the most primitive to be found anywhere, with the exception of that of Willemstad, the "spotless town" of the island of Curaçao.

I made my way over to the leading hotel, and was agreeably surprised to find that its promise of cleanliness and good attention was fully carried out. Cleanliness is certainly not a virtue of Venezuelan hostelries generally. A small drum-and-cornet corps came and placed itself in the vestibule and broke out into a dreary military reveille. There was a momentary flurry among those near by, for, *quien sabe?* something might be afoot. But assurance was given that the "call" had no significance, and what little life had suddenly been brought upon the scene made a rapid exit. Caracas has an efficient carriage service, and one may still enjoy long rides in and about town, and in good fiacres, for the

payment of a few *bolivares* (francs); but where, one asks one's self, are the places that should attract for such drives? Humboldt, in his 'Essai Politique sur la Nouvelle Espagne,' refers to Mexico as one of the most attractive cities in the world, and likens it to Philadelphia; and elsewhere, in a comparative study, he describes the site and beauty of Caracas. One may without much violence to his conscience concede to the modern Mexico this characterization of the illustrious traveller; but between Caracas and the Mexican capital there is a vast gulf. Time has widened it, and its borders are being removed further and further every day. In the one city progress and modernization are apparent everywhere; in the other, the eye sees hardly more than somnolence and decay.

ANGELO HEILPRIN.

Notes.

Macmillan Co. will shortly put forth the first of four volumes of 'The Cyclopædia of American Agriculture,' edited by Prof. L. H. Bailey of Cornell, and 'From the Cotton Field to the Cotton Mill: A Study of the Industrial Transition in North Carolina,' by J. Holland Thompson.

Dr. William Shaw's book on the 'Knights of England,' from the earliest times to the year 1904, will be printed and published immediately in two volumes for the Central Chancery of the Orders of Knighthood by Sherratt & Hughes, 60 Chandos Street, London, W. C. The want of an authentic register of English knighthood has long been felt. That it has not been met hitherto, has been owing partly to the difficulty of compilation, such records as have been available being notoriously confused and contradictory; and partly to the fact that the ultimate sources for large portions of the subject-matter have been jealously withheld. These obstacles have now been completely removed. Dr. Shaw has been granted access to each and every collection of official historical sources relating to Knights Bachelors and to the Orders of British Knighthood, the Garter, the Thistle, the Bath, the Star of India, etc. With his work is incorporated a list of Knights Bachelors dubbed in Ireland, compiled from the records in Dublin Castle by Mr. G. B. D. Burtchaell of the Office of Arms.

The late Augustus Hare's guide-books seem to hold their own, and the little volume for Sicily, brought up to date by St. Clair Baddeley, has been reissued by E. P. Dutton & Co., with illustrations, and an excellent map of the island, engraved under the direction of Heinrich Kiepert. The volume is of a convenient size and shape.

The taking little "New Pocket Library" of John Lane Co. proceeds with Trollope's 'The Small House at Allington,' in two volumes. Algar Thorold's brief introduction is but a bird's-eye view of the characters in the story.

The five-volume reprint of Swinburne's Tragedies (Harper's) is more showy than elegant. The blue binding is tasteful, but the print and paper are undistinguished—unless the want of sheen in the latter be a mark of distinction; it is certainly commendable. The letter-press, however, is very clear, and this is another virtue.

Ginn & Co. have brought out an abridged edition, in one volume, of Prof. J. H. Robinson's 'Readings in European History' (extracts from sources), originally in two volumes, as our readers will remember. The unavoidable method of reduction has been followed—by omission, cutting down (but sparingly), and a giving up of the more advanced bibliographical references.

A second edition of Mr. Aksel G. S. Josephson's 'Bibliography of Union Lists of Serials' issues from the John Crerar Library of Chicago. It has been both enlarged and rearranged—this time geographically, as is most fitting. There is an index, and a chronological table specifying the class of serials included in the joint list of the several library groups.

The appearance of 'The True Andrew Jackson,' by Cyrus Townsend Brady (Lippincott), enables us to congratulate the publishers on having presented to the public at least seven "true" biographies. A perusal of this volume leads one to the conclusion that there is, after all, something in a name; the series by another name would assuredly not sell so well. Mr. Brady's estimate of Jackson is, on the whole, fair enough; but if a true biography implies nothing more than his achievement leads us to suppose, there is no reason why the list should not be indefinitely and rapidly extended, the main requisites in the author being admiration for the subject, reasonable judgment, a pair of shears, and a complaisant disregard of any demand on the part of the reader for finished literary workmanship. Mr. Brady's 'Andrew Jackson' must rank neither as biography nor as history, but rather as a book simply—a book, the existence of which is justified, if at all, by the divine right of authors to write and of publishers to publish.

A handy little book is 'Elocution: Its First Principles,' by W. H. Breare (Putnams). The author talks familiarly, with much good sense, and gives advice as to breathing, demeanor, and the like. He does not lay down rules, but proffers advice. One who announces it as a fundamental principle that "the art of teaching is making the pupil do the right thing unconsciously," is on the right track; and the modest, well-printed volume which Mr. Breare submits will be found helpful to young men who aim to succeed as public speakers.

The sixth volume of newspaper extracts, being vol. xxv. of the 'Documents Relating to the Colonial History of the State of New Jersey,' edited by William Nelson, preserves much interesting material of the date of 1767-68. When Lazarus Pine, of Philadelphia, wants to sell a young, healthy negro wench, he mentions, as adding to her value, the fact that she "has had the small-pox and measles." It is rather late in the day to expect to overhaul James Morris and get thirty shillings therefor. James ran away from Change-water-forge, in Sussex County, in May, 1767. One way in which it becomes easy to recognize him is from the peculiar circumstance that "he has a pearl on one of his eyes, and a remarkable long nose, speaks good English, but seems always as if he had a cold." The volume has a full index of names.

There are many signs that the various churches in England are waking up to the need of improvement in the provision they themselves make for religious education. One of the most notable is the appearance of such a book as 'Reform in Sunday-School Teaching' (London: J. Clarke & Co.), by so distinguished a scholar as Mr. A. S. Peake, professor of Biblical Exegesis and dean of the faculty of Theology in the University of Manchester. The first half of the volume is occupied by a discussion of the scheme of study provided by the International Lessons Committee, which Professor Peake condemns as "educationally disastrous." As the work of this committee is, in origin and influence, as much American as English, it may be hoped that these careful criticisms will be widely read in this country. They are followed by a few chapters of valuable constructive suggestion for teachers and superintendents.

'A Bodleian Manuscript' of five of the minor poems ascribed to Virgil is the title of a paper lately read at Corpus Christi College by Prof. Robinson Ellis and now published in a small pamphlet (Henry Frowde). The manuscript is of no particular importance for the text of the poems themselves, but it has considerable interest on account of the numerous explanatory glosses, written in Latin, French, and a few in Early English. Professor Ellis treats these as in type fairly representative of mediæval commentaries on Latin poems, and, as such, subjects them to rather minute investigation in his usual thorough and learned manner.

Naval manuals are apt to be little more than collections of statistics, and opinions based on mere figures little better than paper judgments. Howard of Effingham, and Tegethoff, and Togo have demonstrated that an equal or even inferior force may, in defiance of figures, annihilate an opponent. It is the chief merit of Captain Abeille's 'Marine Française et Marines Étrangères (Paris: Armand Colin) that it recognizes this fact. Although he examines, figures in hand, all the great navies of the world, comparing them with that of his own country, he is never the victim of his figures, but sees beyond them those broad currents that count for even more. He has much that is suggestive to say on the relations between the economic, strategic, and naval situations of France, England, Germany, and the United States. He relates these questions to present-day tendencies in international law, and discusses their bearing in connection with the approaching Hague Conference. The book is a good one, and, although primarily intended as an appeal for the reform of the French navy, contains matter that should not be missed by students of international relations.

While waiting for the definitive census to be taken at the end of each decade, the Bureau of Statistics of the Imperial Cabinet of Japan sends forth two folio publications (pp. 303, 357) with introductions and letter-press in French accompanying the Arabic and Japanese figures. One of the monographs treats of the Movement of Population in the Empire of Japan in 1902, and the other of the State of Population in 1902. The brief text calls attention to the diversity of systems of record prevalent before 1868

in the various feudal fiefs, and to the unity that now prevails and makes accurate and exhaustive record possible. Four sorts of declarations are required of those who change their locality—of temporary emigration or immigration and of permanent departure or reëntrance. The legal and the resident population are carefully distinguished, the latter numbering, in 1903, 48,500,000 souls, or, in detail, 5,053 nobles, 2,168,058 gentry (old *samurai*), and 46,732,138 *heimin*, or commoners. In the second brochure, the vital statistics of births, marriage, diseases, and death, are minute and accurate, furnishing excellent data for the study of disease and health on a national scale. The figures concerning beri-beri, smallpox, etc., show marked contrast by diminution with those of previous years. These annual publications reflect high credit on the veteran Director, N. Hanabusa.

Mr. Carnegie's rectorial address at the University of St. Andrews, delivered last October, finds publication in America through the columns of the May *Popular Science Monthly*. The address is a remarkably vigorous and sensible plea for international peace as against "the foulest blot that has ever disgraced the earth, the killing of civilized men by men, like wild beasts, as a permissible mode of settling international disputes." The speaker enumerates the many mitigations of the evils of war adopted during recent decades, but sees a lamentable step in the opposite direction in the comparatively new idea that one nation may allowably strike another in the midst of negotiations, without waiting for any formal declaration of war. This new method, he says, "belongs to the infernal armory of assassins hired to kill or poison opposing generals, of forged dispatches, poisoned wells, agreements made to be broken, and all those diabolic weapons which for very shame men have been forced to abandon as too infamous even for the trade of man-slaying." In the difficulty of obtaining recruits, experienced in both England and America, he finds a very encouraging mark of progress, indicating "the influence of education upon the masses in evolving clearer ideas of responsibility for their actions." From John Jay he quotes the sentiment that "Our country, right or wrong" is "rebellion against God, and treason to the cause of civil and religious liberty, of justice and humanity."

"Peter Schoeffer at Work" is the title of an article contributed by Mr. Alfred W. Pollard to the latest number of the *Book-Lover's Magazine*. It is an attempt—and a successful and very interesting attempt—to show in a narrative form how it happened that so many curious discrepancies are to be found in copies of apparently the same editions of books from the earliest printing-presses. The British Museum possesses four copies of Schoeffer's edition, of 1471, of Valerius Maximus, three of which agree throughout, while the fourth shows, on a number of pages scattered through the book, several variations, in themselves insignificant, but proof that the type has been changed. By examining and comparing these four books, Mr. Pollard has found that the size of the edition must have been increased while the printing of the book was still in progress but after part of the type had already been distributed; further, that at the same time Schoeffer introduced a new kind of comma, slightly differing from the one he had hitherto been using. Mr. Pollard also discovers that not less than six presses were used simultaneously in printing the book, and that only one page was printed at a time, while in 1474, when Schoeffer printed an edition of Turrecremata's 'Exposition of the Psalms,' he had facilities for printing two pages at a time. The story of Peter Schoeffer in his printing-office is introduced by some remarks about the claims in favor of Schoeffer as the inventor of printing; but they lead nowhere.

Dr. Paul Trommsdorff, who, by the way, is travelling at present in this country in order to gain some personal familiarity with American library methods, contributes to the March number of the *Zeitschrift für Bücherfreunde* an interesting article describing the work of the Bureau of Information for German Libraries in Berlin. From its opening in April of last year up to the end of 1905 the Bureau received inquiries as to the whereabouts of 2,270 works, in regard to 1,330 of which it was able to transmit the desired information. Nearly 500 of the books inquired about were found to be in the Royal Library in Berlin, and 300 in one or other of the eleven university libraries in Prussia. Of books not found in any of these libraries, printed lists are issued from time to time and sent to all the libraries that coöperate through the Bureau. Dr. Trommsdorff gives the titles of a number of books of which not more than a single copy could be found. Among these *unica* we notice the *Athenæum* for 1831, the *Century* for 1892-93, *World's Work* for 1903, George Paston's (Miss E. M. Symond's) 'Little Memories of the Eighteenth Century' (New York, 1901), and Mr. Copper Curtice's 'Animal Parasites of Sheep,' published in 1890 by the United States Department of Agriculture. While the majority of the books about which information was sought were philological or historical, or of particular interest to the bibliophile or antiquarian, a large number of scientific and technical works, especially periodicals, were put in the hands of students through the medium of the Bureau. That the services which the Bureau renders the world of learning are duly appreciated, has been shown by the fact that the number of inquiries is steadily growing, and that in many cases a casual inquiry has led to a quite regular correspondence.

The Imperial Library in Tokio, having outgrown the brick building erected in 1889, is to be housed in a new edifice of modern style, in steel and stone, after the American method of construction. The illustrated pamphlet just issued shows the noble proportions of the final structure in Uyeno Park; it is to cover 5,760 square feet, and to be seven stories in height. The finished portion, covering 1,290 square feet, is imposing in outward form, and is inwardly arranged and equipped according to the best ideas of modern library economy. Besides the principal hall for readers, there are reception and office rooms, and abundant provision for the work of cataloguers, for special researchers and women students. One-third of the building is occupied by the stacks, seven feet high, to which the users of books are allowed to go directly. The finishing of the halls with fine woods, carpets, desks, chairs, and in Doric, Ionic, and Corinthian styles of columns and pilasters, with electric lights, steam heat, steel shelves and supports, elevator, etc., is on a par with the best in Europe and America. A general library law passed by the Diet gives encouragement to the formation of other libraries, and this collection of 444,646 volumes is both nourishment and stimulus. The artistic decoration has been done by the Tokio Art School.

In view of the fact that missionaries in China are so frequently accused of being the cause of uprisings against foreigners, an interview between the Chinese commissioners and representatives of eighteen different Protestant English missionary societies in London on April 7 is important. Sir T. Fowell Buxton presented an illuminated address, of which the object was to impress upon the commissioners the true motives and aims of the societies, so that they might on their return use their influence to dissipate misunderstandings in regard to them. They had no political or commercial interests, and they "expressly direct their missionaries not to interfere with the internal politics of China, carefully to respect the administration of civil law, and not to seek the conferment of social *status* for themselves or extra-territorial privilege for their converts. The missionaries have deplored and opposed all action which has fostered the spread of the opium habit, and all things which have been prejudicial to the best interests of China." The address closed with a grateful acknowledgment of the kindness and courtesy of many high officials, and especially of invaluable services rendered during the Boxer disturbances. Duke Tsai-tse said in response that the interview to him was "a sign that the whole British nation is well disposed towards my country, and I can assure you that this good feeling is reciprocated on our side."

Capt. R. F. Scott, commander of the National Antarctic Expedition, was presented with the gold medal of the American Geographical Society at the April meeting of the Royal Geographical Society. In his presentation address our ambassador, Mr. Whitelaw Reid, spoke of the interest which America had always taken in Polar research and had shown especially in two Arctic expeditions; but, judging from the report in the London *Times*, he made no reference to the fact that one of the most successful Antarctic expeditions was that of Wilkes. In concluding, he said that those whom he represented would not be the young, daring people they were, if they did not take a special pleasure in the fact that this expedition was led by a man who was barely thirty years of age when the work was assigned to him. Capt. Scott expressed his appreciation of the gift, saying that his cup was brimming over with American honors, for it was the second time an American geographical society had awarded him a gold medal.

The treasurer of the Nobel foundation reports that the five prizes at the next distribution will amount to 138,536 kroner each, or an average increase of 453 kroner beyond the sums distributed last year. This is significant in view of the fact that the steady decrease in recent years had called forth considerable criticism in reference to the management of the funds.

—Richard Mansfield opens the May *Atlantic* with a paper on "Man and the Actor." He adds his voice to that of those who would have a National Theatre, free from the bad effects of the ordinary necessity for commercial profit, but it must be no scheme devised by a few individuals in behalf of some social or literary fad. As one of the accessories of such a theatre he suggests a board of literary directors, "composed of such men as William Winter, Howells, Edward Everett Hale, and Aldrich, and others equally fine, and the presidents of the great universities," to determine how the "American language" should be spoken in this theatre, and thus give an authoritative standard to people at large on debatable points of usage. Cannot some one persuade our eager spelling-reformers to simplify their task by waiting until this is done? Readers of President Roosevelt's recent book will remember its warm introductory tribute to John Burroughs. In an article on his camping trip with the President, the naturalist leaves no stone unturned to emphasize the fact that the admiration is mutual. The best of the story is in some of its amusing incidents of the President's career, such as an appeal from a Rough Rider in trouble for shooting a lady in the eye: "I didn't intend to hit the lady; I was shooting at my wife." Richard Washburn Child writes of the "Critic and the Law," but fails to draw any definite and intelligible limit beyond which the critic may not safely tread, for the very good reason that neither legislatures nor courts have as yet worked out any limit capable of definite statement. It is easy to say that criticism must confine itself to that which is of public interest, must be fair, and must represent the honest opinion of the critic, but, in spite of decisions which may be cited to that effect, one must not lose sight of the fact that critics may transgress upon matters of purely personal interest, may be grossly unfair and evidently insincere, and yet subject themselves to so little chance of successful prosecution as to make efforts in that direction practically useless. Just how far freedom *should* go in this direction is a problem; that it *does* go too far and fast for the halting gait of legal authorities to keep up, is a fact.

—*Scribner's* puts to the front this month a paper on vanishing Indian types, by E. S. Curtis, to which those who know anything of Mr. Curtis's work will turn at once for its reproductions of his famous Indian photographs. The text, however, is not to be slighted. Mr. Curtis succeeded because he learned the Indian as thoroughly as he learned his camera, and what he has to say of the Apaches and Navajos is of value on its own account. However true it is that the camera cannot rank with the brush in the realm of art, still one cannot compare Mr. Curtis's Indian faces with ordinary photographs and not realize that photography in the hands of really intelligent votaries can escape its usual narrow mechanical limits and occupy a wide and important field. In this connection we may mention the discussion of color prints by Russell Sturgis, in the "Field of Art," illustrated by a frontispiece reproduction from a color-printed etching by George Senseney, entitled "Moonrise." The second paper of the "Railways of the Future" series is by Sir Percy Girouard, and treats of the railways of Africa. The author is not immediately interested in such ideals as the "Cape to Cairo" project, which at one point would have to parallel 1,000 miles of free navigation on the Nile, and that, too, "through a country which any engineer would condemn as impassable." Africa's true railway policy will be in the future, he says, as it has been in the past, one of development toward her sea communications. Senator Culberson writes of Gen. Sam Houston and Secession, a very interesting picture of that oft-occurring tragedy of 1860-61, a strong nature torn by temporarily conflicting emotions of State and national attachment.

—We find nothing else in *Harper's* quite so attractive as the witty comment of the Easy Chair on the recently published Letters of Ibsen. Mr. Howells traces back to the Romanticists the conception of self-worship as not only a pleasure but a duty of the man of genius. This egoistic cult reached its extreme in Goethe, and left him the permanent type of heartless selfishness given up to the exploitation of supposed genius by any means available, fair or foul. In the letters of Ibsen the tradition appears again, "oddly zigzagging from the classic Goethe to the most mystical of the realists." No greater mind or more perfect art has revealed itself in our time, and yet his letters display this great mind "riveted to the little task of making the most of himself, to the pitiful business of getting the best there is in the narrow plot of ground where his poverty tethers him, like a fowl tied by the leg to a stake." By way of comparison, Dante did not go about consciously developing his powers, Shakspere was not subjectively an egoist, and Tolstoy occupied his mind with something other than "assisting the Creator in bringing the sovereign master of fiction to his supremacy." If a hen is too self-centred, the presumption is that it is only a porcelain egg that she is sitting on after all. Even in the matter of bringing one's own gifts to perfection, it is possible that a man's first duty is to others rather than to himself. After all his strictures, however, Mr. Howells expresses a doubt whether criticism has ever been able to advise creativism to its advantage, and asks the reader to remember that it is a more modest thing to advise a poet to make *himself* different than to advise him to make his work different. Yet if he had really made himself different, it is hardly in harmony with the Easy Chair's philosophy of literature to suppose that his works could have been the same. Does Mr. Howells mean rather that he should have kept himself to himself better in the matter of his ill-adjustment to his environment? With Ibsen's course he contrasts that of Björnson, "forgetting his own æsthetic development in the work of freeing his fellow-countrymen from themselves first and from their rulers afterwards, meanwhile writing the loveliest poetry and the truest and most beautiful stories, and the shapeliest and strongest plays, both real and mystical."

—'The Siege of the South Pole' (Frederick A. Stokes Co.), by Hugh R. Mill, D. Sc., as the title indicates, is simply the record of an incomplete episode in the history of geographical exploration. It does not attempt to describe the Antarctic regions nor to discuss the various problems connected with them. The author, who was for eight years librarian of the Royal Geographical Society, has made as readable a book as was possible, considering the mass of monotonous details of voyages in which the main incidents of ice and storm were so very similar. Of its substantial accuracy there can be no doubt. The introductory sketch of the early attempts to solve the mystery of the South Pole is interesting as showing the origin of the idea of a spherical earth and the part which the Antarctic problem played in the theological controversies of the early Christian ages. An Irish monk named Virgil was excommunicated by Pope Zacharias in 741 for teaching the heretical doctrine of Antipodes, "admitting the existence of souls who shared neither the sin of Adam nor the redemption of Christ." The three great expeditions of Cook, Wilkes, and Ross receive the most attention, but to the exploits of the American sealers in the South Seas during the first half of the last century a noteworthy chapter is devoted. The centre of this enterprise was Stonington, Conn. "Fleets of small vessels were fitted out there year after year, and the pluck of their skippers and crews led them often far into the Antarctic regions." In one of them, the 40-ton cutter *Hero*, Skipper Nathaniel B. Palmer, discovered land which still bears his name, given it by the Russian explorer, Admiral Bellinghausen, in token of his appreciation of the achievement. Much use is made in this account of the little known works of Edmund Fanning and Benjamin Morrell, and Dr. Mill records his satisfaction at learning that there is in preparation a history of American sealers in the far south which "cannot fail to be a fascinating work." From the time of Ross to the close of the century there is little to chronicle, the search for Franklin absorbing the attention of all interested in Polar research. After a brief description of the four great expeditions of the twentieth century, the author closes with a statement of what he regards as the best plan of operations for "the raising of the siege." He believes that it would not be wise to despatch a new expedition before 1909, and that it should be provided with light motor cars and a wireless telegraph equipment. The numerous illustrations, which add much to the interest and attractiveness of the work, are reproductions of drawings, photographs and maps, while Mr. J. G. Bartholomew contributes a large map in colors, exhibiting the geographical results of the latest expeditions.

—The official report of the Universal Congress of Lawyers and Jurists held at St. Louis in 1904, "under the auspices of the Universal Exposition and the American Bar Association," published at St. Louis (the Lakeside Press), and edited by the secretary of the Congress, Mr. V. Mott Porter, makes a stout octavo volume of some four hundred pages. It is interesting chiefly from the distinguished and representative nature of the membership; the papers read and proceedings had do not gain in weight by being produced under the "auspices" even of a Universal Exposition. The president of the Congress was Justice Brewer of the Supreme Court, and the members, nearly a thousand in number, were named by the various governments throughout the world to whom invitations

had been sent through the State Department—by bar associations, law faculties, and kindred associations. Many noted lawyers took part in the proceedings of the Congress, and there is every evidence that it was "a most enjoyable occasion"; but it was, on the whole, rather a parade of lawyers than a deliberative meeting with a definite end in view, and consequently it leaves behind it little more than one or two papers, some discussion, and a few resolutions of no very great importance. It should be observed, however, that the Congress was one of the agencies for the promotion of the second Hague Congress, yet to convene; and this lends interest to a paper by Mr. John W. Foster on the settlement of international controversies by resort to the Hague Tribunal or reference to special commissions. Mr. Foster insists, we are glad to see, that the assumed necessity of excluding from general arbitration treaties questions involving "honor" or "vital interests" rests on no substantial basis. The only question which cannot be submitted to arbitration is the Monroe Doctrine, but that is because we will not tolerate the insolence of any one but ourselves saying what it means—not because the questions which arise under it are inherently inarbitrable.

—Paper and type, printer and publisher, have all done their best for Mr. Charles J. Billson of Corpus Christi College, Oxford, in his new translation of the 'Æneid' (London: Arnold; New York: Longmans, Green & Co.), and the two quarto volumes have a stately and dignified air which seems to promise that, within, somewhat may be found worthy of "that Virgil, that fount which poureth forth so large a stream of speech." But alas! *quantum mutatus ab illo!* Again we find the woodenness and monotony which have so often characterized the modern attempt to render into blank verse the stately measure, the long roll, and the constant variation of rhythm which mark the great original. To diffusiveness Mr. Billson can indeed with truth plead not guilty; condensed he is (and Virgil has been called the most condensed of poets), for he renders the Æneid into exactly the same number of verses as the Latin. But in this process he is of course obliged to omit much of the thought which the longer hexameter line can convey. Thus—

"Now a mighty trunk
Lies headless on the shore, a corpse unnamed"

for

"Jacet ingens litore truncus
Avolsumque umeris caput, et sine nomine corpus,"

is one example of what we mean. Another is:

"Whence art thou come
Dear-hoped-for Hector?"

where the real meaning of *oris* (limbos), which adds so much to the bitter cry of Æneas, is wholly lost. Not that there are no good points in Mr. Billson's renderings; a faithful endeavor not to introduce into them ideas and thoughts foreign to the original, marks them throughout as the work of a scholar, but that a scholar's work they are, and not a poet's, is our principal quarrel with them.

—The veteran Gaston Boissier's 'Conjuration de Catilina' (Paris: Hachette) is another of those books in which his charm of style and sound common sense (gifts not too often attendant upon scholarship) have lent fresh life to a well-worn theme. As usual with M. Boissier, the title is a text upon which to base a general treatment of the *tempora et mores* of the event about which Cicero never tired of talking, and which led to the first Latin historical monograph in Sallust's tractate. It may be read with interest by the layman, and the philologian will find not a few pages that are worthy of his study. For instance, Boissier thinks that Sallust's 'Catiline' was a sort of literary manifesto against Cicero—not as man or politician, but as writer. Thus, to take a small detail: everybody knows that the intercepted letter from Catiline to one of his friends is preserved to us in two versions, Cicero's and Sallust's. Boissier holds that the former is the genuine one, and that Sallust retouched it in parts to make it conform to his own ideas of style. On the other hand, those who have read Zielinski's recent treatise on the *clausulæ* of Cicero will remember that he believes that Sallust's is the authentic version, and that Cicero recast the original in order to make it rhythmical. *Quis hos inter doctos dijudicabit?*

LEA'S SPANISH INQUISITION.

A History of the Inquisition of Spain. By Henry Charles Lea, LL.D. In four volumes. Volume I. The Macmillan Co. 1906. Pp. xii., 620.

For nearly twenty years Mr. Lea has been the acknowledged master in the study of the Inquisition. Appearing in 1887, when serious investigation had just begun to penetrate a territory long reserved to the controversialist and the pamphleteer, his 'History of the Inquisition of the Middle Ages' at once took rank as an accepted authority; and with such correction in detail as has been made in the recent French and German translations, it still maintains its position as the only comprehensive account of the subject which rests upon an independent examination of the sources. For the most significant modern phase of the Inquisition Mr. Lea now promises to render an equally important service to historical scholarship in the elaborate work on the Inquisition of Spain, of which the first volume, dealing with the origin and establishment of the Holy Office and its relations with the State, is now at hand, while the other three are ready for the press.

It is, of course, not to be expected that a subject of such controversial possibilities should have been wholly neglected by others. First and last, a good deal has been written about the Spanish Inquisition, but usually in a spirit of rancorous attack or disingenuous apology which has served to obscure rather than to elucidate the real nature of the institution. The most important treatise on the subject, the 'Histoire Critique de l'Inquisition d'Espagne,' published early in the last century by a former secretary of the tribunal, Llorente, made large use of documentary sources, and possesses more merit than Catholic writers have generally been willing to allow, but it bears evident signs of haste and prejudice, and could not escape the taint of its author's apostasy. There is abundant room for new treatment of the whole matter, but the task is not to be undertaken lightly. The subject is intricate and thorny, and the materials for its study lie for the most part unpublished and uncalendared in the archives and libraries of Spain and other European countries, while very little has been done in the way of preliminary exploration or monographic investigation. In this case the historian must be quarryman as well as architect—indeed, he must be quarryman first of all, lest he be tempted to treat his materials in accordance with some preconceived idea, ecclesiastical or anti-ecclesiastical—and must have that combination of patient research and sound historical judgment which Mr. Lea possesses in an exceptional degree.

The *inquisitio hereticæ pravitatis* of the Middle Ages never became important in Spain, for the reason that the heresies of this period—the doctrines of the Waldenses and Albigenses—never acquired a firm foothold south of the Pyrenees. There was no Inquisition in Castile before the days of Ferdinand and Isabella; it was not effectively organized in Portugal; and even in Aragon, where the spread of heretical movements from Languedoc had led to the appointment of inquisitors in the thirteenth century, the institution was never vigorously active. The origin of the new Inquisition established toward the close of the fifteenth century is to be sought in a quite different quarter, namely, in the peculiar conditions surrounding the Jewish population of the Peninsula. Jews there had been in Spain since Roman days, and the Visigothic kings and bishops adopted a harsh policy of persecution which brought them as near the Inquisition "as the rudeness of the age and the looseness of their tottering political organization would permit"; but under Mohammedan rule the Spanish Jews enjoyed the freedom and large opportunities which were open to them throughout Islam, and, curiously enough, the long wars of the *reconquista* served to soften rather than to embitter the relations between the different races and faiths. As in Syria, in the days of the Latin kingdom, so in Spain, "mutual attrition, so far from inflaming prejudices, led to mutual toleration, so that fanaticism became reduced to a minimum precisely in that corner of Christendom where *a-priori* reasoners have been tempted to regard it as especially violent." On the whole, the Spaniards of the Middle Ages, ecclesiastics as well as laymen, appear to have been remarkably tolerant, and the hatred for Jew and infidel which has been so notable a trait of Spanish character in modern times, far from being an inborn quality of the race, a *cosa de España* which requires no explanation, dates only from the fourteenth and fifteenth centuries. The change of attitude with regard to the Jews arose from the gradual introduction into the Spanish church of the spirit of oppression and persecution which prevailed in other parts of Latin Christendom; the terrible massacres of 1391 formed the turning-point, and the religious bigotry thenceforth so assiduously fostered culminated a century later in the inhuman decree which drove all adherents of the Hebrew faith from the Peninsula.

Under the fear of death or the threat of persecution, large numbers of Jews sought immunity by professing Christianity, and, with the barrier of religion removed, these

new Christians accumulated still greater wealth, rose to the highest positions in Church and State, and intermarried with the oldest families. "The time soon came when there were few of the ancient nobility of Spain who were not connected, closely or remotely, with the Jew"; the first inquisitor-general, Torquemada, was of Jewish descent, and so was his successor, Diego Deza. But hatred of the Jew, once it had been aroused against his religion, easily extended to his race, and the prosperity of the *conversos* served only to increase the popular detestation. Moreover, in one respect they were now at a serious disadvantage:

"As Jews they might be despoiled and humiliated, confined in narrow Jewries, and restricted as to their careers and means of livelihood, but withal they enjoyed complete freedom of faith, in which they were subjected only to their own rabbis. They were outside of the Church, and the Church claimed no jurisdiction over them in matters of religion, so long as they did not openly blaspheme Christianity or seek to make proselytes. As soon, however, as the convert was baptized, he became a member of the Church, and for any aberration from orthodoxy he was amenable to its laws. . . . The circumstances under which the mass of conversions was effected —threats of massacre or the wearing pressure of inhuman laws—were not such as to justify confidence in the sincerity of the neophytes, nor, when baptism was administered indiscriminately to multitudes, was there a possibility of detailed instruction in the complicated theology of their new faith. Rabbinical Judaism, moreover, so entwines itself with every detail of the believer's daily life, and attaches so much importance to the observances which it enjoins, that it was impossible for whole communities, thus suddenly Christianized, to abandon the rites and usages which, through so many generations, had become a part of existence itself. Earnest converts might have brought up their children as Christians and the grandchildren might have outgrown the old customs, but the *conversos* could not be earnest converts, and the sacred traditions, handed down by father to son from the days of the Sanhedrin, were too precious to be set aside. . . .

"The insincerity of the conversion of a large portion of the Marranos was incontestable; according to the principles universally accepted at the period, it was the duty of the sovereigns to reduce them to conformity; with the pacification of the land the time had come to attempt this resolutely and comprehensively, and the only question was as to the method."

Nevertheless, some years elapsed between the accession of Ferdinand and Isabella in 1474 and the actual organization of the Inquisition in Castile. Not only did the rich and powerful *conversos* throughout the kingdom bring all their influence to bear at the court and at Rome, but the arrangements between the Catholic sovereigns and the Pope were a matter of some difficulty, for "Ferdinand and Isabella desired, not the ordinary papal Inquisition, but one which should be under the royal control and should pour into the royal treasury the resultant confiscations." The bull of Sixtus IV., authorizing the appointment of inquisitors by the crown, was granted in 1478, but no commissions under it were issued until 1480, and it was not till the following year that the fires of the first *auto da fe* were lighted at Seville. In 1483 Torquemada was made inquisitor-general for Castile, and a special council, the Suprema, created, with jurisdiction over all matters connected with the faith; but the Pope had likewise appointed inquisitors, holding faculties immediately from the Holy See, and it was some years before the relations of the ecclesiastical and secular authorities reached a fairly permanent adjustment. "There was a constant struggle on the one hand to render the Spanish Holy Office national and independent, and on the other to keep it subject to papal control"; and there were special difficulties in extending the new organization to the Aragonese kingdoms, where the Dominican Inquisition still survived, and where the people were fiercely jealous of royal authority.

It will thus be seen that, from its very beginning, the Spanish Inquisition was a peculiar institution, differing from the episcopal and Dominican tribunals of the Middle Ages by reason of its close connection with the State; and the question of its exact relation to the public authorities constitutes one of the most important problems in its history. The view that the Holy Office in Spain was not an ecclesiastical institution at all, but a part of the civil government, can claim so high an authority as Ranke in its support, and has been widely circulated by two generations of Catholic apologists, eager to relieve the Church from so heavy a burden of responsibility. More recently there has been a movement in the opposite direction, and Pastor, perhaps the most eminent Catholic historian of the present day, has abandoned the apologetic attitude and declared frankly that the Spanish Inquisition was "a mixed institution of a predominantly ecclesiastical character." With this view Mr. Lea is in essential agreement; but, instead of treating the relations of the two elements as the fixed and unchanging results of certain principles of law, he makes it clear that they varied considerably from reign to reign. To quote his language:

"What gave to the Spanish Inquisition its peculiar and terrible efficiency was the completeness of its organization and its combination of the mysterious authority of the Church with the secular power of the crown. The old Inquisition was purely an ecclesiastical institution, empowered, it is true, to call upon the State for aid and for the execution of its sentences, but throughout Christendom the relations between Church and State were too often antagonistic for its commands always to receive obedience. In Spain, however, the Inquisition represented not only the Pope, but the King; it practically wielded the two swords—the spiritual and the temporal—and the combination produced a tyranny similar in character, but far more minute and all-pervading, to that which England suffered during the closing years of Henry VIII. as Supreme Head of the Church.

"While thus its domination over the people was secure and unvarying, its relations with the royal power varied with the temperament of the sovereign. At times it was the instrument of his will; at others it seemed as though it might almost supplant the monarchy; it was constantly seeking to extend its awful authority over the other departments of state, which struggled with varying success to resist its encroachments, while successive kings, autocratic in theory, sometimes posed as arbitrators, sometimes vainly endeavored to enforce their pacificatory commands, but more generally yielded to its domineering spirit."

As might be expected, the control of the crown was at its maximum under Ferdinand the Catholic. He made the power of appointing and dismissing the officials of the Inquisition an indispensable condition of its introduction, and, in spite of the manifold cares of domestic and foreign policy, found time to keep every detail of its organization and working under his constant supervision. Moreover, as the Inquisition had no revenues apart from the expenses and salaries which the King allowed it out of the proceeds of its confiscations, it was in no position to assert its independence. "It was inevitable that, when this powerful personality was withdrawn, the royal control over the Inquisition should diminish." The crown never lost the right of appointing the heads of the Holy Office, but they were not responsible to any other body in the State; and with the growth of the cumbersome bureaucracy of the seventeenth century the Suprema succeeded in interposing itself between the crown and its subordinates in such a way as seriously to limit the real authority of the sovereign. The Holy Office also gained control over its own finances, and it was not till the days of the Bourbons that its independence was seriously restricted.

In spite, however, of its close relations with the State, the Inquisition remained a strictly ecclesiastical tribunal. If its sentences of death were executed by the secular power, this had also been true of the condemnations for heresy in the Middle Ages, and only served to demonstrate more clearly the ecclesiastical character of a jurisdiction which observed the precepts of the canon law with regard to the participation of clerks in capital sentences. Though nominated by the King, the inquisitor-general was invested with the powers of his office by *motu proprio* of the Pope, and the members of the Suprema received by delegation from him the faculties which gave them jurisdiction over heresy. Even Ferdinand, as appears from his correspondence, abstained from interference with their spiritual jurisdiction. As a body charged with the maintenance of the faith, the Holy Office asserted its superiority over all other bodies in the State, and insisted with truly Spanish punctiliousness upon the precedence of its officers and agents on public occasions. It claimed exemption from taxation and customs dues, and demanded for its officials and servants the right to bear arms and the right to refuse military service, as well as the right to hold secular office and to decline it. Moreover, this *imperium in imperio* did not limit its jurisdiction to matters of faith. *Boni judicis est ampliare jurisdictionem*, and, by a natural application of the principle of benefit of clergy, the Inquisition asserted its exclusive competence in cases involving its subordinates, and maintained its claims in the face of continued resistance on the part of the various secular and spiritual courts. Multiplication of unsalaried officials subject to its jurisdiction was a natural consequence, so that it might easily arise that "unprofitable business was neglected for profitable, and the suppression of heresy was postponed to the trial of civil and criminal cases which yielded fees."

No summary of Mr. Lea's conclusions can give an idea of the extent of his research or the skill with which he unravels the threads of a tangled subject. Although only a few of the more notable documents are reproduced, the volume rests throughout on original materials, carefully examined and sifted and scrupulously cited. The author's method is that of the sober

and objective historian. There is no moralizing and no striving for dramatic effect; the purpose is simply to trace and explain the development and character of a very remarkable institution, whose real nature is to be seen in its normal operations rather than in the sensational episodes of its history, and whose significance lies "not so much in the awful solemnities of the *auto da fe*, or in the cases of a few celebrated victims, as in the silent influence exercised by its incessant and secret labors among the mass of the people and in the limitations which it placed upon the Spanish intellect."

The amount of detail which this method of treatment involves will to some appear excessive, but it is only in concrete detail that the actual workings of institutions can be understood, and it is refreshing to have at hand a substantial amount of definite fact in a field where previous writers have given us so much passionate and unsupported generalization. Moreover, it is impossible to cut deep into a subject like the Inquisition without throwing light on many other sides of Spanish history. Thus, a careful examination of the correspondence of Ferdinand the Catholic with the officials of the Inquisition not only shows his minute control of every department of the Government and his anxiety to lose nothing of the confiscated property of the condemned, but also reveals "an innate sense of justice wholly unexpected in a monarch who ranked next to Cesar Borgia in the estimation of Machiavelli." The rare appearance of Isabella's name in this correspondence leads Mr. Lea to "the conviction that her share in the administration of her kingdom has been exaggerated." There are also interesting illustrations of the anarchy of mediæval Castile, the struggles of Crown and Cortes, the character of the bureaucracy, and the system of taxation. The appendix contains a list of tribunals and inquisitors-general, and a brief account of the intricacies of Spanish coinage, as well as a number of interesting documents.

AN ENLIGHTENED SPIRIT.

The Journal of Latrobe: Being the Notes and Sketches of an Architect, Naturalist, and Traveller in the United States from 1796 to 1820. By Benjamin Henry Latrobe, Architect of the Capitol at Washington. With an introduction by J. H. B. Latrobe. D. Appleton & Co. 1905.

This is a remarkably comely and restrained filial memorial to a man who deserves to be remembered professionally and for his own high qualities. Latrobe was born, presumably in England, about 1767; there is no precise statement of place or date, and the particulars of his transatlantic life are very meagre. His father, of Huguenot stock, was a Moravian clergyman; his mother was a Pennsylvanian of a family well known to Gen. Washington. He himself was educated in Yorkshire and at Leipzig on the eve of the French Revolution, whose generous principles he imbibed without fanaticism. His draughtsmanship was precocious, and he was well advanced in the practice of architecture when the death of his first wife depressed his spirits and determined him to remove to America. There is no certain knowledge of the works he left behind him.

He landed in Norfolk, Va., and it would appear that he never visited the country east of the Delaware. He resided by turns in Richmond, Philadelphia, Washington, Pittsburgh, Baltimore, and finally New Orleans, where he died in 1820. In the twenty-four years thus occupied he had built a penitentiary for Richmond, the Bank of Pennsylvania in Philadelphia, the Baltimore Exchange and Cathedral (this still unfinished, except as regards the interior), with many other minor edifices, and had furnished Philadelphia and New Orleans with water works. Above all, having been in 1803 made Surveyor of Public Buildings in Washington, he had rescued the new Capitol from its deplorable beginnings and reared the best-known monument to himself. Of architecture, nevertheless, there is all too little in this volume. He says of his craft (p. 147):

"The architect, indeed, requires all the imagination of the painter. The building exists in his mind before it is sketched upon paper; and if the operation of design is the same in other heads as mine, arrangement, construction, and decoration are attained so simultaneously that I seldom materially change the design first elaborated."

Other personal indications are his preference for the French arrangement of domestic interiors by which rooms freely become thoroughfares, as contrasted with "the detestable, lopsided London house, in which a common passage and stairs acts as a common sewer to all the necessities of the dwelling" and forbids equable heating (p. 187). And again (p. 140): "I would never put a cupola on any spherical dome. It is not the *ornament*, it is the *use* that I want." He says (p. 54) of Mrs. Radcliffe that she is particularly successful in descriptions of buildings, "though I once endeavored to plan the Castle of Udolpho from her account of it and found it impossible." Robert Morris's folly, the huge unfinished pile constructed upon L'Enfant's carefully secreted plans, equally baffled him. "It is impossible to decide which of the two is the madder, the architect or his employer. Both of them have been ruined by it" (p. 92). Eight years later, in Washington, "daily through the city stalks, the picture of famine, L'Enfant and his dog. The plan of the city is probably his, though others claim it" (p. 133). Latrobe's criticism of Thornton's plan for the national Capitol, of which no drawings existed, is (p. 115): "To speak plainly, the design was evidently the production of a man wholly ignorant of architecture, having brilliant ideas, but possessing neither the knowledge necessary for the execution nor the capacity to methodize and combine the various parts of a public work." His son tells us that when he had received the commission to build the Bank of Pennsylvania there was no book procurable in this country to which to refer for the proportions of the orders. The Journal fitly closes with his observation of two French officers looking at this building without saying a word. "After some time one of them exclaimed several times, 'C'est si beau, et si simple!' He said no more, and stood for a few minutes longer before he walked away with his companion. I do not recollect distinctly anything that has happened that has given me so much particular satisfaction."

The Journal is the production of a gentleman of breeding, liberal education, tone, humor, democratic instincts, and sobriety of living. He was, for example, a water-drinker, and had every reason to be shocked in his fastidiousness by the coarse manners prevalent in his day at the South; but he records it all without disgust. He discusses the question, raised by a cultivated Italian traveller, "Do you think the Virginians really hospitable?" quite philosophically and in extenuation of "us Virginians." He had a taste of Washington's hospitality on a visit to Mt. Vernon in 1797, a valuable record. The ex-President "laughed heartily several times in a very good-humored manner." Eleanor Custis was a dream of beauty (she is delineated as a figure on a Grecian vase); young Lafayette rather awkward in his build. Latrobe's being consulted as to the regulations and by-laws of the Charlestown (Va.) Academy draws from him an elaborate comment editorially mislabelled, "Thoughts on National System of Education." Noticeable here is his objection not to teaching the classics, but to giving them the preference over everything, and his humane protest against flogging.

New Orleans is the main rubric of the Journal, and it is hard to refrain from quoting Latrobe's many graphic "impressions" regarding the inhabitants and their ways (in 1818), and his broadminded observations on Sabbatarianism, cremation, yellow fever, etc. We shall, however, conclude this notice with his unpremeditated reflections on slavery, in which he speaks as an American or even as a Virginian. It is true, he wrote after ten days' acquaintance with the city and its exemplification of the "peculiar institution," though the Rev. Amasa Converse, D. D., a Northern man with Southern and secessionist principles, laid down the law to the Rev. Albert Barnes, D. D., that no one was qualified to write on slavery who had not lived at least five years in a slaveholding community. Still, here is what Latrobe sets down of the creoles and their reputation for extreme cruelty (p. 182):

"In going into Davis's ball-room and looking around the brilliant circle of ladies, it is impossible to imagine that any one of the fair, mild, and somewhat languid faces could express any feeling but of kindness and humanity. And yet several, I had almost said many, of these soft beauties had themselves handled the cowskin with a sort of savage pleasure, and those soft eyes had looked on the tortures of their slaves, inflicted by their orders, with satisfaction, while they had coolly prescribed the dose of infliction, the measure of which should stop short of the life of their property."

The contrast haunts him, for, after cataloguing some atrocious cases, one on the part of his own landlady—"Madame Tremoulet, why should I conceal the name of such a termagant?"—while he was a guest in her hotel, he recurs to that ballroom on Washington's birthday (p. 184):

"All pale, languid, and mild. I fancied that I saw a cowskin in every pretty hand, gracefully waved in the dance; and admired the comparative awkwardness of look and motion of my countrywomen, whose arms had never been rendered pliant by the exercise of the whip upon the bound and screaming slaves."

But Latrobe was, if not unjust to the creoles, too lenient to his adopted countrywomen. In 'American Slavery As It Is'

(1839), at page 23, one may read Miss Sarah M. Grimké's unimpeachable Southern aristocratic testimony to this effect:

"A punishment dreaded more by the slaves than whipping, unless it is unusually severe, is one which was invented by a female acquaintance of mine in Charleston—I heard her say so with much satisfaction. It is standing on one foot and holding the other in the hand. Afterwards it was improved upon, and a strap was contrived to fasten around the ankle and pass around the neck, so that the least weight of the foot resting on the strap would choke the person. . . . I heard this same woman say that she had the ears of her waiting-maid *slit* for some petty theft. This she told me in the presence of the girl, who was standing in the room. She often had the helpless victims of her cruelty severely whipped, not scrupling herself to wield the instrument of torture, and with her own hands inflict severe chastisement. Her husband was less inhuman than his wife, but he was often goaded on by her to acts of great severity."

In the following acute generalization Latrobe is again too narrow in confining its application to creoles (p. 204):

"Servants who are slaves are always treated with more familiarity than hirelings; probably because if you indulge and behave familiarly to a hireling, you cannot, if he presume upon it, correct him as you correct a slave, and make him feel his inferiority by corporal punishment. Therefore we find cruelty and confidence, cowhiding and caressing, perfectly in accord with one another among the creoles of this place and their slaves."

If we needed any excuse for these extracts it would be found in the old taunt (still echoing), "Why don't you go South and see for yourself?" We know what condition is suppressed: "but [in the parlance of the photographer's studio] 'look pleasant.'" Latrobe went unbidden to the South, lived in the South, without bias. He did not "look pleasant" at slavery. What weight will the Southern mind attach to his testimony?

The numerous charming sketches from Latrobe's brush sprinkled through his Journal are the best sort of historical annals, and illustrate natural scenery and the works of man from the Wissahickon to the Balize. A few thumb-nail pen-and-ink portraits, of marked felicity—Edmund Randolph, Patrick Henry, Washington—make us long for more. On the other hand, a book so beautifully and generously made, with large type and unglazed paper, is painfully marred by faulty proofreading. The worst instance (p. 247) results in this unintelligible characterization: "Chateaubriand, the *disgrace* of eloquence and of talents." In fine, this work, whose entertaining and instructive quality we have but faintly suggested, should find an honored place in every library.

HOW OUGHT HISTORY TO BE TAUGHT AT A UNIVERSITY?

A Plea for the Historical Teaching of History: An Inaugural Lecture delivered by C. H. Firth. on November 9, 1904. Oxford: Clarendon Press; New York: H. Frowde. 1905.

Inaugural Lecture on the Study of History, Delivered on Wednesday, February 7, 1906, by Charles Oman. Oxford: Clarendon Press; New York: H. Frowde. 1906.

Professor Firth and Professor Oman are two of the most eminent among Oxford teachers. They have each given a reply to the above question. It is well worth while to set aside for a moment matters of detail which concern only the mechanism of historical teaching at Oxford, and to consider what is the answer provided by two distinguished historians to an inquiry which assuredly ought to be of interest to the universities of America no less than to those of England. There is the more reason for doing this because readers who compare the inaugural lecture of Mr. Firth with the inaugural lecture of Mr. Oman are likely to imagine (erroneously, as we are convinced) that a very marked difference means something like distinct opposition, and that two men equally devoted to historical study utterly disagree as to the mode in which history should be taught.

Professor Firth obviously considers that the main object of historical teaching at a great university is the preparation of students for the work of historians. It is quite certain, he insists, and, no one can doubt, with perfect truth, that our future historians need special training. In the attempt to ascertain and to draw the proper inferences from the events of the past, or, to use Professor Firth's expression, "to reduce superabundant facts into order, to show their connection with each other and to distinguish the true statement from the false," an historical student needs special training quite as much as does a youth bent upon learning medicine or law or divinity or any other branch of liberal knowledge. It is also certain that this special training is not at present provided at the old English universities. The result seems inevitably to follow that "it is the business of the Professors of History and the University teachers of the subject . . . to provide this in Oxford; *the professional training of historians is our proper function.*"

The words we have italicized contain the true gist of his inaugural address. Nor can any impartial judge doubt that the principle on which he insists is of the very highest value. In the sphere of history, as elsewhere, special and technical knowledge has acquired a new importance. It becomes, therefore, a matter of necessity that a university which fulfils its duty should supply for any man who intends to make the object of his life the ascertainment of historical truth, the discipline essential for the attainment of his purpose. We may go a step further and agree with Professor Firth that Oxford has some special advantages for successfully performing a duty which the University does not at present adequately discharge. The distinction between College tutors and University professors has its evils. No one can fail to see that the relation between the two needs readjustment; but no man who acknowledges, as we unreservedly do, the immense debt owed by the University to the collegiate teachers can doubt that the distinction between College instruction and University teaching might lead to a very beneficial division of work. This division might leave to the historical professors, as their special task, the training of men who wished to become themselves historians. Then, too, the intimate relation between teacher and student which is the essential merit of the College system, might also characterize the relation between the professor and the students whom he trained as specialists. Nor can one keep out of view the consideration that the historical character of the old English seats of learning and of English institutions generally does excite, as it ought to excite, among many undergraduates and graduates special interest in history. To bring the matter home to our own public, we ask whether they can doubt that, if Oxford provided an elaborate training in historical research, England would supply a better school for the training of American inquirers interested in the past of the whole English people than could, for them, be created at Paris or at any of the universities of Germany? If this inquiry be answered as we are convinced it must be, then the doctrine preached by Mr. Firth ought to be hailed with enthusiasm by every American citizen who wishes to join the noble group of historians who form one of the glories of the English-speaking people. For what Mr. Firth maintains is this, not that every man who learns history should be a specialist, but that every man who wishes to become a specialist should find at Oxford the needful instruction. To put his point in plain terms: men who have taken their degrees, or perhaps do not mean to take a degree at all, should receive at Oxford a training at least as good as anything which they can acquire at Paris or Berlin.

Professor Oman, who may seem at first to contradict, will be found, if his lecture be carefully studied, in reality not to oppose but to supplement the doctrine of Mr. Firth. He looks at the matter, no doubt, from a very different point of view. He, rightly enough, perceives what, by the way, Mr. Firth never for a moment denies—the great virtues of the tutorial system. He recognizes a fact which is often overlooked by zealous reformers, that no system of teaching can flourish which does not meet the wants of the learners; and this general truth is in a very particular sense applicable to the universities of England. There are, indeed, far too many men who come there to have a good time and to enjoy the natural and in themselves innocent pleasures of vigorous youth; but with these men we need not for the moment concern ourselves. Teachers at a university must in the main devote their powers to the benefit of students who wish, or whose parents wish them, to receive training in something better than rowing, football, and cricket. But even when we have eliminated the men whose object in coming to Oxford or Cambridge is not the development of their intellectual talents, we must still draw a distinction between two views of this sort of moral or intellectual instruction which a university should provide for its true students.

The fact "that must be faced is, that [Oxford] is a Place of Education as well as a Place of Research"—these words strike the real keynote of Professor Oman's inaugural address. They deserve, as they will receive, careful attention. It is often, as the Professor admits, most difficult to correlate these two functions of general education and special research; but in any case "there remains the obvious fact that we are confronted by a large body of young men who have to be educated, and that the larger proportion of them are intended for careers for which no technical-schools curriculum exists." Of this body a very small proportion indeed are destined in the

end to take up the burden of original research; and to this statement we add that the members of the great public, the so-called educated classes, do not in England appreciate at its due worth the merit of special or technical knowledge, while they do appreciate, not perhaps above its worth but assuredly at its full value, that very curious mixture of good qualities and of defects, of gross ignorance and of a certain broad knowledge of life, which is popularly known as the education of an English gentleman. It is assuredly, therefore, the fact, and we are thankful to Professor Oman for forcing it into attention, that the majority even of the best students at Oxford or Cambridge will not be specialists, nor will they, as things now stand, either desire or with any eagerness accept technical instruction in historical research. But this does not mean that history can teach them nothing; they will learn, if properly taught, and even under a system in many ways defective do learn, the general outlines of English and European history. These outlines, be it remembered, may be taught well or ill. They may be taught, and we fully believe at Oxford are taught, in a way which kindles an interest in the annals of the past that gives learners some kuowledge, not only of the main events that make up modern history, but also of the principles by which these events have been regulated and of the general conclusions which they suggest. Nor is it possible that good teaching, such as is given by the best professors and the best tutors at Oxford, should not excite in the minds of a limited number of disciples the desire to study history on their own behalf, and some sort of idea, however vague, of the kind of training which, especially in modern times, any man needs who aspires to become an historian.

No doubt it is true that no discipline whatever can create genius—just as it is also true that the ignorant pedantry of a university cannot utterly destroy the force of innate originality or of enthusiastic industry. The intellectual torpidity of Magdalen did not, after all, prevent Gibbon from producing the 'Decline and Fall of the Roman Empire,' the Jacobitism and dulness of Balliol did not make it impossible for Adam Smith to become the author of the 'Wealth of Nations.' Still, the negative credit of not destroying innate genius hardly justifies the existence or the emoluments of a so-called place of learning, and at this point Mr. Oman's teaching brings us round to and confirms the doctrine of Mr. Firth. For, after all, it is only the old and eternal story of the two sides of the shield. There exists not the remotest reason why, whilst the mass of Oxford students are supplied with a sound knowledge of history, the select body of men who wish to carry on the special study of history, should not find at Oxford the special training which they now generally seek for on the Continent.

As there is no essential opposition between the lesson insisted upon by each of our professors, we may well come to the conclusion that each places before us one-half of the whole truth. But if one be asked whether the doctrine of Mr. Oman or the doctrine of Mr. Firth be the more seasonable, it is impossible not to answer that the text on which Mr. Firth has preached is that which, in the year 1906, needs, more than any other, to be forced upon the attention of the English universities and the English world. The Oxford School of History has achieved most valuable work; but, as invariably happens, in the case of universities no less than of individuals, the adequate performance of one duty leads to the necessity for taking some further step along the arduous and never-ending path of progress. A school which has created, even among a limited number of disciples, such an interest in history that they long to take up the burden of research, cannot stand still; such a school must, at any cost whatever, provide for the best among its scholars the means for gaining something better than a good degree—that is, for satisfying the noble rage for knowledge.

NOVELS, OLD AND NEW.

Calmire: Man and Nature. Sixth Edition.—*Sturmsee:* Man and Man. Third Edition. By Henry Holt. Boston: Houghton, Mifflin & Co.

Curayl. By Una L. Silberrad. Doubleday, Page & Co.

Called to the Field. By Lucy Meacham Thruston. Little, Brown & Co.

Lady Baltimore. By Owen Wister. Macmillan Co.

The Circular Study. By Anna Katharine Green. New York: R. F. Fenno & Co.

In the fourteenth year of its life, and in its sixth edition, with Mr. Henry Holt as its lately acknowledged author, reappears 'Calmire,' revised and enlarged to the amplitude of seven hundred pages, and transferred to a new publisher. For an adequate review of this book, of its philosophies, its psychologies, its ethics, its æsthetics, its literary qualities, a small staff of experts should be employed. The reviewer of fiction may scarcely hope to pronounce upon the linked details of evolution, upon the histories of religions, upon the origins of superstitions, upon the results of psychic research, upon the possibilities of the soul's future. And these are only a few of the subjects that are threshed out by Calmire, Muriel, and Nina in their talks. The book might well be sub-entitled "The Evolutionist's Harry and Lucy." Who that has been nourished on Miss Edgeworth does not remember the long pages of natural philosophy, the building of bridges, the making of barometers, here and there broken in upon by fitful gleams of story? Even so does each event in the history of the Calmire group become a session in a school of philosophy. To the fiction reviewer it appears that the book loses by being cast in the form of a novel. Unlike the young Edgeworth reader, one would like to keep the bridges and discard the Harry and Lucy. The expositions, however, are invariably clear and animated. The author's style is to say what he means in simplified rhetoric, with buoyant disregard of classic graces. He never fails to make his burnished point. As a popular treatise on the evolution of the universe from star-dust to civilized man, 'Calmire' is exceedingly readable. It would be even more so if it were not associated with the discomfort one must feel on having two men continually sending mother upstairs after dinner and devoting their intellects to tearing up daughter by the roots from her belief in Christianity.

For real enjoyment of the book, then, eliminate the novel, and let Calmire, with his patience and his calm, his wide reading, his warm head and steady heart, give a monologue on the beginnings of things, the building up of human faculties and faiths, the future of souls, the oneness of the universe. With Nina and her susceptibilities removed from the scene, there would be no occasion for him to be kind to God for her sake. He could preach flat pantheism and have done with it.

Man's relation to Nature having been hopefully settled by 'Calmire,' the characters add other chosen spirits unto themselves, and, stepping forward a few years, reappear in 'Sturmsee,' where they dispose of sociology. The relations of labor and capital, coöperation, conspiracy, strikes, competition, Trusts, single tax, the tariff, are the leading motives, yet are there time and space for elaborated views on aristocracies and democracies. New York society, capital punishment, the probationary system, euthanasia, settlement work, æsthetics, dead laws, house decoration, war, divorce, and the relation of ability to the instep, to which may be added sundry topics arising on the fiction side of the work—Mount Desert picnics, with landscape attachments, balls in the East, pageants in the West, obstacles to love between princes and subjects, the Chicago Fair, heroes with brows rent by pain and anguish, ministering angels raised thereto, the eligibility of a tin manufacturer to enter the best New York society, the decision of Calmire that he may worthily do so, and not only that, but that there is no real reason for his hesitating to dine with him, Calmire, who adds encouragingly, "At every dinner I go to, I meet men who are immeasurably beneath you in every particular."

Sociologically, the doctrine is more constructive than were the theologic teachings of 'Calmire.' Like those, they are admirably stated; they are more than lucid—they are luminous and illuminating. One can find no more lively or interesting showing of contemporary theory than in the talks of the various characters. What the magnate, the workman, the settlement worker, the anarchist respectively think is set down vividly and fairly. The reader who saw Calmire cheerfully flinging Christianity into the gulf of past errors will be hardly prepared to find him and his friends on the conservative side of questions pertaining to trades unions and the rights of labor, combating the Marx doctrines that the only value in a product is the labor put into it, and that wages get none of the benefit of increased invention; characterizing collectivism as "a lovely ideal for the future, perhaps," but recognizing in individualism the only productive power as the world now exists; advocating the slow ways of nature in all economic changes, since the cures that go faster than the men will inevitably wreck them; foreseeing that "men's conditions will grow toward equality just as fast as men grow toward equality in productive power"; and declaring that there is no good way to prevent the top-heavy fortunes of to-day "but by increasing the average man's capacity to produce a share of them and by slow experiments in improving the laws."

The searcher for stimulating suggestions must read, too, what Governor Sturmsee thought and did. He inspired legislation against railroad strikes; he believed in denying to self-declared anarchists the protection of government; he was tempted to let a poor wretch die, but saved him, recalling his physician's oath, and reflecting that "no one man's wisdom is safer than the wisdom of the ages." He advocated probation unto the third offence, and would have liked to advocate capital punishment for habitual criminals, but refrained. And his State arose and called him blessed. Between the covers, furthermore, may be found a picture of social struggle, where the Smart Set are to some extent differentiated from the best set, as social novels do not always remember to do. The novel, however, is a handicap to the doctrine even more than in the case of 'Calmire,' inasmuch as there are more characters and more situations to obstruct the real proceedings. 'Sturmsee' contains a good deal of Miss Alcott's instructive and ethical lovemaking, which may or may not be a recommendation. Muriel has partially subsided and improved since his 'Calmire' days. Yet, in regard to his unpleasant pleasantries, it is observable that he is still suffering from arrested evolution. Nina is a finished product, and can afford to be silent. Calmire remains catholic, charitable, judicial. Sturmsee himself, the German-American doctor and governor, is a cross between Lohengrin and a pamphlet on economics.

After novels of ologies and osophies there is a deal of lazy comfort in the old-fashioned rural English, typhus-fever story, with ill-drained cottages and lady and gentlemen volunteer nurses. Such cerebral calm falls on the reader of 'Curayl,' although the last page is reached by ways traversing many original fields and pastures. The posing of a layman as a clergyman, half-accidentally and with benevolent intent, for a single occasion as he supposes, involves him and others in a vast web of consequences made the more impressive by the man's persuasive, attractive, lightly-compelling personality, aptly compared to that of the Pied Piper. Anthony Luttrell's offhand strength and a healthily controlled wild-Irishism are made into a very real little portrait of a character "not black or white, or even the neutral gray that experience had painted half the world, but composite, the brightest white and the blackest black." A great deal of black in the old family surroundings of Beatrice Curayl had made a shaded personality a new creature in her experience. As the wife of a man to whom she has been married for the old family's convenience, she is confronted with the new study which ends well for all concerned. A lost miniature is one of the leading motives in the book, and the characters, white, black, and gray, are drawn with decision. A comparative study of the verbs lie and lay would be of advantage to the writer, or proofreader, together with the use of "as" after "equally." It does not really matter whether Beatrice came to Waterside before or after Caser's death, although on pages 270 and 280 we are liberally offered the choice. 'Curayl' is a very good little novel of the minor order, and throughout holds the interest.

'Called to the Field,' a story of Virginia in the civil war, is a touching and moving recital, dealing less with the called or the field than with the left-behinds and the homesteads. It is more than a story, for it pictures in faithful detail the life of the Virginia that stayed at home, spun, wove, ploughed, and suffered while the men went to the war; that faced the raids in lonely houses and nursed the sick in forsaken attics, and planned escapes by dangerous ways, and never complained—the women of Virginia and their trusty slaves. As a story of the afflicted, harassed, tortured, but unwhining stay-at-homes, this little book has a quality not usual. For characterization, the most notable instance is the Virginian father, he who energetically ploughs and plants to the sound of the guns of Gloucester Point, saying, "There is just one way in this world to live—to plan as if we were to live forever, and then to live each day as if it were our last." The young wife, who is the narrator, has the gay, irresponsible heroic traits of her kind. The negroes are capitally done and not overdone. In short, but for tropical zones of language and landscape, 'Called to the Field' is a well-made book—all the more historically correct, perhaps, for those very exaggerations.

'Lady Baltimore' is marked by all the author's cleverness and power of observation. It is a sketch of American life, but could have been written, we think, only by an American endowed by inheritance or instinct with the power of looking at America very objectively; of seeing the absurd side of things here generally taken seriously. And we must say, also, that it is rather an extravaganza than a novel. That is, the characters behave up to a certain point as people behave in real life, but after that it is a comic-opera atmosphere. This we say, not by way of objection, but as an effort at analyzing an impression which haunts the reader throughout. There is a theatrical vividness about the scenes; the people behave like people in a play. The chapters called "The Girl behind the Counter" are a very pretty little farcical comedy by themselves. The way things happen and the way people reveal themselves is theatrical. Sometimes we find ourselves listening for the music. Even the title of the book is a masked jest. The old aunts and their conversations with the author of the tale are the funnier for being a little exaggerated. If Mr. Wister has been found fault with for these aunts' communicativeness, it must be on the erroneous ground that they are aunts proper to a novel. Once admit that the domain in which Mr. Wister acts as cicerone is often that of burlesque, and the difficulty vanishes. So do many difficulties presented by the vagaries of other persons in the story. The "yellow rich," for instance, are not at all the "yellow rich" who accomplished the ruin of Lily Bart, but almost the "multis" of a French farce.

What Mr. Wister has written might be called extravaganza with a purpose. He has managed through it all to give a charming picture of what is supposed to be left of the old society of Charleston, as it existed before the war, or rather of the provincial well-bred society which has inherited the old ideas. The tale deals with the negro question, but from the Southern point of view. Here Mr. Wister is very real. If John Mayrant's troubles in the Charleston custom house "under a negro" are not the real events of an actual career, they certainly ought to be. It is hardly necessary to say that the book is witty; the author cannot help being entertaining. The "management" of the old classical Charleston joke, its repetition as a matter of course, and the final explosion it causes, are all excellent.

The talented author of the 'Leavenworth Case' ought to be warned in time, or she will make of the detective novel a Chinese puzzle which the reader, even with the author's aid, will "give up" in despair. The "Circular Study" is a room, of course; a room in which a justifiable homicide, at first thought to be murder in the first degree, was committed. To learn the *causa causans* of this shocking event, we have to go back three generations, and get very tired on the journey. Possibly Mrs. Rohlfs cannot help herself, but the interest of such stories cannot be kept up if the plot becomes too involved to follow.

Principles of Economics. By E. R. A. Seligman. Longmans, Green & Co. 1905.

This is the third sizable treatise upon economics brought out by American writers during the last two years—not to speak of various elementary manuals and translations of foreign works. At this rate of increase, it is evident that, before long, in accordance with the principle dear to the modern economist, the marginal utility of a new text-book should fall to something approaching a minus quantity. Yet most of the recent publications have vindicated their right to exist, and, beyond question, Professor Seligman's work will do so. Its success, moreover, will be due not only to the size and rapid growth of the market, but to the fact that it offers something not found in the common run of treatises.

The 'Principles of Economics' is divided into four parts, of which the first, or introduction, deals with the fundamental concepts of the science and with economic law and method. The second treats of the elements of economic life, and considers, first, nature and man, the foundations of economic life; second, the evolution of industrial society; and, third, the conditions of economic life—such as private property, competition, and personal freedom. The third part then describes the "structure and process" of economic life; and here we find most of the subjects treated in the ordinary manual, such as production, exchange and value, and the distribution of wealth. Finally, the fourth part, or conclusion, deals with the economic functions of government and the problem of poverty—substantially the topics to which John Stuart Mill devoted his fourth and fifth books. The whole is prefaced by some thirty pages of bibliographical material which will be useful to many readers.

Turning from the form of the book to the substance, the first thing to attract attention is the large amount of space given to historical, descriptive, and illustrative materials gathered from many different sources. This feature has been prominent in most of the American treatises produced during the last six or eight years, but no previous writer has made so much of it as Professor Seligman.

His book is compacted full of valuable information at every point, and herein, perhaps, its chief merit will be found. Numerous maps and charts—more numerous, in fact, than were ever placed in an economic textbook—give point to the descriptive and statistical discussions of the text. Withal, the data are conveniently arranged and carefully indexed so that even advanced students will find the work a useful repository of information upon matters economic.

In point of doctrine Professor Seligman is, of course, a competent guide, even though, upon this side, his work is open to criticism at various points. With commendable breadth and catholicity of view, he has drawn upon the work of all schools, classical, historical, Austrian, and American, and has sought to grasp whatever of truth there might be in each. In his very care, however, to omit no significant variety or shade of previous opinion, he has at places overburdened his theoretical chapters with references to subjects that need not be brought to the beginner's attention; while he has not always digested and thoroughly assimilated the intellectual pabulum gathered with so much care.

This shortcoming is especially evident in the treatment accorded to mooted points in the theory of distribution. The traditional practice of economists has been to separate land from capital, and to consider the income derived from the former agent of production as a different sort of income from that derived from the second. Recently, however, various writers have sought to break down the distinction between land and capital, and to assimilate the earnings of the two. Professor Seligman, on his part, presents with care the views of the opposing schools, examines each candidly and critically, and then takes what seems to him a satisfactory middle position. But the differences of view are not so easily reconcilable; and it is probable that each disputant will maintain, and maintain fairly, that, at the crucial point, Professor Seligman has missed his real contention. It is not likely that economists will remain satisfied with the halting conclusion that "land is quantitively so important as compared with any other single commodity, and possesses so unique a social significance," that the income from land "should be separated from the income accruing to other instruments of production." We may expect that economists will either conclude that the differences are more fundamental than Professor Seligman supposes, or else will refuse to separate land rent from the income derived from other things. Which alternative will ultimately find favor, we need not now consider.

And this tendency to mediate indecisively between opposing theories is not confined to the chapters dealing with value and distribution—topics which are so often, but not by this author, relegated to the limbo of "pure theory"; it may be found in some of the chapters which deal with the so-called practical problems. Professor Seligman states, with evident candor, the arguments ordinarily advanced in favor of free trade and those advanced in behalf of protection; but his own conclusions hardly satisfy. So, too, with the Trust problem. He canvasses the facts fairly and interestingly, but his presentation of principles is not convincing. Upon these, and some other topics, the most marked tendency of his discussion is, after the manner of the German "historical school," to accept what exists or has existed as "relatively" justified for the particular time and place. To many readers, doubtless, this will be an additional recommendation for the book, but we believe that American economic writing at the present time is suffering from an excess of this scientific "standpattism."

With all its merits, therefore, Professor Seligman's 'Principles' has, upon its theoretical side, serious shortcomings. As a book of reference it should prove highly valuable—more so, in fact, than any other recent work. It shows wide knowledge of the literature of economics and admirable catholicity of view. But it does not advance us far toward a solution of disputed questions of theory and practical policy. Moreover, by its very wealth of material, it will confuse many a beginner who is not yet prepared for such a rich diet as is here provided. For him it is frequently less important to master all varieties and shades of economic opinion than to grasp firmly the things that are fundamental—a fact which is sometimes forgotten in this latest addition to American treatises upon economics.

A Short History of Italy (476-1900). By Henry Dwight Sedgwick. Houghton, Mifflin & Co. 1905.

Mr. Sedgwick addresses the average intelligent person who desires to get a reasonably clear survey of the course of events in Italy from the fall of the Roman Empire to the present time. He disclaims thoroughness, and we have not observed any profound or original interpretations. But he does epitomize with considerable skill the generally accepted views of historians. His work, on the political side, is relatively inferior to the 'Sommario' which Cesare Balbo wrote sixty years ago; but it covers ground which Balbo did not traverse, and Balbo's book has not, to our knowledge, been translated into English. Mr. Sedgwick has little to fear from the abstract of Sismondi's 'Italian Republics' (1832), good but antiquated, or from the Rev. William Hunt's 'History of Italy' (1875), a dry textbook.

The difficulties that confront the historian of Italy are, first, the immense volume of material, and, next, the lack of continuity, or central theme. Until the nineteenth century, Italy was a geographical expression, although her geography included several states which had a lively existence of their own. Mr. Sedgwick's task is not to trace, even compactly, the development of Venice, Florence, and the other political divisions, but to define the movements common to the whole peninsula. So he naturally makes the conflict between the Papacy and the Empire his cardinal topic down to 1300; then the despotisms and the Renaissance in turn absorb his attention. This is logical, and it undeniably makes for clearness.

To criticise Mr. Sedgwick's work in detail would be unfair, since it is avowedly only a sketch, the value of which depends on generals and not on particulars. We might point out that he does not get at the bottom of the Renaissance, and that, on the whole, he lacks capacity to gauge the significance of the great currents of historical evolution; but then, to be just, we should need to add that his description of the surface of events is generally accurate enough. The public for which he writes will scarcely notice his unhistorical habit of mind, which professional students may find annoying. He regards his subject from the literary side, which means that he selects by preference material that is concrete or charged with human interest. Montaigne's 'Journal of Travels in Italy' supplies him with nearly twenty pages of quotations—a rather generous allowance; but the great personages—from Leo I. to Leo XIII.—who crowd the history of Italy are not vividly drawn, unless we except St. Francis of Assisi; portraiture not being one of Mr. Sedgwick's talents.

On the other hand, he does not neglect the artists and the writers, to whom he assigns sufficient space to enable uninformed readers to refer them to their proper period. He has evidently walked the galleries and studied altarpieces with pleasure, and he has his own word to say about many of the painters; witness this remark on Botticelli:

"This rare spirit wandered about half in the world of reality which he ill understood and depicted badly, and half in a world of fantasy which he knew better than any other painter. The secret of this world of fantasy, as he discovered, was motion. If a vision tarries, it becomes touched by the blight of familiarity, soiled by the comradeship of life. The fairy spirit of imagination must be ever on the wing. No artist ever let Sweet Fancy loose as Botticelli did in his two great pictures, The Primavera (Spring) and The Birth of Venus" (p. 246).

This passage represents Mr. Sedgwick at his best. We have him at his worst when he tells us that "the Papacy lay like a cherry between an upper and lower jaw which watered to crunch it" (p. 133)—are we to infer that he crunches his cherries, stone and all?—or that "the moment business expanded beyond the city walls, it *bumped into* feudal rights at every corner" (p. 107); or that "Italy suddenly leaped forward, as if she had drained a beaker of champagne" (p. 182); or that "the blocked current of commerce *poked about* for a new way, and discovered that it could reach the East by doubling the Cape of Good Hope" (p. 264). These and similar blemishes would be less noteworthy in a less bookish writer, but they do not detract from the value of the compendium on its historical side. It can safely be recommended to persons who wish an introduction to the sources of our modern civilization, and to the vicissitudes and achievements of the pleasant land of Italy. No reader will fail to admit that it is written with snap.

Die Sprachfrage in Griechenland. Von Georgios N. Hatzidakis. Athens. 1905. Pp. 144.

On visiting Greece, the ordinary college graduate seems rather surprised to find that the modern Athenian newspapers are printed in the same type which had become familiar to him in his reading of Homer and Herodotus; and if he makes out a few paragraphs on modern events more easily than he would a page of Xenophon, he is ready to believe that the language has been transmitted essentially un-

changed since the time of Pericles. But if he visits the rural districts, he finds his college Greek of little value to him. Not only is the pronunciation very different from that which presumably he has been taught, but the words are new. A horse is an *alogon*, an irrational animal, a 'brute'; a house is a (Latin) *hospitium*, but with the loss of the first and the last syllables; water is *neró*, apparently from the same stem as "naiad"; wine is *krasí*, a 'mixture'; bread is *psomí*, a mutilated form of the word used in the New Testament for 'sop'—all words which Xenophon would not have understood. Returning for a single day, and having ordinary wants to supply, Plato would be distinctly more helpless in speech among the peasants of modern Greece than Cicero in modern Italy. The latter's demand for bread and meat and wine would be understood at once.

The traveller soon learns that the ordinary speech of the common people in Greece is not represented by the newspapers. Greece has a literary and a popular language. During the centuries of foreign domination, under the Venetians and the Turks, the language of the masses was degraded; it was used for no exalted ends, and many Frankish and Turkish words were introduced. With the revival of the national spirit, a century and a half ago, the use of the old literary language, which had been kept alive by the church and in official documents, was revived also and largely extended; and when the Turkish yoke was thrown off, eighty years ago, very many foreign words were ejected from the language, just as the German language dismissed from its service many French words after the Napoleonic wars, and again after Sedan.

For a full century in Greece the literary and the vernacular languages have been contending for the mastery. The advocates of the literary language have claimed to be the only true Hellenists, and have sought to hand down the very torch which was carried by their glorious ancestors. For a time, they grant, only a few of the Greeks preserved the old tradition, but these were a saving remnant. To adopt the vulgar speech, in their view, would be to give permanence to the degrading influences of foreign domination. The advocates of the speech of the common people, on the other hand, claim that the literary language is artificial, and hence not truly national, while the popular language is simply the latest stage in the development of the ancient Greek tongue.

The contest has been waged with great earnestness. The book before us affords, perhaps, the clearest and fairest view of the present state of the discussion. The author is entitled to speak with authority, being a scholar of no mean eminence. His work on Modern Greek is published in the same series as Whitney's Sanskrit Grammar, though it does not profess to be a complete grammar of the language. The tone of the first part of the present work is fair and judicial, but in the latter part of the volume the author is heated at the thought of the criticisms passed on his course by the friends of the popular language. The main contentions of the book are well supported. The literary language is so firmly established in the usage of the best families as well as of the press that it cannot yield. Many words and expressions which were artificial thirty-five years ago are so no longer, since the younger generation from earliest years has been accustomed to them. Most Greeks of culture would now be quite unable to determine what elements of their ordinary speech had been continually in use in Greece, and what had been restored from the study of ancient authors and grammarians. The extravagant ambitions of some who, in 1870, desired to restore to use the Attic language, or at least the *koiné*, and would admit in the schools the use of no Greek grammar which was not good for the orations of Demosthenes, have yielded. On the other hand, the speech of the common people has been greatly modified under the influence of the schools, the newspapers, and the educated classes. Indefinitely more Greeks to-day than a generation ago understand the ancient words for 'horse,' 'wine,' 'water,' and 'house.' Many words have passed from the literary into the common language, and will remain there. An important observation in this connection is that the common people of Greece do not read with special satisfaction the books or newspapers composed in their dialect. All attempts to maintain such periodical publications have needed subsidies, and have been short-lived, after all, while the Society for the Promotion of Useful Knowledge, under the wise guidance of Mr. Bikélas—who is not only the first novelist, but the first man of letters in Greece—has sold more than half a million volumes of its publications, composed in the literary language. Three translations of the New Testament into modern Greek were published, we believe, before 1870, by the British and Foreign Bible Society, each of the two latter more like than its predecessor to the original. Similarly, a well-known professor of the University at Athens declared that he had rewritten his lectures twice, not so much because of changes to be made in the matter as to bring the language nearer to that of Xenophon, as was required by the sentiment of the time.

The language of the common people, while admirably adapted for klephtic songs and tales of adventure, has not proved well fitted for scientific and philosophical works. A recent translation of the Gospel of Matthew into this dialect has not been successful, since too many of the words and phrases had unworthy associations. Societies have been formed in several towns for the cultivation and propagation of the popular language, but each enthusiastic adherent of the cause has wanted to improve the language in a different way, and so the proposed new words for science and philosophy have been as artificial and as strange to the people as any borrowed from ancient Greece, and the results of these various undertakings have never attained more than a local and dialectic eminence. That the language of the peasants should now become the literary language of Greece, is quite out of the question. The history of the last century shows the futility of further efforts in this direction. A Greek who has anything of importance to say, naturally prefers to say it in the literary language; and if his theme is at all difficult, he does not want to be hampered by an imperfect linguistic instrument. Very likely the literary language will be assimilated still further to the vernacular, but the attempt to take the vernacular and make it by force the language of literature and cultured people, is destined to fall.

Giovanni Antonio Bazzi, hitherto usually styled "Sodoma": The Man and the Painter (1477-1549). A Study. By Robert H. Hobart Cust, M.A. London: John Murray; New York: Dutton. 1906. Pp. xviii., 442.

The production of the above study of Sodoma must have entailed enormous labor, and could have been undertaken only by one who was sincerely enamoured of his subject. Besides examining the works of Bazzi at Siena, at Monte Oliveto, and in half the picture galleries of Europe, Mr. Cust has consulted innumerable books and articles in every language, and has spent long hours in original research among the piled archives of Vercelli, Mantua, Modena, Siena, and Florence. Diligence and enthusiasm could do no more, and the result is a treatise which is practically exhaustive. Certainly, no man will ever be able to write of Sodoma again without consulting it, and, when he has done so, he will not be disappointed. In these pages the reader is never compelled to rely upon the author's *ipse-dixit;* authorities are cited at every step, and copious footnotes are supplemented by an ample appendix of contemporary documents, many of which are here published for the first time. Even in the text itself no desire is shown to pander to ignorance and sloth, and Latin and Italian passages are often quoted verbatim—a method worthy of a more scholarly age than ours, and one which can hardly be too highly commended in a work of this character, since even the best of translations rarely preserves the full flavor of the original.

Mr. Cust's style throughout is clear and simple, and, in treating of artistic matters, he eschews the terminology of the modern scientific school. We hear nothing of "tactile values," of "pattern," or of "space-composition." Bazzi's paintings are described in old-fashioned English, in the old-fashioned way, and the reader is not expected to seek only "artistic pleasure." Mere "illustration" is by no means despised, while, on more than one occasion, pictures are frankly treated as so many documents and used to enforce historical arguments. Such, for example, is the case with the Farnesina frescoes, which, in Mr. Cust's opinion, "give the lie to many of Vasari's insinuations" (p. 147). Thus, in spite of its elaborate catalogue and its numerous and well-chosen half-tone illustrations, the scope of the book before us is mainly biographical; and we submit with some confidence that its full justification is to be found in the fact that, "with Bazzi more than with any other Italian painter, the question of his art has always been complicated by his personal character."

On the other hand, it must be conceded that there is an unnecessary and somewhat fatiguing display of the entire process of inference from the documents. Merely to reprint these, with a succinct statement of results, would have produced a much more

useful work. Of æsthetic criticism there is virtually none, and Mr. Cust has devoted too much space to the fruitless discussion of Sodoma's character, attempting to demonstrate that the opprobrious nickname was never literally deserved. One's judgment of the allegations of Vasari will depend upon the impression he gets from the work of the wayward painter. Many will feel in such a picture as the "St. Sebastian" or the "Sacrifice of Isaac," at Pisa, a certain unwholesome *morbidezza* that gives color enough to Bazzi's contemporary disrepute. There is, however, no gainsaying more guileless souls who feel no taint in this art. Since the whole contention is one of irreconcilable points of view and not at all of evidence, a biographer of Bazzi would do well merely to make a personal profession on the angels' side or on the other, and proceed promptly to the actual business of chronicle and criticism.

Heroic Romances of Ireland. By A. H. Leahy. Vol. I. London: David Nutt. 1905.

Mr. Leahy's work, which is to be in two volumes, forms the second number of the very attractive "Irish Saga Library" now being published by Mr. Nutt. The first number was a translation by the same author of the 'Wooing of Ferb,' one of the longer and more important Irish sagas, and the present collection also contains pieces of much interest. Besides the translations themselves there is a sensible prefatory essay on Irish literature, and each tale is preceded by an introduction which supplies the reader with the main facts about its age, character, and literary relations. In these introductions, and in the numerous explanatory notes, special students of Celtic also will occasionally find material that concerns them. Mr. Nutt, for example, has contributed an appendix on the much discussed question of the relation between the different versions of the "Táin Bó Cuailnge.'

The first volume contains "The Courtship of Etain," "MacDatho's Boar," "The Sick-Bed of Cuchulainn," "The Exile of the Sons of Usnach," and "The Combat at the Ford" (the fight between Cuchulainn and Fer Diad in the 'Táin Bó Cuailnge'). In the second volume, which we have not yet seen, Mr. Leahy will give versified renderings of five short stories of cattle-raids which lead up to the great Táin. The substance of all, or nearly all, these tales is accessible elsewhere in English, and most of them have been made familiar, and even popular, in Lady Gregory's 'Cuchulainn of Muirthemne.' But Lady Gregory, in accordance with the necessary plan of her book, used some freedom in condensing and combining the stories, whereas Mr. Leahy has adhered in each case to a version actually preserved in manuscript, and in his first volume he has made, at least for the prose portions of the Irish, very close translations. His work, therefore, is not really a repetition of Lady Gregory's, nor, so far as we have observed, of any of his other predecessors in the translation of these texts. With the passages in Irish verse he has dealt more freely, rendering them in rhyme and sometimes imitating the measure of the original. Perhaps this method would be the best if the translator's metrical skill were always equal to his task, but a couplet like the following makes us wish Mr. Leahy had been content with literalness:

"Through the world of mankind, seeing all, can we float.
And yet none, though we see them, their see-ers can note."

It would not be fair, however, to judge his taste by a lapse of this sort. On the whole, his narrative style, if it lacks the peculiar charm and appropriateness of Lady Gregory's or of the best translations of Dr. Whitley Stokes, is yet suitable to its purpose and will be read with pleasure.

With respect to the accuracy of Mr. Leahy's work, we cannot speak so favorably, though he appears to have given much attention to minute details. We have not undertaken to compare the whole translation with the original, but the parts we have examined are uneven in quality, and we are often forced to disagree with Mr. Leahy. The two versions of the story of Etain (which had the benefit of Professor Strachan's revision) are well rendered, and the notes contain suggestions and comments which Irish scholars will be glad to preserve. But in the "Sick-Bed of Cuchulainn," where Mr. Leahy was apparently left to his own resources, the result is less satisfactory, and we have found a number of errors in both the text and the notes. Mr. Leahy is particularly unlucky in his attempts to improve upon Professor Thurneysen's German translation of the same tale. Most of his criticisms are trivial, and simply show that Professor Thurneysen was translating freely; and when there is a real difference of opinion between the two translators, the German scholar, in our opinion, is usually right. At the foot of page 176, for example, *sirsan* should not be rendered "long." The German gives the sense of the passage correctly. Again, on page 81, *ic imdibi* does not mean "for slaying," but "in the act of slaying," and Professor Thurneysen is again right. Professor Windisch's 'Wörterbuch,' which Mr. Leahy constantly quotes against Professor Thurneysen, here supports the correct translation. As for the 'Wörterbuch,' however, it was made in 1881, and should not be taken, as Mr. Leahy apparently takes it, to constitute a higher authority than Professor Thurneysen's translation of the year 1901, particularly in cases where it cites the dubitable testimony of O'Reilly. Professor Windisch's interpretation of *gus*, for example, which Mr. Leahy quotes on page 178, was really taken from O'Reilly and was called in question by Dr. Stokes in the *Revue Celtique* (v., 245). Professor Thurneysen's departures from the 'Wörterbuch' are due in many cases to the advance of thirty years in Irish lexicography. But Mr. Leahy himself does not always follow the guidance of Professor Windisch. On page 180, he translates *écomnart* "death-weakness," as if it were a compound of *éc*, whereas it is really to be divided *é-comnart*, with a negative prefix, and means "weakness" or "debility," as the 'Wörterbuch' has it.

These are only part of the errors we have noted, but they will serve to show that Mr. Leahy's translation must be used with caution when it is important to have an accurate rendering of the text. They are faults of judgment or insufficient information. We regret to add that the work contains unfortunate lapses in English which must be set down to carelessness, for we cannot believe that constructions like the following are deliberate: "Never was there seen . . . more beautiful birds" (p. 58); "The state in which Cuchulain was in" (p. 60); "Let he who is extolled be increased" (p. 185). It is a pity that a book by which the publishers have otherwise done so well should be marred by careless proof-reading.

Mast and Sail in Europe and Asia. By H. Warington Smyth. E. P. Dutton & Co. 1906.

This is a book about boats; and while 'Mast and Sail' is the title, scantling and planking, model and lines, come in for a good share of description and discussion. Wind and water, though proverbially fickle, are nevertheless conservative in their methods, and the sea-kindly boat of 500 B. C. would find herself at home if launched to-day. The beginnings of navigation and naval architecture are too remote for speculation; in her elements of design the deep-heeled ship that carried Saint Paul was probably the same in substance and effect as the dhow of to-day; the dhow, allowing for variations in rig, sails, and materials of construction, is surprisingly, or rather, one should say, naturally, like the long-nosed Gloucester fisherman whose "spoon" bow is regarded as a novelty. If, then, the sailing-ships of the early Christian era were the same in all essentials as the boats of to-day, it is safe to infer that the right principles of boat building, rigging, and sailing were known by the more intelligent peoples in an antiquity whereto history reaches not. And how invariably intelligence, progressiveness, resourcefulness and material prosperity have gone hand in hand with seafaring skill and hardihood, and the ability to shape and handle good boats! Sea Power and the empire that waits upon it must in turn wait upon the ship builder and the mariner; their skill and intelligence, patience and courage have been and must always be mighty factors in the work and growth of mankind. And, as the author of 'Mast and Sail' shows with true seamanlike appreciation and sympathy, the seagoing boats, of every rig imaginable, with manifold variations in mould and structure, yet always in essentials the same, are beating about in all the waters of the earth, and schooling men in the lessons of fortitude, patience, vigilance, alertness, as they have done time out of mind. After reading this book, one regards the abused junk with repentant respect (perhaps, by the way, our Occidental ridicule of the junk is only another case of giving a dog a bad name and hanging him), longs for a thrash to windward in the Siamese *Rua Pet*, or a cruise in a *Redningskoite*, and feels that the *Chasse-marée* and graceful lateener are, after all, worthier craft than our overbred racing machines of aluminum bronze and pendulous lead mines that have the honor of defending and holding the *America's* cup—and are good for nothing else.

'Mast and Sail' will well repay the study of the boat sailer and yacht designer; it gives a broader view of the art and craft than more technical works, and yet is accurate and instructive to the initiated.

coming as it does from the hand of an expert.

The Central Tian-shan Mountains. By Dr. Gottfried Merzbacher. E. P. Dutton & Co. 1905.

Dr. Merzbacher is well known as a thoroughly equipped and experienced mountain explorer, whose investigations are not summed up in the mere fact of arrival on any given peak or the traversing of some previously uncrossed pass. He is a climber of known efficiency, but he is before everything a scientific student of mountains. Hence, when he sets out to describe two years of travel in a mountain range, we may feel sure that, in what he has to tell us, scientific observation will be more in evidence than mountain adventure.

It was the structure of the range that he went to investigate. Others had preceded him—the Russians, P. P. Semenoff, N. A. Severzoff, and several more, whose names and doings are duly recorded in the introduction; but none of them was a mountaineer, nor were any of them accompanied by experts of the Alpine-guide kind, without whom an inexperienced climber is as helpless in a high mountain region as a landsman would be in mid-Atlantic on a boat without captain or sailors. Dr. Merzbacher had suitable companions and was thus enabled to traverse the range in all directions. He climbed many peaks, though of the actual climbing he says very little. He explored many glaciers, and discovered some of vast dimensions, notably the great Mylchek glacier, about forty-six miles long, and another to the south of it of equal dimensions. The result of his labors is a greatly improved map of the whole district and especially of the neighborhood of the culminating giant Khan-Tengri (*c.* 23,600 feet). This splendid peak, alike in his photographs and his descriptions, stands out as one of the really fine mountains, not in size alone but in form. It far surpasses all its neighbors in altitude (by about 3,000 feet), just as Mont Blanc surpasses its satellites. Yet it is not the knot point of the mountain system. It rises on an offshoot ridge and is built up of secondary rocks, being largely formed of marble. Dr. Merzbacher made no attempt to climb it, nor does his description offer great encouragement to any mere climber to devote himself to the attempt. Alike by the remoteness of its situation and the uncompromising character of its form, it defends its summit from assault by the most serious difficulties.

The book is a contribution of importance to the literature of mountains, and fills a great gap in mountain geography.

The Nation.

NEW YORK, THURSDAY, MAY 17, 1906.

The Week.

If the Duma, which assembled on May 10, is undeniably meeting under a cloud, it falls nearly in the realm of political miracles that it should be meeting at all. Whoever, three years ago, had dared predict that a Russian Parliament was to assemble on any terms, would have passed for a lunatical optimist. Accordingly, it is the part of wisdom not to dwell too much upon the niggardliness of the new fundamental law, nor even upon unseasonable repression by the Czar or divided counsels among the reformers. All these things were to be expected, and it is more profitable to fix one's hope upon the momentous fact that a popularly elected legislature is actually in session in St. Petersburg to-day. Immediate results may seem small, but the moment the Czar receives the delegates he gives up a portion of his power that probably no Czar will ever be able to reclaim. However slight the concessions of self-government, they are irrevocable, and Russia is started on the road, however long and difficult, that leads to free and representative government. This great good should surely outweigh minor evils that partially obscure this day of triumph for liberal ideals. The plan of testing the strength of the Duma and the temper of the Czar by a prompt appeal for political amnesty seems a wise one, but the Duma could not have been expected to limit itself to this minimum programme when such urgent matters (to mention no others) as the land problem and the ascertaining of its own powers are in men's hearts. It is a situation that calls for the utmost tact and sympathy on the part of the Czar. His insight must supplement the arid letter of political memorials. Have he or his councillors the capacity to read the dumb aspiration of the representatives of the mills, and mines, and fields? Under almost identical circumstances, Louis XVI., while the States-General was sitting at Versailles on what history has decided were his momentous days, adorned his diary with the curt memorandum, "*Rien.*" It all meant nothing to him. The Czar's attitude towards the Russian States-General is by far the most interesting personal problem of our time. His address to the delegates, if rather colorless, at least avoided all offence.

It is most painful to every American to see the President involved in a question of personal veracity. Sharp differences of opinion we are accustomed to; but it is something new, and distinctly unpleasant, to have the Chief Magistrate charge that a certain statement about him is "a deliberate and unqualified falsehood," and then to have the statement reaffirmed in detail, with a threat to produce further evidence if it is needed. But the only wonder is that such an unhappy fate has not ere this befallen "the most reckless talker that ever lived in the White House," as an old Senator has characterized Mr. Roosevelt. His confidence has been amazingly respected; but at last he has awkwardly stirred up two men, Senator Tillman and ex-Senator Chandler, who have small regard for the minor proprieties, and to whom the fact that a communication was confidential constitutes no objection to blurting out what they know about it. The unhappy effect of their revelations does not stop with the question whether or not the President was right in saying in his haste that all men who tell a different tale from his are liars. More damaging than any possible verbal misunderstanding is the admitted fact that this most direct and above-board of men was pursuing his ends by subterranean and slippery methods.

Was Chandler an envoy from President Roosevelt to Senator Tillman, or from Senator Tillman to President Roosevelt? This is the question to which our attention is being diverted; but it does not touch the main issue. The essential fact, which President Roosevelt and Attorney-General Moody admit, is that they were forming a compact with the Democratic leaders in order to pass the Rate bill. In so doing, they were, we maintain, wholly within the bounds of morality and propriety. But the President wisely refused to commit himself to any "phraseology"; he was for "essence." He was "entirely willing" to accept any amendment "that did not seek to grant a broad review"; and when an amendment was proposed which granted the broadest sort of broad review, he was delighted with it, and declared that "no genuine friend of the bill can object to it without stultifying himself." So keen was his enthusiasm for the amendment to which he had always been unalterably opposed that, without a word of warning to his Democratic confederates, without a hint to his own go-between, Mr. Moody, he jumped into the galley with Senator Aldrich. Naturally, Mr. Moody, in the first flush of surprise and irritation, expressed himself to Senators Tillman and Bailey as "flabbergasted." "There was nothing," writes Attorney-General Moody, in cooler mood, "in the conversations between the Senators and me which in any way bound you to any particular amendment, or in the slightest degree impaired your liberty at any time to acquiesce in any amendment which you should deem expedient and in the public interest." Absolutely nothing but a fantastic notion that, even when a man is actuated by the purest of motives and devoted to the loftiest ideals, he should keep faith with his allies.

The due process of law, the slowness of which is so trying to President Roosevelt and others of ardent temperament, seems to have done the work for the Paper Trust. In the Federal Court at St. Paul the defendants, who are accused of restraining and monopolizing trade, have practically confessed guilt; and the prosecution has secured a perpetual injunction against the unlawful combination and conspiracy of manufacturers. Attorney-General Moody says, "This terminates the litigation. It is a complete victory for the United States." More than twenty corporations united in the General Paper Company, and through that organization sold practically all of their product. Such a union the courts declare to be a violation of the Sherman Anti-Trust law, and the company will accordingly be dissolved. Considerable time, we must admit, has been consumed by these suits. The first petition was filed on December 27, 1904—nearly a year and a half ago. Of course, an executive order by an omniscient and benevolent despot could have settled the business in ten minutes. But it is only once in a century or so that we choose a President who is both omniscient and benevolent. Our frame of government, with its irritating checks and balances, is intended not so much for the present happy era as for those long stretches when fallible or even malevolent men get into office. In spite of checks and balances, the price of paper in the territory controlled by the General Paper Company has fallen from $2.25 a hundredweight to $1.85.

Secretary Hitchcock warns the West that the twenty-one indictments returned by the Portland grand jury against the men accused of timber stealing in Oregon will not be the last. His agents are at work in the Middle Western States on charges of a like nature. The indictment of the Crook, Lake, and Klamath County operators illustrates the need for the most general investigation. At the head of the list stands the name of F. W. Gilchrist, the second largest owner of vessels on the Great Lakes, and a heavy lumber dealer of

Alpena, Mich. Patrick Culligan, Gilchrist's associate, who was also indicted, is a banker and a man of wealth. Three members of the firm of Elkins & Co., lawyers of Prineville, Ore., are also included in the twenty-one, and at the bottom of the list stands the name of Edgar N. White, a Portland saloonkeeper. The old method was used, it appears; these men secured dupes to file timber claims under the defective Timber and Stone act, who, after completing title, turned over the land to their employers. This plan has the merit of age, but little else, to recommend it now. The Interior Department's agents have become so well trained that they can see "the man behind," without waiting for a row over the "commission" of the entryman.

The standpatters in Congress are again embarrassed, this time by the refusal of Secretary Taft to assume responsibility for an order requiring the Isthmian Canal Commission to buy only American goods. The Commission recently purchased 20,000 barrels of English cement at a saving of 37 cents a barrel on the price demanded by American manufacturers. But the Ohio cement-makers have got Senator Dick to introduce a resolution which would shut out European supplies for the canal. The Canal Commission fears combinations of American manufacturers and dealers which would result in extortionate prices, and the puzzling problem is how to "protect" American interests without leaving the Commission at the mercy of persons who may attempt to corner the market in supplies needed for canal work. This question, coming before the matter of the demand for free building materials in aid of San Francisco has been quieted, promises to furnish matter for debate in Congress and more campaign material for this fall's Congressional elections.

It would be demoralizing in the extreme, we take it, for the Filipinos to acquire all at once the benefits of humane and liberal policies. They would doubtless experience the discomforts of children who should receive at Christmas, say, a whole year's allowance of sweetmeats. At any rate, we are running no such risk in our treatment of them. After several years' consideration we took off 25 per cent. of the Dingley tariff rates to see what would happen. Nothing happened, and this year the impetuous House of Representatives was preparing to concede 50 per cent. more. But the wiser Senate committee did not propose to spoil the nation's wards by such ill-considered liberality. It thought best to give nothing at all. Yet President Roosevelt and Secretary Taft, benevolent uncles, are laboring with the Senate to secure "just a bite"—another 25 per cent. of relief. In exchange for this they are reported to be willing to relinquish that very important provision of the House bill which promised free trade with the islands after 1909. That is the year when the coastwise shipping laws are to go into effect with the Philippines. Possibly, if we judiciously dole out another 25 per cent. by that time, the Filipinos may be even prosperous enough to pay their additional freight bills.

"Regular" Republicans of Pennsylvania suggest to Senator Knox that if he will consent to be elected Governor, it will be an "easy step" to the Presidency. The uninformed might detect in any such programme, on the contrary, a distinct retrogression. To go from the Senate to Harrisburg would, in the present disorganized state of the party, effectually shelve any man of doubtful Presidential stature. The appeal at this time, of course, is purely selfish. A Democratic State Treasurer has just taken office and promised to cut off the graft that formerly fattened the organization. Some $13,000,000 of surplus State funds are to be taken out of the control of the machine banks. The "Lincoln" Republicans mean to hold their State convention at the end of May, a week in advance of the "Regulars," and the Democratic leaders are in a mood to form an alliance with any reform element of the dominant party that splits off from the Penrose organization. Senator Knox might save Pennsylvania to "the party of McKinley and Roosevelt," but we see no chance, in that event, of shattering the unbroken precedent that the "banner State's" Governors never get to the White House.

A pert paragrapher remarked a few days ago, apropos of the arrest and fining of a citizen of Warrensburg, Mo., for making a false return as to his personal property, that "it will be many a long day before that particular wave of reform reaches New York." It may be retorted that this particular species of reform is not likely to last long in Missouri, if Gov. Folk has his way. He has appointed a commission to revise the State revenue laws, and has suggested that the tax on personal property should be removed. "A tax on conscience" is the way Gov. Folk characterizes that part of the present system which turns respectable members of society into arrant liars once a year. "It does not reach the tax-dodger, and it discourages investment," adds Mr. Folk. In his view, the retention of the personal-property tax, with the consequent disregard for the law that is indicated by the annual perjuries, is a serious menace to the integrity of government. To enforce all laws strictly is still Gov. Folk's platform. So long as the old law stands, the citizens of Warrensburg are liable to arrest, but the difficulties of the situation are a strong argument for changing the statute. The Governor's further suggestion that a small State tax on the capital stock of corporations be levied in place of the personal tax, is likely to be favorably received by his commission.

The young District Attorneys militant who have set out either to make the world a better place to live in or to become Governor, "like Folk," should form an association and make John B. Moran of Boston president. As a busy hive of industry, his office is excelled only by the night-and-day bank. His latest feat, the summoning of the entire Massachusetts Legislature to appear before the grand jury to testify that bribery was or was not practised in the defeat of the anti-bucket-shop bill, is characteristic of his genius. Elected to the office in spite of the opposition of practically every organized party, Mr. Moran made his first bid for fame by compelling the proprietors of Boston's best hotels to remove every sash curtain that in any degree impeded the view from the street into the dining-rooms and cafés. When the advertising value of this firm stand for "the equal enforcement of the law" decreased, the District Attorney turned his attention to State Street and big financial game. Lawson found the young prosecutor a credulous listener, and it is due to his initiative that the General Court of Massachusetts is to report, in sections, to the grand jury. We hear that "practically every one at the State House took the whole affair as a huge joke, and hilarity reigned supreme." What saves the General Court from extreme depression—a sense of humor—seems to have been omitted from the District Attorney's make-up, however.

Gov. Cummins of Iowa is making it increasingly plain that he means to become something more than a mere Governor before his political career is ended. To the "Cummins idea," which has "taken" exceptionally well in his State, he now adds the income tax and the popular election of Senators. This is an equipment that is designed not only to land him in the Senate as Allison's successor, but to keep him in the public eye as a Presidential possibility for 1908 or even 1912. It might occur to the ordinary student of the tariff that Gov. Cummins as a revisionist will have his hands full in the Middle West for a long time. Indeed, his present contest for renomination against George D. Perkins, the Sioux City standpatter, leaves him little time for developing other political reforms. But that will be settled shortly, and, in obedience to the resolution of the State Legislature, the restless Governor of ideas will call a convention to consider ways and means of amending

the Constitution in order to secure the popular election of Senators. The income-tax issue was not raised in the last Legislature, but it is a fine radical thing for a Republican to take up.

The Crapsey trial, which has ended in this clergyman's suspension, was certain to reverberate beyond the denomination immediately affected by it. The issues involved concern all churches, touch all clergymen. They raise the whole question of the attitude of the Church towards modern learning. Wherever clergymen are gathered together the matter comes up, though not often is it discussed with the frankness shown by the speakers at the dinner of the alumni of Union Theological Seminary on Monday evening. Invited to deal with the subject of theological education and the training of the modern minister, President Hyde of Bowdoin College and Dr. Knox of the Seminary went to the heart of the question with a refreshing directness and candor. Their remarks showed how a breath from the Crapsey case is stirring the dry bones everywhere. President Hyde drew with sure hand the picture of the ordinary education of the ordinary clergyman. It is cloistered, narrowing, deadening. Original thinking is discouraged. Free inquiry is frowned upon. The customary methods of testing assertions, by reading, debate, comparison, weighing of evidence, give way to dogmatic teaching on authority which must not be disputed. Occasionally, large natures are able, as Emerson said a man of native force might be, to take these old and musty conventions and use them for rational and moral ends in profitable and even inspiring ways; but the common result is, as President Hyde said, to turn out clergymen who "can comfort a few sisters weaker than themselves, and that is all." The consequence is, he declared, that the fixed gulf before which the religious world stands to-day is more sharply marked than ever before.

There were published in Germany last year the results of an inquiry among educated people who were asked to answer the question, "Has the clergyman any longer an independent significance in the modern enlightened world?" We know this work by Theodor Kappstein only as it is summarized in the Cincinnati *Volksblatt*. Replies were had from many distinguished professors and writers. Their general tenor was very much that of the opinion of Friedrich Dernburg, who said, "Formerly the office made the clergyman, to-day the clergyman makes the office." Some of the scientists, like the Director of the Zoölogical Museum in Berlin, objected strongly to the departure of the clergy from "practical Christianity" to attack the progress of learning. The dramatist Von Wildenbruch wrote that, in his judgment, the clergyman as a mere cut-and-dried professional man had no reason for existing longer, but that there was more need than ever of a true priest.

The International Postal Congress, which has long been perplexed over the demand for an international stamp, has at last voted in favor of a plan by which it will be possible to send return postage with foreign letters. The scheme, proposed by England, and adopted on Thursday by a majority of one, provides for coupons sold in each country at the price of the regular foreign letter stamp, and exchangeable at the destination for the equivalent stamp of that particular country. The initial difficulty has always been that the international rates were not uniform; twopence halfpenny, for instance, not being exactly equal to 5 cents. With a single international stamp, speculators could buy in quantity in a country where this stamp was cheap and sell it in one where it was dear, making a possible profit of a dollar or more on every thousand. Apparently, though the details are not explained in the brief dispatches, the new plan is to issue in this country, say, a special 5-cent stamp for foreign letters to which is attached the return postage coupon. These exchangeable slips, therefore, cannot be obtained except by using an equal number of stamps on outgoing matter, a requirement that would presumably make speculation impossible on any scale large enough to be worth while.

Col. Gädke, the well-known military expert, pays a high tribute, in the Berlin *Tageblatt*, to the French army. "In equipment and military worth" he declares that it "stands high." In some respects, conditions are superior to those across the Rhine; maltreatment of soldiers by officers, for instance, being absolutely unknown. The weak point lies in the frequent lax discipline and lack of loyalty. Gen. André, during his exceptionally long activity as Minister of War, gave up much of his time to efforts to secure a corps of officers devoted to republican principles, but in vain. Many officers are monarchists; and no less powerful is the clerical influence. The want of discipline and obedience was recently exemplified in a manner inconceivable in the German army, when the three oldest officers in succession refused to obey their brigadier-general's order—given in presence of the soldiers—to force entrance into a church. The fact that in this and similar cases the offenders were either exculpated or subjected to a ludicrously mild punishment, could not but foment the spirit of insubordination. Nevertheless, Col. Gädke believes that the ardent patriotism of Frenchmen would minimize the dangers from this source in case of a foreign war.

General strikes break out with startling suddenness in Italy, and testify to the efficient organization of the advanced Socialist party. The latest political strike extended from Milan to Rome, and had the unusual effect of bringing about the wholesale resignation of Socialist Deputies in Parliament. The Government majority—a composite one, to be sure—is not likely to be seriously affected by this move, but the disaffection of the Socialists may cause resignations in the Cabinet. The issue is one on which Baron Sonnino cannot yield. The Socialists protest against the right to suppress industrial rioting by force of arms. They assert the privilege of disorder, and seek to reduce the weapons of constabulary and army to those of moral suasion. Of course, no nation can live long on any such basis, and Sonnino, who stood behind the stern military repression of 1900, the year of the bread riots, is not likely to change his policy now. For several years past, popular sentiment in Italy has upheld all Government measures taken to preserve order. Accordingly, it seems unlikely that the recent strike will have serious political results. Still, it shows a formidable degree of organization among the Italian proletariat.

In the latest appeal to the Hungarian electorate, the Wekerle Government has received a large majority. The Independence party, which is Ministerialist *pro tempore*, secured a little more than half the seats in the Diet. It is, of course, the ruling element of the Government, and the future of Hungarian politics will depend largely upon Francis Kossuth. The election marks the complete disintegration of the old Liberal party, which has long, if only nominally, been in power at Budapest. The Wekerle Ministry is, it will be recalled, by its very constitution one of transition. Its chief business is to pass a univeral-suffrage bill, besides a minimum of routine supply bills. After the election of a new Diet under the liberalized suffrage, a Government will be formed in accordance with the vote, and the longstanding disputes over the army and language questions will be faced anew. As Kossuth put it the other day, the present situation is "a truce, not a peace." It is a decided gain, however, that the Independence party will enter the new Diet in a spirit friendly towards the Emperor. Speculation as to the effect of universal suffrage on the Diet is rather idle. Some observers hold that it will, by enfranchising many of the other races, actually reduce the Magyar element; but, obviously, political and racial lines are by no means identical in a mixed population like that of Hungary.

THE NECESSARY LAWSUIT.

In his Standard Oil message, the President spoke with some impatience of suits at law as remedies for corporation abuses. "It is impossible," he said, "to work a material improvement in conditions such as above described merely through the instrumentality of a lawsuit." This bespeaks partly a mind which President Harrison described as always wanting the millennium, and wanting it right off; partly that lack of legal training which has so often led Mr. Roosevelt astray; partly, it may be, a lingering resentment at the failure of the Government's Beef Trust prosecution, owing to the perverse unwillingness of Judge Humphrey to agree with the law as laid down by the President.

This attitude has since been thrown into fresh prominence by the Attorney-General's proceeding in court against the so-called Drug Trust. This is a lawsuit. It is but the latest of several similar suits brought by the present Administration. In its name, injunctions have been sought against the Northwestern Paper Trust, the Tobacco Trust, the Elevator Trust; by it suits have been brought against the Sugar Trust and various railways. The famous Northern Securities case, which the President had so much reason to contemplate with satisfaction, was nothing but a lawsuit. Why, then, should he speak of such a legal process as miserably inadequate for the reforms he has in mind? Various reasons suggest themselves. A legal trial is necessarily slow; but the President's habitual prayer is, "Lord, have mercy, and have mercy *quick*." The short way with dissenters from his views is his favored way. Then, too, lawsuits are little spectacular. There is no glitter about men of the robe. Judges are seldom theatric. The opinion of the court is apt to be dull reading, badly fitted for delivery from a stump. And if President Roosevelt may not fairly be called sensational in his methods, he at least is fond of sharp and decisive utterance from somewhere near the centre of the stage. Compared with that, the slow droning of lawyers and judges naturally seems pretty tame.

Yet the Executive, under our Constitution, finds his main duty in enforcing the law; and to enforce the law means the constant bringing of lawsuits. They are not picturesque, but are necessary. There is really no shorter road. The President seems to think that swift and radical action by Congress is preferable to the slow processes of the law. But such action by Congress will itself be the mother of endless lawsuits. Not even a Federal statute can be self-executing, like the decree of a Czar. Every man who has an interest at stake, every corporation, is entitled to come forward and insist that the Congressional enactment, which Mr. Roosevelt appears to regard as a cure-all, be challenged and tested in every possible way in the courts. Its constitutionality may be called in question; its application may be disputed; the true implication of its every phrase and word may be brought up for judicial decision. Trained lawyers may search the statute as with a lighted candle and demand that the courts pronounce upon every defect or loophole. That is what is involved in taking no man's property without due process of law. As a great constitutional muniment of liberty, we all assent to that and admire it. Well, then, we must not rail at the lawsuits which grow out of it.

It is probably the belated perception of these elementary truths which has led Mr. Roosevelt to give, at last, his reluctant assent to the amendment of the Railway-Rate bill so as to safeguard every right of the carriers. Who was the successful instrument of the President's conversion, we need not ask. We presume that, whoever he was, he mixed political with legal arguments. He pointed out to the President, doubtless, that it was rapidly becoming a question whether this is a Republican Administration or not; whether Mr. Roosevelt was really going to set up for himself against the leading Republicans of the Senate, or would conclude to accept what they in their wisdom would give him. It is known that President Roosevelt has expressed a determination to "have no Andy Johnson business" of his own; and his deep desire to keep in line with his party would only need to be skilfully played upon in order to make him drop suddenly his dalliance with Democratic Senators and with the handful of extremist Republicans. But the main thing is that he has finally gone over to the broadest kind of judicial review of the rate-making power of the Interstate Commerce Commission. Every resource of the law—including the enjoining of the Commission, suspension of its rates, or their annulment—is to be left open to the railways. If it be said that this leaves the situation very much what it was before, that is only to state that we had a government by law before, and shall go on having one in the future.

IMMIGRATION AND THE SOUTH.

In many of the Southern States an unprecedented movement for the encouragement of immigration is one of the features of the legislative year now ending; and in most cases there has been an appropriation to employ commissioners and defray expenses. Perhaps the most important effort was that of Virginia, where $10,000 was voted by the Legislature, on the understanding that work should begin at once. In Mississippi, intentions were as good, but the bill was carelessly drafted, and as a result the matter must be laid over for the next Legislature. Several other Southern States have sent representatives to Europe and to the great cities of the North, where the seamy side of the immigrant problem presents itself. Altogether, the South shows signs of general awakening to the possibilities that lie in attracting immigration.

The movement must contend against two obstacles: the prejudice of the South against foreign labor, and of foreign labor against the South. These prejudices are not hard to understand, and they should be easy to dissipate. The conservatism of the old South, which saw in the coming of the aliens the breaking down of many traditions and the end of the easy-going relationship of proprietor and field-hand, has long since given way before the demands of the newer, bigger South. The progressive element is fully aware that a new industrial era has come, and that if the South is to hold its own—to say nothing of making an advance—either in agriculture or in manufactures, it must make a strong bid for that immigration which has so rapidly built up the West. In Mississippi and Louisiana there are still traces of feeling against the Italians—provoked by the unfortunate outbreak in New Orleans some years ago. But that incident will be forgotten, for the Italians are showing themselves to be in the main industrious and law-abiding.

The prejudice on the other side is perhaps more difficult to deal with, for there are very few means of getting at the immigrant and persuading him that the South is the place where he ought to go. For years he has been listening to another gospel. There is truth in the complaint of the South that certain States of the Northwest, in their eagerness to advertise and populate the wheat fields, have sent out circulars which make comparisons unfavorable and unfair to the States below Mason and Dixon's line. These advertisements, together with certain too well-founded complaints about lawlessness and the miscarriage of justice, have helped to deprive of its share that part of the country which most needs the infusion of new blood. Yet the immigrants who have gone to the South have succeeded well. When we remember that the entire peninsula of Italy, excluding the Alps and the Apennines, is but little larger than the State of Georgia, and that it supports, chiefly by agriculture, a population of 36,000,000, we can see why newcomers from the south of Europe, trained to methods of careful and intensive cultivation, should get ahead in a region where the farming methods are among the loosest and most wasteful in the world. Many instances could be given of the achievements of adventurous immigrants who have disregarded all warnings, and have found comforta-

ble homes, hospitable friends, and a freedom which they could not have hoped for in the over-crowded cities. A colony at Ladson, South Carolina, has found silk-raising profitable. Prosperous Italian and Bohemian truck-farmers are now living along the seaboard from Norfolk to Jacksonville. An experiment in Alabama, where a colony was set at work in the cotton fields, has been wholly successful, and has shown that the cultivation of cotton can be performed by white labor as well as by black. In the South more than one "model" farm, demonstrating the effect of intensive methods and hard work, is in the hands of men who, though industrious and intelligent, have been in this country hardly long enough to make themselves understood. These examples of adaptability, as they become more widely known among immigrants, cannot but have the effect of turning attention to the South.

The importance of immigration to the South can hardly be overestimated. The population in many districts is very sparse, and the opportunities for development of agricultural and mineral resources are boundless. For this work there must be both men and money; but if the South can once turn the tide of immigration, the capital will be forthcoming in abundance. A question often raised is the effect of foreign labor upon the negro. If the South carries out its plan of drawing the best foreign labor, the effect upon the negro should be beneficial. If he is to hold his own in competition, he will be forced to improve himself, and he will be stimulated intellectually and morally. One reason why he is lazy and irresponsible is that he often regards himself as not a direct competitor of the white; and he measures himself by no standard of achievement except that of the shiftless and ignorant of his own race. The coming of the immigrant should open the eyes of his mind and soul. Placed side by side with earnest, steady workmen, he himself should reach a higher degree of skill and trustworthiness.

From every point of view, it is the South's plain duty to itself and to the rest of the country to correct the evil impressions that have gone abroad as to its conditions of life and the opportunities for tranquil, profitable, livelihood. In order to set forth its manifold advantages the South must employ such businesslike methods as have been used in advertising our own Western States and the Canadian Northwest. Keen, alert agents at home and abroad will doubtless obtain desirable settlers in growing numbers. Above all, the South should make good its promises by strictly enforcing law and protecting all its citizens. Each lapse of justice and unpunished mob rule will keep from the South thousands of people whose coming is ardently to be desired. Without law and order the door will stand open in vain.

A TEST OF "CIVICS."

We all know what a vast amount of instruction about government has been given of late years in our public and fitting schools, not to speak of women's clubs. A preparatory school that did not offer courses in "civics" could to-day scarcely hold up its head. "Current events" and "questions of the day" have been among the most popular of subjects. On all sides there has been an effort by teachers to provide a sort of handy-volume *vade-mecum* of citizenship, and to turn out a generation of students well-grounded in the whole duty of an American. Thus was accurate information to lead to reform. It has occurred, however, to a Western college professor to seek to ascertain just how accurate the information is. Prof. W. A. Schaper of the University of Minnesota had reason to doubt the political knowledge of his own students. He subjected them to examination, which they did not pass with honor. Then he extended his inquiries to other institutions. The same questions were put to 350 students in ten universities, four in the East, six in the Middle West. The illuminating results are set forth in Professor Schaper's paper, now reprinted from the Proceedings of the American Political Science Association.

The five simple questions about government related to the method of choosing members of Congress, with their terms of office, qualifications, and compensation; the nature of the Federal courts; the method of amending the Constitution; an outline of county government in the student's own State, and an explanation of the New England plan of township government. An identical test was made in a number of universities, under conditions as nearly equal as possible. The questions were put to "seniors in the courses in engineering, and to sophomores, juniors, and seniors in the academic courses who had taken no college courses in Political Science or American History." Thus the aim was to discover the residuum left over from instruction in civics in preparatory schools, and to enlighten the college professor in regard to the information which he might take it for granted his students had acquired from former teaching and from their own observation. The outcome was astonishing and deplorable. These young Americans, of the average age of 20.6 years, got an average of less than 10 per cent. in the examination. Professor Schaper analyzes the figures variously. One inference which he makes has a bearing upon the theory that we are in danger of being destroyed by the ignorance of our immigrant population.

"It may be an accident, but the college group that counted among its number four of colonial stock, four of German, five of Scandinavian, a Belgian, a Hungarian, a Pole, and thirteen of mixed Swiss, German, English, Scottish, Irish, Scandinavian, and American colonial descent, stood first on average for the five best, and second on general averages. In the little group of five best there appeared one of English-Scotch parentage, one of German, one of German-American, one of Swiss-American, and one of Norwegian parentage."

A few of the more imaginative answers given by these college students may be cited:

"The members of Congress are chosen by use of the Australian ballot system. The term of office of the members of Congress is four years in most all cases."

"If the Constitution of the United States is to be amended, it has to be brought befor the House and voted upon."

"The predominating qualification of a U. S. Senator is to be able to tell funny stories for publication, and go to church regularly. He should also contain a smattering of law."

"They must be 25 yrs. old and have committed no crime of which they have been convicted."

"A Senator must be a resident of the State which chooses him, and an upright citizen." (As an afterthought he crossed out all after the comma.) "He must be of sound mind."

"The Federal Courts were supplied to meet a demand for accessible courts where small cases could be tried without taking them to the higher or Supreme Court."

"The courts of the United States are as follows:
"The Supreme Court.
"The Circuit Court.
"The Criminal Court.
"The Juvenile Court."

A certain discount should doubtless be made from this bad showing. One detects here and there the irrepressible impulse of the student to refuse to take the examination seriously. In some cases, it is not ignorance that is displayed, but levity. Yet "plain ignorance" is revealed in amazing quantity, and reflects seriously upon the teaching in government and history which more than half of these students had regularly had before going to college. But it also reflects seriously upon their own powers of observation and their personal interest. One of the worst papers was handed in by a young man 24 years old, of New England parentage, who had passed through graded schools, had read a daily newspaper for several years, and had voted in two elections. He seemed unable to give even an elementary account of the system of government in his own country.

Such a case suggests the truth which Secretary Taft presumably had in mind when he advised the Yale students to complete their political education by freely consorting with saloonkeepers and others deep in the actual game. It is the concrete which bites deeply into the mind. Book learning is never more barren or fugitive than when it deals with government in an abstract way. The book-theory is, besides, too often wide of the fact. In what text-book could a student learn the real government of New York city by Tammany Hall, or find explained the functions of a Quigg or an Odell? It is contact

with the living reality which both corrects book-knowledge of politics and makes it more than a dead thing. So it may well be argued from Professor Schaper's showing, not that the teaching of civics should be dropped, but that it should be vitalized. Here, too, abstractions should yield, so far as possible, to examples. The live Congressman, rather than the pale ghost depicted in the Constitution, should be vividly brought before the mind of ingenuous youth; who should be bidden, further, to supplement their books by that sure knowledge of politics which comes only of seeing and handling.

ALLIANCES, SPECIAL AND GENERAL.

When a bank begins to publish gratuitous and frequent evidence of solvency, it is time for the depositors to be on their guard. So the repeated protestations that the Triple Alliance is unimpaired seem excessive and almost suspicious. Count Guicciardini, the Italian Foreign Minister, in a remarkable speech before the Senate, the other day, gave the Triplice a new certificate of health, but advanced a comparatively fresh reason for its validity. All the world knows that Bismarck drew Italy into the alliance by appealing to mistrust of French aggression in Tunis. To-day, the Italian Foreign Office regards the pact with Germany and Austria primarily as a guarantee of the *status quo* in the Balkans. "It protects us," said Count Guicciardini, "against any change without a hearing." He went on to say that, as regards Albania, a special understanding exists with Austria, whereas the friendship with France and England has become a cardinal point of policy, safeguarding as these newer *ententes* do the position of Italy in the Mediterranean. These special agreements, Count Guicciardini maintained, were perfectly compatible with the older obligation to Germany and Austria. To that effect, he cited Chancellor Bülow's statement, made in 1902, that "the good relations of France and Italy are, in my opinion, the complement of the Triple Alliance," and Lord Fitz-Maurice's sensible *mot*, that "the fact of being on good terms with one Power does not necessarily imply being on bad terms with another."

This theory that the more general and comprehensive alliances are compatible with any number of special agreements, well deserves scrutiny. The arguments for the view are by no means immediately convincing. The fact, however, is clear that beside the more general alliance, like the Triplice, the Franco-Russian, and Anglo-Japanese treaties—all of which are based upon somewhat indefinite and remote contingencies—there is an increasing number of special agreements resting upon very definite and practical issues. We need not recall Bismarck's private understanding with St. Petersburg, which set the fashion of a "friendship" superimposed upon an alliance—or secretly undermining it. It is sufficient to say that Austria has special agreements with Russia and Italy as regards Macedonia and Albania. France has, in addition to the Dual Alliance, undertaken especial obligations to Italy, England, and Spain; in short, a nexus of friendly bargains now covers pretty nearly every disputed point in European politics, and the older so-called fundamental groupings of the Powers begin to have the look of retiring into some abstract and unrealized realm.

It is in the nature of the case, perhaps, that the more sweeping and ambitious alliances should have little permanency. Based on national sentiments of a temporary sort, they pledge national policy for a long future. Germany, for example, must to-day be pretty well free of the dread of Russia and France, which was the reason for rallying Italy and Austria to her side. In other words, what began as a measure of Imperial defence persists merely as a matter of national vanity, or as an abstract ideal of a central European tribunal. Similarly, France, since her reconciliation with England and Italy, should have nearly outgrown her fear of Germany. Moreover, it may reasonably be doubted if any member of the three great alliances would be bound by past engagements against its present interests. Can it be doubted that, if France were called upon to fight beside Russia, or even England beside Japan, either ally would construe its duty not by the letter of a treaty, but by its sense of immediate self-interest?

A further reason why the more comprehensive pacts do not promise the "federation of the world," is their moral weakness. They are made in a spirit, not of conciliation, but of potential defiance. When the Kaiser virtually rebuked Italy by praising Austrian action at Algeciras, he showed the old sentiment of exclusiveness. He assumed that the rival or opponent of any member of the alliance could be the friend of no other member. In this sense, one may say that the older treaties, framed with a view to the balance of power, make for peace very imperfectly. Being based on the theory of existing animosities between nations, they give to such hostilities a kind of international warrant. When friendlier feelings come, it is no wonder that the signatory Powers which are accustomed to the older régime of distrust, feel obliged to protest that nothing has changed. When a watcher has to pinch himself to make sure he is awake, the worth of his vigilance is at least questionable.

Against international agreements of a special and limited kind no skepticism need arise. The Anglo-French *entente*, for example, has the moral advantage of dealing with perfectly concrete issues and of seeming to mean no more than it actually does. All treaties that concern trade, fishing rights, boundaries, spheres of influence, and the like have a similar character of sincerity. That they are limited in application is their strength. None goes beyond an immediate point in controversy. Each is an admirable argument for a new agreement when occasion arises. In a sense, we cannot have too many especial agreements. They greatly promote the habit of frank negotiation and frequent arbitration among nations. They mark a stage beyond the arbitrament of arms and the view of world-politics that regards international prejudices as a chief asset. It is a just instinct that sees in these special treaties an impairment of those older pacts which presuppose a European equipoise of battalions and battleships. Should the habit of especial agreements ever became universal, the traditional military alliances would become superfluous.

CARL SCHURZ.

The patriot, orator, journalist, statesman, soldier, reformer, who died in this city on Monday morning, was born March 2, 1829, in the village of Liblar, near Cologne; in 1840 he entered the Catholic Gymnasium of Cologne, and in 1846 proceeded to the University of Bonn with the intention of studying philosophy and history. Like many other ardent and generous-minded young students, he fell under the influence of Professor Johann Gottfried Kinkel, who threw himself unreservedly into the revolutionary movement of 1848, and served as a private among the insurgents in the spring of 1849. Schurz, following the example of his friend and teacher, served as adjutant to Gen. Tiedemann, and, when the latter surrendered the fortress of Rastadt with forty-five hundred revolutionary troops on July 21, 1849, made an almost miraculous escape from it through the sewer connecting with the Rhine, and fled to Switzerland. In the following summer he returned to Berlin, under an assumed name, for the purpose of liberating Kinkel, who had been taken prisoner, tried for treason, and sentenced to imprisonment for life. With the aid of wealthy sympathizers, this daring and romantic project was carried to a successful conclusion in November, 1850, and created a sensation throughout Europe. In fact, a more remarkable instance of self-sacrifice and heroism for friendship's sake has seldom been recorded, and it demonstrated the singular nobility of Schurz's character. Schurz and Kinkel escaped on a Mecklenburg vessel to Leith in Scotland.

Schurz spent about two years in London and Paris, supporting himself by giving music lessons and by acting as correspondent of German newspapers. In July, 1852, he married Margaret Meyer, the daughter of a well-known Hamburg merchant. The match was a romantic one, the acquaintance

being traceable to the fame of Schurz's exploit in liberating Kinkel, and was the beginning of a long and happy union, broken only by the death of the wife in March, 1876. In September, 1852, Schurz crossed the ocean and took up his abode in Philadelphia, where he remained for three years, removing then to Watertown, Wis. He attached himself at once to the newly formed Republican party, and in the following year, 1856, made German speeches which contributed so materially to carrying Wisconsin for Frémont by a majority of more than 13,000 votes that in 1857, although he had but just become a citizen, he was nominated Republican candidate for lieutenant-governor, and came within one hundred and seven votes of an election. Two years later he was offered the same nomination and declined it. His first English speech, made in 1858, during the senatorial contest in Illinois between Abraham Lincoln and Stephen A. Douglas, attracted general attention, and was widely circulated under the title of "The Irrepressible Conflict."

In the following year he began the practice of the law in Milwaukee. The National Republican Convention of May, 1860, which he attended as chairman of the Wisconsin delegation, upon his motion incorporated in the fourteenth paragraph of the party platform a declaration unequivocally pledging the Republican party against all legislation by which the existing political rights of immigrants could be impaired or abridged. Moreover, he supported George William Curtis in his successful appeal for the insertion in the platform of the sentiments of the Declaration of Independence, which had been denied to Mr. Giddings. Although he steadily cast the vote of his whole delegation for William H. Seward, Schurz was appointed a member of the committee to notify Lincoln of his nomination; a member of the National Republican Committee, consisting of one representative from each State; and also a member of the Executive Committee, which then consisted of only seven members. During the ensuing canvass he made many brilliant speeches in German and in English, which were an important factor in bringing about the election of Lincoln, who, after his inauguration, recognized the valuable services of Schurz by appointing him United States Minister to Spain. Schurz presented his credentials to Queen Isabella on July 16, 1861, but in December resigned his post, and, after a brief visit to his native land, returned to his adopted country in January, 1862, to take service in the Union army.

He was commissioned brigadier-general in April, and on June 17 took command of a division in the corps of Gen. Franz Sigel, participating in the second battle of Bull Run (August 29 and 30). He was appointed major-general on March 14, 1863, and on May 2 commanded a division of Gen. Oliver O. Howard's Eleventh Army Corps, at the battle of Chancellorsville. With the same corps he participated in the battles of Gettysburg and Chattanooga, and served under Sherman in the Georgia campaigns. The surrender of Gen. Johnston to Gen. Sherman on April 26, 1865, terminated the war; and Schurz, having obtained leave of absence, proceeded at once to Washington and resigned his commission as general. His resignation was filed May 5, and was the first one received by the War Department, with the sole exception of Gen. Sigel's, which was filed May 4.

In the summer of 1865 Schurz was commissioned by President Johnson to make a tour of the Southern States and prepare a report on their condition and the state of public sentiment. He made a careful and conscientious study of the subject, and embodied the result of his investigations in a candid and judicial-minded report, in which he recommended that, before readmitting the rebellious States to full political rights, a Congressional Committee be sent there to make a thorough survey of the ground and suggest appropriate legislation. In 1866, he removed to Michigan and became editor of the Detroit *Post;* in 1867, to St. Louis to become editor and, with Emil Pretorius, joint proprietor of the *Westliche Post.* Even during the war, and while in active service in the field, Schurz had not intermitted his activity as a political orator, but had occasionally taken leave of absence when it seemed necessary to rouse public sentiment to support the Administration, and in 1864 had made some notable speeches in the second Lincoln canvass. As a matter of course he was one of the most effective speakers in the campaign of 1868, which resulted in the first election of Grant. On January 19, 1869, the Legislature of Missouri elected him Senator, and he took his seat at the special session beginning March 4, being the first German-born citizen who had ever been a member of the upper house of Congress.

The career of Carl Schurz in the Senate would have been sufficiently remarkable if regarded merely as a demonstration of his great gifts as a parliamentary orator and of his readiness as a debater. The course of events has taken his part in nearly all the controversies which put him at odds with his party in the Senate. He was in advance of public sentiment, not so much by reason of any superior foresight or political sagacity, as because of his fidelity to his ideals, and his conviction that, in the long run, truth was bound to prevail. He was the original Independent in politics, and the whole political faith of the Independent can be educed from his utterances. He was a warm advocate of civil-service reform, of tariff-reform, of currency reform, at a time when the friends of any kind of reform were few and far between, and had nothing to expect from either party but obloquy and sneers. Perhaps the greatest practical service he rendered at this time was by his unwavering advocacy of correct principles on the currency question. He was among the few public men who never made any concession on this point to ignorant public clamor, and his mastery of the subject was equal to the honesty and courage with which he stood for the right. The two speeches against inflation and in favor of a return to specie payments which he made in the Senate on January 14 and February 24, 1874, were models of sound doctrine. Of the second of them, Prof. Bonamy Price of Oxford said that it was the ablest speech ever made on banking in any parliament, that its range and solidity were wonderful, and that it offered a body of detailed doctrine which almost throughout will bear the test of the closest examination.

A complimentary dinner was given to Schurz on April 27, 1875, to mark the regret which honest men of all parties felt at his retirement from the Senate, failing a reëlection—at his being (in the words of one of them) "exiled from one party by his independence and principles, and repelled by the other apparently because it is too ignorant to recognize his value in public life." Banqueted a few weeks later in Berlin, a more signal vindication awaited him on his return from Europe. Although he had broken with and defied the Republican party by taking sides against it in the Louisiana question, in the matter of the Ku-Klux laws, in advocating a general amnesty; although he had opposed the Administration in the San Domingo discussion, in the debates on the sale of arms to France and on abuses in the New York Custom House; although he had originated the Liberal Republican movement in Missouri in 1870, and had thereby given the first impetus to the current of independence in politics which afterwards swept the country; although he had presided over the Liberal convention of May, 1872, which nominated Horace Greeley for the Presidency, and had advocated (with much reluctance, it is true) the election of Greeley; although he had done all these things, and many others that equally demonstrated how little amenable he was to the ordinary canons of party discipline, and how much he placed the cause above the party—no sooner, nevertheless, had he returned home than he was appealed to by the Ohio Republican Committee to stump that State in favor of Hayes and honest money, as against Allen and inflation. Within a week he was in harness, and resumed, with all his wonted boldness and brilliancy, the good fight against financial folly, quackery, and knavishness which he had fought in the Senate, and which he was to fight over again for many years to come. His appointment by Hayes to the Secretaryship of the Interior was only a just recognition of the importance of his services, and at the same time a partial redemption of the pledge, if a pledge there was, in regard to civil-service reform, of which it was on all sides admitted that Schurz was a sincere and ardent advocate. So well was this understood by the enemies of the reform that, while his nomination was pending, they spread a report that his confirmation would be opposed by some Republicans from a "dispassionate belief" that he did not possess business experience and administrative ability enough for the proper discharge of the multifarious duties of the office.

The duties of the office were, indeed, multifarious, but Schurz was soon to convince the country that an idealist can be a very practical man in any business which is compatible with honesty, industry, intelligence, and courage. He was confirmed on March 11, and before a week had expired he assured the clerks that no removals would be made except for cause, unless the force had to be reduced, in which case the least competent would be removed; that no promotions would be made except for merit; and that, as there were no vacancies, no recommendations to office would be entertained. This was not empty declamation, for Schurz did not even bring a new private secretary with him. On April 6 he promulgated an order providing for the investigation and practical determination of questions connected with appointments, removals, and promotions by means of a

board of inquiry composed of three clerks of the highest class; and his subsequent actions demonstrated that there was no sham about this measure, but that it was meant in sober earnest. Clerical reform, however, was but a small part of his task. He found the service in a deplorable condition, particularly the Indian Bureau. The Secretary of the Interior, and even the Commissioner of Indian Affairs, were kept in ignorance of what was going on, and contractors and Indian agents were allowed full swing. As fast as Schurz could fasten the responsibility for wrongdoing or negligence or even mere carelessness, he made changes and removals right and left, regardless, as he had ever been, of the enemies he made. His efforts to check the timber thieves brought him into conflict with powerful corporations and with his old Republican antagonists in the Senate, while his intelligent and well-considered Indian policy was attacked not only by a noisy company of traders who had a vested interest in corruption, but by army officers on the one hand, and by well-meaning, sentimental philanthropists on the other. All of these foes he faced undismayed, and did not allow clamor or vituperation to swerve him from what he considered the straight path of duty. He put an end to the swindling of Indians by agents who were appointed to protect them, and in four years gave the wards of the nation a better start towards civilization than they had ever had before. In other departments he displayed the same capacity for practical business.

Returning to private life when his term of office had expired, and making his home in New York, Schurz became one of the editors of the *Evening Post*, when that journal changed ownership in July, 1881, and retained the position until December 9, 1883. In 1884 he took a prominent part in the independent movement which was called into being as a revolt against tendencies in the Republican party that represented the antipodes of everything he stood for. He had himself helped materially by example and by precept to create the public feeling which made such a movement possible, and he contributed no less to its culmination in the election of Grover Cleveland, with whom he had, indeed, much in common. The leisure afforded him by his release from public duties he employed to good purpose in writing his 'Life of Henry Clay,' which appeared in 1887, and at once secured him a high rank as a man of letters. Repeatedly chosen president of the National Civil Service Reform Association, his speeches and activities in that behalf were notable. In the elections of 1888 and 1892 he again effectively supported Cleveland, although in the latter year his health did not permit him to take as active a part as he had been accustomed to do. His latest literary effort was devoted to his autobiography, now in course of publication.

Mr. Bryce has expressed surprise at the want of influence upon American politics of the great German infusion, and it is certain that no one of the refugees of '48 attained anything like the distinction of Carl Schurz, or had either so conspicuous or so happy a share in repaying his debt to his adopted country. As a whole, it may be said of the Germans as of the Irish that, deceived by the name of "Democracy," they cast their weight—at least during the years of moral agitation—against the anti-slavery party. In this particular Schurz shines by contrast, since he at once saw things as they were, and divined the essential unity between the Slave Power and the despots of the Old World. He differed again from many of his countrymen in making a complete surrender to his new nationality, desiring and aiming to be only a high-minded American citizen. Unlike his noble compatriot, Friedrich Kapp, he was not tempted by the conquest of German unity to return to his Fatherland. In the end, he came to *think* in English rather than in German, though both languages were constantly on his lips. The late Professor Price of Columbia—the most competent of judges—once said that Schurz's mastery of English was the most astonishing intellectual feat that he had ever known. It was not simply that this German had learned to speak English without mistake or accent, nor that he had acquired a rich and varied vocabulary. The amazing thing was that he appeared to have penetrated the very spirit of the alien speech. Its idioms seemed native to him. Among its living growths he moved with ease and certainty. His crisp pronunciation, his flexible handling of phrase and instinctive building up of sentence and climax, made listening to him a blending of delight and wonder. We hear frequent boasts of bi-lingual achievements, but they relate ordinarily to the restricted speech of travel or social intercourse or diplomacy. Schurz could in either tongue be playful or powerfully argue, soar or thunder, and do it with the facility and grace of one to the vernacular born. It was, however, the moral force residing in the man that set him apart in strength. His eloquence was of the kind that is a virtue. His rare intellectual gifts, his ready bonhomie, his power as an orator, might all have gone for naught had they not clothed a conscientious judgment and inner purpose which nothing could shake. This, after all, was the main theatre of Schurz's idealism. He early formed noble political conceptions, and clung to them through evil as through good report. The tasks which he had willed in hours of insight, he fulfilled through hours of gloom.

In the multifariousness of his talent and his experiences in public and in private life, it was not to be expected that he should be equally surpassing. His military career was certainly less brilliant, though not less creditable, than his civilian. As a journalist, too, he was less successful than as an orator, and, in fact, the world has seldom seen these two functions combined (in the first order) in the same person. The speaker's rhetoric is opposed to the directness and terseness demanded of the daily writer for the press, and as a speaker it is to be observed that Schurz was accustomed to elaborate his weightier deliverances by a careful preparation in his closet. The journalist has not time for this, and pays the penalty in an ephemeral fame.

It would be unjust to close this imperfect appreciation without a word as to Carl Schurz's private character, which was both pure and amiable in a singular degree. He was very companionable, very warm and kindhearted, most affectionate in his family relations; passionately fond of music; absolutely simple and unaffected in his manner, and happy to escape from the observation of the world and the exactions of society to be at home with his books and engaged in literary pursuits. Like Lowell and like Curtis, he learned that the possession of these virtues, superadded to abundant examples of public spirit, patriotism, and self-abnegation, was no security against the most vulgar and odious aspersions on the part of his political adversaries. Yet the fullest appreciation came, too.

THE ROYAL ACADEMY.

LONDON, May, 1906.

The Academy of late has been complimented on the judgment displayed in its elections. Men have been found worthy of admission within the Academic fold for their distinction not as good fellows, not even as billiard players, but actually as artists. Among Academicians and Associates there is now a fair sprinkling of names of painters and sculptors, engravers and architects, who are doing some of the best work done to-day in England. And yet the extraordinary thing is that the Academy's summer exhibition remains what it has always been within my memory—and this means almost a quarter of a century. It shows absolutely no sign of improvement in the quality of the work, nor in the manner of exhibiting it. In fact, I should be inclined to say the exhibition just opened is the worst I have seen for years, had I not been saying the same thing regularly summer after summer. With the number of big shows given nowadays, I know it is impossible to fill each as full as it will hold with fine or even intelligent work—there are not enough fine or intelligent artists to supply it. But that is no reason why the Academy should reject, or discourage, or sky the most distinguished outsiders to make room for, or give prominence to, the chance dauber and amateur. Nor is there any obligation to fill the Academy as full as it can hold, especially as everywhere on the Continent, and in such London exhibitions as the International, harmonious spacing, appropriate hanging, and decorative grouping are considered indispensable. But the Academy goes on, scrupulously covering every inch of its walls, piling pictures one above another to the ceiling—good, bad, and indifferent jumbled together anyhow, so long as they fit in and the most conspicuous places are saved out of the chaos for the performances of Academicians and Associates. The Academy is really a monument to the indolent obstinacy that in Britain passes for conservatism.

If the Academy continues to repeat itself with such persistency, it is impossible to write of it without repetition. Again this year, as for several years past, Mr. Sargent, by sheer physical strength and downright energy, towers above the large company of timid and anæmic portrait painters. I have seen far stronger work from him. But then what are the other portraits? A wooden figure in costly laces and costlier jewels, sitting against evidently as costly a background, with no difference of texture suggested, colorless, without atmosphere—catalogued as "The Duchess of Northumberland," by Sir Edward Poynter; another figure that might pass for a dressmaker's manikin, draped in rose-tinted satins, propped against a

stage-property magnolia tree—entered as "The Duchess of Westminster," by Mr. Frank Dicksee; the usual assortment of Herkomers, Oulesses, Solomons, and the usual royal effigies; rather insignificant examples of M. Carolus-Duran and M. Blanche, who, you might fancy, are disheartened by finding themselves in Academic company; an excellent portrait of Mr. W. T. Richards by Mr. J. McLure Hamilton, placed where it can offend no Academician by its excellence; a well-thought-out decorative arrangement of a lady in blue by Mr. George Henry; a not remarkable family group, by Mr. J. J. Shannon; a straightforward, unaffected portrait of "The Lord Bishop of Salisbury," by Sir George Reid; a sudden eruption of children on horseback and ladies in inappropriate garments, wandering through romantic landscapes, that would never have been painted but for the success of the late Charles Furse, who started the fashion—and I remember few others. There is, therefore, not much, it will be seen, to compete with the work of a painter like Mr. Sargent, who is no more afraid of a large canvas than he is of diligent application.

His most important picture, either at the Academy or at the New Gallery, is the huge presentation group of Professors William Welch, William S. Halstead, William Osler, and Howard A. Kelly, of the Johns Hopkins University, Baltimore. I do not know whether the picture has been already exhibited in America or whether it was designed for a special space in a special room or hall, where it may look better than in its present position at Burlington House. To me, it is a disappointment. The subject gave Mr. Sargent something of the chance Rembrandt had with the Syndics, and Franz Hals with the Regents, and I do not think he has taken advantage of it. Nothing could be simpler than Rembrandt's grouping, and yet there is not one of the Syndics who does not belong to the group, is not a part of it. But I cannot help feeling that each of Mr. Sargent's four figures would be more effective as a separate portrait. There is observation in the four heads, good, sound study of character; the official robes, so much more pictorial than plain coat and trousers, are put in with that full sweep of the brush Mr. Sargent delights in. But, as so often in Mr. Sargent's groups, the arrangement is haphazard; unity is destroyed by the way the standing figure toward the centre is enveloped, lost in atmosphere, while the head of the seated figure immediately in front so lacks this envelope that it fairly jumps at you from the canvas. It is all you see at first; it monopolizes the interest which, in character, the others share quite equally. Nor is the background very successful. It is dark, vague, dingy, spacious, out of proportion to the group. When the picture finally reaches Baltimore, as I suppose it is destined to, the whole effect may be so different that I hesitate to say more about it. It is Mr. Sargent's most ambitious exhibit this year.

He has also at the Academy a portrait of Lord Roberts, in which the interest is concentrated on the uniform and the countless decorations; another, of "The Hon. Mrs. Frederick Guest," in which he has allowed himself the rare pleasure of rendering personal beauty and feminine grace; a third, not very striking one way or the other. For the most sympathetic presentment of character, you must go to the New Gallery, where, in a small sketch of "Padre Albera"—whoever the Padre may be—Mr. Sargent reveals unusual tenderness and charm. Two or three other sketches here and one at the Academy are his record of a recent journey in the East; brilliant notes of hot, blazing sunshine, so true, so suggestive, that one wishes Mr. Sargent would devote to landscape some of the time he gives to people who evidently do not appeal to him or interest him in the least. Surely, he has arrived at the moment in his career when he could permit himself this luxury.

Of the sort of pictures that used to be expected of Academicians—subject pictures, historic pictures, heroic pictures, allegoric pictures, call them what you will—the examples are few, and of these few only one or two are above the average. One of the exceptions is "A Venetian Funeral," by Mr. Frank Brangwyn, who has just been made an Associate. He is an artist of distinct individuality. He has done good work, both as illustrator and as decorator. But as painter he has reached a point where, if he does not take care, he may fall a victim to his mannerisms—to his convention—as have already so many of the Glasgow school. He can no longer see nature except through the formula he has invented for himself. That "A Venetian Funeral" is a most picturesque motive, any one who has been to Venice knows. Mr. Brangwyn, however, has made of it only an excuse for the mosaic of paint he now produces with every picture. The boat in the foreground, the men in it bearing unlit candles, the flowers at their feet—all in shadow not quite accounted for—the figures in the distant boats that fill the hot background, are so many *tesseræ* in this mosaic. It takes several minutes to untangle, to puzzle out the design. It is the same with his "Wine Shop" at the New Gallery, in which there is nothing in the treatment to distinguish the figures from the objects of still life that surround them. It is the same, I might say, with his big etching of "Santa Maria della Salute," a confusion of shipping in the foreground that no amount of study has so far made clear to me. However, Mr. Brangwyn has an individual way of using his eyes; he may still triumph over his formula, and there is no other large subject-picture at the Academy to be mentioned with his, except, perhaps, Mr. Abbey's "Columbus in the New World."

I say this, though I cannot deny to myself that, if it were not for Mr. Abbey's name in the catalogue, I probably should have turned from the picture with no desire to come back to it, so hot and garish is it in color, so discordant in design. He has chosen the moment of landing, and Columbus (presumably) kneels in the foreground, where it is some little while before you discover him, so dazzled are your eyes by the flight of violently pink flamingoes, or herons, for I am not ornithologist enough to know just what, across the staring blue sky, and by the banners his followers hold aloft, and by the elaborate vestments in which the priests who wear them are quite lost. Nothing really explains itself, but least of all the birds, by whose astonished flight—that is not a flight at all, for there is no movement—Mr. Abbey probably meant to symbolize the newness of the New World to man, though the symbol in paint resolves itself into no more than an unpleasant experiment in color and decoration. By giving this picture the principal centre in the principal gallery—the centre that used to be occupied by Leighton—Academicians, no doubt, have wished to express their appreciation of Mr. Abbey. Like Mr. Sargent, he comes by his prominence without much trouble. Who is there to dispute it with him? No one but Sir Alma-Tadema, with the old marble seat and the old figures in the old classic draperies, against the old background; or Mr. Waterhouse, with his more substantial versions of Burne-Jones's maidens, this year bearing water-jars and called "The Danaides"; or the various younger men who are struggling by Academic means or by imitation of Mr. Abbey himself for Academic recognition.

The landscapes compel the same repetition as the portraits in any attempt to write about them. Those that have distinction or merit come from the same men who have contributed the only landscapes of importance for some years past. Again, as so often before, one passes the perfunctory Academic machine, the photographic record that a good photograph could beat all to pieces, to come with delight, with a sense of life and freshness and charm, to a little canvas by Mr. George Clausen, in which the sunshine really falls in pale green light through an open door into the deep shadows of the barn, or where one looks, with the laborer at rest, across miles and miles of low rolling country lying in sunshine and shadow, or where one sees the morning open in golden brilliance over all the white, frost-laden countryside. The problem of light and air absorbs Mr. Clausen, and the beauty of the simple pastoral or agricultural landscape. He is not concerned with the dignity or tragedy of labor as Millet—in a way his master—was; for him, the peasant is but a part of the picture, no more important than the trees, or the hayricks, or the clouds sweeping the heavens above, or the barn's low eaves and dim corners. And every year, it seems to me, he comes nearer the successful solving of this problem. I remember, not so long since, when his haymakers or reapers stood out in strong relief against the landscape, distinct and separate from it; now, they take their place in it, belong to it, are inseparable from it, entirely contained within the atmospheric envelope. And I know of no painter in England to-day who can give so well the feeling and beauty of great space, its repose and impressiveness.

His three landscapes are small and simple, but no others in the collection can be compared with them. Mr. La Thangue, whose bold, uncompromising studies of sunlight have usually, by sheer brutality of realism, compelled one to look at them, seems unable to carry this realism further except by forcing effects already forced further, in their strict adherence to nature, than art can justify. One of his pictures, "Carting Bracken," shows such zeal for the least important facts that you would think any minute the woman behind the heavily-laden cart and the boy in front must push and pull it right out of the picture. Like Mr. Brangwyn, Mr.

La Thangue is letting his mannerisms get the better of him. Here and there, a broad, quiet sweep of brown common by Mr. Anmonier, or a little Yorkshire moorland village in its sombre setting by Mr. James Henry, or a delicate impression of "Washing Day" in the open air by Mr. Edward Stott, another of the new Associates, may catch the eye and bring it an interval of rest and pleasure in the midst of the acres of discord and restlessness. But there is nothing of great note. Mr. East continues his pursuit of the composition earlier generations of painters thought so necessary in a landscape, and one continues to be grateful, even if in the pursuit so many no less essential qualities seem to elude him. There is a characteristic rendering of the royal palace at Copenhagen by M. Thaulow, who is another artist, however, threatened by too close cultivation of one and the same formula.

In the Black-and-White Room, neither the two Associate engravers, Mr. Strang and Mr. Short, nor the presence of Mr. Brangwyn with his big plate of the Salute, can do more than emphasize the general mediocrity and dulness. It is unpardonable, after the International has proved how interesting and splendid a collection of prints and drawings filling a large gallery can be made, that the Academy cannot succeed in filling one small room with good work. In the Architectural Room, attention is attracted to one or two schemes for the "improvement" of London that County Councillors and building speculators and Queen Victoria Memorials are rapidly "improving" out of existence; an entirely different and brand-new London rising from the ruins. When the symmetry of Regent Quadrant was deliberately sacrificed for the sake of still another huge hotel, an outcry was heard from certain quarters, because the Quadrant is one of the few streets in London with any pretension to architectural dignity and design. Recently, it was explained that no great harm would be done because Mr. Norman Shaw was to provide the plans for the Regent Street façade of the hotel, and the old lines—or rather curves—were to be adhered to. Mr. Shaw's elevations and drawings are now exhibited, and they provide not merely for the hotel façade, but for the entire Quadrant, which, as far as I can find out, there is no immediate idea of pulling down. In the drawing, Mr. Shaw's new street seems a little heavy, a little severe, and in any case it will not be the Quadrant in harmony with the period whose name it bears. Another plan is for a County Council Hall built on a bridge across the river. As I believe it has been definitely decided to build this Hall on the southern side of the river between Hungerford and Westminster Bridges, one can afford to look at the new scheme with no fear for the future of the river, which, as it flows through London, is without a rival in its pictorial beauty.

Little need be said about the sculpture. There is nothing even in the way of sensation, like Mr. Thomas's "Lycidas" at the New Gallery last year. In the dispiriting row of busts, in bronze and marble, Mr. Gilbert's "Francis Petrus Paulus, pictor" has the distinction of life and vigor and character. There is life, too, in his sketch model for a proposed war memorial that has as subject "St. George and the Dragon, Victory Leading"; too much life really, for, while the small model, with its amusing use of color, is delightful, you feel that the swirls of the saint's ribbon-like drapery and the long lines made by the widespread wings of Victory and the dragon would, when carried out on a large scale, become unbearably restless in effect and confused in outline. Beyond these things, however, I recall no sculptures of sufficient importance for mention. Mr. Swan has a small group of "Polar Bears," in which so much is left to suggestion that you have to examine it very minutely before you make out anything save the lapis-lazuli base, an inchoate lump of silver, and a square of crystal above. Sir William Richmond sends the model for his monument to Mr. and Mrs. Gladstone, to be placed in Hawarden Church; it makes one wonder what Mr. Gladstone ever did to deserve a memorial that, in the model at least, looks like a modern travesty of the beautiful old tombs whereon husband and wife lie side by side.

If I have not written of the New Gallery, except to refer to one or two pictures, it is because the exhibition there has become more than ever the merest annex to the Royal Academy. Burne-Jones has gone, only one or two of his followers linger. No special school, no special movement, no special artist, is represented. There does not seem any good reason why such an exhibition should be held.

N. N.

AUSTRALIAN LAND SCANDALS.

SYDNEY, April 9, 1906.

A people, like a family, ought to wash its dirty linen indoors, as the Catholic Church invariably does; and if the scandals that have lately made the Lands Office of New South Wales a hissing and a reproach throughout the Empire had been only scandals, no word should be written about them here. The actors and the parts they played in this particular phase of the human comedy were all alike too Lilliputian to be worthy of description, or even of censure; but they have a far-reaching significance. It was not only a State department that was on its trial before the royal commissioner appointed to investigate them: it was the ethics of State action in such a sphere and the possibility of an equitable administration of public lands that were in question.

More than thirty years ago, on the way to a racquet court in the north of London, the writer took the liberty of asking Herbert Spencer whether he still adhered to the view that the land of a country should be nationalized. All of his answer that remains in memory is the word, "Eventually." The reply was enigmatical, but the impression left was that he had abandoned the strong ground taken up in 'Social Statics.' He was, at all events, already wavering; a few years later he had ceased to waver. In 1880 Henry George published his epoch-making book, and thus precipitated a development in the mind of "our great philosopher" that might otherwise have been delayed. The reformer founded his propaganda in good part on the memorable chapter on "The Right to the Use of the Earth," and claimed the English philosopher as his ally. Spencer could refuse the challenge only by accepting the affiliation, and he went out of his way to denounce the reasoning in 'Progress and Poverty' as "a tissue of sophistry and contradictions." George was as painfully astonished as the advocates of female suffrage to whom, in 1870 or 1871, Spencer refused leave to issue as a pamphlet the chapter from the same early work on "The Rights of Women." The female-suffragists maintained a dignified silence when they might have branded his apostasy, but Henry George was too much of an enthusiast to lie down under an authoritative disavowal that was also a formidable attack. His 'Perplexed Philosopher' left a wound that long rankled in Spencer's mind, and it gave rise to the only embittered chapter in his bulky 'Autobiography.' George's insinuation that he recanted his belief in the nationalization of the land from interested motives—barbed with a classical quotation from Browning that was still more ludicrously inapplicable to Spencer than it had been to Wordsworth—was as pointless as the accusation of mercenariness made against him by the Positivist chief in England, as it had previously (and far more gently) been made by Renan against Strauss. From Diogenes and Stilpo onwards, philosophers have an honorable record for their political independence, and Spencer stands high in the category of those who have renounced nearly all the things that most men prize. The explanation of his change of opinion is simplicity itself. His own deepest convictions, reinforced by all that he had known of the working of political institutions, led him to conclude that the land of a country could not be acquired and administered by the State without chronic inefficiency and ruinous loss. He would have rejoiced to find his belief confirmed by the ugliest exposure of any public department that has been made in Australia.

The Victorian railways department and the New South Wales lands department have long been promenaded in books on Australia as notorious examples of governmental corruption. A day of reckoning came for the Victorian railways three or four years ago with the advent of the reform ministry that swept them clean. A day of reckoning has now come for the Lands Office of New South Wales. It came by a kind of accident. A suit brought by some graziers (the term that has superseded "squatter" as a name for pastoralists who depasture large flocks of sheep on Crown or other lands) to recover a sum of money paid by them to land agents who undertook, and failed, to negotiate an alteration in the terms on which certain lands were leased by them from the Crown, opened a glimpse of a possible Inferno beneath the smooth surface of the Lands Office that sent a shudder through the community. Another transaction, of a different sort, contributed the additional dynamite needed to blow up the department. The new Minister for Lands, pursuing the policy initiated by New Zealand of providing lands for settlers by buying back the large estates owned for the most part by companies, and breaking them up into moderate-sized farms, purchased a tract known as the Myall Creek Estate. An ex-Premier at once denounced the purchase as having been made on extravagant terms. Uneasiness spread, and the public grew clamorous for an inquiry. A sanguine interviewer bearded the Minister for Lands and asked

him if a royal commission would be appointed to inquire into the purchase and into the other questionable transactions that had come to light. Aping the manners of Crispi, who coldly told a pressman that the Italian Government did not desire the support of the press, the Minister replied that he was unaware of anything in the Lands Office that needed to be inquired into. We are reminded of Mr. Hammond once Permanent Under-Secretary at the Foreign Office, who informed Lord Granville, when that nobleman became Foreign Minister, that in his long experience he had never known the political horizon of Europe to be so unclouded. A few months later the dream of the official optimist was rudely shattered by the cannon thunder of the Franco-German war; and the very next day our colonial Doctor Pangloss was promptly brought to his senses. In the morning an influential journal published a trenchant article imperiously calling for the issue of a royal commission. That very day the Cabinet met, and, in a manner unprecedented in the history of parliamentary government, decided, at the instance of a strong-willed Premier, to appoint a judge of the Supreme Court as a royal commission to inquire into the purchase of the Myall Creek Estate and the fees paid to land agents. The decision was a triumph for the Australian press, which is modelled on the English press and is worthy of its exemplar.

Then began the sittings of a commission that has broken the record for length, having sat for nearly a year. Next was seen the strange spectacle of men of the highest political rank being examined and cross-examined like compromised witnesses in a trial for felony. Premiers and ex-premiers, ministers and ex-ministers, legislators, under-secretaries and heads of sub-departments, land agents, landowners, and squatters followed one another in what seemed likely to prove an interminable procession. The legislative rack and the judicial thumbscrew were copiously applied. First one and then another special statute were enacted by the Legislature to arm the commission with fresh powers. Leading counsel were engaged to extract evidence from reluctant witnesses. Officers of the incriminated department offered to make revelations, provided they were guaranteed against injurious consequences, and a bill of indemnity was passed to protect them. The Commissioner was pressed to extend the inquiry into past years and unearth more distant scandals. Thus expanded, the inquest would have been endless. "It is in working within limits," says Goethe, "that the master comes out"; and the Commissioner decided to confine his investigation to the previous lustrum.

It yielded fruit enough—Dead Sea fruit. First, he had to ascertain what foundation there was for the accusations of corruption made in connection with the purchase of the Myall Creek Estate. It is characteristic of the political condition of the mother colony that the very first repurchase of private lands by the State should have sprouted a thicket of scandals. It was openly charged against the present Minister for Lands that he had received a large sum in order to purchase the estate at about £15,000 in excess of its market price. No evidence was adduced in support of the charge of bribery, but it is admitted that the amount paid was excessive, and it was proved that a well-known political land agent received £6,000 from the owners for negotiating the purchase on terms favorable to them. Had the transaction been equitable, his intervention would not have been needed. He was, in fact, bribed to defraud the State, which paid both the bribe and the excess of the purchase money. The well-meaning Minister may be acquitted of dishonesty; he cannot be acquitted of incapacity. The British, and sometimes the more privileged Australian, workman is made to pay for his breakages; the minister who lets himself beduped by a scallawag should be asked to compensate the State for the sum it has lost through his error of judgment or his lack of perspicacity.

A German scholar, Nasse, was perhaps the first to show that there was in Tudor England, in consequence of the humidity of the climate, a constant tendency for the cultivation of the soil to revert from agriculture to pasture. The climate of Australia is still drier than that of England is moist, but the tussle between pasture and agriculture is as keen as ever. The pastoralist strives to keep as much land as possible under grass, and the agriculturist struggles to bring even more of it under crop. That is the key to a large class of transactions investigated by the Commissioner. It was discovered that, a suitable inducement being offered, the Lands Office was willing to convert settlement leases of State lands into pastoral or improvement leases. As the holder of a settlement lease, the farmer pays a liberal rent; as the holder of an improvement lease for twenty-eight years, the pastoralist is bound to improve the land to the value of 4*s.* 6*d.* per acre, while he pays a nominal rental of, at most, a few pence per acre. How low that rental may sink will appear from a single fact. Sir Samuel McCaughey is one of Australia's territorial princes. Besides a lordly demesne of his own, he leases from the State an extensive tract of 110,000 acres, for which he pays the truly "ridiculous sum" of £180 yearly, or a good deal less than a halfpenny an acre. No wonder that settlement leaseholders were eager to undergo a change of heart and get converted into improvement leaseholders. It could not be done offhand. Machinery had to be set in motion, and ministers and under-secretaries manipulated. There are three or four distinct factions in the Lands Office, said a high authority, and whenever one of them sets itself to do something, the other two or three combine to thwart it. The authority cited—the agent who negotiated the Myall Creek purchase—proved to be master of the situation. He alone could thread his way through the labyrinth of the land laws. What was his Ariadne's clue? Knowledge of men and power of managing them. A grazier came from the country to get his lease converted. Theseus took him to the Legislature and there showed the wondering squatter how such august beings as legislators could be twirled round the finger. Another, who had long been vainly endeavoring to change his tenure, he took to the Lands Office, where he interviewed the minister, and "in five minutes" the business was settled. What instruments did he use? Primarily, the vulgarest of all—hard cash; for he would accept no tale-telling check, and give no compromising receipts. About £60,000 in all was sworn to as having been paid to him and other land agents, but those who instigated the inquiry have estimated that as much as £250,000 was thus levied by the fraternity, and public lands to the value of two millions sterling thus temporarily or permanently lost to the State. So ingrained was the general belief that nothing whatever—even things of unquestioned right—could be passed through the Lands Office otherwise than by corrupt means, that graziers, desiring an area for which there was no competition, paid an agent large sums (in one case, £700) to procure a lease that could have been got by simple application. One result of these shady transactions is that large tracts of land, on which hundreds of families might have dwelt, will be massed in large pastoral holdings for many years to come. Numbers of farmers in the State and in England who were desirous of leasing or buying such lands, and of turning the sheepwalks into profitable farms, have had to emigrate to Queensland, Canada, or South Africa.

As day after day revelations were made, the air hurtled with missiles, and danger thickened around the chief actor. Barabbas fled—first to West Australia and then to Natal, on his way to London. In both the distant State and the more remote colony he was pursued by the authorities (under indignant popular pressure, be it told); and it reveals the flimsiness of the Australian Federal bond on the one hand, and the non-existence of a strong Imperial bond on the other, that the most persevering efforts have hitherto failed to bring back the robber to justice. Throughout the Empire, extradition for such offences is almost proved (for the end is not yet) to be impracticable.

While the grand conspirator was thus eluding justice, the Judas of the department scorned to flee. None of the transactions mentioned could have been completed without the coöperation or the connivance of the Minister for Lands. A series of confessions made by a station agent directly incriminated the late holder of the office. The story, as he told it, read like a passage from a mediæval mystery or a miracle play. Mephistopheles (the minister) met the new Faust (the agent) and whispered in his ear: "These land agents seem to make a lot of money; why should not *you* make some?" An unholy compact was silently made. "I understood him," said Faust, "and he understood me." The terms were those of all such arrangements. Renan amused a dinner party in Paris by relating an ancient tale about a Babylonian merchant and a dæmon, with whom he equally divided his spoils till he married, when the dæmon's claim of 50 per cent. became shockingly unreasonable. So did our two confederates go halves. Many thousands of pounds were thus shared. There was a lack of refinement in the relations between the pair. "I fling the money down," said the agent, snarling: " 'There's some money for you!' " Mephistopheles has evidently a great deal to put up with at the hands of his clients. On the back of these admissions the Commissioner, Mr. Justice Owen, directed that the ex-minister should be

prosecuted. He was committed by the stipendiary, and last month he was tried before the Supreme Court. What with the technicalities of the law and the subterfuges of the chief witness, the case completely broke down, and the accused was discharged. His escape gave a profound shock to the public conscience.

There is much more to be told, but we should never end. The lantern carried by "the Light of the World" in Holman Hunt's luminous painting would be wanted to explore the Egyptian darkness of the Lands Office and reveal its piled-up abuses. A parliamentary Hercules is required to turn the Spercheios through these stables of Augeas. The Premier has announced that the Lands Office is to be reorganized, and placed under permanent commissioners who shall be emancipated from the political intervention and ministerial control that have wrecked it. The moral of the inquiry is that colonial public institutions are tainted with corruption exactly in proportion as they are pervaded by Socialism.

Correspondence.

THE DANGERS OF CASUISTRY.

To the Editor of The Nation:

Sir: I have a neighbor, an Episcopal clergyman, who repeats the creed regularly, yet does not accept literally the statement, "born of the Virgin Mary." I asked him lately how he explained his apparent inconsistency. His explanation was in substance as follows: "The Eastern nations habitually accounted for the advent of a personage of heroic or extraordinary powers by ascribing to him a Virgin birth and a directly divine origin. This was the case with Zoroaster and Buddha; and the same idea is repeated in many of the Greek legends. The clause in the creed, therefore, is intended to affirm the divine origin of Christ, and, as I heartly believe in that divinity, I am constrained to repeat this particular affirmation. I should, in fact, violate my principles if I omitted it."

Such is my neighbor's profession—not his apology, for he believes himself entirely within his rights. Dr. Crapsey tells us, in effect, in his profession: "I do believe in the Virgin birth—that is to say, I believe Christ was born pure and immaculate." Finally, any one of his prosecutors (Dr. Locke, for example) would affirm his absolute and literal acceptance of the Virgin birth—an occurrence improbable to the last degree, contrary to all the experience of mankind, unsupported by any adequate evidence, and contradicted by the New Testament itself. Not only does he accept this cheerfully and without reserve, but he insists that Dr. Crapsey shall accept it as a matter of contract and compulsion. "This dogma," he would say, "was affirmed by the Council of Nice; if you deny it, you are not a Christian, though you may have all the virtues and most of the beliefs of a Christian."

Here, then, are three different kinds of interpretation and belief. Dr. Locke and his class accept unreservedly the clause in the creed, without any mundane proofs (to put it frankly); Dr. Crapsey accepts the same clause, figuratively and metaphorically; my neighbor accepts it with an elaborate and ingenious implication. They are all honorable gentlemen; the character of Dr. Crapsey, I may be permitted to say, since it was discussed publicly at the trial, is notorious among his intimates for sweetness, charity, honesty—for all the Christian virtues and graces.

Observe, now, what a burden and yoke the Council of Nice imposed on the intellect and conscience of these three gentlemen—the yoke of acceptance without evidence, or of acceptance, with certain subtilizings and refinements which the public might, perhaps unjustly, term casuistry. What habit of mind would naturally be engendered and developed by such modes of reasoning and interpretation? Suppose these gentlemen sitting in a court of equity for the interpretation of a will, and applying the same canons of evidence and interpretation to the decision of a case which involved the fortune of a man's wife and children. With what dismay would he regard the application of such methods! And, to come to my point, how is the ecclesiastic himself to guarantee the integrity of his reason—the sincerity of his "yea and nay"—against the contagion of such mental processes?

Let me quote what a great thinker and moralist says of their danger—a plain Pagan, who was not embarrassed by the physics or the metaphysics of the Council of Nice. Socrates, at his last hour, is cautioning his friends against the impropriety of inaccurate and misleading expressions—against promising that they will bury *him* when they mean that they will bury his *body*; "for false words," he adds, "are not only evil in themselves, but they infect the soul with evil." This is the voice of Plato speaking through the mask of Socrates.

E. L. S.

"MENSUR" and "KRIEGSHERR."

To the Editor of The Nation:

Sir: I beg to file some exceptions to your remarks on the German Emperor's telegram to the Austrian Foreign Minister apropos of the Algeciras conference. This telegram was written in German, and does not contain a single word alluding to or sugesting "the duelling-ground" from which you infer a deadly combat. The word used by the Emperor was "Mensur," a technical term among German students which has quite another meaning. "Mensur" means a measurement of strength, and is frequently used for all kinds of arguments, but never as a synonym for a deadly combat. Of course you relied on the Associated Press. By the way, does it not look queer that, of all the news spread broadcast all over the world by the Associated Press during recent years about German political affairs, more than 90 per cent. was absolute falsehood, or, to call a spade a spade, lies, made up for no other purpose than to stir up distrust and hatred against Germany? A short glance over the telegraphic news published during the last year will convince you of the correctness of my statement. Be this as it may, no German reading the telegram of the Emperor to Count Goluchowsky will derive from it the meaning upon which you base your indictment.

Even a verbatim translation is often very inept. Take, for instance, "Warlord." According to the Constitution of the German Empire, the Emperor is commander-in-chief of all the German armies in time of war. The President of the United States is commander of the United States army in time of peace too. This is not so in Germany. There the Emperor is commander-in-chief of only the Prussian army and the German navy, while the various monarchs retain their commanding power over their respective armies during peace. This command in war makes the Emperor master of the armies in war, for which the Germans have the very proper word "Kriegsherr," *i. e.*, master in time of war. Some ingenious fellow, with "little wit and ease to suit him," instead of translating this word into "commander-in-chief in time of war," found for it the magnificent word "Warlord." If it jollies the boys they are welcome to it, but the silliness remains.

Dr. E. Schrader.

Spokane, Wash., May 8, 1906.

A SPANISH LITERARY ENTERPRISE.

To the Editor of The Nation:

Sir: May I ask you to call the attention of your readers to the "Nueva Biblioteca de Autores Españoles," which has just been inaugurated at Madrid under the general editorship of Sr. Menéndez y Pelayo, the Director of the National Library in the Spanish capital? As the title indicates, the new series is in continuation of the "Biblioteca de Autores Españoles," successfully engineered by Rivadeneyra over half a century ago. The names of the collaborators of Menéndez y Pelayo in the present enterprise are in themselves a sufficient guarantee of the scholarship that will characterize the editorial work as a whole, for they include R. Menéndez Pidal and A. Bonilla y San Martín of the Central University of Madrid, M. Serrano y Sanz of the University of Saragossa, E. Cotarelo y Mori, M. Mir, Fr. Rodríguez Marín, and other well-known specialists. By a staff constituted of men like these attention will be paid to the great advance that has been made during the last fifty years in matters appertaining to philology, criticism, and the comparative history of literature, and therefore the scientific value of the "Nueva Biblioteca" will be appreciably higher than that of the Rivadeneyra series. This fact has been made patent by the appearance of the first number of the new publications, namely, Volume I. of Menéndez y Pelayo's 'Orígenes de la Novela,' containing an astonishingly full and clear account of the rise and growth of the novelistic fiction of Spain. A second number has likewise been published; it is entitled 'Autobiografías y Memorias de Españoles de los Siglos XVI y XVII,' and is due to the careful efforts of Serrano y Sanz.

There are already in press a second volume of Menéndez y Pelayo's book, Menéndez Pidal's longed-for 'Crónica general de España mandada escribir por Don Alfonso el Sabio,' Bonilla's 'Libros de Caballerías,' Cotarelo's 'Teatro del maestro Tirso de Molina,' Mir's 'Predicadores de los siglos XVI y XVII,' and an edition of Las Casas's 'Historia apologética de las Indias,' by Serrano. Among the volumes announced are 'Cantos populares españoles,' 'Obras selec-

tas de Ramón Lull,' Sigüenza's 'Historia de la orden de San Jerónimo,' and the 'Obras completas de D. Ramón de la Cruz.'

To all students of Spanish literature it is obvious that many lacunæ are to be filled up by the new collection, which, if the hopes of the editors are realized, will embrace no fewer than seventy-one volumes. Furthermore, it is to be noted that attention is not restricted to Castilian authors:

"As our Library," says the prospectus, "calls itself one of *Spanish Authors*, it will not only comprehend Castilian authors (including in the number, of course, those born in the Spanish-American republics and the numerous Portuguese who have written no less in our language than in their own), but, in accordance with the express and reiterated desire of the two illustrious founders, D. Buenaventura Carlos Aribau and D. Manuel Rivadeneyra, there will figure at the end of this national work several volumes of Catalan poets and prose writers of the Middle Ages, chronicles so admirable as those of Don Jaime I., Desclot, Muntaner, and the one so long ascribed to Don Pedro IV., encyclopædic and doctrinal works of Ramón Lull and of Eximenis, novels such as the 'Tirant lo Blanch,' and the compositions of poets like Ausias March, Jaime Roig, and Corella. These publications will be bi-lingual, . . . for the text and the Spanish translation will be printed juxtalinearly."

In conclusion it may be stated that the editors contemplate including in the scheme of the "Nueva Biblioteca" Spanish translations of Latin works written by Spaniards during the Middle Ages and during the humanistic period, and, with the help of competent Orientalists, the works of Arabic and Hebrew authors that were actually produced on the soil of Spain. For the press-work of the two volumes already issued the highest praise must be accorded to the publishers, Messrs. Bailly-Baillière é hijos of Madrid; the quality of their paper and of their typography is a source of delight.

Yours truly, J. D. M. Ford.

Harvard University, May 6, 1906.

THE NOELDEKE FESTSCHRIFT.

To the Editor of The Nation:

Sir: I have been asked to call the attention of libraries and of scholars to the publication of the 'Nocldeke Festschrift,' a publication in two volumes issued in commemoration of the seventieth birthday of the distinguished Professor Noeldeke of Strassburg, who is generally regarded as the world's leading Semitic scholar. On the occasion of his birthday his pupils and colleagues in all parts of the world united in paying him tribute by preparing articles of a scientific character for the 'Festschrift.' The two volumes contain contributions from eighty-five scholars, and it may fairly be said that the articles are commensurate with the reputations enjoyed by their authors.

The volumes are handsomely published, with a fine portrait of Professor Noeldeke and a bibliography of the distinguished scholar. The publisher (Alfred Töpelmann, Giessen) has undertaken this work as a labor of love and as a tribute of respect to Professor Noeldeke. It is not a commercial undertaking; and even if the entire edition is sold, the publisher, I am assured, will still be out of pocket.

Very truly yours,

Morris Jastrow, Jr.

University of Pennsylvania, May 4, 1906.

Notes.

'A History of Seventh Day Baptists in West Virginia,' now in course of publication by its author, Corliss Fitz Randolph of Newark, N. J., is more comprehensive than its title, as it takes account also of the churches at Woodbridgetown and Salemville, Penn., and the Shrewsbury Church in New Jersey. The volume will be illustrated, and will be rich in genealogical material.

The Oxford University Press will shortly publish 'The King's English,' "illustrating by living examples, with the name of a reputable authority attached to each, all blunders that observation shows to be common." There will be a very full index.

On the 14th of December, 1909, it will be five hundred years since the University of Leipzig was organized by the secession of several thousand German students from the University of Prague. Arrangements are being already made to celebrate this semi-millennium by the publication of a massive work on the history of the city and the University of Leipzig. Professors Kämmel, Hähnel, Koetzschke, and Wüstmann will prepare the different parts referring to the university and city, while Professor Witkowski furnishes a general survey of the whole intellectual life of this academic centre.

The "Caxton" thin-paper pocket Newnes-Scribner editions of the English classics, externally delightful to the eye, and, with their limp covers, to the hand, are continued with Byron's Poems in three classified volumes, and Addison's Essays. Akin in appearance, but smaller, is Keble's 'Christian Year.' Each has its etched frontispiece.

Bunyan's 'Life and Death of Mr. Badman, and The Holy War,' reprinted in each case with much scrupulosity from the first edition, swells the excellent series of "Cambridge English Classics" issued by the University (New York: Macmillan).

Betwixt Classical Schools and the Stadium, Athens now makes a fresh appeal to English-speaking tourists, and these may like to know of a little "practical guide," 'Athens and the Environs,' published by C. Eleutherodakis (New York: Lemcke & Buechner). It has numerous illustrations, which, being half-tones, exact a glossy paper intolerable in a guide-book, and a folding map bounded by the Stadium on the south and the National Museum on the north—a divorce in space quite appropriate in our day. The text is in solid, very fine type, made less legible by being whimsically printed in red ink. *Per contra*, the English is evidently from the hand of one to whom the language is vernacular; but the publisher advertises his bookstore (not book*stall*, as one may see from the photograph) as the "oldest and largest book*shall* in the Orient"—a sin against our idiom in at least one particular.

Sigmund Krausz's 'Practical Automobile Dictionary' in English, French, and German (Frederick A. Stokes Co.) meets a growing and imperative need. It is, of course, almost wholly technical, with an eye to repairs, but *sergeni de ville, mairie, procès-verbal, interrogation, interprète, avocat* and *dommages intérêts* are caution-signals against overspeeding and recklessness. The appendix contains frontier regulations for foreign automobile travel, a list of United States consulates in Europe, a table of cable rates from New York, with others of weights and measures, coins, etc.

From the press of T. W. Laurie, London, comes a little volume entitled 'Fishing for Pleasure and Catching It,' by the veteran "Amateur Angler," Mr. E. Marston. The book is quite varied in its contents, turning aside from the author's own angling experiences to extracts from the nature books of William J. Long, paraphrase of portions of the Song of Hiawatha, and other not very intimately related subjects. Mr. Marston can still tell an interesting story of a day out of doors when he tries, but the chief appeal of this volume must be to the readers of the series which have preceded it, beginning with the now rarely to be found 'Days in Dovedale,' which appeared in 1884.

'The Spoilers,' by Rex E. Beach (Harpers), is an attempted translation into fiction of the well-known Alaskan official rascalities to which the author has been applying the "muck-rake" in one of the magazines. Concerning the rascalities there is no question, and the title of the book is quite appropriate, since the appointments under which the Alaskan ring developed and did its dirty work were peculiarly of the spoils nature. In turning his material into the form of the novel, however, the writer has won no success other than that of maintaining a high sensational tension. "Primordial passions" (what a boon they have been to recent sensational novelists!) are seriously overworked, the comeliest of virtues seem almost of choice to keep the most questionable company, relief by the narrowest of margins makes connection with dire necessity in a proportion of cases beyond all human experience, and the capacity of the English language is sometimes put to sore straits to convey the strenuousness of the situation. Bret Harte could have fashioned two or three characteristic short stories of high value from parts of Mr. Beach's material, but the underlying struggle over a gold-claim is hardly adequate as the vertebral column of a serious novel. Nor was this later Alaskan corruption fundamentally as important as the crimes and blunders which at an earlier date fell so heavily upon the native population, as described in the *Atlantic* a few years ago by David Starr Jordan.

Budgett Meakin has published, through T. Fisher Unwin, an extensive compilation of information concerning model factories and villages and other attempts of intelligent employers of labor to further their own interests and the interests of their employees at the same time by establishing pleasant conditions of work. The greatest gain in such movements Mr. Meakin rightly feels to be the restoration of personal touch between employers and employed, which has been so largely sacrificed since the introduction of modern machinery and the consequent concentration of labor in large masses and generally at a distance from the residence of the employer. The practical success of these efforts, he thinks, depends on the preservation of a genuine spirit of fraternalism rather than paternalism. So far as is at all possible, the management of any institution for the benefit of the employed must

be left in their own hands; and if the institution can be of their own devising, the employer simply giving moral and financial support, so much the better. Mr. Meakin strongly supports the tendency to remove large manufacturing concerns out of crowded cities to situations where light, air, and pleasant surroundings are possible, and where the health and comfort of the laborer are, of course, supported by the possible saving in land values. The many scores of concrete illustrations cited, from Great Britain, the Continent, and especially the United States, indicate a more rapid quickening of conscience and commendable self-interest in such matters than most people have been aware of. The book is abundantly supplied with photographic illustrations, but they are too often of inferior quality. There is no good reason for the annoying division of the inadequate index into two parts.

That a third edition of Dubois's and Beauchamp's 'Hindu Manners, Customs and Ceremonies' (H. Frowde) has been called for within a few years is sufficient proof of the value of this record of personal experiences by one of the most trustworthy of students. Mr. Beauchamp's part has lain in editing and correcting the manuscripts (of which there are two versions) of Dubois. Since the original publication of the MS., prepared in 1806, there was no opportunity to secure the revised text except in French form, copies of which are extremely rare, till the first revised English text was published in 1897. The third edition of this revised text compresses the two volumes of the first edition into one little book of 700 pages, which compensates for inferior paper by its handiness. In other respects it is identical with the former editions.

The latest volume of the Columbia University "Indo-Iranian Series" is a 'Bibliography of the Sanskrit Drama,' by Montgomery Schuyler, jr., now secretary of legation and consul-general of this country to Siam. Parts of this work have already appeared in the *Journal* of the American Oriental Society. The ordinary reader will naturally feel more interest in the introductory "Sketch of the Sanskrit Drama" than in the lists of authors and titles of works which perforce make a bibliography; but to the Sanskrit student these lists, difficult to compile, will be of permanent use, and even to the student of drama in general it will be a great convenience to have at hand such references to the literature of the subject as are here given. Mr. Schuyler appears to have exhausted his subject as far as possible, which includes lists of manuscripts as well as of printed works.

Another school edition of Schiller's "Tell" has been added to the many already published, the editor being Dr. E. C. Roedder, assistant professor of German philology at the University of Wisconsin (American Book Co.). There are the usual paraphernalia of vocabulary, explanatory notes, and a good critical and historical introduction, but what is of special merit is the attempt to create for the student, by means of footnotes describing the dress and each separate act of the character then appearing and talking, a *Bühnebild*, or stage picture; the material being largely that which made Jautsch's stage edition unique. There is also a good bibliography not found in preceding American editions.

Students of ornithology who have been in the Philippines or who have cast an inquiring eye in that direction, will be interested to know of a new Philippine Government publication, entitled 'A Hand-List of the Birds of the Philippine Islands,' by McGregor and Worcester, which is Bulletin No. 36, Department of the Interior, Manila. It was prepared by R. C. McGregor, Philippine Government ornithologist, and revised by Prof. Dean C. Worcester, Secretary of the Interior, who himself secured his first knowledge of the Philippines as an ornithological explorer in 1887-1888 and in 1890-1893, in company with Dr. Frank S. Bourns. Worcester and Bourns's list of Philippine birds, which was republished by the Smithsonian Institution in 1898, showed 243 genera and 596 species. The new list is, of course, the most complete to date, the work of Mr. McGregor and of volunteer workers having produced many additions; it shows 284 genera and 691 species.

It is a pleasure to note at last one American periodical in the Philippines which is not an organ of truculent jingoism or an exponent of general cheapness. The American newspapers and weeklies of Manila have been of this sort or have had a very ephemeral existence. But the *Far Eastern Review*, published at Manila by an American and devoted to engineering, commerce, and finance in the Orient in general, is a monthly publication of more solid character. The January number, for instance, has as its leading illustrated article an excellent description of the construction of the Canton-Samshui branch of the Canton-Hankow Railway, an enterprise which is of great importance for the development of southern China. The recent construction of large public works in the Philippines, especially in Manila, appears to have given the occasion for the publication of such a periodical, whereas other American periodicals in the Philippines have mainly had their foundation in soldier-domination. The February number of the *Review* contains, besides some interesting news as to Philippine railway construction and illustrated material upon public improvements in Manila, a very enlightening contribution upon the already important and growing shipyards of Japan, and articles upon water-power electric plants in Mysore, India, and timber tramways in Madras. The Japanese, it seems, have taken over the English technical terms for shipbuilding as well as on board their steamships.

The *Indian Mirror* of March 10 contains reports of the meetings held in Calcutta by educated natives of India to hear the two Japanese scholars, Dr. Motoda, principal of the Formosan College in Tokio, and Mr. Harada of Kobe, an editor, on "The Progress of Japan." Other themes treated were "The Young Men of Japan" and "The Orient and the Occident." Both speakers were content to state facts; the former outlining the system of public education in Japan, showing the emphasis laid on industrial, technical, and professional training, and the latter portraying political development since 1853. Dr. Motoda was more pragmatic, and his colleague more historical, in his review. Mr. Harada, declining to state the problem in items of logic or inference, whether a pleasure or otherwise to Orientals, dwelt upon results without inquiring deeply into causes. He showed that, in old Japan, popular education, individual right, and religious liberty, which are the common ideas of modern civilization, "to say nothing of the manifold conveniences and improvements of material civilization," were unknown. Summing up statistically his country's progress, Harada states that "the grade of a civilization may be fairly tested by the position accorded to woman." In 1905, besides a woman's university and over 100 high schools for girls, 18,000 women were teachers in the common schools, while the occupations of clerks, physicians, editors, etc., are open to them. "As different as a moon from a tortoise" is the Japanese way of contrasting the old and the new condition of woman.

A new and interesting subject, the ancient commercial roads (*Handelsstrassen*) of Germany, is treated by F. Rauers of Bremen in number three of *Petermann's Mitteilungen*. He throws much light on the inner history of those days, showing how, for instance, noblemen, priests, and pilgrims were allowed free passage, but a toll was required from all others; how the building of new roads and the use of cross or by-roads was prohibited by the Government and the landowners. The rise and fall of great cities is noticed. Nuremberg reached the height of its prosperity at the close of the old and the beginning of the new period, and then Leipzig took its place. Till the Spanish conquest of the Netherlands, first Bruges, then Antwerp, were the great world ports, to be replaced by Hamburg and Bremen. A large map in color shows the different kinds of roads in the first part of the sixteenth century; even those on which traffic was forbidden are designated. Professor Hess gives the results of numerous observations on the winter flow of glacier brooks, and Dr. Friederichsen contributes a long note upon the additions to our knowledge of the morphology of the Tian-shan Mountains through the researches of Prof. W. M. Davis and Ellsworth Huntington.

The financial committee of the Danish Folkething has accepted the proposal of the Minister for Public Defences to give the sum of 13,000 kroner towards the proposed Mylius Erichsen polar expedition along Northeastern Greenland. The total expense of the expedition is calculated at 260,000 kroner, half of which sum has been contributed by private persons. The expedition starts from Copenhagen at the end of June, and expects to return by the fall of 1908, while taking such a route that no news from it can be expected before its return. In addition to the Danish participants, a German, Dr. A. Wegener, as physicist and meteorologist, and the Russian Baron von Fircke, as geologist, will accompany the expedition.

From Brussels news comes that 500,000 francs has been subscribed for a Belgian expedition to the South Pole to start in 1907 and to explore the Pacific side of the Antarctic regions, returning in 1908. A preliminary congress of experienced polar investigators of all nations is to be held in Brussels in May to advise in the matter.

Lord Cromer's annual report on Egypt and the Sudan, just published, is one of the most valuable and suggestive documents issued by any Government. While

the economic condition of Egypt is highly favorable, he calls attention to the danger of depending too exclusively on one crop, cotton, and recommends an increase in the cultivation of sugar and the introduction of cereal crops. The largest space is devoted to the question of proposed modification of the Capitulations, of which we have already spoken. Of especial interest at this time is Lord Cromer's description of the primitive social conditions which prevail in the Sinaitic peninsula, and the means which have been taken to improve them. In treating of the Sudan, he dwells at some length upon the great advantage which it has over Egypt in its "freedom from the complicated network of international institutions in which the Egyptian administration was, and to a great extent still is, entangled." The great wants are labor and capital, and the important question is what public works shall be undertaken. Lord Cromer contends that the construction of railways should precede that of irrigation works, and says that surveys are now being made of lines to connect Khartum with El-Obeid on the west and Kassala on the east of the Nilo. He recommends, besides, the building of a railway up the Blue Nile, as an essential preliminary to the construction of any large irrigation works intended to fertilize the extensive tract of country known as the Ghezireh, lying between the Blue and White Niles.

The practical problems which the contact with Western civilization forces upon the pious Moslem for solution to-day are numerous and interesting. One of the ulemas or teachers of the University of Al-Azhar at Cairo, the leading Mohammedan university, has just published two pamphlets on the subject of phonographs and insurance, and their relations to the Sacred Law of Islam. He declares that there is nothing in Islamic doctrine to forbid Moslems to listen to the phonograph, and that, if sentences of the Koran are suitably intoned from the instrument, the listener may be justly considered to be performing an act of worship. Fire and life insurance, on the other hand, are condemned by the Sheikh as a gambling transaction, contrary in spirit to the teaching of the Koran.

We are obliged to a correspondent who reminds us that, in our recent account of the new Imperial Library building at Tokio, we inadvertently substituted *feet* for *metres* in stating dimensions.

—By insisting that extracts from contemporary material should tell the story of his 'Declaration of Independence' (Dodd, Mead & Co.), Mr. John H. Hazelton has produced an elaborate work for reference rather than for reading. It may be taken as embodying the final study of the Declaration as a document. Every known detail concerning its framing, signing, and publication has been carefully gathered. The author has resorted to the originals of the letters, diaries, drafts, and memoranda wherever found, and depended upon printed sources only where the original manuscript could not be located. The amount of labor put into the compilation and collation of authorities is notable, and the results seem sometimes hardly worth the trouble involved. The text of seven forms or versions of the Declaration are collated, and the wealth of notes explain every shade of difference among them, every incident connected with the attendance and opinions of the members of the Continental Congress. The eleven facsimile reproductions are well chosen and are of real value. With a lawyer's training Mr. Hazelton examines the contradictions of those who sought to describe the events before and after the Declaration, and it is not strange that the credibility of some should be challenged. Even Jefferson, as much interested as any man could be in giving a true relation, does not stand the test; while McKean and others, writing as they did long after the event, are shown to be weak authorities in matters in which they had taken an active part. Certainly, Mr. Hazelton has produced an encyclopædic work on this one state paper.

—Unfortunately, his methods have serious defects. It is not enough to string together a large number of extracts from contemporary documents. Unless they are well digested, only a partial picture, confused by over detail, can be gained. For example, the debates in Parliament after the Declaration reached England are summarized by extracts; but the effect produced on the Continent of Europe is dismissed in a few sentences from Bancroft. Nor does Mr. Hazelton weigh his authorities. The rhetorical phrases put in the mouth of Henry by Wirt are quite as important to him as the known writings of Washington or Jefferson. An anonymous communication to a newspaper receives as great consideration as a contemporary official document. No attempt is made to estimate the numbers in each colony in favor of independence, and the Loyalist side of the question receives scant notice. In the great mass of quotation the reader finds it difficult to retain the thread of the story, and indeed must find that thread by his own efforts, for the system of notes and cross-references (which, with the appendix, comprise one-half of this bulky volume) is as original as it is confusing. It is almost impossible to refer from the notes of one chapter to those of another, and the great repetition of like references could easily have been avoided. Clearness would have been gained by giving one class of notes with the text of the chapter, relegating to the appendix special quotations or discussions. Notwithstanding the author's care, misprints may be found, and curiously careless references to printed books. Yet, in spite of its drawbacks, the volume cannot but be highly useful to the student of sources. The publishers have done their part well.

—William Morris once declared to a friend that Mary Stuart was the greatest bore in history, and expressed wonder at the interest taken by Swinburne in such a theme. Carlyle had the same opinion about "Junius," and doubtless all of us are plunged into a state of profound ennui by the mention of some too famous name. Certain it is that a careful analysis of the historical periodicals which deal with general subjects rather than particular periods or movements, will show more articles to the credit of Mary Stuart than to the credit or debit of any other personage. This statement, which we make after giving special attention to the matter, is here called forth by Mr. T. F. Henderson's 'Mary Queen of Scots, her Environment and Tragedy' (Scribners). The object of the work—and an object pursued through two volumes—is to deal "in a somewhat detailed and critical fashion with the main episodes of her career." This does not mean that the book becomes a series of technical studies rather than a genuine biography. It is a sketch of the Queen's life first, and a commentary upon the moot points of Marian literature in the second place only. Mr. Henderson prides himself upon his freedom from ecclesiastical prepossessions, and writes neither to praise nor blame. How complete is his detachment from theological partisanship the narrative of Mary's execution proves. "Perfectly faithful to her supposed religious convictions and ambitions she had not been; but, whatever the nature of the value she set on the form of religion with which her life had been so peculiarly associated, she had had sufficient cause to be now, at the end of it, an enemy to Protestantism. . . . She must on the whole be ranked amongst the countless victims that throughout the ages have been immolated on the devouring altar of Christian intolerance. But the causes that determined her immolation were complex and manifold." With regard to the details of Darnley's murder, Mr. Henderson is not disposed to differ from the results arrived at by Mr. Lang, and in the Queen's fatal passion for Bothwell he sees the cause of her willingness to take any and every risk. From a controversial standpoint (and there remains little but controversy in the life of Mary Stuart), the most entertaining part of this work is its criticism, in a long appendix, of Mr. Lang's theory regarding the Casket Letters. With great skill and every show of candor, Mr. Lang has argued against the authenticity of the letters. Mr. Henderson, with full recognition of the cleverness displayed, regards the thesis of forgery to be impossible from beginning to end. His arguments, covering thirty-five pages, we are unable to rehearse. Like the literature of the Gunpowder Plot and the Popish Plot, the dialectics of this mystery proceed from a body of evidence which is not only conflicting, but vitiated by the spirit of special pleading. The chief thing for the reader of the present biography is that Mr. Henderson, while viewing the letters as genuine, is still able to admire the more heroic elements in the Queen's character. His book not only claims to be free from prepossessions, but succeeds much better than most works on Mary Stuart in preserving the mood of objectivity. The illustrations are numerous and excellent.

—The discussion of the plan for the Union Catalogue continues in the *Zentralblatt für Bibliothekswesen*, the February number containing not less than three contributions on the subject. Dr. C. W. Berghoeffer outlines a plan for the organization of the undertaking, involving a comparison of the Berlin title-entries by four of the largest libraries, Strassburg, Leipzig, Munich, and Göttingen, before the entries are printed for distribution in proof among the rest; further, the printing of both card and book catalogues, and the preparation of a classed catalogue in book form. Prof. B. Bess points out that a com-

plete list of all the books in the coöperating libraries is not needed; that the Union Catalogue is an undertaking in the interest of scholarship, and that consequently some limitations must be put on the work. Dr. Schwenke's article in the March number, on the appropriations for cataloguing purposes in German libraries, is not directly connected with the present discussion, though it touches on points related to it, in showing that the appropriations for cataloguing in most libraries are entirely inadequate. In the April number Dr. O. Glausing presents an adverse criticism of the whole plan, which he regards as injurious to the individuality of the several libraries, and tending to destroy the interest of library workers in "their" institutions. Incidentally he attacks what he regards as a tendency to enhance the importance of technique at the cost of scholarship, and deplores the discontinuance of the gatherings of librarians in connection with the "Philologentag." Dr. Schwenke, in a short rejoinder, points out that one of the reasons for this was that so many librarians were specialists in other branches of learning than philology, and felt more or less out of place there; and the opposing tendencies in the library world to-day are, he rightly says, not characterized by the term technique vs. scholarship, but by that of isolation vs. coöperation.

—In the same number Dr. A. Keysser proposes that, in addition to the Union Catalogue, a Guide to German Libraries be prepared, showing, together with other pieces of information about the libraries, the present locations of the many collections formerly belonging to monasteries, bishoprics, or other institutions, as well as to individual collectors and scholars, but which in course of time have been absorbed by other libraries. Information as to many of these may be found in Schwenke's 'Addressbuch der Deutschen Bibliotheken,' but the smaller collections are not mentioned there, and the book is now thirteen years old. The proposed Guide should also tell of the literary specialties of the various libraries, so that students may be able to choose the one most likely to be of aid to them in their investigations. It would, besides, serve the libraries themselves by crystallizing, so to speak, their efforts at specialization. Dr. Keysser's proposal is worth considering in this country, too. It is fourteen years since Messrs. W. C. Lane and C. K. Bolton published their 'Notes on Special Collections in American Libraries.' We understand that a new edition of this work is among the publications contemplated by the Bibliographical Society of America. The American Library Association appointed some years ago a committee to prepare a 'Handbook of American Libraries,' and at the Magnolia meeting of the Association in 1902, the committee reported that the Handbook would be printed by the end of that year; but the following year, at the Niagara Falls meeting, the committee was discharged, at its own request, without having published anything.

GREENE'S PLAYS.

The Plays and Poems of Robert Greene. Edited, with Introductions and Notes, by J. Churton Collins, Litt.D. 2 vols. Oxford: Clarendon Press; New York: H. Frowde. 1905.

The Delegates of the Clarendon Press were late in realizing their responsibilities with regard to the Modern English classics, their efforts in this direction for many years being limited almost entirely to the publication of select school editions. They have evidently begun now in earnest, however, to make good past deficiencies, and in no department of literature are their labors likely to be crowned with more cordial blessings than in that of our old dramatists. The admirable editions of Kyd and Lyly which they have lately presented to the world are among the most highly prized volumes that have been added of recent years to the shelves of students of English literature, and the new edition of the 'Plays and Poems of Robert Greene,' under the editorship of Mr. Churton Collins, will worthily find a place by the side of these achievements. It is true that Mr. Collins, in the preparation of it, has not come upon any new material relating to the life of his author of such startling interest as that which rewarded the research of Mr. Boas in the case of Kyd. Nor was his task one of such magnitude as that which Mr. Bond has performed with such credit to himself in his edition of Lyly. On the other hand, he does not yield to either of these editors in mastery of his subject, in the care which he has bestowed on his text (of the plays, at least), or in the value of his critical apparatus. This last feature of the edition, in fulness and accuracy, is, as it should be, up to the level which has long been required in the case of the Greek and Latin classics, and, we might add also, in the case of writers of the mediæval period. The notes especially are replete with learning. If we now proceed to criticise some of the views which Mr. Collins advances in his general and special introductions to the plays, we do not mean in so doing to disparage the excellence of this edition, which we believe will be received with grateful recognition by all students of the English drama.

One of the most interesting points, we think, which Mr. Collins makes is in regard to the limits of Greene's dramatic activity. This did not begin, according to the editor before the first part of 1591, and, lasting until his death in the following year, covered not quite two years. If this view—which differs from that of all previous writers on the subject—is correct, it may be accepted as practically certain that we possess the whole (unassisted) dramatic production of Greene—namely, "Alphonsus," "Orlando Furioso," "Friar Bacon and Friar Bungay," and "The Scottish History of James the Fourth." Of the two remaining plays included in this edition, Greene composed "A Looking-Glass for London and England" in collaboration with Thomas Lodge, and the authorship of "The Pinner of Wakefield" is doubtful. Our editor justly rejects "Selimus" entirely from the canon of Greene's works, and the plays which Shakspere recast under the name of "The Second and Third Parts of Henry VI." he very naturally does not reproduce, although inclined to believe that Greene had a hand in them. Mr. Collins infers the above limits of date for Greene's activity as a dramatist from the silence on this subject of the author—usually communicative enough in everything that related to himself—and also of his friend Nash down to 1591. We are perhaps not at liberty to draw inferences about Greene's life from his romances, although they are so largely autobiographical, else we might point out that the hero of 'Francesco's Fortunes' (1590), being in circumstances like those of Greene, ashamed to face his wife, remained in London and supported himself by writing plays. In any event, however, there are passages in pamphlets of both Greene and Nash of later date than 1591 which, as it seems to us, point to a different conclusion in regard to this matter. For instance, take the passage in the posthumous 'Repentance,' where Greene says: "After I had continued some short time and driven myself out of credit with sundry of my friends, I became an author of plays and a penner of love pamphlets, so that I soon grew famous in that quality that who for that trade grown so ordinary about London as Robin Greene?" This passage, from its context, would seem to refer to a time shortly after Greene's leaving the University for good. Still further, in view of Nash's statement in his 'Strange News' concerning Greene, that "he was the chiefe agent for the companie, for he writ more than four other," it is hard to conceive that his production was limited to something less than the last two years of his life and the five plays we possess. Indeed, when citing this last passage, a doubt evidently comes over Mr. Collins himself in regard to the tenability of the opinion which he has asserted with so much emphasis elsewhere, and he makes the concession that "it is possible that his dramatic activity extended over at least four years."

There is another matter of more importance than the above, involving, among other things, a question of date also, in which we find ourselves taking issue with Mr. Collins—the question, we mean, of the supposed influence of Greene on Shakspere. "It seems to me, indeed," says Mr. Collins in winding up his comments on this subject, "that Shakspere owes as much in romantic comedy to Greene as he owed to Marlowe in history and tragedy." Now, even Marlowe's influence on Shakspere, unmistakable as it is, has been, in our opinion, often greatly exaggerated, except in those matters where the example of the earlier writer determined the development of the Elizabethan drama generally. But what specific instance of the influence of plays written by Greene on plays written by Shakspere can be cited that will at all correspond to the influence of "Edward II." on "Richard II.," or of the method or characterization in "Tamburlaine" on that in "Richard III."? Mr. Collins notes especially the similarity in versification and diction between Greene's "medleys" and the earlier comedies of Shakspere. The question of diction is too elusive and subjective a matter to count for much here—at least as long as no detailed investigation of the problem has been made. We confess that, for our own part, we have not been struck with this similarity; and surely the resemblance in versification does not extend beyond peculiarities which are common to all blank verse in the earlier Elizabethan drama—namely, monotony of structure and the tendency to make

logical and rhythmical pauses coincide. Mr. Collins says still further on this subject: "We open Greene's comedies and we are in the world of Shakspere; we are with the sisters of *Olivia* and *Imogen*, with the brethren of *Touchstone* and *Florizel*, in the homes of *Phoebe* and *Perdita*. We breathe the same atmosphere, we listen to the same language." And in the paragraph that follows: "It was Greene who first brought comedy into contact with poetry, into contact with romance. He took it out into the woods and the fields and gave it all the charm of the idyll; he filled it with incident and adventure, and gave it all the interest of the Novel." Now, there is an undeniable freshness and charm about the country scenes in the best of Greene's plays which is well expressed in the words of Mr. Collins last quoted, but is the atmosphere of "As You Like It" or "Winter's Tale," two of the plays referred to above, really due in any measure, however remote, to the influence of Greene's dramas? Is it not rather the natural result of Shakspere's magic genius working on the pastoral material which he found embodied in Lodge's "Rosalynde" and Greene's "Pandosto"?

In making up our judgment on this question of Greene's relation to Shakspere, it is necessary, besides, to pay heed to the matter of dates. There are only two of Greene's (extant) plays—namely, "Friar Bacon and Friar Bungay" and "The Scottish History of James the Fourth"—which it is possible to conceive of as influencing Shakspere's romantic comedies. Now the earlier of these two is assigned by Mr. Collins himself to the "end of 1591, or the beginning of 1592." But by this time Shakspere had certainly produced "Love's Labor's Lost" (to say nothing of "The Comedy of Errors"), and it is an open question whether he had not already composed also "The Two Gentlemen of Verona." The fact that Greene's dramas are more archaic and cruder in workmanship does not prove anything, for under any supposition, where the dates run so close together as in the case of the two sets of plays we are here discussing, this must have been due practically altogether to Greene's inferiority in genius, and accordingly Shakspere's superior constructive power cannot be ascribed to the improvement which naturally comes with time in the development of any literary *genre*. To be sure, these early plays of Shakspere's are not exactly in the style of "As You Like It" or "Winter's Tale," but we may safely say that all that was necessary for the birth of romantic comedy, as illustrated by these last-named plays, was for the author of "Love's Labor's Lost" to light on the Elizabethan pastoral romances, and it is not at all necessary to call in a theory of extraneous influence. As far as the charm of country life is concerned, the germs of that are surely not absent from "Love's Labor's Lost," to say nothing of "The Two Gentlemen of Verona," and we should not forget besides that, long before this, in all probability, Shakspere had already composed his "Venus and Adonis." In conclusion, on this subject of the relations of Greene and Shakspere, is it not too much to say that the "Midsummer Night's Dream" "only gave more articulate expression to what found stammering and partial expression in the interlude portions" of "The Scottish History of James the Fourth"? The idea of introducing *Oberon* into this play was not improbably derived from Greene, but surely it is rather Lord Berners's 'Huon of Bordeaux' (or possibly some early dramatization of that romance) which gave Shakspere the main conception of his character of the fairy-king, who (unlike *Oberon* in Greene's drama), as a beneficent *deus ex machina*, takes as active a part in the troubles of the "human mortals" as the corresponding character in the Old French romance.

It is perhaps too much to expect that in a work issued under the auspices of the University of Oxford the spelling of the original editions of these plays should be modernized. We cannot but feel, however, that the retention of such spellings as "heel" for "he'll," or "shocs" for "shows"—simply to choose examples at random—are likely to detract from the pleasure of the reader without serving any good purpose, save, perhaps, in the case of an occasional student of Elizabethan pronunciation and orthography. We believe that there are few students of literature (as distinguished from pronunciation) who will not congratulate themselves that the general editor of the Variorum Beaumont and Fletcher, now appearing, has had the courage boldly to modernize the text in this matter of spelling. Quite as objectionable, it seems to us, is the general tendency of the times, which Mr. Collins follows here, to reproduce typographical peculiarities of sixteenth and seventeenth-century texts in editing works of these periods. We refer particularly to the italicization of proper names. Mr. Collins, for instance, reproduces the name of the River Volga just as he finds it in the original quarto, not only italicized, but with a small initial letter. Of the last point we may even remark that it is most likely merely a printer's error (in the quarto). In a world full of irreverence, why, we may ask, should printer's errors be regarded as especially sacred?

In conclusion, we would call attention to an interesting feature of Mr. Collins's edition of Greene's plays—namely, a more accurate reproduction of the Alleyn MS. (now at Dulwich College) of Greene's "Orlando Furioso" than has hitherto been printed. This manuscript (which is fragmentary in its present state) is evidently the very copy from which the famous actor Alleyn, who took the leading rôle in the play, learned his part. Owing to the purpose for which it was intended, the manuscript simply contains the speeches which the actor was to deliver in the character of *Orlando*, together with the cues to these speeches. As Mr. Collins remarks, this is "not merely the only important manuscript we have belonging to so early a period of the Elizabethan drama, but, when we compare it with the text of the Quarto, we see either how greatly the stage copies were altered when a play was printed, or how greatly the printed copies must have varied from the stage copies, and presumably, therefore, from the author's manuscript."

A FINLANDER ON REVOLUTIONARY RUSSIA.

The Russian Revolutionary Movement. By Konni Zilliacus. Translated by the authority and at the request of the Author. E. P. Dutton & Co. 1905.

Amid the flood of portentous volumes which has poured from the world's presses during the past two years on the topic of Russia's internal politics and condition, together with their origins and future, this work merits attention chiefly because it emanates from a native of Finland. Finlanders have enjoyed, for many years, numerous privileges and immunities above the native subjects of the Tsar, and have thriven upon them, in worldly goods and in culture, with due appreciation of their rights and advantages, until the unwise usurpation of chartered prerogatives a few years ago (now, happily, abandoned) aroused them to hostility. Precisely because of that hostility Mr. Zilliacus's attempt to set forth the whole case judicially is of value, in that it demonstrates the admirable temper of the people of whom, we have a right to assume, he is an average example. Far from agreeing with those reviewers (mentioned by him) who have expressed doubts as to his impartiality, we heartily assent to his declaration that "no partiality has wittingly dictated the opinions expressed." Indeed, the very calmness and cautious semi-aloofness of his manner constitute one of the most convincing evidences as to his personal character, his attitude, and the facts. He frankly "pleads guilty to partiality to the fighters against autocratic despotism"; but that partiality (which the mere existence of the book logically presupposes) is not allowed to exceed legitimate bounds.

The difficulty is, that, after Prof. Paul Miliukoff's invaluable work, 'Russia and Its Crisis,' the foreigner or semi-foreigner is, practically, driven from the field. But this does not imply that Zilliacus's serious effort to state the problem and its solution possesses no value or deserves to be dismised with a few indifferent words. Those who know not Miliukoff may chance upon Zilliacus and desire to learn to what degree he has succeeded in his task. First of all it must be stated that the author's conversion to the revolutionary cause was not effected by the recent injustice of Russia toward Finland; he mentions that he was one of the contributors to a revolutionary journal established in 1887, which did not enjoy a long life because it was printed in Switzerland, too far from its editorial base in St. Petersburg. It advocated "moderate political reform," he says, although Vera Sassulitch and other extreme revolutionaries were also among the contributors. When, however, the crisis became acute under Nicholas II., and the Russian revolutionaries were regarded in Finland as "criminals, or at best as utopians of a dangerous kind," the author prepared the present volume as a "part of the work of enlightenment" for his fellow-countrymen. It is precisely this long connection with revolutionaries, coupled with his remark that "no statements of facts have been made without as far as possible having been checked as to correctness by reference to other than revolutionary sources of information," which evokes sur-

prise at many points, as will presently appear.

Our author starts out with the assumption that "the seed of the social evolution in Russia which in our day has brought Tsardom to the verge of revolution, must be considered as having been sown by none other than Tsar Peter the Reformer, or the Great, as he is styled." That is a good start, regarded from the spectacular point of view. As a matter of fact, Peter only accentuated and vigorously accelerated the (r)evolutionary movement initiated by his father, who was, in turn, the heir in that respect of former Tsars; just as the rulers of other lands do their share in (r)evolution initiated by their predecessors in a line whereof one individual always receives the credit and thanks, in many cases for the whole movement, no doubt because of personal attributes or the accidents of history. However, Mr. Zilliacus makes his point clearly, that "the first revolutionary outbreak," at the accession of Nicholas I. (known as the plot of the "Decembrists"), bore a direct relation to the spirit evoked by Peter I., and ably maintained by Catherine II., who remained absolute autocrats, equally with the first Nicholas, despite the reforms they introduced in certain directions. Under the chapters respectively designated "The Era of Reform," "The Revolutionary Movement," and "The Terror," we obtain a compact account of the three periods of Alexander II.'s reign. In the last-named chapter a just observation is made which, although indispensable, is generally omitted in discussing the reluctance of peasants and workingmen to yield to the revolutionary propaganda. Incidentally, it explains present conditions, in some sections of the country, during these troublous times, while it also illustrates the change which has come over certain classes since the epoch directly in question.

"Workmen and peasants were well alive to the fact that their existence and surroundings were wretched, and that thorough-going changes must be effected. A practical programme of reform, the meaning of which they could grasp at once, would have secured their whole-hearted support; but the vast majority of them could not go into raptures over principles and theories. If the authorities had understood what a poor chance the propaganda, urged with so much enthusiasm but also with such limited common sense, possessed of creating a really genuine popular movement, the propagandists might have been left undisturbed to realize for themselves how little their methods were calculated to achieve any result. This would undoubtedly have been much more judicious from the political, not to mention the humane, point of view."

That the revolutionaries of that epoch did eventually attain to such realization was confessed to the writer of this review by Stepniak, who narrated his personal experience among the peasants in that line. From Stepniak, also, the writer heard the story of how he assassinated Mesentseff, chief of the Third Section, and hence is able to correct a small detail in our author's account of that notorious affair. It took place not on the Nevsky Prospect (as here stated), but on a parallel street, the Grand Italian, at nine o'clock in the morning. The difference is more important than may appear, at first sight, to the non-expert; it aggravates the daring of the assassin in a degree, precisely as the transference of the scene for such a crime from Irving Place to Broadway would constitute an aggravation in New York.

For example, the extremely well-known ex-Procurator of the Holy Synod, Constantine Petrovitch Pobiedonostzeff, is called "Paul." The title of "Prince" is accorded to Constantine Aksakoff, in the same breath which calls his brother (rightly) plain "Ivan." There are only three Metropolitans in Russia; yet Zilliacus appears to think there are five, divorcing the double titles of two, St. Petersburg-Novgorod and Moscow-Kolomna, and thus multiplying their possessors and increasing the size of the Holy Synod, which he professes to state accurately. A different sort of multiplication and confusion arises from lack of uniformity of spelling, such as Garikoff and Harikoff (Kharkoff); Gomel and Homel (both cases involving a question of phonetics as well as of orthography); Balmascheff, Belmatcheff, and Belmatscheff; "the poet, Maxim Gorki"—Gorki being a prose writer of poetic temperament, not a poet; the statement that the Countess Stroganoff was a relative of the Imperial family. Other puzzling errors may be typographical or emanate from the author; Schian for Shisn (or Zhizn), and Mir Coschi for Mir Bozhi; Tifomiroff for Tikhomiroff; Miliuvoff for Miliukoff; Diniaburg for Dunaburg; Ulfa for Ufa; Gorevikin for Goremikin—all names of well-known persons and places; *dvornikos*, an utterly un-Russian form, for *dvorniki*—to which the explanatory footnote is misleading, as these yard-porters neither are nor can be "grooms." To two quotations from other authors, which Zilliacus uses without comment or objection, apparently with full approval, we are indebted for a grave misrepresentation of the truth and what is, we trust, a comical misstatement. Speaking of the Stundists (who, as they originated not earlier than 1860, can hardly have been "the most severely persecuted during the last two centuries of the many religious sects"), he states, on the authority of the *Christian World*, that the pictures of the saints hung on Russian walls are called "God" by the people, who burn sacred oil before them. The oil is not "sacred" and the word mistaken for "God" (bog) is *bozhnitza*, indicating the "image-case" (with its contents, of course), derived from the adjective *bozhiy*, pertaining to God, and meaning simply that the saints whose pictures are referred to are connected with God—a proposition which even enthusiastic "Protestants" would hardly deny to saints! The comical quotations deal with the habits of the Molokani, another sect. "They have no churches; a house, an open yard, or, better still, a field, serves the believers as *sleeping*-places" (the italics are ours)!

The enumeration of "Ukrania" (it should be "Ukraina"), Ruthenia, and Little Russia as separate nationalities belonging to the Empire is a gross error of statement on the part of the author, who, strangely enough, in the same paragraph, as well as in a preceding chapter, when discussing the prohibition of the Little Russian language and the "war of the Government against the Little Russian nationality," appears to be fully cognizant of the fact that, for all practical purposes, the three designations are identical. What he is evidently ignorant of is, that the restrictions on the Little Russian language (or, more properly speaking, dialect) were resorted to as a means of preventing political agitation along factious lines, tending towards disruption dangerous to the peace of the Empire and of Europe, wherein purely literary and innocent poetry and prose played a remarkable part, and were accordingly placed under the ban as premeditatedly seditious pamphlets would have been elsewhere. Inextricably involved with this far-reaching question of the Ukraine is that of federation, to which the author refers, but without fully comprehending its scope.

A misconception of rather serious nature causes the author to state that Jews (because many were engaged in smuggling), "were forbidden to live at a greater distance than fifty versts from the frontier," and were, consequently, "driven indiscriminately to the town nearest to the fifty-verst limit"; Berditsheff being specifically mentioned as an instance, in connection with the terrible over-crowding thus entailed. The fact is, that the law prohibited their residence at a distance of *less* than fifty versts from the frontier, as is logically apparent, even to those ignorant of the case in hand; and Berditsheff, which is 150 versts from the frontier, thus cited in confirmation, manifestly furnishes a direct contradiction of the assertion in the beginning of the paragraph above quoted. A somewhat similar contradiction is involved in the statement of the laws, old and new, as to the baptism of Jews.

"Formerly," says the author, "the Jews had always enjoyed, so soon as they were baptised, the same civil and political rights as orthodox Russian subjects; but in the year 1890 a ukase was promulgated providing that not the baptised, but only their grandchildren, descendants in the second generation, should have the full rights of citizenship. The result of baptism was merely to allow the baptised, but not his family, the right to choose his domicile in the Empire. This system of Pobiedonostseff therefore proved distinctly that he did not want to encourage the conversion of the Jews to the orthodox faith. With regard to them, the motive already suggested for the religious persecution under Alexander III., the attainment of homogeneity in the Empire by the incorporation of Dissenters with the orthodox Church, played no part."

It is refreshing to find Mr. Pobiedonostzeff, the much-assailed, treated with fairness; and in a previous sentence of the paragraph the Tsar is coupled with him in a like statement. But it must be remembered that Alexander III. was still on the throne in 1890; so the "facts" are obviously self-contradictory. The ukase referred to, it may be said in passing, was a move in the right direction. No civil and political rights should ever have been granted as the result of "conversion" and baptism, which are naturally, under the circumstances, in the great majority of cases, merely a matter of form, as is frankly admitted by all parties concerned, when not speaking officially. The whole question should be readjusted on a radically different basis, with religion totally eliminated from consideration.

The author would appear to have visited Russia occasionally; but he cannot have been familiar with St. Petersburg, although so near his native land, judging from his repetition of the worn-out legend that Alexander III. "lived as a prisoner in his castle at Gatchina, coming very seldom to the capital, and then always so unexpectedly that no preparation could he made to waylay and slay him on any of his flying

visits"; and that "during the last years of his reign, Alexander did not reside in the Winter Palace." He never lived in the Winter Palace (because of the painful associations connected with his father's death there), using it only for state ceremonials and court festivities, but, during his frequent stays in the town, resided in the modest Anitchkoff Palace, whence he drove out daily like a private person. When in residence at Gatchina (like any private citizen of any land who is fond of the country), or at Peterhoff during the hot season, his movements and trips to town were either announced beforehand in the morning papers, or could be calculated with absolute accuracy by every person acquainted with the Court calendar (or the Church calendar) and the most ordinary customs of the land, as the assemblage of vast throngs to greet him proved in countless instances.

One of the interesting features of the book is the quotation, in full, of the letter sent to Alexander II. immediately after his accession to the throne, by the terrorists who had assassinated his father. The demands and predictions therein contained are worthy of attention in view of recent happenings. Zilliacus, with commendable justice, recognizes the impossibility of compliance with the demands, the impracticability and imprudence of this "ultimatum" of the executive committee issued at such an inopportune moment, and admits that it indubitably contributed to the postponement by the Tsar of the definite ratification of Loris Melikoff's liberal proposals; apprehension concerning the ambitions of the Grand Duke Vladimir—and of the Grand Duchess, he might have added—also and rightly playing an important part. It must be conceded that more justice is done to Alexander II.'s character and aims than is the case in most books which deal with his reign; and the author says, in discussing the condition of affairs at that epoch, concerning that Emperor's biographers: "They have been unable to see that the apparently unrestricted autocratic power of the Tsar can, so far as he himself exercises it, be hardly called a power." Alexander III.'s widow, the Dowager Empress, who has been so widely and violently attacked as a bitter reactionary, he assigns to the reform and liberal party, with accompanying facts to support his view.

The picture which he presents of rural self-government is not encouraging to the concession of complete suffrage in national affairs; in point of fact, it reads like a chapter from the municipal history of certain great cities in the United States. The lack of proper revision may be responsible for certain irreconcilable statements, like that concerning the Dukhobortzy, whose numbers are given as four hundred thousand and four thousand (the latter being nearly correct) in the same paragraph. The author is mistaken in asserting that Count L. N. Tolstoy was excommunicated because of his attacks upon the Government. The excommunication arose from the same cause which has brought about excommunication from various sects in the United States within the last few years—attacks upon the tenets of the church of which he was a member, and the repeated announcement and propaganda of beliefs inconsistent with such membership, as the great writer himself was the first to recognize and proclaim. As to the expediency of the Holy Synod's action in that case, opinions varied very widely in Russia among the most zealous adherents of the Church, as well as among official classes, and it constitutes a separate problem. In summing up as to the chances for a revolution, our author admits that the masses of the people are "only to a very slight extent revolutionary in politics," and that the only way to interest them is by working skilfully on their chronic need and desire for more land.

With the exception of occasional slips, very few in number, the translation is entirely adequate.

BOOKS FOR MUSIC LOVERS.

Grove's Dictionary of Music and Musicians. Edited by Fuller Maitland. Macmillan.

The Oxford History of Music. Vol. II.: Polyphonic Period, Part II., by H. E. Wooldridge. Vol. VI., The Romantic Period, by Edward Dannreuther. Oxford: Clarendon Press; New York; H. Frowde.

A Complete History of Music. By W. J. Baltzell and Others. Theodore Presser.

Music Dictionary. By Louis C. Elson. Oliver Ditson Co.

The second volume of the new edition of 'Grove' (as musicians, for short, call the most important dictionary of music and musicians in the English language) is, like the first, a great improvement on the original issue. In that issue the year 1450 was given as the point of departure. In the new version an elaborate article on Greek music calls attention to the fact that the field is now more fully covered. Japanese music receives attention, although, oddly enough, Chinese music was ignored in the preceding volume. Some of the leading articles, like Grove's on Handel, Pohl's on Haydn, Parry's on Harmony and its evolution, were so thoroughly admirable that little or no improvement was to be expected in the new edition. An elaborate bibliography of two columns has been added to Irish music. Gymnastics is a new head, under which pianists will find a discussion of the problem of training the hands by mechanical means. In place of Rockstro's far from up-to-date article on Orchestration, we have here a much better treatment of the subject by Corder, under Instrumentation, although this also contains questionable statements, especially regarding the use of trombones by Beethoven and Schubert and the "progress" in the art shown by a comparison of Weingartner's arrangement of Weber's "Invitation to the Waltz" with Berlioz's. The individual instruments are also more satisfactorily treated. The number of pages devoted to Liszt is doubled, and that many-sided man's achievements are discussed with intelligence and freedom from bias—an encouraging circumstance, for England has been the last country to appreciate Liszt. Of special value, also, is the complete classified list of this composer's works. "Libraries and Collections of Music" is an important new bead, to which no fewer than 59 columns are devoted.

Under the head of individual musicians the bibliographic references are sometimes inadequate. American books, especially, are ignored. Indeed, American composers and writers on music are not by any means treated as fully as one would expect in a work of this kind, which is intended for the American quite as much as for the English market. In its five buge volumes one might hope to find at least as many American names as are included in Baker's 'Biographic Dictionary of Musicians' in one volume, or in the English 'Who's Who.' Of the leading writers on music in New York, Boston and other cities, only one is mentioned. The public may not be especially interested in the lives of critics, but it has a right to expect lists of their books, especially when, as happens to be the case in several instances, these are admitted, even abroad, to be the best on their subjects in the English language. Astonishment must also be expressed at the lamentably inadequate treatment of one of the greatest of all song writers, Jensen, who is disposed of in less than a column, while Löwe gets two and a half and the singer Farinelli seven! However, the shortcomings of the new 'Grove' are few compared with its many sterling qualities, not the least of which is that the longer articles are, for the most part, not only instructive, but admirably and even entertainingly written, in marked contrast to the articles in Mendel's similar encyclopædia in the German language.

What 'Grove' is among musical dictionaries, the 'Oxford' may be said to be among histories of music, so far at least as the English language is concerned. It is now complete, in six volumes, two of which remain to be considered critically—Mr. Wooldridge's 'Polyphonic Period,' Part II., and Edward Dannreuther's 'Romantic Period.' The appearance of Mr. Wooldridge's volume is somewhat belated, as it takes us back to the fourteenth, fifteenth, and sixteenth centuries. An unusually large part of his volume—perhaps a fifth—is taken up with illustrations in musical type, which students will welcome because of the difficulty of access to many of the originals. Particularly good are the accounts of the *musica ficta*, the hexachordal system and the *faux bourdon*. The reference in a footnote on page 85 to Jean de Muris of the fourteenth century, complaining in his 'Speculum Musicæ' of musicians who create "a constant cacophony," yet are "full of confidence and ready to defend their intervals as 'new consonances,'" reminds one somewhat amusingly of Richard Strauss and his apostles in our day.

Of the writers who coöperated in producing the 'Oxford History of Music,' the most favored undoubtedly was Edward Dannreuther, for he had the period which is of most interest to music lovers of our time—the nineteenth century, with Weber, Schumann, Rossini, Donizetti, Verdi, Berlioz, Mendelssohn, Chopin, Liszt, Wagner, Tchaikovsky, Grieg, and other present-day idols. The author died, unfortunately, before he could add the final touches to his manuscript; but it was completely written out, and little remained for the editor, Mr. W. H. Hadow, to supply but the musical examples, which here, too, are given in great abundance. Mr. Dannreuther treats his period on the subject plan, and not the biographic. In other words, in dealing with Liszt, for instance, he does not devote a special chapter to him, but recurs to him repeatedly, in the chapters on Programme Music, Religious

Music, Pianoforte Music, and Solo Songs. This plan has its advantages, as well as its disadvantages, which need not be dwelt on.

The author treats romantic music as an offshoot of literature: "a reflex of poetry expressed in musical terms, . . . a desire to produce musical effects suggested by natural phenomena; an art eager, sensitive, impulsive, which seeks its ideal of beauty through emotional expression." He does not dwell on the abundant germs of romanticism in Bach and Beethoven; nor does he sufficiently acknowledge the great rôle played by Schubert as a leader of the romantic movement (probably because Schubert is treated in vol. v., "The Viennese Period," by Mr. Hadow). But he discourses most eloquently and suggestively on the many innovations in operatic and instrumental music introduced by Weber, the pioneer who paved the way for Wagner and made his works possible. Schumann also is sympathetically treated. With programme music the author has little sympathy, nor does he point out the fact that Liszt's symphonic poems revolutionized concert music almost as thoroughly as Wagner's music dramas did the opera. It is amusing, too, in these days of Strauss, Reger, and D'Indy, to read complaints about Liszt's cacophony. Liszt always had a reason for his discords. More satisfactory is Mr. Dannreuther's discussion of Liszt's religious music. That Wagner fares well at his hands need not be said. In the otherwise excellent remarks about Chopin, it is amazing to find once more the preposterous assertion that that chief representative of the *tempo rubato* kept strict time with his left hand. Chopin was no barrel organ; Berlioz said of him he *could* not have kept time had he tried. More amazing still is the statement that "Schumann, in his *Lieder* and choral pieces, was the first of the Germans who troubled about correct declamation." Schubert was a model in this respect, even more than Schumann. One might point out other disputable criticisms, which the author probably would have modified on revision; but his book, on the whole, is quite worthy of the company in which it appears, and will probably enjoy a larger sale than any of the other volumes.

The most useful and up-to-date history of music in any language is Mr. Baltzell's. Although in one volume only, it has this in common with the Oxford History, in being the joint work of several writers, viz., W. J. Baltzell, H. A. Clarke, Arthur Elson, Clarence G. Hamilton, Edward Burlingame Hill, Arthur L. Judson, Frederic B. Law, and Preston Ware Orem, who treat of the different epochs, countries, and schools. Mr. Baltzell, who is the managing editor of the *Étude*, has succeeded surprisingly well in welding these contributions in a connected narrative, while avoiding repetition and clashes of estimates. Being intended chiefly for classes, or musical clubs, the chapters are followed by questions and suggestions as well as by bibliographic references. The modern national schools of Bohemia, Scandinavia, and Russia receive attention, and of the sixty chapters, three are devoted to music and musicians in the United States. Mr. Baltzell's volume thus serves as a sort of corrective of the English volumes above referred to, which so loftily ignore Americans, while growing garrulous over the Englishmen of all ranks. By way of emphasizing this injustice, we may as well quote what Mr. Judson has to say here about the English and their scant achievements in music. He admits that English folk-music ranks favorably with the best examples of other nations; but regarding that thirteenth-century canon, "Sumer is icumen in," of which the English are so proud, he remarks that "impartial historians believe most strongly that the canon is of French origin, reset to English words and carried to England by a student of the Paris school." He declares that—

"native composers have had more encouragement in England than usually falls to the lot of a creative musician. Indeed, England has always been a patron of the best in music, native or foreign; and no nation has, as a whole, been more generous in appreciation; her treatment of Beethoven on his deathbed is a notable example of disinterested generosity. But in real, original, creative art, England has had no great past."

One of the American books which have not been equalled in England is Elson's 'Music Dictionary,' a marvel of lucid condensation. In its 306 pages it contains not only the definition and pronunciation of such terms and signs as are used in modern music, but a brief list of composers and artists, a list of popular work in music, and an English-Italian vocabulary of musical words and expressions. In the vocabulary we have noted one important omission, Tonality. Some of the heads, like Suite, Sonata, Symphony, Pedal, Prelude, Temperament, receive a column or more of space, and are models of compact information, historic as well as explanatory. By an accidental oversight, Schubert and Schumann are not mentioned under Symphony. Not content with defining words, Mr. Elson has some sensible suggestions to make in cases where (as under Portamento and Rhythm) terms are used in a dubious sense. The book is printed with clear type on good paper.

A Book of the Riviera. By S. Baring-Gould. E. P. Dutton & Co. 1905.

Winter sojourners on the Riviera are constantly asking for some book that will inform them as to the history, traditions, manners, and customs of the various towns of the region they happen to be staying in. Such books as exist are chiefly confined to the French Côte d'Azur, and especially to its archæology and ancient history. There are local guides also, but the ordinary visitor is apt to ask for more and for less at the same time—a wider range and less specialized. Mr. Baring-Gould's book is a partial attempt to meet this want; it does not stop short at Mentone, but includes Bordighera, San Remo, Alassio, and Savona; nor does it treat merely of Phœnicians, Greeks, and Romans, but essays to give the more striking and picturesque episodes of all periods, including quite recent ones. Mr. Baring-Gould says nothing, however, of the coast to the east of Savona. Necessarily his book is a compilation, made up from sources more or less easy of access and generally good. It is written in a clear and animated style, so that it should make pleasant reading for those who ask for a lively, anecdotic summary of the story and topography of the Riviera.

Still, as the French saying goes, the prettiest girl in the world cannot give more than she has got, and it would be useless to look to Mr. Baring-Gould's scraps of history for anything like thoroughness, completeness, or even accuracy. Let alone that his liveliness sometimes betrays him into flippancy, one soon perceives that he has not merely vulgarized his authorities—as often in the worse as in the better sense—but that he also misrepresents them on occasion. For instance, he borrows repeatedly from M. Lenthéric's excellent 'La Provence Maritime,' a book that is in the hands of every one who is seriously interested in the Riviera, so that there is no difficulty in seeing what sort of a sea-change Mr. Baring-Gould's statements have suffered in the borrowing. One example will suffice to show, for good as well as for bad, his method. On page 119 is found the following passage containing his version of thirty pages of Lenthéric (op. cit., pp. 320-350). He is writing of Fréjus:

"The ruins are many, but not beautiful; everything was built in a hurry, and badly built. The aqueduct was no sooner completed than it gave way and had to be patched up. The triumphal arch on the old quays is a shabby affair. The amphitheatre is half cut out of the natural rock. There was plenty of granite and porphyry accessible, but the builders did not trouble themselves to obtain large and solid blocks; they built of brick and small stone, without skill, and impatiently. The work was probably executed by corvées of laborers impressed from the country round. . .. . On the ancient mole is the most perfect monument of Roman times extant in Fréjus. It goes by the name of La Lantern [*sic*]; but it was not a lighthouse at all, but a lodge for the harbor-master, who gave directions with a flag to vessels how to enter the harbor and avoid the shoals."

There is just the sort of rough fidelity in this summary that might be expected from one whose memory is not exact, who had read in haste, and who aims at making his recital "vigorous." Some statements are correct, some are slightly twisted, and some are positively misleading. That relative to "La Lantern" is of the last order: while undoubtedly not a lighthouse, it was certainly not a lodge, for, says Lenthéric, "l' édifice est complètement massif"—there is not even a staircase inside, and the use of the monument as a signal post is given only as a probable conjecture. The "flag" is of Mr. Baring-Gould's invention.

The part of the book relating to the Italian Riviera is rather meagre. Ospedaletti is mentioned only in a quotation from the 'Adèle et Théodore' of Mme. de Genlis, and beyond Savona everything is ignored, save for a paragraph or so about Genoa, ending with a passage so grotesque that we cannot resist the pleasure of quoting it:

"The palaces of the Lascaris, the Grimaldis, the Durazzos, the Della Roveres, the Dorias, are in ruins [!], but in their places rise hotels de Paris [!], de l'Univers [!], the Metropole; and the hands of bravos entertained by the nobles are replaced by Italian and Swiss waiters."

And this reflection inspires our author to quote:

"The more we read the history of past ages, the more we observe the signs of our own times, the more do we feel our hearts filled and swelled up by a good hope for the future destinies of the human race."

Mr. Baring-Gould's French is shaky on occasion (perhaps he thinks an accent a

good thing in itself when he persists in putting one on the first syllable of René), and his Italian is positively dilapidated.

The book is illustrated with very pretty photographs, and there is a good index.

The Wild Flowers of Selborne, and Other Papers. By John Vaughan, M.A., Rector of Droxford and Hon. Canon of Winchester. John Lane Co. 1906.

Here we have another indication of the strong hold which the name of Selborne has upon the reading public. The title of the above volume as given on its back is simply, 'The Wild Flowers of Selborne'; but, within, the title-page gives the whole story—"and other papers." With one exception the other papers have little to do with Selborne or with Gilbert White, the naturalist who made it celebrated. Notwithstanding this, the whole volume is very acceptable even to those who are misled by its name.

Many attempts have been made to explain the charm which Gilbert White's 'Natural History of Selborne' possesses. All are agreed that much of this charm is due to the fact that he was a true pioneer and a faithful recorder of what was to be seen when the first rough paths were made. But there must be something over and above this fact that he was the first of the English-speaking nature-students. It has seemed to us that much of the attraction may be properly ascribed to the inherent tendency which people have to get others to do their work for them. Thousands do all of their fishing while lounging by the winter fire or idling in the hammock, with the last edition of Walton in the hand. Walton does more fishing to-day than he and Viator and Piscator together ever did in all their lives. And most of this fishing is done by those who hardly know the difference between a hook and a line. Gilbert White is eyes to-day for thousands who are too lazy to keep their own eyes open in the hundred Selbornes of the Old World and the New. It is vastly easier to have Gilbert White watch the flight of a bee or a bird, and tell you what happens, than to go out from the shadow of your own arbor and see for yourself. And, moreover, you know you are in good company when you do this: you have as your fellow-naturalists many who are likewise dozing in a hammock or reading by a fire. The Dutch say, "Those on the bank always skate best"; with Gilbert White to do your work in collecting, observing, and recording, you are sure to make no mistakes. As it was, he made only three, it is said; with these three corrected by the editors, you will not make any. In short, we carry on much of our out-of-door nature-study in the same way in which we accomplish wonders on the athletic field. With intense absorption we watch the professional baseball or cricket champions in their startling feats, and there is not a spectator who does not move as the ball is thrown or the bat is swung. Everybody plays the game in this easy way; everybody shares in the victory or defeat, even if he knows very little about the game. It is probable that the spectators do not get quite as much exercise out of the game as the players do, although the old proverb says that they see more of it.

Now it may well be that this method of observation at second hand, by which we let Gilbert White do our seeing, is sound in principle and practice. It is certain that it is exceedingly popular at the present time, since, even with the scores and scores of recent nature-study books, Gilbert White is to have two new editions this very year. But this volume by Rector Vaughan is not one of them. It is a book which makes a lawful use of White's popularity, and tells us something about the present condition of the old district. It is to be regretted that the Rector does not tell us more. The first essay gives a pleasing account of a few of the plants which were rare or plentiful at the time White wrote (that is, ten years, or a little more, later than our Revolutionary war), and he speaks of some of the recent accessions. Among the latter is one of considerable interest, namely, our pretty Spring Beauty (*Claytonia*), which American plant has made for itself a pleasant home in these surroundings. The chapter on "The Wild Flowers of Selborne" occupies only eight pages. Next we have a chatty sketch, of about eight pages more, devoted to White himself; and then follow in succession the chapters on The Use of Simples, Pot-herbs, Wild Fruits, Wall-flowers, Poisonous Plants, and so on, until we come to the essays on Mary Rich, Countess of Warwick, Izaak Walton at Droxford, and French Prisoners at Portchester. From this list, which we have somewhat shortened, it may be gathered that whoever obtains this volume as an accession to his library of Whiteana may possibly be disappointed, but nevertheless will get his money's worth in cheerful gossip about matters that certainly would have interested Gilbert White.

Chronicles of London. Edited, with Introduction and Notes, by Charles Lethbridge Kingsford, M.A., St. John's College, Oxford. Oxford: The Clarendon Press; New York: H. Frowde. 1906.

In his Introduction the editor tells us that "from the beginning at least of the fifteenth century, aldermen and citizens of London had shown their interest in civic and general history by compiling or causing others to compile, English Chronicles arranged under the years of the municipality. The Chronicles of London, which, as we now know them, thus came into being, can, however, trace their ancestry much further back. Early in the growth of municipal life there must have arisen the desire for a readily accessible record, giving at least the succession of city officers." Robert Fabyan, "to whose labors all knowledge of the Chronicles was for three centuries chiefly due," was but one of the last in a long line. The Chronicles of London are historical summaries from the point of view of the London citizen, to whom naturally the affairs of his municipality were of primary importance. But the vision of the chronicler was not limited to what has been called "the parish pump": he could "think imperially" on occasion. The great events of the kingdom find their place in the London Chronicles, even when those events are not immediately connected with the city. "To some extent," says Mr. Kingsford, "the Chronicles of London possess that personal element which makes 'memoirs' so fruitful in sidelights on history. Yet from this point of view they are often disappointing." This applies especially to the earlier portions of the Chronicles. The narrative, if it may be so called, is excessively meagre, being little more than a list of names. From the middle of the thirteenth century the record lengthens and becomes more interesting.

This volume contains four Chronicles printed from MSS. in the Cottonian collection. They are known respectively as Cotton. Julius B II, Cotton. Cleopatra C IV, Cotton. Julius B I, and Cotton. Vitellius A V. Of these one has been partly printed before, the other three are here printed for the first time. The Introduction states very carefully the relations between the MSS. and other Chronicles. The text is printed, so far as may be judged without collation, with great care, the pagination of the original being indicated in the margin. Appendices show the variations of texts, and the volume is completed with copious notes, a glossary, and a full index. It is impossible to praise too highly the manner of executing the work.

These Chronicles are for the most part very artless performances; their interest lies solely in the things told, not in the manner of telling them. They are the material from which skilled craftsmen like Holinshed and Stow compiled their annals. There is here no proportion observed. The chronicler took whatever came to hand. In the first of the series forty-four pages are given to a single year, 1399; two pages suffice for the next seven years. The Chronicle ends with Lydgate's long metrical account of the reception in London of Henry VI. The most valuable of the series is the "Vitellius Chronicle," the publication of which was desired by Dr. Gairdner more than forty years ago. It is recognized "as one of the best contemporary records of the reign of Henry VII." It contains a long, detailed account of the insurrection led by Jack Cade. A quotation showing what took place after the dispersion of the men of Kent, will convey an idea of the style of the Chronicle and of the manner in which Mr. Kingsford has dealt with the text:

"And when all were departed and goon there were made proclamaciouns, that what man cowde take the Capeteyn, Quyk or Deed, shuld haue a M[l] marks for his labour: after whiche proclamaciouns made One Alexander Idon, Gentilman of Kent, toke him in a garden in Sowsex: but in the takying the said Capiteyn was slayne. And so brought into Southwerk that all men myght see hym, and that nygbt left in the kynges bench, and from thens he was drawyn to newgate, and then hedid and quarterid; and his hede set vpon London Brigge. And his iiij quarters were sent in to dyuers Townes in Kent. And anone after the kyng Rode into Kent and commaundid his Justices to sit at Caunterbury, to Enquere who wer accessariis and cawsers of this Insurrection; and there were viij men Jugged to deth in oon day, and in other places moo. And from thens the kyng Rode into Sowthsex, and from thens in to the West Cuntre, where a litell before was slayn the Bisshop of Salisbury. And this yere wer so many juggid to deth that xxiij hedis stode vpon London Bryge. Vpon whos soules Jhesu haue mercy."

Literature: Its Principles and Problems. By Theodore W. Hunt. Funk & Wagnalls Co. 1906.

As the title indicates, Professor Hunt, who occupies the chair of English Language and Literature at Princeton, covers

a wide range, and we shall not attempt to follow him in detail. As to literature in the colleges, we are glad to see that he plants himself distinctly and emphatically against the extreme philological heresy so prevalent in the treatment accorded to literature by college teachers of recent years. On the topic of literary criticism we find his paragraphs involving either a slight self-contradiction or else lack of clearness in meaning. We are told that criticism must never be allowed to stand upon its own merits, must always be a mere means to an end, and never an end in itself; but at the same time we are assured, in the words of Professor Richardson and others, that the critical function is as high as the creative, that some criticism is creative literature in the best sense, and that not a few representative English authors have done their best work and won their highest repute in the critical field. "Critical genius is a distinct order of genius in the realm of letters." All this hardly leaves room for as sharp a distinction as Professor Hunt has asserted between criticism of literature and literature itself, though one may readily admit the entire fitness of the distinction as applied to the bulk of present-day "criticism," which is born under conditions practically prohibitive of any ascent into the realm of "creative literature." Literature could hardly be the gainer were critics to accept what our author calls "the better method, by which what is meritorious is magnified and all demerit reduced to a minimum." If press, pulpit, and legislative forum had spent the past year in magnifying all the good to be found in life insurance and reducing the offences of culpable insurance officers to the minimum, it would take very little printer's ink to record the reform legislation which would have resulted, and it does not yet appear, from any authoritative study of human nature and history, that the best way to set authors to uprooting the tares from their literary wheat-field is to minimize their presence and importance.

In a short chapter on "Hebraism and Hellenism," we think that the author does serious injustice to Matthew Arnold's position. Of course Arnold strongly contrasted the two tendencies, and pleaded earnestly for more of Hellenism in the attitude of the English-speaking world, but it is a mistake to assume that he favored the complete substitution of the one set of virtues for the other. It ought to be possible, in these days, to make the necessary allowance for somewhat extreme argumentative statement. We note that Professor Hunt introduces this chapter with a quotation from Miss Scudder's 'Social Ideals in English Letters.' It was in this same volume, if we remember rightly, that Miss Scudder seemed to do Arnold the injustice of assuming that when he asked of British reformers a pause for more light on the subjects in hand, he did not intend that they should go right on with their reforms as fast as adequate light for intelligent, and therefore effective, action should be secured. Arnold's final goal was surely nothing less than the essentials of the Hebraic instinct for conduct, enlightened and guided by Hellenic culture and insight.

L'Empire Libéral. Par E. Ollivier. Vols. I.-X. Paris: Garnier.

Histoire du Second Empire. Par P. de La Gorce. Vols. I.-VIII. Paris: Plon.

These two books represent two classes of literature, one of them, so far as the Second Empire is concerned, just coming into existence, the other just dying out: M. La Gorce writes history, M. Ollivier politics. M. La Gorce, with his eighth volume, has the distinction of completing the first history of serious merit of the reign of Napoleon the Third. M. Ollivier, with his tenth volume, continues his wordy but eloquent vindication of the part which he played in the Empire, and of that policy of liberal imperialism which was based on illusions and terminated in a cataclysm.

Nothing could be more rhetorically brilliant and more historically unconvincing than the apology of the Minister who engaged France in the war of 1870. The jealous rancor with which he constantly attacks Thiers, his obvious conceit, his affected superiority towards those giant statesmen who crossed his path, Bismarck and Cavour, his amusing belief that eloquence and wit are synonyms for statesmanship and wisdom, his frequent casuistry and occasional slips in accuracy—all these are matters that alienate a discerning reader and detract from the value of the book. And yet 'L'Empire Libéral' must take a high place in the historical literature of the mid-nineteenth century. It is the work of one of the conspicuous actors in the events narrated; it contains many sidelights on prominent persons—Napoleon, Prince Jerome, Morny, and others; it occasionally gives us new information in the form of unpublished material. In this respect more may be anticipated from the concluding volumes, in which we shall have the author's version of the Franco-Prussian conflict of 1870 unfolded.

The work of M. La Gorce is notable for very different reasons. Although consistently readable, he lays no claim to brilliancy or epigrammatic force. His work is one of careful historical research, well compacted, solid, and, for a writer whose antecedents are Bonapartist, singularly unprejudiced. The success of the book in France has grown steadily since the publication of the first volume; and now that the last is before the public, it is fairly safe to predict that it is likely to remain the standard work on the history of the Second Empire for some years to come.

The Nation.

NEW YORK, THURSDAY, MAY 24, 1906.

The Week.

One of the most troublesome questions that the Reclamation Service has had to deal with has been settled by the treaty just signed between the United States and Mexico, which apportions the waters of the Rio Grande available for irrigation. The fight for the right to divert water from the Rio Grande has been going on for years, but it has become serious only since the irrigation idea grew popular. Increased use of the flow in New Mexico has resulted in a shortage for the Mexican users, and the quarrel naturally went to Washington and the City of Mexico for settlement. The terms of the compromise appear to be advantageous to the United States. From the costly Engel dam in New Mexico, which practically controls the Rio Grande's flow, Mexico is to get about one-eighth of the store in return for the relinquishment of her ancient rights of diversion. Those Western Senators who, it is reported, are opposed to giving Mexico any of the impounded water, should not carry their opposition to the point of defeating the treaty; if they do, we shall have another long-drawn-out, harassing Kansas-Colorado suit that will not only disturb our excellent relations with Mexico, but retard development along the Rio Grande as well. "Irrigation rows" are notoriously difficult to patch up, and the success of Secretary Root and Ambassador Casasus in settling this one is matter for congratulation.

Whoever reads the report of Saturday's debate in the House of Representatives on the bill to provide against the "leaking" of information from any department of the Government, will perhaps understand why the Senate still has the "effrontery" to "block" that branch of our national Legislature which "does things." As agreed upon at a joint conference, the bill provided that every officer and employee of the United States, while holding office or position, be forbidden to give out information as to the products grown in the United States that would affect the market value of United States bonds or the bonds and stocks of any incorporated company. The prohibition embraced the President as well as the charwomen in the offices of the Department of Agriculture. The only point on which the conference was in doubt was whether members of Congress should be included. Interrupting the discussion, Representative McCall of Massachusetts secured an hour's time, and showed that, in trying to remedy one specific evil, the "leaking" of cotton statistics, the bill would really go far beyond all proper bounds. What the proposition to include members of Congress in the list of those who should remain clam-like amounted to, Mr. McCall declared, was "to complete and make perfect the exquisite absurdity of an absurd bill."

"The ideal perfection of the universe" —this, as the Massachusetts Representative pointed out, was the real intent of the bill. "After hearing of this trouble about cotton, the gentleman tries to perfect the whole universe in order to take care of cotton." Pursuing his argument, he warned the House that it would, by enacting any such legislation, encourage State trials, "the spectacular and bizarre prosecution" of officeholders who might be judged by the dominant party fit victims to "enhance the popularity of somebody." Such a measure, too, would "augment executive influence over Congress." With such a weapon, the President might set up his Paul Mortons and pull down his Judge Humphreys with no thought except for the "good of the country." Going on in his heartless way, Mr. McCall exposed the bill as one of the haziest bits of legislation ever attempted. Not a dozen members, he affirmed, knew what the bill meant. Its minimum penalty of a year's imprisonment he characterized as "absolutely heathenish." A Cabinet officer would go to his post in fear and trembling. If some morning in talking to a newspaper correspondent he remarked that the weather was very bad, and the price of corn dropped, and the stock of a corn-products company fell in price, clearly the Cabinet officer could be imprisoned for a year. Before Mr. McCall's hour was gone, the whole matter was exposed in its crudity, with the result that the bill was tabled and killed by a vote of 107 to 63. This showed what unfettered discussion can do in an unchained House.

In finally deciding in favor of a sea-level canal at Panama, the Senate committee has gone back to the recommendations of the majority of the consulting engineers whose advice President Roosevelt rejected. As a matter of fact, we suppose the committee's action was intended mainly as a disapproval of the 85-foot project, with three locks in flight at Gatun. The weight of technical opinion seems against that plan. But merely to vote sea-level does not get us there. One lock at least is necessary, even at so-called sea level. And it is doubtful if Congress, in its present weary and angry mood, can be held in Washington long enough to come to a clear decision between rival plans. This will throw the whole matter back upon the President. He has said that, in that event, he would begin building a lock canal, as provided for in the Spooner act, though he admitted the probability of "modifications." For them, he would certainly have to call in the engineers again. Perhaps a compromise between the 85-foot plan and the sea-level may in that way be reached. Best of all would it be to throw the whole matter open to bidding by responsible contractors, and take the Government's blundering hand off the business.

While challenging the House Committee on the Judiciary to show that Congress spends the people's money more wisely than the officers of the big insurance companies who contribute to party campaign funds, Senator Bulkeley resorted to the only defence a plain-speaking man could offer. Suppose I did give $5,000 of the money paid by the Aetna Fire Insurance Company's policyholders to help elect McKinley in 1896? he asks. Am I not a faithful guardian of my stockholders' interests? And were not other faithful guardians vigilant in protecting the country from such perils as W. J. Bryan? Senator Bulkeley was exceedingly moderate in his estimate of the proportion of peril threatening the Aetna company, as he admits. Even $20,000 would have been but a "flea-bite" to what he personally paid to help defeat the Democratic party. This statement will be appreciated in Connecticut, where the continued display of Bulkeley's skill as a manipulator of campaign funds led finally to the passage of a corrupt-practices act by the Legislature. The Milwaukee investigation bears out the impression that Bulkeley, McCall, McCurdy, and the rest of the insurance patriots who rushed to help the Republican party save the country with the country's own money, were following an accepted precedent. The only difference appears to have been that, in the Wisconsin case, $2,000 was judged sufficient. But then, the West is notoriously indifferent to "political peril."

The sworn testimony at the hearing of the Interstate Commerce Commission in Philadelphia last week that trusted officials of the Pennsylvania Railroad are vulgar "grafters," would have shocked and surprised men a year and a half ago; but the insurance revelations have hardened us to news of this kind. George W. Creighton, general superintendent of the Altoona division, received some 1,300 shares of stock from mining companies

with which the railway has constant dealings. Asked whether the gifts had been presented for "pure love and affection," Creighton replied, "I just accepted them without asking any questions." George W. Clarke, a car distributor, was made happy by such tokens of regard as occasional checks for $50, baskets of wine, boxes of cigars, and dividends on coal stock. He didn't know what the checks were for, but, he added, "I cashed them." He came into possession of stock worth $5,000, but he didn't "recall the circumstances." John M. Jamison, president of the Jamison Coal and Coke Company, frankly declared that, in order to secure favors, he had sent a check for $5,000 to Robert E. Pitcairn, assistant to President A. J. Cassatt. He had also given stock to other specified Pennsylvania officials. Michael Trump, general superintendent of transportation, and R. L. O'Donnel, general superintendent of the Buffalo and Allegheny Valley division, both confessed that they ha accepted as presents the stock of companies which shipped coal over the railway. Charles E. Pugh, second vice-president, had bought considerable amounts of coal stock and bonds. Naturally, he was not inclined to encourage the development of new mines along the railway, because the old mines, as he explained with a laugh, "furnish more coal than is needed." To mistake the significance of these admissions is impossible. A coal company which wishes to avoid trouble presents neat blocks of stock to Pennsylvania officials, or else persuades these gentlemen that the stock is a good investment. The managers of the railways are certainly in a position to increase or diminish the earnings of the coal companies. Not to put too fine a point on it, the officers of the Pennsylvania have subjected their shippers to elaborate and systematic blackmail.

These transactions throw light on a phase of high finance that has provoked frequent comment—the inexplicable transfer or even disappearance of shares of stock. In some of Whitaker Wright's operations certain mysterious "press calls" were noted by the censorious. The mystery was cleared up, however, when four high-minded newspaper writers were forced to disgorge £13,454. A yet more striking instance occurred in the organization of the American Steel and Wire Company. John W. Gates was chairman of the finance committee. When he was asked in 1902 what had become of a little block of stock—$26,000,000 in all—which had not been accounted for, he confessed that he did not know. In the light of present knowledge, we can imagine that the stock was judiciously allotted to trainmasters, division superintendents, car distributors, and other gentlemen who were able to show favors at the right time to the right people. Mr. Jamison's company got off without paying such heavy toll—only $35,000. Such dealings show the most cynical disregard of moral obligations—to say nothing of mere law. A bank president or cashier who should accept a private "rake-off" on every important loan, would be generally recognized as a scoundrel. The buyer of a department store who should take gifts from manufacturers, would be discharged as untrustworthy. The case of the bribed railway official is in certain respects even worse. He serves a corporation which enjoys peculiar rights and which in return is bound as a common carrier to serve all patrons alike. If he forms a conspiracy to help one shipper at the expense of another, he is guilty of a crime not merely against his employer, but against the public.

Senator Patterson's promise to the people of Denver that, if the municipal ownership ticket was defeated this year, he would run for Mayor of the city next year on that issue, should not be remembered against him. Undoubtedly, the Senate would spare him resignedly, but it is most unlikely that Denver would put him at the head of her city government. At the election on Tuesday week, when six important franchise propositions and five charter amendments were voted upon in addition to aldermanic candidates, county supervisors, and election commissioners, a two-to-one vote was recorded against the municipal-ownership programme. Among the propositions favored were those to grant franchises to the Denver Gas and Electric Company, to the Northwestern Terminal Company, to the Union Pacific, to the Municipal Traction Company and the Denver Terminal Company. The charter amendments were concerned with the regulation of charges by public-service corporations, the purchase of a lighting plant by the city, the voting of $5,000,000 to beautify the city, the making of a ten-year contract for street lights, and a police pension scheme. The opportunity for a straight fight between the "M. O.'s" and the "corporation slaves" was an exceptional one; the fact that Senator Patterson deserted Washington and had been for two weeks working continuously for the ownership ticket, showed how earnestly the issue was pressed. Denver's negative and decisive verdict should give the public-ownership enthusiast something to think about.

By passing the Shurtleff direct-primary bill, the Illinois Legislature ended ingloriously a dismal special session that had lasted since April 10. On that date Gov. Deneen called the lawmakers together at Springfield to remedy the mistake of a year before, when an unconstitutional measure was passed. It is probable that the Shurtleff bill will stand the test of constitutionality, but it will hardly satisfy those who really want the direct primary. As explained by the Chicago *News*, candidates for elective State and county offices, for municipal offices to be filled in November, for clerkships of Appellate Courts, and for the House of Representatives and the Senate are to be voted upon. The delegates to the nominating conventions are to be bound to the candidates selected in the primary "for at least one ballot" only; and to the County Central committees, which are not named by the party voters, is left the definition of the delegate districts. With such an imperfect bill before him, it is not surprising that Lieut.-Gov. Sherman, who declared that "there is not a line in the bill that gives the people a right to say whom they shall nominate," should have denounced the session as a humiliating failure. It is to be hoped the report that Gov. Deneen will sign the bill is not true.

A "lawyers' ticket," proposed by the bar of the city for the action of the voters in November, when ten new Supreme Court justices are to be chosen in the First Department, should have an excellent chance to win. Not only are the ten thousand and more lawyers of the New York bar competent to select a ticket free from entanglements with Tammany or Quigg, but they know how to run a campaign in which they are deeply interested. Almost to a man, the Jerome workers last fall were lawyers. They supplemented the District Attorney's enthusiasm with hard work and an unexpected ability to organize and convert. This year there is no possible reason why these practitioners should not disregard every offered political alliance and say: "Here is our ticket; take it or leave it." We believe that prompt action of this kind by a really representative body of lawyers would force sufficient endorsement from the party organizations to insure the success of the ticket. But, even if it did not, the city is in a mood to appreciate a vigorous independent campaign, based on the demand that the judiciary shall be absolutely free from the dictation of politicians, while the machine is horrified that the lawyers and the Citizens' Union do not propose to "wait."

George W. Jimenez, a New York patrolman of Cuban birth, has just returned from Panama after an unsuccessful attempt to reform the police of the republic. His experiences, though doubtless serious enough to him, are diverting reading for others. He took charge of a corps of 360 policemen, many of whom were crippled derelicts of ancient revolutions; a good half the force were detailed as butlers, coachmen, and waiters to the Government officials;

about 150 were on daily duty. Chief Jimenez variously attempted to make the police of Panama conform to the New York standard, but very soon found that the chief and only imperative duty of an officer was to vote early and often for the Administration on election day, and so far as possible prevent the Opposition from voting. Between elections the force was chiefly a refuge for pensioners of the wives of the authorities. Mr. Jimenez also objected to the ill-treatment of persons imprisoned on suspicion, and it revolted his manly soul to see handcuffs immediately clapped upon any person under arrest. It appears that the average Panaman officer is not of a physique to make a compatriot, much less an American, "walk Spanish" without such artificial aid. It is ill dealing as a reformer with a people that abhors reform, and Mr. Jimenez's unhappy experience lends an illustration to Mr. Taft's offhand statement that the United States will intervene in Panama to keep order as it sees fit. Evidently, the Republic of Panama is a poor thing, but our own.

After four years of President Palma, the Cubans are glad to have four years more of his rule. If his Administration has been open at times to criticism, it has, at any rate, brought a new prosperity to the island, has been successful in suppressing irresponsible revolutionists, and in making the people contented. President Palma, of course, had the moral backing of Washington in 1902 when he took office—indeed, he was more American than Cuban after twenty-five years of residence in New York State; but that has not altogether explained his success. It might have accounted for his first election, but not his second. The sensation of self-government has been felt all over Cuba, and it is because Palma has thrown himself enthusiastically into the work of transforming "free Cuba" into prosperous Cuba, that he has strengthened his hold to such a degree that all opposition was withdrawn before the last election. The reciprocity treaty, better sugar and tobacco crops, and the development of transportation and manufacturing have been powerful campaigners for Palma; and the Isle of Pines incident only served to show the good understanding between the Administration at Havana and that at Washington. The President of Cuba has increased his claim to the title of "Cuban patriot."

The French Ministry increased its majority on the second balloting on Sunday, which saw the defeat of the group of Nationalists and other reactionaries left in suspense at the first trial. The victory has been won on a basis of anti-clericalism and of social reform. M. Sarrien is backed by a group of Radicals falling only a little short of a majority, and is less dependent than he has been on the votes of the Socialist Left. The *Temps* accepts the voting as primarily a triumph for the Republic. It points out that for the first time since the Third Republic was founded, no prominent candidate has dared to present himself as its opponent. The various types of Royalists and Imperialists have taken to cover under the vague appellation of Nationalism. When the *Temps* also professes to see in the elections a check to collectivism, its case is not so convincing. If the Socialists languish temporarily, it is only because successive Governments have outdone each other in the attempt to kill their exacting allies by kindness. Most parties will stand an enormous amount of this treatment without giving up the ghost. Paternalism is likely to have full sway for a number of Parliamentary sessions. Fortunately, men of proved sense and executive capacity are in charge. A curious result of the vindication of the Separation Act is to make Rome a far more interesting point for observers of French politics than Paris itself. Will Pius X. follow the advice of the most distinguished Catholics of France and accept a hard dispensation resignedly, or will he oppose the application of the Separation Act and take the chances of a religious war? His decision will be momentous, and will pretty well settle the question, raised by certain skeptics and old-line Catholics, whether the Cardinal-Patriarch of Venice was "popeable" or not.

The rejection of a Labor bill in the Lords is a straw that shows the drift. The particular act aimed to suspend the incoming of all laborers from abroad during a trade dispute. It looked towards a foolish and impracticable embargo, and was well voted down. The incident, however, gives a hint of very embarrassing possibilities for the upper house. Will it dare throw out the trade-dispute bill granting immunity for trade-union funds? What will be its attitude towards the act promising a free meal to all school children? It is years since the calm of the Peers has been so constantly threatened. Obviously, a practice of rejecting bills from the Commons will hardly do. The Lords are not popular enough to risk a course that would point the outcry for their abolition. It is likely, then, that the more radical labor legislation will go through relatively unopposed, and that the negative and amendatory votes will be kept for the Education bill, or on the off-chance that the local self-government bill for Ireland should bear the look of an advance towards home rule.

Delimitation of spheres of influence in Persia, perhaps the most important feature of the Anglo-Russian understanding now nearing final negotiation, would relieve international politics of a particularly dangerous question. It is said that Russia abandons her claim to a port on the Persian Gulf, and Great Britain acknowledges Russia's paramount position in the northern half of the Shah's dominions. British influence was once supreme throughout Persia, and imports into that country came almost entirely from Manchester; but the markets of Teheran, Tabriz, and Meshed have been flooded with Russian goods, and the energy of Russia's agents has destroyed British influence in the north. But if Britain gives way in North Persia, she holds her own with the greatest determination in the south. Every Foreign Secretary, Liberal or Conservative, has recognized the necessity of keeping Russia at a distance. No one within recent years has been more instrumental in maintaining this policy than Lord Curzon. In his book on Persia he says that he would impeach as a traitor to his country any minister who permitted Russia to penetrate to the Gulf. Hence the fact that Russia and England are in agreement is a particularly encouraging sign of the times.

The Duma's reply to the Czar's address held language respectful but firm. It appears to be a body that knows its own mind, perceives the need of extending its powers, while exercising them in an orderly manner, and has clear ideas about the only way in which representative and responsible government can be established in Russia. Its demand that the Imperial Council be either abolished or shorn of its obstructive functions, so that the Duma may express the people's will directly to the Czar, is the most radical that it makes. One must doubt if it will be acceded to without a struggle. Probably the autocracy will consider this an attack upon one of its inalienable prerogatives. The Duma is on surer ground when it calls for the instant repeal of exceptional repressive laws, for the doing away with imprisonment without trial, and for the right of the people's representatives to have a direct voice in all legislation. The reactionary policy could not well be challenged more sharply. The Czar's refusal to receive the memorial of the Duma direct from its president and a deputation is, however natural, calculated to stir discontent to the depths. To the Duma it will be the sign that Nicholas II. is still swayed by bureaucratic counsellors. For the present, the new Legislature proceeds quietly to the land question, assuming its jurisdiction in the premises quite as cavalierly as the Czar has stood on an improvised punctilio, and awaits the first probable concession, at least partial amnesty.

PASSAGE OF THE RATE BILL.

The sudden passing of the amended Railway-Rate bill by the Senate on Friday afternoon may have been due to weariness superinduced by either heat or talk. Of the latter, the Senate should surely have gone through a surfeit cure during the past three months. Be this as it may, the bill now goes to conference, and we are able to guess very nearly what its final form will be, as also to estimate its practical and political effects.

All agree that, but for President Roosevelt's initiative, no such bill could yet have been got through Congress. Senator Tillman frankly gave that as his opinion in the closing hours of the debate; though he added, as in duty bound, that the whole idea was stolen by the President from the Democrats. But that sort of charge hardly counts in politics. No one can file a notice of patent applied for in the case of a political invention; and a radical, accidentally in power in a conservative party, may take his own wherever he finds it. Accordingly, the reluctant acceptance of the Rate bill by the Republican Senators must be reckoned as the personal achievement of Mr. Roosevelt. Unluckily for him, the very hour of his triumph has been clouded by revelations which have unquestionably damaged his reputation more seriously than anything that ever befell him in public life; so that he loses the fruits of victory at the moment of plucking them. A dozen Rate bills could not make up for the Chandler letters and diary and the unrefuted assertions about the President's tergiversations made in the Senate. Even if this withering of the laurel at the instant of putting it on had not occurred, it would still have been necessary to ask just what it was the President fought for, and precisely what it is that he has got.

From the first, it was clear that the bill had some excellent features. But these were chiefly non-contentious. Certain abuses had grown up in the development of railway practice, which everybody but their greedy beneficiaries agreed to be abuses, and which everybody but themselves was willing and even eager to correct. These were such matters as rebates, jugglery about terminals and terminal charges, the outrages committed by private-car companies, extortion under the guise of payment for refrigeration, etc. There was no objection on the part of any member of Congress having the slightest influence to the passage of laws rigidly forbidding and punishing these public evils. They were of a sort to clamor for regulation under the interstate-commerce clause of the Constitution, and every measure aimed at them met with instant approval in Congress. Indeed, the Senate itself went far beyond the House in the stringency of the provisions aimed at such railway wrongs. In general, it tore the Hepburn bill to pieces, so that its printing in the amended form looks very much like a map of the earthquake section of San Francisco; but in no respect did the railroad-ridden Senate outstrip the House more clearly than in sweeping clauses levelled at these incidental railroad abuses. It restored the criminal clause in the law against giving rebates. It reduced the pass mischief to a minimum. It brought sleeping cars and express cars under the scope of the act. It forbade railroads to own coal mines. It made pipe lines common carriers. There was, in a word, a perfect enthusiasm and unanimity of reform in all these respects. The President's recommendations were, in that sphere, far exceeded. There was practically no opposition to these wholesome reforms; and they could have been enacted into law in a month as really non-contentious, had they not been mixed up with the bitterly and long-contested clause conferring upon the Interstate Commerce Commission the power to fix railroad rates.

This was the one thing for which President Roosevelt went to battle, and we need take only the testimony of his friends to conclude that he comes back defeated. It is not necessary to go over again the acrimonious charges and countercharges of the past fortnight. It is sufficient to go to President Roosevelt's messages and speeches, and even his letter of May 14 to Senator Allison, to put it beyond mistake that he desired to give all power to the Commission, and to keep railway rates out of the courts so far as could be done constitutionally. But the bill, as amended, throws everything into the courts, which may "enjoin, suspend, or annul" any rate whatever made by the Commission. As a last rallying-point, the President and his friends stood for the words "in its judgment," as defining the powers of the Commission. Commissioner Prouty thought it vital that these words should remain in. But they were stricken out, 50 to 24. The point is, of course, that they seemed to warrant the exercise of both legislative and judicial powers by the Commission. It is highly doubtful if Congress can delegate any such powers; but, to solve all doubt, the Senate struck out the last thing in the rate-making clause which made it look as if it had what Senator Bailey calls "teeth."

The bill, as we have said, contains many meritorious and needed features—depending, however, Bunsby-like, upon their application. If rigorously enforced, they will go far to cure long-standing evils. But, we may be sure, the people will at once pass to other things. If the bill had failed, there would have been a great outcry and agitation; passed, it enters at once the limbo of things fully discounted, and of which the country is "tired," and politicians will turn restlessly to other issues.

REPUBLICAN FOREBODINGS.

Worried before over the outlook for the Congressional elections this year, the anxiety of the Republican managers is visibly heightened by the occurrences of the past week in Washington. It may well be. Such strained relations between the President and the leading members of his party have not been seen for years, if ever. The most damaging charges against the President were made in open Senate, and not one Republican Senator rose to defend Mr. Roosevelt. Even Lodge left off running to the telephone. When the breach between Cleveland and the Senate was at its worst, there was always some Senator to speak up for him; but the Republican oracles have all been dumb. The President was attacked with the greatest directness and particularity; Messrs. Tillman and Bailey challenged the Republican Senators to reply, but they all sat silent. Their silence was most eloquent, politically. It testified strikingly to the distrust and dislike which Mr. Roosevelt has excited in the minds of the chief Republican Senators. So extraordinary a party situation cannot fail to be reflected in the Congressional campaign.

The troubled Republican managers at Washington are, reports the *Herald*, pointing to the fact that "no Republican President ever before sought deliberately to defeat his own party with Democratic aid." The effect of the disclosure that Roosevelt was concerned in such a scheme will, they fear, have "a stunning effect upon the straight-party men and paralyze the organization." Accordingly, their efforts are to be directed to restoring the shocked patient, and causing the symptoms of paralysis to pass away. This they propose to accomplish by calling in the physicians of the American Protective Tariff League. The plan is to rally the demoralized party by a galvanic stand-pat campaign. It is to be opened in Philadelphia this week, with Speaker Cannon as chief lauder of the all-wise and unchangeable tariff. By making a loud noise in that way, divergent voices within the party are to be drowned out.

These tactics are the natural resort of a certain order of mind, but they are not even shrewd, in the circumstances. If the party is divided about Roosevelt, it is still more badly split by the tariff. The revelations about cheap sales abroad by protected manufacturers who exact the uttermost farthing from the American consumer, have stirred many Republican consciences to revolt. We have not forgotten what Gov. Guild of Massachusetts wrote to the President last fall. Of what advantage would it

be to the stand-patters to keep Pennsylvania but lose Massachusetts? Tariff revision sentiment is strong among Republicans in many parts of the land, and cannot be stilled by the loudest beating of stand-pat drums. "President Roosevelt and the Republican party which he leads are for tariff reform," declared the Portland *Oregonian* of May 11. With Republicans all over the country believing and asserting this, how can you turn the Congressional campaign into a hurrah of the stand-patters?

A more skilful, if equally insincere, strategy is advocated by the *Oregonian*. This consists in drawing party lines taut. "The true test of Republicanism is to vote the Republican ticket." That is, in effect, the platform which the *Oregonian* lays down for the June election of Representatives from its State. A Democratic county convention had affirmed that "a party exists to maintain principles"; but the Portland editor shows the folly of that. He denies that it is the true function of a party to "sit perched forever like a fat Buddha on a pedestal and eternally utter abstract propositions." "No party that is worthy of public confidence exists merely to maintain principles." Precisely: the main thing is to win elections and get the offices. So let tariff reformers and stand-patters sink their differences and vote alike for the grand old party that doesn't know its own mind except on the point of liking uncommonly to be in power.

Even, however, if there could be agreement upon such a policy of waiving principles and going in for the offices, Republican reasons for apprehension would scarcely be lessened. The party has suffered blow after blow. Perhaps the heaviest one came from the revelations of the way in which previous Republican campaigns have been corruptly financed. The managers have had their ignominy disclosed. *That* they could endure, but they have also lost their insurance money for this year at least. The two things together make a burden greater than they can bear. It is not strange that they look forward with trepidation to their task of saving the country without the aid of funds stolen from widows and orphans.

Behind all these uncertainties of policy and ways and means, lies the uncertainty how the President will interpret the election. If the Democrats win, he will be tempted to say to his party: "There, you see what comes of not listening to me. Besides, I always did get on well with Democrats." If the Republicans succeed, he would probably, in like manner, take it as a personal endorsement, and demand that all of his miscellaneous programme be written into law at once. But there are thousands of influential Republicans who would prefer, rather than that, to see their party beaten. This adds dubiety to the prospect. Prophecy is always the most gratuitous of blunders, but this may be said with perfect safety: if the Democrats do win the next House, even by the narrowest margin, it will be accounted a great Republican disaster, in view of the large Republican majority in the present House. And President Roosevelt will be held, justly or unjustly, accountable for it, exactly as President Cleveland was for the Democratic *débâcle* of 1894. In that event, the President's philosophy, personal resource, and political skill will be put to a ruder test than they have yet had to undergo.

CHEAPENING THE CANAL.

Lovers of logic and consistency, among whom we venture to reckon ourselves, must be profoundly disturbed by the course of the Administration in purchasing supplies for the Panama Canal. If we are to stand pat, let us stand pat, without shuffling and compromise. If the glory of the country, the development of its manufactures, and the wages of its workmen demand that we pay from 25 to 500 per cent. more for home than for foreign products, let us all, including our rich Government itself, put our hands into our pockets and settle our heavy bills like gentlemen. What is sauce for the goose is sauce for the gander, even if that sauce happens to be the blessed protective tariff.

This question of alien machinery and materials for the Panama Canal is not raised for the first time to-day. Some time ago the Administration bought some foreign-built vessels on the wretched pretext that they were much cheaper than anything to be had in this country. Then Secretary Taft, in a letter published last January, appealed to Congress for specific direction whether or not he should continue to purchase in the cheapest market; but the oracles of Congress have remained dumb. And now a new case vexes the soul of Mr. Taft. A Scottish firm is the lowest bidder for some dredges; the Maryland Steel Company comes next. Shall the Government pay a domestic corporation from $60,000 to $70,000 more and thereby protect American capital and labor; or shall it turn to the Scot and thereby strangle an infant industry in its cradle? If the Government, which is far from bankrupt, is justified in patronizing the canny Scot, why should not the individual enjoy the same privilege? Government money is certainly not so tainted that beneficiaries of the tariff will haughtily spurn it. Indeed, your protected interest is notoriously as insatiate as the daughter of the horseleech.

The sophistry by which Mr. Taft persuades himself that he should buy in Scotland could be torn to shreds in a moment by Speaker Cannon or Secretary Shaw. As a precedent, the Secretary of War cites the purchase of large amounts of meat in Australia for the army in the Philippines—merely because the Australian meat cost about half as much as that brought from the Pacific Coast. But this example proves nothing except Mr. Taft's callous indifference to the prosperity of American packers. The foreigner pays the tax; and embalmed American beef is better for the stomach of any patriot than the juiciest sirloin produced by the pauper labor of Australia. Still another plea advanced by Mr. Taft is that Panama is "outside the tariff wall." That, on the face of it, is a mere quibble. He should view the tariff wall not as a physical entity, but as a spiritual conception. The appropriation act of 1875 expressly declares that the Government must give preference to American material; and to that act he should conform in spirit as well as in letter. The mere fact that the material is to be used in Panama does not alter essential relations. When Mr. Taft refuses to buy of the Maryland Steel Company, the Maryland Steel Company is in so far forth denied the boon of protection, and a deadly dagger is driven into the heart of one of Dingley's darlings.

In the course of this discussion some men who are secretly tariff-reformers—whatever creed they profess—have maintained that, unless the Government can buy abroad, our home manufacturers will form a combination to charge extortionate prices. No argument could be more irrelevant. The great practical benefit of protection, as we have learned by abundant experience, is that it makes possible just such effective combinations. That is exactly what the tariff is for. It is intended to give the American a weapon by which he can extort from the consumer the highest possible price. If the tariff failed to accomplish this, it would fail in everything. Adherents of protection who complain that the life is squeezed out of them by the Trusts, are about as consistent as a clergyman who should object to religion on the ground that it converts men from sin. So long as we are bound to have a tariff, let us look it squarely in the eye and know it for what it is.

Toward the end of his latest utterance on this topic, Mr. Taft lets the cat wholly out of the bag. "Some purchases," he says, "have already been made abroad and a saving effected in the purchase of comparatively small quantities of cement. In the construction of the canal an enormous quantity of cement will have to be purchased"; and presumably there might be enormous savings. In fine, Secretary Taft has a sneaking desire to build the canal cheaply. We have known some men and more women who are inspired by this sordid wish to get their clothes, their furniture, and even their houses at a cost as low as

may be consistent with good quality. These bargain-hunters have been sternly rebuked by the high priests of protection. Every devout worshipper of the McKinley and the Dingley schedules thrills when he recalls President Harrison's apothegm of the stump, "A cheap coat makes a cheap man." If a cheap coat casts such a terrible blight on intellect and character, a cheap canal would utterly corrupt our national conscience. The higher the cost, the greater our happiness, the more exalted our virtue.

SCHOOLS FOR GENIUSES.

A demand for special schools for the specially gifted is making itself heard in Germany. Notable among those advocating the plan are Wilhelm Bölsche, in his 'Weltblick,' and Dr. J. Petzoldt, in his 'Separate Schools for the Conspicuously Gifted.' Dr. Petzoldt of the gymnasium of Spandau feels his heart going out to "the highly endowed, who, misunderstood by those nearest to them, see their divine spark being slowly extinguished," for lack of proper training.

The neglected genius has always been more abundant in Germany than elsewhere, but Herr Bölsche and Dr. Petzoldt show us how to foster both unrecognized genius and the less elusive variety. The Doctor makes it clear that he is not lacking in sympathy for those slighted by nature. There are in Germany numerous schools for backward and feeble-minded children. In nearly 170 cities and towns about 12,000 of them are being educated by the State. In thus providing for them, Dr. Petzoldt asks, "Do we not allow the impulses of our heart to get the better of cool reason? Are not the especially gifted far more entitled to pity than the mentally disinherited?" He makes a strong showing for the feasibility of establishing special schools without throwing additional burdens on the State or sacrificing existing schools. He would select, say, from the fourth class of the gymnasium, twenty of the brightest pupils, to form the first class of the *Sonderschule*. The teachers, a picked corps, must be able to recognize clearly the peculiar mental gifts of their scholars. A special diary is to be kept for each. The natural sciences are to be given first place in the curriculum, the main object of all the courses being to train the student in "thinking to the very root of the subject, until hatred of superficiality becomes an instinct." The study of biology is expected to lead to a higher conception of art than prevails among the moderns, whose bizarre creations, Dr. Petzoldt incidentally remarks, are simply the result of ignorance of natural science. Psychology, biography, and English and Italian are to be compulsory subjects in the lower classes; the higher are to provide elective courses, scientific, technical, artistic. The hours of instruction are to be limited to four a day, and two hours daily are to be given to gymnastic exercises in the open air. Singing and drawing are not to be neglected.

The entire plan of instruction, by condensing two years' teaching at the higher classes of the gymnasium into one, is to enable the student to devote the time from the fifteenth to the eighteenth year to subjects usually taught only at the university. A specialist in nervous diseases, of thorough pedagogic training, is to be constantly on the lookout for any sign of over-exertion or abnormal behavior. As to the cost of establishing these *Sonderschulen*, Dr. Petzoldt argues that the 400 gymnasia and 100 *Realschulen* in Prussia would, through the elimination of their brightest pupils and teachers, save enough money to endow twenty-five *Sonderschulen*, while the gain to the country from an estimated steady supply of 3,000 unusually bright and specially trained young men would be incalculable.

There is, of course, no particular originality in the plan itself. The need of providing suitable instruction for gifted pupils has often and in various ways received practical consideration, not least in Germany itself. In the town of Mannheim, for instance, the most talented school children—about 10 per cent. of the total—have for some time been specially taught, though in the same class with those of average capacity. But there is a novelty in the almost aggressive attempt to lay down hard-and-fast rules for the treatment of genius, in disregard of the great difficulty which educators and philosophers have from time immemorial experienced in even defining the very term. If Lessing be right in maintaining that it takes genius to awaken genius, Dr. Petzoldt's initial difficulty would seem to lie in discovering the genius of the teacher. Nor is this all, for, in the new education, environment plays a very important part. Apparently, Dr. Petzoldt would as nearly as possible provide for the budding Moltkes, Bismarcks, and Kants the conditions that made their prototypes what they were. "Could a Moltke in time of peace and a Bismarck under a ruler like Frederick II. have attained their full development? Did not Kant employ all his ingenuity in the service of theological metaphysics until awakened by Hume from his dogmatic slumber?" It is true that the Faradays, Liebigs, and Schliemanns triumphed over a thousand obstacles, but Dr. Petzoldt would spare their successors an equally hard struggle—fatal, he thinks, in many recorded and unrecorded cases. It appears to him highly probable that, under adverse circumstances, even Goethe would not have given to the world his masterpieces (Schopenhauer has confessed as much for himself). He maintains stoutly—*pace* Lessing—that Raphael could not have become a great painter had he been born without arms.

Dr. Petzoldt is well aware that genius may be simultaneously creative in various directions. But varied stimulus, while imperatively called for in some cases, must never degenerate into coercion. The obstinacy of genius in rejecting instruction is often only wise recognition of its own limitations—*vide* Alexander von Humboldt, "who ought never to have been forced to take music lessons." As the object of the *Sonderschulen* is eminently practical, it may be asked what test as to the quality of genius fostered in any given pupil will be applied on graduation. Or is the output to be measured in quantity? Productivity of the right sort was defined by Goethe to be the surest touchstone of genius, though its results be only an occasional song like Béranger's. But we fear there are many perplexing problems for the teachers in charge of genius at the *Sonderschulen*.

A SELECTIVE ART MUSEUM.

At the organizing meeting of the Association of American Museums, on May 15, Mr. Benjamin Ives Gilman, Secretary of the Boston Museum of Fine Arts, made an important contribution to the new science of museology by advocating a selective or anthological principle for public art museums. Mr. Gilman believes that the duty of an art museum is not primarily to afford instruction in archæology, but to minister to the pleasure that comes from the undisturbed contemplation of beautiful objects. With this end in view he would select from the possessions of a museum its finest objects, and exhibit them under the best conditions of light and space. The rest of the collections he would store or exhibit compactly for the use of students and investigators, holding such study collections open, however, to all applicants. In both the public and the study collections the arrangement would be chronological, but in the public galleries the arrangement would be based on æsthetic, in the study halls on scientific, considerations.

A twofold plea is made for this somewhat revolutionary theory of dualism. First, it is obvious that the public is unequal to the task of picking out the excellent exhibits from the mediocre or merely curious. As collections increase, the task becomes ever more vexatious. An entire public is forced to plod through miles of galleries, many of which appeal only to the professional student of art, possibly the hundredth part of the museum's public. Hence the duty of sifting the collections into an anthology. An ideal director would treat his possessions much as Matthew Arnold did the works of Wordsworth, making such a selection as should at-

tract interest and minister to culture. The special student, it is plausibly maintained, would also profit by the introduction of the selective policy. The greater part of the collections would be accessible to him, with a more compact and convenient installation, under favorable conditions for undisturbed study and in handy proximity to libraries, workrooms, and the offices of consulting curators.

The chief objections to the anthological idea were raised by Professor Goodyear of the Brooklyn Institute in a very trenchant but courteous rejoinder to Mr. Gilman's address. Professor Goodyear held that the selection of the best is practically impossible, being based simply on individual taste or caprice, and that our only certitudes are of an historic sort. Hence history and chronology are the only safe guides for a director, and the best arrangement for the student will turn out to be the best also for the man in the street. Professor Goodyear's agnostic attitude as to decisions of taste represents a way of thinking widespread among scholars. It is based partly upon a praiseworthy caution, partly upon a less commendable distrust of the emotions. As a matter of fact, the dictum, *de gustibus non est disputandum*, is practically ignored by those who preach it most vehemently. There is an absolute consensus as to the finest periods of art and as to many individual works. No archæologist hesitates to affirm that the Greek sculpture of the fifth century B. C. excels that of the fourth and third. There would be no dispute of the dictum that the Dutch painting of the seventeenth century surpasses that which precedes and follows it. Nor would any well-informed person deny the supremacy of French painting in the nineteenth century. If it were really true that taste is merely personal and helpless, there would be no such consensus of judgment.

Within these great periods, also, one does not hesitate to distinguish the varying merits of different works. The comparative mediocrity of Rubens in portraiture is generally admitted; the greater significance of Rembrandt's later works has become a truism; conversely, every one is familiar with Van Dyck's degeneration into an elegant but meaningless mannerism. We perceive in Vermeer an exquisiteness beyond that of the Dutch school, and we balance the merits of his score of surviving canvases as exactly as the tea-taster sorts tea by quality. There remains a fringe where judgment is varying—a certain number of debatable examples of art; but in all main matters these accepted verdicts of taste are quite as sure as the date on a birth certificate. Practically, a jury of connoisseurs and artists which should be asked to pick out from any museum the tithe best worth exhibiting, would agree in about three-quarters of the cases. As to the rest, a broad-minded director would give them the benefit of the doubt, exhibiting all that obtained the suffrages of two or three competent judges.

As to historical considerations, it should be noted that Mr. Gilman and Professor Goodyear, representing the advanced and the orthodox schools of museology, would treat three-quarters of the exhibits in any given museum in precisely the same fashion. The difference would be not in internal arrangement, but in conditions of public admission, and in the disposition of, say, a quarter of the exhibits. Mr. Gilman believes the finest should be selected and advantageously shown; Professor Goodyear believes that no sorting should be made by the museum, but that the duty of selection should be left to the average visitor. Mr. Gilman looks forward to a large public enjoying impressions of art, and a small public deeply studious of its history; Professor Goodyear is skeptical as to the æsthetic public, but hopes for a great increase in the number of the studious.

We hold no brief for either view, and are willing to believe that both sorts of museums have their value. But, clearly, the unwieldiness of modern collections plays into the hands of the anthologist. Wherever the number of pieces is too great for complete exhibition, the anthological idea holds. For example, print and coin departments rarely show more than a mere fraction of their treasures at one time. Resourceful curators in such departments ordinarily arrange a small permanent exhibition of the choicest pieces, and offer also periodical exhibitions from the reserve. This is precisely the policy advocated by Mr. Gilman and likely to be adopted by the Boston Museum of Fine Arts, when it moves into its new building. One may readily foresee a state of things where the general collections of museums will be as congested as the print rooms are from the outset. The cumbered state of such museums, the fatigue and distraction of their casual visitors, the increasing inconvenience of their overgrown and badly dispersed collections to investigators, will eloquently plead the cause of the selective idea.

THE COMMERCIAL CONQUEST OF SINALOA.

FUERTE, MEXICO, March, 1906.

In three years a subtle change has stolen into the life of Sinaloa. Where there was formerly vague talk of progress, with an occasional electric-lighting plant or municipal water-works adduced as an example, while knowing ones insisted on their superior knowledge of the time when the railroad from Chihuahua would reach Topolobampo, and when steel rails would entice the slumbering lead mines of Topia to activity, now there is nervous restlessness in the face of the actual fact that a great wave of industrial development is sweeping upon the State; that a railroad, with all the power and determination of the Southern Pacific Railway Company behind it, is actually being built through the fertile coastal plain; and that a well-financed land company is laying its hands upon the richest agricultural and grazing areas in the region. The effect of this, combined with the spectacle of in-rushing hordes of adventurers and investors, has been to disquiet a goodly portion of the people, who see in it, with more or less reason, the prospect of changes subversive of the old standards of living and threatening the existing social order. The wealthier classes, who hold the reins of power, number many who have travelled widely, have read much, and are not ignorant of the dominant habit of the Anglo-Saxon when he strikes deep root in a foreign soil. Already the foreign colony refers to this or that Mexican notable as being "anti-American," which is significant. The distrust of the impending commercial invasion has been communicated to the well-to-do masses, and the old-time cordial hospitality is less conspicuous than formerly, coupled with a sharp discrimination in prices, not to the advantage of the newcomer.

The working people—we may as well cease calling them *peones*, since even local usage is attaching the implication of a slur to the term—are indifferent to the ultimate results of the awakening which steam and labor-saving machinery, and their masters, may effect. They are conscious only that there is a keener competition for their services than formerly, and that this has raised the compensation from one hundred to two hundred per cent. At the same time the small planter has felt the scarcity of labor, and has raised his prices for corn and fodder and mules. The excessive rains which for two years past have damaged crops, are chiefly credited with the advance in prices, but this is only part of the truth. There is no doubt that the area under cultivation has declined because sufficient labor has not been available at the usual wages. It is difficult for the man used throughout his life to paying thirty to forty cents silver a day for ranch hands, to acquiesce in the demand for fifty cents to a dollar. He has not yet become as profoundly impressed as the common laborer with the urgent cry, from the mines in Sonora and across the Gulf of California at Santa Rosalía, for workmen, and ever more workmen, at two and a half to four dollars a day. He has not seen the shiploads of laborers disembarked at Santa Rosalía, nor the trains from Guaymas crowded with eager seekers after opulent rewards, hurrying towards Cananea, and he tries in vain to cling to the ancestral conditions while the formerly-contented workers around him are having their standards of values profoundly altered by the tales of riches so quickly won at the mines and in the service of the railroads. By not taking warning from the changes already wrought, he is thus widening the opportunity for the aggressive colonists who are coming to fill the gap.

The wiser heads perceive all this, and foresee its consequences. Hence the anti-American sentiment already noted as be-

ginning to spring up, the general increase in land values, and the unwillingness of many of the largest landholders to sell at any price. It will be hard to dispossess these sturdy Dons of their broad acres, though a multitude of the lesser ranchers must inevitably succumb. One device for their undoing is destined to hasten their catastrophe far beyond the effects of normal competition. Several years ago the Mexican Government granted a so-called survey concession to Don Luis Martinez de Castro, one of the most astute lawyers and politicians in the State of Sinaloa. The avowed purpose of this contract was to eliminate all faulty land titles, and to determine with exactness what lands were held by perfect title, all others then becoming *baldio*—that is, public and open to location. The concessionaire was accordingly required to survey, at his expense, all the lands of the State, and was given power to summon all landholders to produce their titles, in accordance with which and the laws touching the questions of *demasias* and *excedencias* * the boundaries were to be adjusted and permanently fixed and marked. The gaps thus discovered between neighboring estates would, of course, be *baldio*, as likewise would be all other lands to which perfect title could not be proved. In compensation for these services the concessionaire was to receive one-third of all lands declared *baldio* in the State, and to have the right to locate in accordance with the land laws as much more of such lands as he might choose. The only limitation of this right was that conceded to the original occupants of lands whose title proved faulty, whereby they might, within a specified time, rehabilitate their claim to ownership by purchasing the land back from the Government and the concessionaire at the Government price per hectare, which at present is $1.30 silver, or nearly 53 cents per acre.

This method of farming out a public function to an individual, whose self-interest would naturally cause him to subvert rather than sustain the old claims to title, is one with which the foreigner can have no quarrel, if it pleases the people who choose to adopt and submit to it. In fact, at the present time, it is operating distinctly in the interest of the foreigner, since this princely grant has been conveyed by the original concessionaire to the Sinaloa Land Company, a corporation financed and managed in the United States. Whether it pleases the people of Sinaloa is another question. It undoubtedly is acceptable to many who have valid titles, and its necessary effect in bringing order out of the existing chaos of conflicting pretensions to ownership can be only beneficial. It makes tremendously for financial stability and ultimate progress, but it is producing grievous distress among a large, industrious population, which finds itself threatened with reduction from a state of agricultural independence to one of complete dependence upon daily wage, or to possible tenancy under landlords.

To appreciate the opportunities for the acquisition of valuable lands through the operation of this survey concession, one needs to go back to the rise of an old institution in Mexico, which had the sanction of ancient usage in almost every country in Europe, with Far Eastern prototypes carrying the custom back into the unremembered past. This was the village community, from which so many of our common-law ideas as to *meum* and *tuum* are derived. In its essence it is a social solidarity, confirming by official instrument, in an extended and more highly differentiated form, the tribal relation of individual to individual and to the group. The rapid growth of the missions in Mexico among a people of sedentary habits, and the co-fraternity established in these groups, which were as essentially industrial as they were religious, tended naturally to just such a democracy as one of these village communities finally became. The recognition of absolute equality among all the members of a group was necessary as a means for discipline under that theocracy which the priests sought to establish, and in large part did maintain. Accordingly, royal letters-patent were issued to such groups of individuals for lands to be held and enjoyed *en mancomunidad*. A *fundo legal* of the "pueblo" was set aside, 1,200 *varas* square, with the village church in the centre, forever inallenable from the pueblo or community as a whole; a very close analogue to the old English village-green. Outside of this lay the *ejidos*, for residences and private gardens, and surrounding these in turn lay the *terrenos* for general agricultural and pastoral uses. The boundaries were determined by reference to well-known geographical features as landmarks, all duly set forth in the royal patents; but unfortunately these documents undertook to declare the areas of the lands included within the boundaries, which necessitated rude guesses at the distances between landmarks. In level country the errors need not have been very great, but in the mountains it was nearly all the result of surveying by the eye and the judgment of the observer, aided now and then by a compass. This laxity on the part of the *peritos* or estimators (we dare not call them surveyors) extended to all lands, so that in effect a recognition and certificate of landmarks was about the sum total of the benefits secured through their services. From this has arisen the conflict of boundaries which the recent survey concession is destined to remove. Whether copies of these ancient titles were kept in Spain or not, certain it is they were not recorded in Mexico. It was assumed that a man would guard his own. If he lost the very necessary royal charter to his ancestral acres, so much the worse for him, regardless of warfare, fire, and the "moth and rust" that doth corrupt. It probably assumed also that the Church was the greatest and most enduring fact in these communities, and that the priest, with his strong-box, was the natural protector of the people's interests; therefore, that the pueblos' titles would rest securely in the inviolable sanctity of the house of God. Such, in truth, is the view expressed by many a padre in his memoirs and correspondence.

To-day it is indeed a rare pueblo that has its priest; that does not see its church in ruins; that does not hunt in vain for its precious titles, or treasure some torn, discolored fragments, or perhaps a rude copy, lacking in some essential to establish its authenticity. Sometimes, in the last extremity, after loudly proclaiming "Tenemos los titulos ilesos" (We have the titles free from injury), they produce in court an unattested document, setting forth that such a one conveyed to such another his rights under a title, etc., giving dates and extracts perhaps from the original title, but insufficient to do more than establish what the universal testimony of all men for leagues around would have equally and better confirmed, viz., that the parties pretending to ownership had inherited from their immemorial ancestors lands recognized as theirs by virtue of an ancient royal grant. To the mind of the layman the existence of the pueblo, with its population so long rooted to the soil; the tradition in favor of inheritance from early ancestors who as a group received recognition of an ancient sort of tribal right to the soil, thus generously and justly confirmed by monarchs zealous, as all the world knows, for the welfare of their Indian subjects; the general assumption that the land is more likely to belong in strict justice to those who, as well as their fathers and grandfathers before them, were born and reared upon it, than to some one else who perhaps never even looked (unless perchance once or twice in envy) upon the soft beauty of its fertile *vegas* and swelling wooded uplands—to the mind of the layman these things are sufficiently conclusive, and he would know how to frame laws to protect helpless men and women and children in such rights. But the law flourishes in a realm of logic apart; and in the end, after the wave has swept over, others will come maintaining a tenure which will bear analysis under this inscrutable logic. After all, it is no more inscrutable than nature's disregard of the individual in the general scheme of racial development.

The immediate effect is that vast seeming injustice is to be done, people rendered homeless, desperate ones robbed by disreputable lawyers, who, instead of advising their clients to "agree with thine adversary quickly, whiles thou art in the way with him," will encourage them to cast aside the scanty relief which the law affords, in reliance upon a hopeless contest on flimsy documentary evidence of rights, exhausting the last dollar that had better have been paid out for a new title. Some of the *herederos* (for the owners of right in these pueblos are, in both common speech and in legal phrase, called heirs), have taken refuge in the arms of the money-lender, sacrificing large areas to protect their houses and garden plots, which, however, is the most rational procedure, under the circumstances, for those communities which are financially powerless.

The tide of foreign colonists is just setting in upon Sinaloa. It will be at full flood in about twelve months, by which time, the Yaqui, Guadalajara and Pacific Railway, as the Southern Pacific calls its west coast line, will be well on the way to Culiacan. It is now completed from Guaymas to Torin, on the Yaqui River, and is being built northward from Mazatlan at the same time. Shiploads of steel rails have arrived at Guaymas and Mazatlan, and other shiploads are afloat. It is significant that the Southern Pacific Company has found the cheapest market for steel rails for Mexico to be, not in the United

* See the *Nation*, vol. 77, No. 1993, p. 205.

States, but in the English-managed iron and steel works of Spain. It was widely reported at one time that the Gould interests were supplying the sinews for the Kansas City, Mexico and Orient Railway, which contemplates a trunk line from Kansas City to the splendid port of Topolobampo, of which a portion is now built in the United States, another section completed and operating on the central plateau of Mexico to the eastern base of the Sierra Madre, and a third section open for traffic from Topolobampo, sixty miles eastward to Fuerte. It is difficult to understand how such experienced railroad managers could have permitted so important a concession as that for a north-and-south coast line through the broad, fertile plain fronting the Gulf of California to escape them. It was a vital point in the success of the transcontinental railroad; necessary as a feeder, without which practically no through freight to and from the west coast can be expected to choose that route. The Southern Pacific has made a great strategic move in securing the concession. It makes that company master of the situation, able to develop one of the few rich virgin areas of large size north of the Isthmus of Tehuantepec, and to offer an outlet via Mazatlan, Tepic, and Guadalajara to the central plateau, the City of Mexico and Atlantic tide-water at Vera Cruz, and in the other direction via Guaymas, Mex., and Benson, Ariz., to the great transcontinental trunk line east and west.

The agricultural and mineral wealth of the territory thus controlled is enormous. It is a fair presumption that systematic advertisement of the region as one with lands as rich as, and a climate softer than, California will produce here a vast boom in real estate, and a crowding in of fugitives from Northern winters to revel in the balmy air, and to make merry amid the ideal beauties of rocky promontories and blue sea and dashing surf of Mazatlan, at once the most picturesque and salubrious port in the southern latitudes of North America.

COURTENAY DE KALB.

JAPAN'S FIRST POST-BELLUM BUDGET

TOKIO, April 24, 1906.

Let me begin this letter by saying that, misled by a usually trusty source, in my letter of March 31 I included in the list of foreign war loans a 4 per cent. 100-million loan which antedates the war. The part of war costs thereby balanced is covered by loans authorized in the new budget.

The Diet met on December 25, organized, was formally opened by the Emperor, and immediately adjourned till January 22. Meanwhile, the Ministry changed. The Katsura Cabinet, first organized as a makeshift, was the longest-lived and most eventful since the Constitution took effect. In war, it won the people's trust and praise. It became a victim of unpopular terms of peace. Deaf to rising clamors for an extra session of the Diet to let the nation share in plans for peace and fiscal readjustments, it meanwhile placed large foreign loans in July and November. After the "Portsmouth surrender," unwise police methods turned protests into riots. A late promise to convene the Diet on the return of the peace commissioner from Portsmouth endangered treaty ratification, and so, unkept, became a *faux pas*. After that, prolonged discussion and small concessions at Pekin brought more surprise and disappointment. Strong restraints on press and agitators kept firm the Ministry's grasp on Government, but acted as a ceaseless irritant. In time, the nation saw that Russia's vitals were safely wrapped in thousand-leagues, that "awakened China" is, like other States, a suspicious ingrate with new confidence of strength, and that some such terms at Portsmouth and Pekin were after all inevitable. Meanwhile cleavage between Ministry and nation became a chasm. Unusually late assembly and the long New Year vacation of the Diet allowed the Ministry unhindered to bring negotiations for ending war to a close. Then, even before Baron Komura was back from Pekin, it adroitly passed the reins of Government over to the Saionji Ministry, and so smoothed the way for post-bellum readjustments.

The change of Ministry before the Diet could strike a blow deftly dissipated a pent-up storm. Many things favored the smooth and rapid working of the Diet, and gave an amazing sum of legislative grist. The new premier, Marquis Saionji, enjoys the twofold prestige of liberal views and aristocratic associations. Successor of Marquis Ito as head of the Seiyukai (Friends of the Constitution), he was sure of devoted support by the strongest political party—for in Japanese politics personal attachments have greatest weight. By a catholic choice of colleagues, he avoided the resentment of those who oppose party government, and also conciliated a variety of influential interests. While others had sharply criticised the recent policy of the Katsura Cabinet, he kept an "open mind," and rather upheld the unpopular measures as unavoidable. Aid and sympathy, won by his tactful leadership, made expeditious and fruitful what was expected to be a stormy and intractable Diet.

In presenting and explaining the budget, both Premier and Finance Minister disarmed opposition by the frank avowal that the new Ministry had perforce adopted the budget of its predecessor, and so could be responsible only for its execution; that for want of time it had been unable to shape post-bellum plans for industrial and commercial expansion. In its main features, the budgetary scheme includes the budget proper, which is divided into ordinary and extraordinary parts; two supplementary budgets to cover deficits; a special supplement to complete the war budget, which is treated as a unit; a bill to continue the special war taxes; and a bill to create a sinking fund for extinguishing the war debts—the last two features being embodied in separate laws. With only slight changes, this scheme was made law. In the normal budget and in each supplementary budget, some part of the expenditures had been paid and some part of the loans placed by authority of Imperial decree. Furthermore, the war policy of economy by postponing public works of less urgent nature was continued, and the sums so saved were used to balance budgetary accounts. But, as much analysis and detail would be confusing, a summary statement of the main results will best show post-bellum fiscal measures and conditions.

The first supplementary budget covers, out of Treasury surplus, a war contingent fund deficit of 7.2 million yen for the last fiscal year. The second supplementary budget pays another deficit of 46.7 million yen, viz., 43.35 millions debt redemption paid from the last foreign loan, and 3.36 millions military pensions and sundry expenses paid from Treasury surplus. The war supplementary budget borrows 450.45 million yen to pay costs of repatriating troops, military and naval rewards, enterprises in Mantchuria and Korea, and deficits caused by rising prices. Of this sum, 88 millions had been borrowed, leaving only 362.45 millions to be placed. Furthermore, in connection with the purposes of the first supplementary and the war supplementary budgets, payments of 28.8 and 60 millions respectively had already been made by authority of Imperial decree, and so do not figure in the budgets. All the supplementary budgets were voted as proposed.

In the normal budget, the main change made in the Government proposals was a reduction of five millions in expenditures for army and navy restorations, and a corresponding reduction in the amount of loans required to balance the budget. As adopted by the Diet, the normal budget for 1906-07 balances thus:

	Revenue. Yen.	Expenditure. Yen.
Ordinary	391,186,958	354,925,475
Extraordinary	96,711,614	132,973,097
Total	487,898,572	487,898,572

The ordinary revenues are drawn from taxes, stamp and custom duties—together 278.3 millions; from Government enterprises and property 104.4 millions (tobacco monopoly 30.3 millions, salt monopoly 26.3 millions, railways 10.1 millions, posts and telegraphs 30.2 millions, forests 5 millions, convict labor 1 million), from interest and income from special funds 6 millions, from miscellaneous 2.5 millions. Extraordinary revenues include mainly 14.2 millions yielded by the sale of state properties, 2.2 millions taken from the forestry fund, 2.9 millions miscellaneous, and a balance of 75.8 millions raised by loans.

On the side of expenditure, the most striking fact is its increase. Put beside the average expenditures for the last three years before the war (1902-1904), the facts are (million yen):

	Yearly average. 1902-04.	Budget, 1906-07.	Increase.
Ordinary	167.1	354.9	187.8
Extraordinary	101.5	133.	31.5
Total	268.6	487.9	219.3

To the increase of ordinary expenditure the war added directly 172.5 million yen, viz., sinking fund for war-debt interest and redemption 110 millions, pensions and annuities 32 millions, expansion of the army 10 millions, for the navy 4.9 millions, posts and telegraphs in Korea and Mantchuria and Saghalien 1.7 millions, costs of salt monopoly and tax collection 14.5 millions. These expenses must continue thirty years or more. Of the extraordinary expenditure, the war gave rise to 79.5 millions, which go through a contingent fund to army and navy restorations (45 millions), establishment and maintenance of garrisons in Mantchuria and Korea (20 millions), and

sundry purposes. About 40 millions of this sum represent instalments on expenditures which must continue for at least six years. Other extraordinary expenditures are likewise of a recurring nature. Hence the normal budget of the next six years, if constructed on the basis of the present budget, would require at least 93 million yen yearly extraordinary expenditure, thus making a prospective yearly total expenditure of 447.9 million yen, *i. e.*, an excess over the average for the years 1902-1904 of 179.3 millions. With no change of revenues, that would mean after this year a yawning deficit of some 50 millions.

But in fact the present budget was constructed mainly on the basis of retrenchment adopted during the war. For new subsidies and enterprises and for resuming works suspended in the war, it appropriates only about 10 million yen. Besides, the schemes for post-bellum industrial and commercial expansion—long and much talked about—are promised by the Ministry for the next session of the Diet, and they must entail enlarged expenditures. Finally, the capital of the permanent funds which was used for the war should by law be restored. The Finance Minister informed the Diet that the Government could not now see its way to replenish those funds. Presumably, it will soon try to do so. In the face of all these facts, increase seems more likely than any reduction of expenditures in the next few years. Meanwhile, the 16 millions this year obtained from the sale of war prizes will in the future fall away from the present amount of extraordinary income. Also, a loan of 75.8 million yen was needed to balance the present normal budget.

In brief, the financial situation presented to the Diet in the budgetary scheme was this. The war adds to the bonded debt over 1,800 million yen, with yearly interest charges (after proposed conversions are made) of 82¼ millions. To pay this interest and cancel the principal, the Government proposed to set aside a yearly sum of 110 millions as a sinking fund. War pensions and annuities, military expansion and other new needs require an additional yearly recurring sum of 62.5 millions. As a resource to meet this 172.5 millions of yearly recurring expenditure, it was proposed to perpetuate the new and increased war taxes, with an expanded yield of about 160 millions, and to draw the remaining 12.5 millions from the Treasury surplus. Again, in the extraordinary part of the normal budget, the war causes an expenditure of 79.5 million yen for army and navy restorations, for creation and maintenance of garrisons abroad and sundry purposes. For this year, that expense is covered by sums obtained from the sale of war prizes and by loans. But about 40 millions of this sum must recur yearly for six years, and no source of revenue now exists to cover it after this year. The net result therefore is, that the normal budget this year could be balanced only by borrowing 75.8 million yen, and that at least 40 millions of the sum so covered must recur yearly for six years. But, from the normal budget so balanced, the continued policy of retrenchment has eliminated the less urgent expenditures by postponing the execution of works for which they were planned. Furthermore, it is commonly understood that schemes for post-bellum expansion, involving new and additional expenditures, must be adopted by the next year's Diet.

The whole scheme thus outlined is now law, but it was a big and bitter pill. In three points especially it was assailed by Diet and press, viz., the creation of a sinking fund, the continuation of the war taxes, and the resort to loans for balancing the normal budget. The sinking fund of 110 millions is solely to pay interest, and in about thirty years to cancel the principal of the war debt. Many thought it unwise thus to pledge a yearly sum equal to 65 per cent. of the whole ordinary revenue just before the war. It would hamper fiscal administration, put on the people unduly heavy burdens, surrender control of resources which might at times be more advantageously used, restrict the power by limiting the means for post-bellum expansion. Such an engagement now was hasty, because fiscal readjustments are not yet clear and settled. Worst of all was the means to maintain the sinking fund, viz., to continue the hastily devised and temporary war taxes *en bloc*, and still to balance the normal budget with new loans—a course that would injure the nation's credit more than the sinking fund would raise it. Finally, the Opposition was irritated by the report that the Government had, without authority of the Diet, through its financial agent in England, stated its intention thus to deal with the war debt. Against perpetuation of the war taxes, it was urged that they were hastily devised and contained some specially bad features; that the nation accepted them with slight consideration or discussion, from patriotic motives and because of the clear provision that they should end within a stated time after the end of war; that to continue them without revision was to break faith with the people after their loyal support of the war, and deliberately to fix on a heavily taxed people a radically bad scheme of taxes. Finally, the critics argued that the Ministry props up its bad financial scheme by balancing the normal budget with loans which seemingly must be recurrent. Hence, in their opinion, the sinking fund to maintain the nation's credit rests partly on a bad tax system and partly on recurrent loans. In short, the Government proposes to pay its debts and provide means for expansion by making more debts. This leads Count Okuma and others to deprecate "the present Government's loan policy."

In reply to anxious questions in committee—for there and in party councils the struggle was decided—the Government said that the sinking fund was absolutely necessary to maintain national credit, especially with foreigners; that it would be efficacious in doing so; that such maintenance of credit was needful both to bear the war burdens and to get means for future expansion; that continuation of the war taxes was an indispensable support for the sinking fund and other new expenditures; that the Government would seek new sources of revenue to substitute for loans in the future normal budget; that, while the Government regretted the necessity of both measures, there was no other way out of the present situation; that therefore the creation of a sinking fund and the continuation of the war taxes were the main basis of the present budget and of future financial policy. The Government pressed these measures with all its power, and it was rumored that their failure would cause the Finance Minister to resign. Strong elements of opposition in all the political parties brought, as usual, a compromise. The Lower House agreed to pass the measures. The Ministry agreed to appoint a comprehensively representative tax commission which should make exhaustive investigation and report within two years a scheme for tax revision, the Ministry to ask this Diet for an appropriation to pay the costs. The appropriation to pay the costs of a tax commission was, however, rejected by the Upper House. Meanwhile the budgetary scheme became law. This is in itself a feat, for Japan's budget is usually born in travail—sometimes with the aid of the Emperor's prestige; and sometimes it is still-born, being, by constitutional provision for failure of the Diet to act, merely a continuation of the last year's budget.

A few other facts will complete the survey of Japan's financial condition as shaped by the new budget. After deducting from the loans authorized in normal and all supplementary budgets those which had already been raised, there remained a total of about 425 million yen to be borrowed. The Finance Minister hinted that the indemnity receivable from Russia for prisoners' maintenance might be used to reduce this sum. But, assuming that the whole 425 millions are floated at 5 per cent. at home, then Japan's national debt will by present plans take this approximate form:

DEBT GROWING OUT OF THE WAR WITH RUSSIA.

	Amount (million yen).	Yearly interest (million yen).
Foreign bonds @4½%	600.	27.
Foreign bonds @4%	500.	20.
Home bonds @5%	705.	35.25
Total war debt	1,805.	82.25

DEBT NOT CONNECTED WITH THE RECENT WAR.

Foreign bonds @4%	100.	4.
Home bonds @5%.....about	475.	23.75
Total of other debt	575.	27.75
Grand total national debt..	2,380.	100.00

Of the above debt not connected with the war, two blocks of "Home bonds" aggregating 93 millions were in the past sold in London. Of the war debt, "Home" 6 per cents, which are being converted into 5 per cents, were sold abroad to the amount of about 130 million yen. The new sinking fund to deal with the new war debt and other existing provisions to pay the debt not connected with the recent war will if the plans are carried out, extinguish the whole national debt within the next thirty-five years.

To sum up, Japan's first post-bellum inventory shows, as liabilities, her debt quadrupled by a net addition of 1,800 million yen, her yearly expenditures almost doubled, most revenue organs hard-worked, her financiers still seeking some needful revenue resources. As assets, she finds still growing trade and industries, a larger field with much natural wealth, release from some overhanging dangers, an alert Government and people, a new national consciousness, credit and prestige. For her, the fruits of war weigh heavily in both scales.

E. H. VICKERS.

Notes.

We learn, pleasurably for the author's sake, that Mr. James Ford Rhodes's great task, a history of the United States from 1850, is now closed with two final volumes which will appear in November (Macmillan). As it stands and may stand, it covers a little more than a quarter of a century, for Mr. Rbodes has receded from his original intention to make 1885 his goal, and ends instead with 1877—that is to say, with the culmination of tbe reform movement which thwarted Grant's third-term adventure, which signally revived in 1884 and again in 1892, and bas since been nearly dormant except sporadically.

A new translation of the Arabic fables known as the 'Kalilah wa Dimnah' is at present in course of preparation by Prof. Morris Jastrow, jr., of the University of Pennsylvania, together with two of his students, thc Rev. William J. Hinke and Mr. Ellwood Austin Welden. Though the work is rapidly progressing, the book can scarcely be finished before a year or so. The authors expect to make a comparison of the text of the Beirut edition, on which their translation is based, with the other Arabic versions, and later to compare the Arabic with the Sanskrit, Syriac, and Hebrew's recensions. The book, when completed, will make two volumes, the first being devoted exclusively to the translation, and the second containing a general introduction, together with notes and illustrative material bearing on the text.

The University of Chicago Press is on the point of publishing 'The Legislative History of Naturalization in the United States,' by Frank George Franklin.

'The Mother of Clubs: Caroline M. Seymour Severance: An Estimate and an Appreciation,' edited by Ellen Giles Ruddy, will issue from the Baumgardt Publishing Company, Los Angeles, Cal.

The "World's Classics" of tbe Oxford University Press are to be augmented by a thin-paper pocket edition of Shakspere in seven volumes or thereabouts, the text edited by Mr. Watts-Dunton, who supplies also a preface and a bibliography to each play, while Mr. Swinburne will give an introductory discourse on Shakspere and his art. A part of the set will appear in the autumn.

Tbe seeker after out-of-the-way knowledge will find much satisfaction in the 'Allegations for Marriage Licenses Issued by the Commissary Court of Surrey between 1673 and 1770,' transcribed from the original documents. Of tbe said allegations, those dating from the year 1674 to the year 1692 are bound up in a volume preserved in the Faculty Office; for all the later ones it has been necessary to examine the original records, many of them in a very dirty and dilapidated state. It is reckoned that there must be at least 9,800 of them in the MS. and not less than 20,000 names. The contracting parties appear to have belonged to every rank in social life, almost every town and village in Surrey being represented. A large number of the names known in past times in the Surrey parishes will be found in tbe collection. The book will be put out by Messrs. Goose & Son, No. 19 Rampart Horse Street, Norwich, in an edition limited to 100 copies.

Forewarned, forearmed. The first-fruits of the lesson taught by the destructive fire in the Library of the University of Turin is a facsimile reproduction of a surviving codex, 'Il Messale Miniato del Card. Nicolò Roselli (detto il Cardinale d'Aragona).' The prospectus of this enterprise, which is under the direction of the Royal Academy of Sciences of Turin, proceeds from the firm of Fratelli Bocca in that city (New York; Lemcke & Buechner). The reproduction promises to be in all respects generous, as befits a codex of such importance in the history of miniature illumination.

A second edition of Thomas Gold Frost's 'Incorporation and Organization of Corporations' (Boston: Little, Brown & Co.) brings the book—a very good one for its purpose—down to January 1, 1906 (it was in 1905 that the first edition appeared). What has made a new edition necessary has been "the material changes made in the Business Corporation Acts" by State legislatures in a single winter. The author has revised his forms and added five hundred cases. His Digest of Incorporation Acts covers one-third of the book; it begins to look, therefore, as if an annual reissue would be called for. One of the White Man's most serious burdens is his State legislatures. It is, of course, monstrous that incorporation acts should be continually overhauled and changed as they are—frequently in the interest of jobbery. A rational and well-drawn act ought to last for a generation at least.

'Fiscal Reform: Speeches delivered by tbe Right Hon. Arthur James Balfour, M.P., from June, 1880, to December, 1905' (Longmans), betrays further on in the title the politico-controversial quality which pertains to this volume of nearly 300 pages. It embodies, to wit, also "a reprint of the pamphlet 'Economic Notes on Insular Free Trade,' and letters from and to the Right Hon. J. Chamberlain, M.P. (September, 1903)." The author offers it as a time-saving work of reference, and while it would suggest and bear a great deal of comment, we think none is necessary. Its place is in the hands of party men in England and in libraries generally.

Similar remarks are in order respecting 'Lord Curzon in India: Being a Selection from his Speeches as Viceroy and Governor-General of India, 1898-1905' (Macmillan), which has, what is lacking in Mr. Balfour's collection, explanatory notes, an index, and a portrait. Tbis volume is much larger, too—of double the size, in fact, and is more manifestly a displaced statesman's apologia. Lord Curzon's political future, granted health, is likely to outshine Mr. Balfour's. His selected speeches are for those who have to reckon with him in domestic politics, and again for all libraries.

Mrs. Elizabetb (Robinson) Montagu (1720-1800) was a great lady in London, where she had a salon, knew everybody, and was called "Queen of the Bluestockings." In 1742 she married Edward Montagu, who died in 1775; he and the husband of the more famous Lady Mary Wortley Montagu were cousins. Elizabeth has a small place in literary history as author of an Essay on Shakspere (1769), answering Voltaire, and of three "Dialogues of the Dead" in Lord Lyttelton's book, but chiefly by four volumes of her Letters, published in 1810 and 1813 by her nepbew, Lord Rokeby. Her great-great niece, Mrs. Emily J. Climenson, has now edited, with great diligence, her correspondence to 1761, and so much more than edited it that the two handsome and liberally illustrated volumes (E. P. Dutton & Co.) might be styled a memoir. According to this filial biograpber, her subject was a wholly admirable person, "purest of the pure," beloved by her dependents, and "adored by men of all opinions." "She was one of the first people to institute Sunday schools. She was as interested in Betty's rheumatism as she was in the conversation of a duke or a ducbess; a discussion with bishops and Gilbert West on religion, or with Emerson on mathematics, or Elizabeth Carter on Epictetus, all came alike to her gifted nature." Yet this publication will hardly add to her laurels, for, though it contains letters from Burke, Johnson, Sterne, Young, and other eminences, it offers little beyond everyday gossip. Thus, the numerous references to Conyers Middleton, his books and his wives, include nothing more vital than his deathbed comment on the uselessness of medicines, and Mrs. Montagu's complaint (1751) of "an insolence in the booksellers, . . . a set of wretches that live by other people's wits," in proposing to print by subscription his works, for which they had paid his widow £300. More elaborate is this sarcasm (1740) on ber connection, Lady Mary: "She is a woman of great family merit; she has banished her children, abandoned her husband." Mrs. Climenson has all her great-great aunt's letters (between 7,000 and 10,000), enough to fill "a large bookcase" if printed entire. As she intends to handle the rest of them (probably the great majority) from 1761 to 1800, we may bope it will be done with stern compression.

The latest issue of "Newnes' Art Library" (Frederick Warne & Co.), devoted to Fra Angelico, is true to type. There are the usual large number of fairly good reproductions of works by the artist and tbe usual unimportant text, and there is no perceptible improvement in arrangement. It will be neither more nor less useful than its predecessors.

'The Drawings of David Cox,' as published in the Newnes-Scribner "Modern Master Draughtsmen," will hardly add to the reputation of an artist already much overrated, at least in England. As a man, Cox was deserving of affection and admiration, but his art is only a *bon ordinaire*.

Cox is one of "The English Water Color Painters" treated of by A. J. Finberg in his little book on that subject in the Duckworth-Dutton "Popular Library of Art," and Mr. Finberg treats him sanely, but the author's remarks about Turner are more novel. Briefly, he maintains that much of Turner's later work was dominated by tbe desire for immediate effectiveness; that it made him vastly popular and successful at the expense of some of the finer qualities of his art; and that it is as far as possible from being the natural expression of his personality indulged in in spite of public misunderstanding. "He wishes either to conciliate, or to astonish, or to flout his audience," and produced little work of pure inspiration, most of it being tinged with wilfulness and theatricality. The illustrations tend to reinforce the judgment of the reviewer that, taken all in all, John Sell Cotman was tbe finest artist among English landscape painters.

Those who may wish to know what the art of Goya was like, and why he is so much talked of, will find little to their purpose in Richard Muther's monograph in the Langham series (Scribners). There is a good deal about Goya's relations to politics and history, something about his personal character, a little about his relation to earlier and later painters, but nothing that gives any idea of his methods of painting, his technical merits or defects, the essential qualities of his work. It is a book about a painter, but not about painting.

'Jerome Bonaparte,' by Philip W. Sergeant, B.A. (Brentano's), is a work made up from the best-known sources for this subject. Jerome had most of the Bonaparte defects and few of the Bonaparte virtues. Mr. Sergeant writes only for the general public, but his literary powers are not sufficient to impart freshness or interest to such a personage. The author appears capable of better work.

Dr. Hyslop's 'Enigmas of Psychical Research' (Boston: H. B. Turner & Co.) is essentially a compilation from the records of the Society for Psychical Research, interspersed with censures on the apathy of the religious and on a generation which remains stubbornly indifferent and unwilling to consider these matters scientifically. For the rest, the book has the well-known qualities of Dr. Hyslop's work, which are not precisely calculated to stir the masses. It may be hoped, nevertheless, that he may be more successful in raising a permanent endowment for the scientific prosecution of these researches than the British Society, which has not yet collected the $40,000 it demanded as a minimum.

The 'Robert Louis Stevenson Reader' compiled by Catherine T. Bryce, an Eastern primary-school teacher, will find acceptance outside the schoolroom. It is a mixture of simplified Stevenson biography and of his children's poems. The numerous illustrations in color are anonymous, but successfully catch the Willcox-Smith and Greenaway manner and are truly decorative.

A useful and suggestive list of books for boys and girls about gardening is appended to the May Bulletin of the Boston Public Library. It includes the making and care of gardens, a few stories and poems, as, Celia Thaxter's "My Island Garden," famous works containing descriptions of them, as, Homer's account of a Greek garden in the Odyssey and Hawthorne's of an American garden in 'The Old Manse,' and the leading American works on school gardens.

Three years ago, Messrs. Dodd, Mead & Co. put forth a blank book for original memoranda and for critical quotations called 'Plays I Have Seen'—a record over which (if the playgoing was indiscriminate) the maker might gloat or blush, like Pepys, in secret. Now the same firm issues in corresponding shape a ruled tabular blank-book for 'Magazine Articles I Have Read.' The sections are classified by topics, and for those who feel the need of this sort of aid to memory it will be just the sort of aid they will like. The duodecimo volume is neatly bound in green cloth.

The last number of the *Archæologia*, the tracts of the Antiquaries of London, contains a particularly interesting series of articles. Four relate to things Roman or Romano-British, viz., the account of the Excavations at Silchester for 1903 and 1904, by Mr. St. John Hope and Mr. George Fox, Mr. Ashby's account of those at Caerwent (Venta Silurum) for 1904, "The Linares Bas-relief and Roman Mining Operations in Baetica," by Mr. Horace Sandars, and Mr. Fox's "Notes on Some Probable Traces of Roman Fulling in Britain." There are two on English churches, viz., Mr. Cheales's description of the Wall-paintings in All Saints', Friskney, Lincolnshire, and Mr. Webb's "Notes on the Augustinian Priory of St. Bartholomew, West Smithfield"; there is a paper on the price of Judas, "The Thirty Pieces of Silver" and the part they played in mediæval legend, by M. G. F. Hill; a paper by Mr. Clement Reid on the Island of Ictis and the Ancient Trade-routes to Britain, etc., etc. Most striking of all is Doctor A. J. Evans's account of the Prehistoric Tombs of Knossos, making up a third of the whole volume. This number (vol. 59, part 2), like all the Society's publications, is profusely illustrated.

A study of the situation in the Far East resulting from the recent war, and one to be warmly commended, is that of M. Louis Aubert, 'Paix Japonaise' (Paris: Armand Colin). One might nearly guess that the author has been a student of the École des Sciences Politiques from the care and thoroughness of his method and from the impartiality of his point of view. He allows no preconception of Japanese altruism to run away with his judgment, but, by copious quotations from Japanese statesmen and publicists, draws reasonable conclusions as to the near future of the East. If for a policy of a "Japanese peace" of the Orient the author had substituted a policy of "Hands off, Europe," he might have been a shade closer the mark, but he would also have missed a good title for a good book. American commercial and political relations with the Far East are treated in chapters on "Japanese and Americans" and "The Struggle for the Pacific."

We have received and, what is more, examined with interest and profit the 'Catalogo Completo' of the publications of the firm of Ulrico Hoepli in Milan, from 1871-1905. The first date is that of the year following the enterprising Switzer's arrival in Milan, and with a just pride he gives the chronology of his "vita editoriale libraria," with all the appointments, decorations, and royal gifts which have attested his merit. Another shows his small beginning with two volumes in 1871, and his output of 144 in 1904 (in 1897, 157). Next follows a list, year by year, and month by month, of editions from July, 1896, to May, 1905, complementary to a similar one for the first twenty-five years in Hoepli's jubilee catalogue (1896). An author-catalogue succeeds, and finally a classed subject-catalogue. The volume well betokens the compiler's sense of his honorable profession. Among his clients have been Rosmini, Scartazzini, Beltrami, Gubernatis, Lanciani, Fogazzaro, Leo XIII. and Cardinal Mai, Luzzatti, G. Negri, Schiaparelli, and Villari. There is a notable line of manuals, dictionaries, and "libraries"; and juvenile books even of "indestructible" make are not *infra dig.* with this house.

To the energetic bibliographical publisher H. W. Wilson, in Minneapolis, belongs the honor of having given American librarians for the first time an adequate and convenient record of their professional literature. The first (April) number of his new periodical, *Library Work*, contains a "Bibliography and Digest of Current Library Literature" for the year 1905. Eventually the material will be cumulated, and it seems to be the publisher's intention to cover some day the literature of past years also. A large number of the titles are accompanied by excerpts or summaries. In addition to this, the number before us contains various notes and news of interest to librarians, and a short account of the H. W. Wilson Company, with pictures of its new building. *Library Work* is sent free to librarians on request.

The *Library* for April is a Shakspere number. It opens with some "Notes and Additions" to Mr. Sidney Lee's Census of Copies of the First Folio, by Mr. Lee himself. Fourteen new copies have come to his knowledge since 1902, making a total of 172 copies now known to be extant. One of the new copies was in this country in 1902, five more have followed since. In all, 61 copies of the First Folio are in America at the present time, and Mr. Lee predicts that about 1915 there will be as many copies here as in Great Britain. As he already has announced in the *Athenæum*, the copy which is now the property of Mrs. Leiter in Washington (No. LIII. in the Census) is really a perfect copy; the preliminary leaf headed "A Catalogue of the Severall Comedies, Histories, and Tragedies contained in this volume" being not missing, but bound in an unusual place. Among the other articles we might mention Mr. H. R. Plomer's story of the vicissitudes of the "Printers of Shakspere's Plays and Poems," all, or nearly all, of whom seem to have been given to illicit printing, and Mr. Arundel Esdaile's survey of the most important Shaksperian publications of the years 1091 to 1905, numbering nearly 170, with upwards of forty editions and translations of his works.

The San Francisco earthquake is the prominent subject treated in the *National Geographic Magazine* for May. Mr. F. L. Ransome, of the United States Geological Survey, gives his reasons for believing that it was of tectonic origin. He sketches the geological history of California, and maintains, from the frequency of quakes—there were 768 shocks in California from 1850 to 1886, of which 254 were recorded in San Francisco—that the Coast Range is young and still growing. Hence the region, which is cut by long north-northwest faults into narrow blocks that are in turn traversed by many minor dislocations, is in unstable equilibrium. "Under the operation of the unknown forces of elevation and subsidence, stresses are set up which finally overcome the adhesion of the opposing walls of one or more of the fault fissures, an abrupt slip of a few inches or a few feet takes place, and an earthquake results." The records of the earthquake written by the seismographs at Washington and Cheltenham, Md., are also described, from which it appears that the time taken for the waves to cross the continent, 2,450 miles, was 6 minutes and 46 seconds. Mr. H. L. Bridgman gives an account of a voyage up the Nile to the head of navigation, Gondokoro, the most novel part of which was the passage through the sudd. He received a very fa-

vorahle impression of the country under Anglo-Egyptian rule, and prophesies a prosperous future from the inexhaustihle richness of the soil and adaptiveness for raising cotton, wheat, cane, ruhher, and tropical fruits. The remaining articles are upon the recent eruption of Vesuvius and the spring "hreak-up" of the ice of the Yukon.

An International Type-Facsimile Society ("Gesellschaft für Typenkunde des 15 Jahrhunderts") has recently heen formed with Dr. K. Haehler of Dresden, Dr. E. Voûlième of Berlin, Dr. H. O. Lange of Copenhagen, and Dr. I. Collijn of Upsala among the leading spirits. The purpose of the Society is to issue facsimiles of the types of as many incunabula as is practicahle, giving two facsimiles for each type—Firstly, one full page of each in the original size, containing the M- or Qu-form on which Dr. Haehler hased his classification in the 'Typenrepertorium,' and also a set of facsimiles of as many of the letters of the alphabet used as possihle. Each member of the Society will have the right to ask for the inclusion of one facsimile. The annual fee is not expected to exceed 25 marks. The life-membership fee is 500 marks. The treasurer is the hookseller, Rudolf Haupt, in Halle a. S., who will handle the puhlications of the Society.

The expedition fever has taken hold even of Switzerland, notwithstanding its inland position. The privat-docent of zoölogy in the University of Bern, Dr. Walter Volz, will head an exploring expedition into the practically unknown Hinterland of Liheria, penetrating from Sierra Leone. The funds are furnished by the Geographical Societies of Switzerland, and the purposes in view are as much commercial and industrial as ethnographical and geographical. The scientific collections are to hecome the property of the museums of the Repuhlic.

The first of the North German universities to agree to the matriculation of women is Jena, the territorial institution of the Thuringian States. Women are to be admitted to all the faculties. As is well known, only the six universities of South Germany have hitherto consented to this innovation, while those which in scholarship and prestige stand highest in the Empire, namely, Prussia's, are almost aggressively hostile to it. Not a few of the professors in these universities, in the list of courses offered, expressly advertise the fact that women will *not* he admitted to their lectures. Still, even here the ice is gradually hreaking. The authorities in Berlin have announced that hereafter women students need no longer secure the special permission of each docent to attend his lectures, except in cases where the professor has especially announced that such permission is indispensahle. In the office or "Quaestur" a list is displayed of those who do and those who do not admit women. Leipzig, again, has just decided that, heginning with the present summer semester, women, with the proper *testimonium maturitatis*, may he matriculated, hut they will not be admitted to examinations in the law and the theological departments.

—The third volume of Smyth's Writings of Benjamin Franklin (Macmillan) continues the chronological development of Franklin's career as scientist and politician. His activities in this period, 1753-1759, were many. The Academy was a favored scheme until it ran down under Dr. Smith, against whom Franklin had a grievance. Electricity, water-spouts, and house-heating gave rise to many an experiment and homely examples in illustration of his fondness for theorizing. The Almanac appeared regularly, and the immortal 'Way to Wealth' was thrown together in 1758. As postmaster, Franklin gained influence and favored his newspaper; as a puhlic man, he supported a militia law, opposed the claims of the proprietaries to he exempt from taxes, and drew up a plan of union for the colonies. He was sent to England to present the case of Pennsylvania, and the letters written to his wife during this visit are among the most characteristic in the book. The description of an outfit needed by a printer in 1753 is of high interest, and it is shown that Franklin was interested in printing-offices from Antigua to Boston, aiding his nephew Mecom in the West Indies and Parker in New England. The editing is well done, and only one slip attracts notice—a variation in the spelling of the name Lutwidge. Mr. Smyth's resort to the original manuscripts shows that former editors have made one letter from extracts of two or more papers, and our editor has proved in more than one instance that matter has been omitted for no good reason, and that a draft is fuller than the letter as sent. Corrections in names and dates enhance the value of this edition.

—'The Transactions of the Royal Historical Society' (vol. xix., new series) for 1905 contains, besides the presidential address, some eleven research papers communicated hy as many investigators. The retiring president, Dr. G. W. Prothero, delivered his farewell on February 16, 1905, his central theme heing the relation of history to hoth literature and science. In general his attitude is a well-halanced reaction against the ultra-scientific conception of history. The gist of his contention is that "a well-written hook is a work of art; and the writing of history partakes at least as much of art as of science. If it is said that history is science, I reply that history is *not* science, and never can be science in the proper sense of that word—the sense that applies to astronomy, to physics, or to hiology—the sense that differentiates science from knowledge. I grant that the preliminary processes are scientific, or rather semi-scientific; for ahsolutely scientific they can never be. . . . But in compacting these results into a finished whole, in laying them before the reader, we pass into another field—the field of art" (p. 20). The somewhat labored conclusion is sound enough, if not exactly original. Incidentally Dr. Prothero lets drop the interesting remark that competent historical scholars would, for the most part, name Gihhon as "the greatest of modern historians."

—It so happens that of the eleven monographs contained in this volume the two from women's pens are of peculiar interest. Miss Enid Routh recounts from documentary sources the English occupation of Tangier (1661-1683), and the story sounds like an early Philippine experiment in miniature. Pepys's sententious remark is cited: "It is plain that we do overspend our revenue; it is of no more profit to the kingdom than it was the first day . . . no more people of condition willing to live there, nor anything like a place likely to turn his majesty to account; it hath heen hitherto, and for aught I can see likely only to be, used as a joh to do a kindness to some lord, or he that can get to be governor" (p. 70). This has a very modern ring. Miss E. M. Leonard discusses the inclosure of common fields in the seventeenth century, and insists that this process, instead of heing temporarily arrested in that period, was continuous. A curious hit of hiography is rescued for us in the Rev. J. Neville Figgis's paper on the mediæval jurist, Bartolus (h. 1313). The claim is made that it was Bartolus and not Grotius who is the real source of International Law. The scholastic hent of Bartolus is well illustrated in the story recounted of his legal discussion of the property rights of Lazarus after he rose from the dead. The part that Americans are taking in the investigation of English history is shown hy the fact that one of these eleven monographs—that on the Beginning of the King's Council—is the work of Prof. James F. Baldwin, associate professor of history at Vassar; while the Report of the Council makes mention of the recent presentation hefore the Society of a paper on The Midland Revolt and the Inquisitions of Depopulation of 1607, hy Prof. Edwin F. Gay of Harvard, and also of the impending issue of 'The Minute-Book of a Preshyterian Classis in the Reign of Elizaheth,' edited hy Roland G. Usher, a Ph.D. of the same university, already reviewed in these columns.

—Dr. Grenfell and Dr. Hunt, the Oxford scholars who from the first have heen in charge of the field-work of the Græco-Roman branch of the Egypt Exploration Fund, and have proved themselves as skilful in editing as they are expert in finding ancient papyrus documents, have recently made an informal preliminary report of the results of their excavations during last winter and the early spring, at Oxyrhynchus. They report the most remarkahle discovery yet made of literary papyri, with dates ranging from the second century B. C. to the sixth century of our era. In a Roman mound a heap of hroken literary papyrus rolls was discovered. Amid hundreds of smaller fragments there were a couple of cores of rolls, each containing ten or twelve columns, several pieces containing five or six, and many containing one or two. One of the longer pieces contains ahout 150 verses of Pindar's pæans, with the authorship proved hy a coincidence with an already known Pindaric fragment. The text is accompanied hy elahorate explanatory scholia. Another long poetical fragment is from the lost play, "Hypsipyle," hy Euripides. Of the prose MSS. several belong to extant works of Plato, Demosthenes, Lysias, and Isocrates. The most valuahle of the prose pieces is part of an unknown history of Greece, possibly by Ephorus or Theopompus. Another prose text is part of a commentary on the second book of Thucydides, different from the extant scholia. In another Roman mound, fragments were

found of a library of which the owner had been interested in the lyric poets, and seems to have owned two or three MSS. of Sappho's poems, as well as one of Bacchylides. One of these fragments of papyrus contains more than seventy lines of Cercidas, of whom only fourteen lines were known before. A Byzantine mound yielded a vellum leaf (forty-five lines in all) from a MS. of a lost gospel, telling of the visit of Jesus with his disciples to the temple at Jerusalem, and their meeting with a Pharisee, who reproaches them with their failure to perform the necessary ceremonies of purification before entering the holy place, and describes in some detail the formalities which he himself had observed. The question of the nature and value of the gospel to which this fragment belongs, is likely to provoke much controversy.

—We will add that American scholars and libraries have not given to the Græco-Roman branch of the Egypt Exploration Fund the support which it deserves and might expect. It has published already in six volumes about a thousand documents of the Ptolemaic and Roman periods in Egypt, of high importance for philological criticism and for historical and archæological studies; each document being provided with introduction, commentary, and translation. Now we learn of the most important discovery of all. Another season's work of exploration remains to be done at Oxyrhynchus, and subscriptions to the fund are urgently needed. The concession for excavation closes next year. The volume containing the documents just discovered is expected to be published in the summer of 1907, and will be sent to all subscribers to the fund. The double volume of Hibeh papyri will be ready in a few weeks. Annual subscriptions (five dollars) may be sent to the secretary of the Fund, Miss Grace I. Gay, Pierce building, Copley Square, Boston.

—A third collection of historical portraits, this time of the worthies of the eighteenth century, is on view at Oxford. In the earlier portion of the series are specimens from the brush of Sir Godfrey Kneller (*e. g.*, his portraits of Addison, of Trelawney, of Atterbury, etc.), and others of the foreigners by whom English art was largely dominated at this period, side by side with works by a younger school, essentially English in spirit and style. Chief of this prosaic but most praiseworthy band was Jonathan Richardson, represented here by his portraits of Matthew Prior (Nos. 14 and 15) and of Hans Sloane (65). He was followed by Thomas Hudson—his Archbishop Potter (64) is a magnificent figure—and by such excellent portrait painters as William Hoare (George Grenville, 81) and Joseph Highmore (Edward Young, 77). The first, however, to shake off the tyranny of Kneller and the fashion of the "face-painter" was Hogarth. Number 83, representing an "Assembly of Artists," is from his hand. Had it not been for him and Hudson's great pupil, Sir Joshua Reynolds, the British school would most probably have died a natural death. The work of Reynolds and of Gainsborough, Romney, Hoppner, Lawrence, the other great figures of the golden age of British portrait-painting, not to mention that of a number of other artists only inferior to these, is splendidly exemplified in the latter half of the collection. Among the masterpieces are Sir Joshua's portraits of the poet Warton, of Lord Rokeby, of Archbishop Markham, and the famous Gibbon lent by Lord Rosebery; so, too, are Romney's Warden Oglander and John Wesley, Gainsborough's Doctor Buckler, and Lawrence's Lord Auckland, an astonishing performance for a youth of twenty-two. A word of mention must be given to the portrait of the Duke of Portland, by the American Benjamin West, and to the George III. and Queen Charlotte Sophia of the Scotchman, Allan Ramsay, who won court favor despite the claims of Sir Joshua.

—Taking it as a whole, the exhibition of this year compares more than favorably with those of 1904 and 1905. The persons represented, ecclesiastics, judges, doctors, statesmen, soldiers, are no less distinguished, while the works of art are far more attractive and more varied. Not only so, but, with the exception of three portraits of Gibbon—we have already mentioned the Reynolds—all these fine pictures have been brought together from the halls, common-rooms, and official buildings of this one university. The catalogue, as usual, is excellent; Mr. Cust's introduction is valuable, and the notes on the pictures, with their racy morsels from Hearne, Wraxall, Walpole, etc., are capital reading. An illustrated edition will appear shortly after the close of the exhibition on the 24th of May (H. Frowde).

BIELSCHOWSKY'S GOETHE.

The Life of Goethe. By Albert Bielschowsky, Ph.D. Authorized translation from the German, by William A. Cooper, A.M., Assistant Professor of German, Stanford University. Vol. I., 1749-1788, from Birth to the Return from Italy. Illustrated. Pp. xvi., 439. G. P. Putnam's Sons. 1905.

Was man in der Jugend wünscht, hat man im Alter die Fülle. To those who began their study of the great German in the good old days when texts were slovenly, and explanatory notes conspicuous by their absence, and one had to construct one's own biographical notions out of the clever flippancy of Lewes and the dry dust of Düntzer and Goedeke, the need of a real life was heartfelt. Of late years, indeed, much help has come. Apart from carefully annotated editions, there have been many essays and monographs from some of the soundest and most brilliant scholars in Germany. All these writings, however, were only partial; they gave us either views of Goethe from individual points, or discussions of certain periods or sides of his activity. It was reserved for Bielschowsky to make the bold venture of giving us the whole Goethe as he lived and wrought and triumphed, of drawing not merely the poet and student, but the *man*. And this was a venture after Goethe's own heart, for was it not Goethe's doctrine that in every writer the essential thing is the man? Further, in addition to his courage, Bielschowsky has brought to his task the two indispensable requisites: on the one hand, familiarity with the details of Goethe research, a world of scholarship by itself; on the other hand, the ability to think and feel and enjoy independently and to write with clearness and charm. The present reviewer, who has waited long and impatiently for such a life, may well be forgiven, then, for beginning his remarks with one of Goethe's favorite adages.

Yet, alas, to quote another well-worn adage: *Habent sua fata libelli.* Just as Bielschowsky was about completing his monumental work, he sank into the grave. Never very robust, he was doubtless worn out with his absorbing devotion at the age of fifty-five. The first volume of the German original appeared during his life, the second (and concluding) volume appeared the year after his death. The translator says in the preface: "The second and last volume was so nearly completed before his death that it was an easy matter for others who were familiar with his methods and aims to finish it." What is meant by *finishing?* If nothing more is meant than bringing the book to a typographical and editorial conclusion, the judgment may pass. But if to *finish* means to preserve the same vital, informing spirit to the last page and sentence, then the translator is much too optimistic. One consideration will be quite enough to make us pause. In the second German volume 112 pages are given to "Faust." Now the veriest tyro ought to know that "Faust" is the reflex and running commentary upon the poet's innermost life, almost from boyhood to the grave. When we read in the German preface, then, that only the first 22 pages are by Bielschowsky and the rest by Theobald Ziegler, we can only shake our heads and ask, Do twenty parts Bielschowsky and ninety parts Ziegler form the *Einheit* indispensable to any treatment, however humble, of the "Faust"? Verily, one need not be a witch at a riddle to suspect more than one discord between Bielschowsky and his "finisher," The very opening sentence of Ziegler (p. 591), "Faust ist eine wirkliche Persönlichkeit gewesen, vielleicht ein Schwabe aus Knittlingen," etc., comes upon us, after Bielschowsky's glowing generalizations, with the shock of a cold douche.

There are other discrepancies in this second German volume; some of them may even be due to Bielschowsky's own method of composition, to a slight weakening of his hold upon the complex subject. All such considerations, however, need not interfere with our enjoyment and appreciation of the volume before us, the first of the translation. Covering the first 417 pages of volume i. of the original, it ends with Goethe's return to Weimar from his travels in Italy. It is, to speak in German, *aus einem Guss:* a clear, homogeneous, sympathetic, and illuminating narrative and estimate of the first thirty-nine years of Goethe's life. We lay stress upon the term "narrative"; for the biographer's method is essentially that of the narrator, who tells first and explains afterwards, or, rather, who lets the explanation grow out of the narration. The method is, we repeat, after Goethe's own heart; the abstract and general are evolved from the concrete. At all events, we learn to know Goethe the man, we gain an intuition of the creative spirit shaping things to its conscious or sub-conscious impulses. And those thirty-nine years determined Goethe's individuality. Though he lived almost for-

ty-four years longer, though he produced after 1788 some of his best-known works. "Iphigenie," "Tasso," 'Hermann und Dorothea,' the 'Meister,' 'Elective Affinities,' not to mention his scientific and critical writings, all these later products emanated from a mind and were embodied in a style definitively formed. From 1788 on, there is endless variety, but there is no change.

Our first volume, then, presents to us Goethe in his formative period. The study is one of surpassing interest and value. To watch the growth of any productive spirit is a gain; how great the gain when that spirit is one which touches life at almost every point, enters fearlessly into joy and sorrow, struggles on and on toward an ever higher goal, until it reaches the clear consciousness of its powers and its limitations, an object-lesson for all thinkers! Through a good part of this volume, nearly one-half, the biographer is inevitably in competition with his hero as author of 'Dichtung und Wahrheit'—a hopeless competition, of course; yet Bielschowsky has, it seems to us, kept very happily the middle path between a mere echo and résumé of Goethe's autobiography and a sham independence. He supplements, occasionally (though rarely) corrects, often presents the situation from a different side, and always guides his readers to a more comprehensive understanding. Even the professed Goetheaner will return from Bielschowsky to Goethe with enhanced pleasure.

The core of the volume is that part (pp. 254-367) which treats of Goethe's establishment in Weimar. Not that we think lightly of the concluding chapter, Italy; Bielschowsky's handling of Goethe's peregrination in the land of art leaves little to be desired. Still, the ordinary reader knows at least something, right or wrong, of Goethe in Italy; and, after all, the connection between literature and art is self-evident, whereas Goethe's early residence in Weimar is, even to the well-informed Anglo-American, quite *terra incognita*. In truth, it is not too well known even to the Germans themselves, all but the chosen few. Court dissipation, frivolity, favoritism, desertion of the poetic vocation—all these sins and many more have been discovered in the first Weimar period. How fundamentally wrong such a conception is, our readers can learn from Bielschowsky. True, he is not the pioneer in this field; notably he was preceded by Adolf Schöll in the series of studies entitled 'Goethe als Staats- und Geschäftsmann,' published originally in the *Preussische Jahrbücher* and republished in Stoll's volume, 'Goethe in Hauptzügen.' For the ordinary reader, however, Bielschowsky's account is the more useful because simpler, briefer, more genuinely biographical. At any rate, we behold now for the first time in English garb the man who literally made Weimar, made it the centre not merely of literary and artistic impulse, but the starting-point in social and political regeneration. One of the pettiest of German states, Weimar became under his guidance the model for its more powerful neighbors. That harmony of interest which we call modern Germany and which was sealed in blood forty years ago on the field of Sadowa, started in Goethe's Weimar; we refer our readers to the conclusion of Herman Grimm's romance, 'Unüberwindliche Mächte.' When, in 1782, Goethe accepted his patent of nobility and the presidency of the Weimar Council, he had already given more than he was receiving. No man saw more clearly, carried out more strenuously, the motto. *Noblesse oblige.* During the eleven years from 1775 to 1786 he had but one abiding purpose—the regeneration of the duchy through the upbuilding of the young Duke. Accordingly, we see him throwing himself with wisdom and energy into everything, into finance and army reform, into drainage, agriculture, forestry, mining, even into the fire department. Common sense, improvement, enlightenment, humanity—above all, *economy*—were his ceaseless preachment. Never has a young ruler been moulded for the right with such utter frankness, yet with such marvellous tact, as Karl August was moulded by his prime minister, only eight years his elder. When at last in 1786 the prime minister literally ran away to Italy to seek rest for the body and rejuvenation for the overworked spirit, he could whisper to himself, as a *nunc dimittis:* My Duke is now able to rule without my daily presence.

Naturally, the unsophisticated will exclaim with honest regret: But all these years were lost for literature, for poetry; the genius of the German folk was fretting himself away over dollars and cents, ministerial squabbles, court intrigues, bureaucratic red tape. In truth, Goethe thought as much in moments of despondency. More than once Pegasus was on the point of kicking over the traces and bolting. Yet Goethe's calmer mood always led him back to reason. He learned thoroughly the lesson which many of his readers are only now beginning to apprehend dimly, namely, that a great writer's final training-school is life. In wrestling with the hard, arid actualities of life, Goethe acquired that poise of thought, that delicately adjusted moderation of utterance, which were to be thenceforth his chief distinction.

A single quotation will make our meaning clear. A sufficient number of our readers are acquainted with 'Werther,' the masterpiece of Goethe's youth. It is a work of which any writer might be proud, and—in a sense—Goethe himself never produced anything better. It is powerful, elemental. Nevertheless, in the light of Goethe's maturer genius, it is crude; it is lacking in poise and moderation. We ask our readers to compare with it the following, from the paper on Granite, based on the notes taken by Goethe during his Harz trip in December, 1777, though not worked out until 1784 (pp. 340-341):

"I do not fear the reproach that it must be a spirit of contradiction that has led me from the observation and description of the human heart, the most recent, most complex, most mobile, most changeable, most perturbable part of creation, to the consideration of the oldest, hardest, deepest, firmest son of nature. For it will readily be granted that all natural things have an exact relation to one another, that the searching mind does not willingly allow itself to be excluded from anything attainable. Let me, who have suffered and still suffer many things from the variations of human emotions, through their quick changes in myself and in others, enjoy the sublime peace which that lonely, silent presence of great whispering nature bestows, and let him who divines something of it follow me.

"With these sentiments I approach you, ye oldest, worthiest monuments of time. Sitting upon a lofty, barren summit, and overlooking a wide landscape, I can say to myself: 'Here dost thou rest directly upon a ground that extends down to the deepest places of the earth; no newer stratum, no heaped-up, washed-together fragments have been deposited between thee and the solid bottom of the primeval world.' . . . In this moment, when the earth's inner powers of attraction and motion are exerted upon me directly, as it were, when the influences of Heaven hover about me more closely, I am attuned to the higher thoughts of nature, and, as the human mind is wont to see a soul and life in everything, there dawns upon my mind a comparison, the sublimity of which I cannot resist. 'So lonely,' I say to myself, as I look down from this utterly barren summit, and even at the foot in the distance can scarcely see a bit of puny moss—'so lonely,' I say, 'will that man be who opens his soul to none but the oldest, first, and deepest feelings of truth.' Indeed, he can say to himself: 'Here, upon the oldest eternal altar, reared directly upon the depths of creation, I offer to the Being of all beings my humble sacrifice.'"

'Werther' was completed in the midsummer of 1774. We can now estimate the progress in these Weimar years. The transition illustrates Goethe's brief essay on Imitation, Manner, Style, which, although aimed directly at art, is also applicable to literature. 'Werther' is in the author's best "manner"; the Granite essay is in his noblest "style."

High as we rate Bielschowsky's treatment of Goethe's first Weimar period, we feel constrained to admit that it might have been fuller in one respect, namely, in the elucidation of the purely personal element in the relation between Goethe and the Duke. Herein our biographer is less satisfactory than Herman Grimm in his 'Goethe Vorlesungen,' ii. 1-22 (ed. of 1877), the lecture entitled "Carl August und Goethe in den zehn Jahren." Grimm's tone could scarcely have been more delicately sympathetic had he been an eye-witness of this extraordinary friendship. His charm is due for the most part to his appreciation of Goethe's poem "Ilmenau," given entire in Von Loeper's edition of the 'Gedichte' (ii. 36-41). Composed for the Duke's birthday, September 3, 1783, it remained in manuscript until published by Goethe in the 1815 edition of his works. In 191 verses the poet sketches with all his cunning a daring situation. The language is veiled, yet—to the initiated—the thought is obvious. The poet pictures a hunting party camped by a fire in the woods; some of the portraits are still recognizable. Their youthful leader, however, is apart in a hut, asleep. Approaching the hut, the poet is challenged by his double, watching over the sleeper. The watchman refuses to reveal clearly who and what the sleeper is. With an indescribable mixture of delicacy and firmness he intimates his own shortcomings and their half-justification, but is scarcely able to tell whence he has come or how: *Wer kennt sich selbst?* As for the sleeper—

"A noble heart turned aside from Nature's path by narrow destiny. . . . Assuredly the years will give to his powers their true direction; meanwhile, with all his fondness for the truth, error is his passion. . . . Gloomily wild in mirth, boisterous without gayety, bruised and wounded in body and in spirit, he falls asleep on his hard couch, while I, silent and scarcely breathing, my eyes directed towards the free stars, half awake, half dreaming, can hardly shake off the dream-spell."

Truly, a unique blending of devotion and admonition.

A word or two upon the translation. Evi-

dently it has been made with scrupulous care and regard to our English idiom. It reads smoothly and reproduces the original closely. The passage quoted from the paper on Granite is a fair specimen of the translator's skill in overcoming difficulties. In view of this labor of love kept up through hundreds of pages, the generous critic will refrain from harping on minutiæ. We note only a few passages in which the translator has made what may be called a slip. The description of Wilhelm Jerusalem (p. 157) is scarcely intelligible without the original (p. 159). And the same holds good of the paragraph (p. 207): "It was woman's work that *compromised* the misunderstanding between Goethe and the Jacobis, etc." The italics are ours; the original (p. 211) reads "Es war Frauenwerk, das den Zwiespalt zwischen Goethe und den Jacobis . . . ausglich." At page 231 the translator renders: "In 'Lilis Park' he [Goethe] has given us an exaggerated picture of such situations, portrayed in passionate Storm-and-Stress style." This is a sheer perversion of the original (p. 234); Bielschowsky wrote: "In 'Lilis Park' hat er einen mit genialer Heftigkeit gesteigerten Reflex solcher Situationen hinterlassen." That Goethe would ever have admitted his charming little poem to be in passionate storm-and-stress style, we take the liberty of denying; "Lilis Park" was *in* the storm-and-stress, but not of it, and Bielschowsky has not said that it was of it.

In the matter of illustrations, the American publisher has been generous where his German colleague was decidedly parsimonious. In this first volume alone we got ten, against two in the whole German original. Still, we should gladly have exchanged Goethe's House in Weimar for the Tischbein Goethe in the Campagna, which opens the first German volume; this Tischbein Goethe is the fitting accompaniment to the Italian Journey. Paper and press-work are excellent.

ENGLAND'S WHIG PARTY (1807-1821).

Further Memoirs of the Whig Party (1807-1821). With some Miscellaneous Reminiscences. By Henry Richard Vassall, Third Lord Holland. Edited by Lord Stavordale. With Portraits. E. P. Dutton & Co. 1905.

This is an Old-World book, containing Old-World gossip, and written by an Old-World politician. Of new information it contains little or nothing; the topics with which it is filled can but slightly interest the readers of to-day. Few care to hear about the undubitable virtues and the equally undubitable dulness of the irreproachable Francis Horner. The vagaries the follies, the doubtful virtue, and the certainly hard treatment of Queen Caroline can now evoke neither a tear nor a smile. The meannesses of her contemptible husband are almost too petty to arouse indignation, and now too unimportant to kindle active contempt. Who can really care much about the dulness of Mr. Perceval or even the so-called Peterloo massacre, which, after all, to any student of the State trials, will seem to have been no massacre at all? The plain truth is that the heroes, the patriots, the intriguers, and the villains of 1815-21 were a very poor lot. Their goodness and their wickedness are equally interesting. Yet the Old-World character of Lord Holland's book lends it a curious interest. The reader who learns from it nothing which is, taken in itself, of any great importance, is yet perplexed by one question which well deserves consideration: Wherein consists the "Old-Worldliness" of the society of which Lord Holland was at once the member and the chronicler. Why is it, in other words, that the England of 1807-1821, which is divided from us by not quite a century, seems almost as unlike the England of to-day as are the times of Charles II.?

The first answer to this inquiry is, that the English society whereof Lord Holland has painted to the best of his ability the interests and the follies, formed, even in his day, but a small part of the life of England. It was, after all, little else than a circle of Whig noblemen, of Whig writers, and of Whig politicians. It was a little world which derived its importance from the special conditions of public life at the beginning of the nineteenth century. These conditions have changed, and no society now exists which really resembles the class of superior persons who met together at the dinners of Holland House. The reform of Parliament and all that went with it meant much more than a mere redistribution of seats, the parliamentary enfranchisement of the £10-householders; it meant at bottom the overthrow of a constitutional system under which the Crown, the nobility, and a certain number of rich merchants were virtually the body who governed England. No doubt men took a part, and an active part, in politics who were neither landowners nor men of wealth, but it was difficult for any man to obtain entrance into Parliament or to take any effective part in public life unless he found a patron in the Crown, or in some nobleman or man of wealth who could dispose of seats in the House of Commons. True it is that the Parliament more nearly represented the sentiment of the mass of the electors than is generally supposed by observers who note only the anomalies of a representative system which might seem framed for the very object of not representing the will of the people. A curious remark of Lord Holland's, that even the borough of Calne, where the Lansdowne "influence" was almost supreme, could probably not have been induced to return a member who should advocate the resumption of cash payments, is significant. Boroughs which were close or corrupt might occasionally, under the pressure of strong public opinion, show an unexpected independence. It may, indeed, be doubted whether on any great question, such as the resistance to the American Colonies, or the war with France, the unreformed Parliament ever substantially misrepresented the dominant feeling of the nation.

The system, however, which gave immense weight to influence and connection, made the personal character of a small body of statesmen and politicians of extraordinary importance. We feel through every page of Lord Holland's book the immense weight attributed in the political world of his day to the characters, the peculiarities, and even the manners of leading politicians. Hence the best feature of the Memoirs: they contain valuable pictures of individuals. Lord Holland, indeed, was not, from a literary point of view, a great artist. He was, moreover a thoroughgoing party man. He never for a moment forgot the principles or the prejudices of a good Whig—every one who opposed Fox was, in Lord Holland's eyes, in the wrong. But, for all this, he was a man of sound sense and of great good nature, and was born with a certain natural kind of fairness; hence his sketches of contemporaries are always worth consideration.

Few things are better in their way than this summary of the character of the Marquis of Wellesley: "He had," writes Lord Holland, "more genius than prudence, more spirit than principle, and manifestly despised his colleagues as much as they dreaded him. Unlike most English politicians, he was rather a statesman than a man of business, and more capable of doing extraordinary things well than of conducting ordinary transactions with safety or propriety." Even to George the Third he is fair; at any rate he sees, what few Whigs could bring themselves to acknowledge, that the King, by whom at every turn they were defeated, was a monarch of some virtues and even of some remarkable though limited talents.

"He was," to quote Lord Holland's language, "a man of principle, honest, and anxious in forming his rule of action, sagacious in the application and steady in the observance of it; but then his views were narrow and mischievous, his judgments warped, and his feelings illiberal. His distrust of mankind made him deem insincerity necessary and justifiable. He practised dissimulation, and in some instances simulation likewise, without scruple. If he had the heart of a courageous and the talents of a dexterous or shrewd man, he wanted the enlarged understanding which constitutes wisdom, as well as all elevation and refinement of sentiment which shed so much lustre on rank. He was, too, a stranger to every generous affection which renders a prince either amiable or benevolent. There was nothing great, nothing kind, nothing open, nothing graceful in his character or manners."

This summary of George's character makes, at any rate, intelligible the power which he in fact exerted. But even the authority which a King of England endowed with high courage, a strong will, inexhaustible industry, and, above all, unfathomable cunning could exercise for nearly half a century, is a far less sure proof of the existence of a state of things utterly unlike the social and political situation of to-day, than the power ascribed by men of ability to a worthless and cowardly voluptuary such as George IV. Lord Holland's Memoirs make it clear that, in the opinion of the Whigs, the Prince of Wales could, on becoming Regent, have transferred political power to the friends and the flatterers of his youth. He could, they certainly believed, have reversed the policy of the nation. Whether, indeed, the faith of the Whigs in the power of the Regent would have turned out better founded than their trust in his promises and expressions of good will, may admit of question. It is, however, certain that the Regent, with all his defects, might, if he had possessed the requisite ability and character, have exercised an authority perhaps as great as that which falls to-day to an ordinary prime minister. However this may be, the expectations formed by friends and foes of

the change which might be worked by the Prince of Wales becoming Regent, is proof, if proof were needed, that the Government of England lay, during the times in which Lord Holland was the chronicler, in the bands of a small body of wealthy men. It was in fact, though not in name, an oligarchy, among whom the King could, if he had chosen, or had possessed the requisite ability, have played a leading part.

If, however, the first answer to our inquiry is to be found in the change which the social and political conditions of English social life have undergone since 1821, the true answer must go rather deeper than any reply which depends wholly upon the visible changes either in the form or in the working of the British Constitution. The most satisfactory answer which can be given in a few words, is that tbe external revolution in the political life of England is merely the outward sign of a changed spirit. A man must be a bold optimist if he can confidently assert that the Englishmen of to-day are better or wiser men than were their grandfathers. Tbe man must be a confirmed pessimist who can express a confident assurance that the changes wrougbt by a century of so-called progress have wholly or mainly worked evil. All that a sensible observer can venture to suggest is, that the England of 1820, whether better or worse, was in spirit no less tban in institutions essentially different from the England of 1906. A whole bost of ideas, good and bad, wbich make up the public opinion of to-day, were, to judge from Lord Holland's Memoirs, almost unknown to himself and bis associates. Of tbeological disputes, except in so far as they touch directly upon politics—*e. g.*, in the conflict over Catholic Emancipation—he writes little or nothing; for political economy or economical problems he and his friends cared, we may suspect, very little. No doubt in 1821 if you stepped outside the society which had its centre at Holland House, you might have heard many things which did not interest the Wbigs whom Lord Holland entertained and Lady Holland bullied. For, in truth, the Whigs, whose hero had been Fox, were, with all their merits, bebind rather than in advance of their time; their claim to our respect is, tbat, in a time of political reaction, they preserved their faith (tbough it was a rather narrow faitb) in civil and religious liberty. But they certainly had little prescience of tbe then coming time. Lord Grey, though the accidental leader in the pacific revolution carried tbrough by the Reform Act, was essentially an aristocrat; he also belonged to the body of Whigs who believed in protection, and believed in it partly because it maintained tbe influence of landowners. The Whigs of tbat day did not turn their minds vigorously toward economic problems. During tbe years, indeed, whicb elapsed between 1821 and 1832 the younger members of the Wbig party who did not belong to the great Whig houses bad become steeped in Benthamism, and aided in the production of that change of opinion which is typified by the transformation of Whigs into Liberals. But Lord Holland had, as a true adherent of Fox, very little sympathy witb the middle-class Liberalism which became dominant after the Reform Act.

Nor, again, did the Whigs as a body share that passion for national independence which, under the form of the nationality movement, colored European politics say from 1835 to 1870. It was from the Tories, not from the Whigs, that tbe Spaniards received sympathy in tbeir resistance to the power of Napcleon. Tbe desire to promote constitutional government abroad and to preserve popular government against the threats of the Holy Alliance, was exhibited by Canning; but Canning was the disciple not of Fox, but of Pitt. And Palmerston, who in latter years carried on tbe policy of Canning, was always in sentiment ratber a Liberalized Tory than a Whig. At home no less than abroad the Whig Party displayed a singular incapacity for entering into national feeling. The whole attitude of Lord Holland towards Napoleon betrays a defective appreciation of all that was at stake in the life and death contest between England and the Emperor. But this is not all. The bitter resentment of the Whig leaders at the treachery of tbe Regent is fully justified if you regard the question from a wholly personal point of view. Anything baser or more treacherous than George's conduct is not easily imagined; nor can one bonestly suppose that he was influenced by the belief that, if he betrayed his friends, he was loyal to the interests of the nation. On no single occasion, as far as history can be trusted, did he ever prefer any interest whatever to his own immediate comfort and pleasure. But if the charges brought against the Regent are looked at from a national ratber than a personal point of view, George's character is not raised, for no one could suppose that he gave even a passing thought to the welfare of the nation; but the character of the Whigs is placed in the most unfavorable light. It was as clear as day that the one vital matter was that the nation should be united in its resistance to Napoleon. The best of the Whigs knew this, and insisted upon the necessity of every Englishman standing firm on behalf of the independence of England. It was also clear that English opinion supported the Tories, yet tbe Whigs were prepared to accept office from the Regent, and tbis though they were apparently divided in their views as to the war with France.

But the strangest matter of all is, that the Whigs who denounced and resented the influence of tbe Crown when that influence was in the hands of George III., were prepared to use the influence of the Crown when it had been transferred to the Regent for securing tbe rule of the Whig Party. This, at least, must seem to a candid reader to be the inference necessarily suggested by Lord Holland's Memoirs. It assuredly is completely in keeping with the conduct of Fox as leader of the Coalition, and later, during the debates on the Regency, wben the Whigs seemed on the point of driving Pitt from power—that is, of overruling the will of the nation by obtaining the patronage of the Prince of Wales on his becoming Regent. Nor is it fair to ascribe conduct to them which most historians now blame wholly to party spirit; it was due, in great part at any rate, to two features which characterized the Whigs between 1760 and 1830—they were, speaking broadly, a party which in some respects advocated good causes; but they were never able to raise their thoughts above party feeling and to recognize the supreme importance of bowing to tbe will of what Chatham calls the "Great Public." And though, under the influence of Fox, they sometimes adopted and played with democratic sentiment, they were never democrats; they believed, in reality, not in the sovereignty of the people, but in the sovereignty of Parliament.

MORE NOVELS.

Between Two Masters. By Gamaliel Bradford, jr. Boston: Houghton, Mifflin & Co.

A Diplomatic Adventure. By S. Weir Mitchell, M.D., LL.D. The Century Co.

The Lady of the Decoration. By Frances Little. Tbe Century Co.

The world-old theme of the soul hesitating between God and Mammon will probably never be exhausted, certainly not abandoned, by novel writers. The modern purely pbilantbropic novel is now old, too, and begins to specialize itself. To teach the orpban boy to read, the orphan girl to sew, is superseded. There must be improved ways of living, and an equal number of ways of teaching those ways. 'Between Two Masters' is a record of conflict between the opposing forces of good and evil in the very concrete forms of "tainted money" on one side and modern Boston Settlement work on tbe other. Amos K. Phelps is rich and philanthropic, but his money has been made in the stock market and Trusts; and as "to be rich means simply making some one else poor," he stands for Abriman. On the other side are the Episcopalian Church, the Settlement, the Tenement; in between stands, hesitant, Harvey Pbelps. The millions are his if he will go into business with his uncle—witb an easy-going athletic cousin to wife, if be is so inclined. A moderate competence and the approval of his conscience are all that Ormuzd promises, but in the end a saintly girl is thrown in, and virtue not only is, but has, its own reward. On the side of light are an ascetic rector and Diana the Settlement Saint, skilled in all latter-day sanitation and tenement accommodation; tbe powers of darkness behind the uncle are Phelps's golf-playing daughter, a comic journalist, and a frivolous girl. The love affairs of the group are remarkable for interchangeableness, and for the entire frankness with which the young folk plot and plan for one another's weddings, playing a kind of game of progressive hearts. The kernel of the matter, however, is not the story, but the arraignment of the top-heavy fortune and the exaltation of personal Cbristian consecration to good works.

A pleasant half hour for tbe reader lies tucked away between the covers of 'A Diplomatic Adventure.' A Dumas-like set of persons is made freshly interesting by being assigned parts in a Franco-American tangle during the dark days of the civil war, when recognition of the Confederacy was the international menace. Dr. Weir Mitchell contrives, as only an accomplished writer could contrive, to bring into his little novel mystery, conspiracy, comicality, diplomacy and romance, with probability enough to keep unbelief at bay. French and Yankee swasbbuckling are contrasted

picturesquely. The diplomatists are reasonable and human, and the fact that he who tells the story is neither the real hero nor his Boswell is refreshing. The valet in the pay of both the Empire and the American Secretary, with his sly, recurring "circumstances," is a crisply modelled little figure of fun. And the hiding-place devised for the valuable papers is far too good a one to be here disclosed.

'The Lady of the Decoration' gives very pretty pictures of Japanese life, landscape, babies and mothers, and very comical ones of the Kentucky woman implanting in Asiatic minds the seed of American knowledge, under missionary auspices. The babies were taught to laugh and romp; the class in physical culture studied "skipping," and initiated the mothers in that tonic exercise. The young teachers were instructed in psychology—effectively, we may be sure, for one of them handed in this definition: "Reflex action is of a activity nervous. It is sometimes the don't understand of what it is doing, and stops many messages to the brain, and sends the motion to the legs." The young Kentuckian reflects in her narrative the flowery charm always to be expected of Japan, and is able even to enhance it by her special experiences, for they include many little every-day contacts acquired in the routine life which she leads as a teacher in winter, with summer vacation journeys into holiday places. With these peaceful affairs is contrasted a glimpse of the Japanese-Russian war, the horrible sights of the hospital, the gay departures of the soldiers, the harrowing bravery of the women. "I hope," writes the American, "I shall never get to the point of believing that it's right for strong, useful men to be killed or crippled for life in order to settle a controversy."

The book is in the form of letters, wherein pluck strives with homesickness for the mastery, and humor—a truly American humor—with a sentiment made rather overprominent by the first person singular. It is to be hoped that the little Japanese did not copy their teacher's wills and shalls, unless, indeed, they reversed them. The missionary accessories tempt her mirthfulness into an occasional lapse from taste; and it may be added that though the letter-writing form makes colloquialism more than allowable, the slang should be tempered with mercy for proportion's sake, since it reaches the reader in cold print. Mr. Henry James has said that Mrs. Kemble "was a constant proof that the richest colloquial humor is not dependent for its success upon slang, least of all (as this is a matter in which distance gilds) upon that of the hour. I won't say," he adds, "that her lips were not occasionally crossed gracefully enough by that of 1840." It may be that in 1980 Miss Little's slang may appear as graceful and gilded as a Japanese fan.

The Cathedral Builders in England. By Edward S. Prior, M.A., F. S. A. London: Seeley & Co.; New York: E. P. Dutton & Co. 1905. Pp. 112.

This is one of the Portfolio Monographs, and although very many of them are of great importance, admirable books to read and to keep within reach of the hand, it may be thought to overtop them all. Mr. Prior is the author of a 'History of Gothic Art in England,' which appeared in 1900 and was duly reviewed in these columns. Since that date Mr. Prior has thought much upon the theme, and what he has to say now is most impressive. The present is not to be regarded as in any sense an abridgment of his former work; yet, treating an important subject from one point of view, it may be thought to give to many readers that which the more exhaustive work will not give. The general title includes much, for, in Mr. Prior's presentation, the mediæval building from the beginning of the pointed style in England until the sixteenth century was very largely in the hands of the same artists who were in charge of the cathedrals.

Of the nine chapters, each stands for a period of time. The first period, 1066 to 1150, deals with the Saint Albans crossing (that is to say, the important open space where the transept crosses the nave and choir), with the crypt and transept of Winchester, the transept and nave of Ely, and so on through eleven churches, all of cathedral rank. There is also the note, given in the place where it is most needed, that in two of the churches in question where "choir, transept, and nave" are studied, the "crossing" itself is a nineteenth-century rebuilding. In this way the reader is told exactly what is under examination—the still unmarred ancient structure in this part and in that of any given church. Thus at the very outset is struck the keynote upon which the whole symphony is to be composed. To draw the sharpest possible line of division between rebuilt, reconstructed, "restored" nineteenth-century copies and the originals, no matter how close the imitation may seem to the ignorant and the careless, and to find out by study of the authentically ancient parts, larger and smaller, what the old artist was after—that is Mr. Prior's worthy and much-loved task. He makes it clear at the beginning that he does not look on the architectural mass alone—the proportions, the majesty, the dignity, the general style—as the characteristic works of the eleventh-century and twelfth-century artist. The detail—the sculpture and the painting and the glass—requires all that the keenest observer and the most fearless critic can express by way of minute characterization.

The fourth chapter has to do with the "Summit of Gothic Art," 1250 to 1290, and names ten parts of churches, such as the choir of Old St. Paul's, the nave of Lichfield, and the chapter-houses of Wells, Southwells, and York. Herein lies the most serious part of the author's attempt to show that the European uniformity of Gothic architecture in those later days may have been largely the result of the French evolution of the style, while the battle begun in the earlier chapters against the general assumption that Gothic architecture is a French art is still continued. We do not much admire that patriotism which makes a writer contend for the origin, in his own little political division of Europe, of some great movement in art or literature; but in the case of Mr. Prior and his patriotism there is a vast knowledge of details—details of building and of ornamentation, discoveries of date and of individual influences, minute comparisons of sculpture with sculpture, arcade with arcade, all over England and Wales. So many foolish theories are here set upon and routed that the chief enemy is left unmentioned until another chapter has been begun. Much is made of the fact that the architecture of Angers and of Anjou generally is about the last which can be thought to have influenced English twelfth-century work; but if any assertion to the contrary was ever made, it must have been by historians of dynasties and foreign wars, not of architecture. One can see the "closet historian" and his suggestion of reasons why Gothic must have come to England from the Continent: "Why, don't you see? Three Angevin kings in a row, Henry II. and his two sons, and just at that period, too, 1154-1216. Of course, it was in this way that the Gothic was introduced." That, however, is not the assertion of the more serious students of the art.

The question as to where the ribbed vault and the vaulting-shaft first came in as a supersession of the Romanesque ways of building, has been answered by non-English writers with the statement that the neighborhood of Paris, the old royal domain of France, saw the beginnings of the new art. One exceptional building is in Normandy and puzzles everybody, but in general a circle drawn with a radius of forty-five miles, with the Cathedral of Paris as its centre, would contain the buildings in which the Gothic vaulting perfected itself; and our quarrel with Mr. Prior is that he seems reluctant to accept the peculiar vaulted structure with constructional ribs and flying buttresses as the one test of what is Gothic. The earnest appeals of the Introduction, the appeal to the sense of mystery, to the love of irregularity, to the love of originality, to the love of color, are to be accepted as a truthful rendering in words of what Gothic architecture says to us. The mistake seems to lie in the assumption that the color design, the carving, the moulding, the irregularities, the originality and dash, are essentially Gothic. They are not Gothic, at least not in a peculiar sense; they are the characteristics of any living art, of an art in its springtime. And if the copies of thirteenth-century Gothic are wretched things, as we are told on pages 15, 18, and elsewhere, it is not an unexplained mystery that they should be so. Given a rebuilt nave, we hate it because it replaces a lost work of the thirteenth century; because we do not feel sure that this was what the mediæval artist intended; because it is very hard and exact, and we believe that the old work would have been less precise; because it has no accidents or failures; because it shows no signs of old, half-effaced painting; because, finally, it disagrees, in its accuracy, with the less methodical old work with which it is associated. It is true that some of our dissatisfaction with new Gothic buildings, when of the highest type, is unfounded. The reasons for our rejection of these are not the lack of the evidences of growth, of the visible "procession of mighty forces" (p. 18), but the mixture of real and imagined inferiority which we find in the new-built piece of work. And if it is found that a good modern design such as Truro Cathedral is still disregarded, or is looked at with disfavor, that is because the modern world is wholly

out of touch with Gothic architecture. Mr. Prior asks (p. 107) why Truro was not built of the material found near at hand, the granite of the hills, and finds a partial answer in the fact that "Pearson, a nineteenth-century architect, . . . having learnt his Lincoln Cathedral, . . . could only use a stone in which the Lincoln detail could be worked." He was "obliged to repeat himself and give his clients what they had been trained to expect." Precisely! And it is because the modern architect cannot build freely, because he is an archæologist in the first place, because he cannot go to a granite country and make a granite Gothic, even as the Breton architects did in the fourteenth century. It is not because Truro Cathedral is like Lincoln that it is not great architecture; it is not even because it is built of foreign stone that it is not great architecture. It is very good and very freshly imagined work; and if it is not still better than that and really a great design, that is because one cannot make a great design all by himself. He must have all the master builders of his time (whatever you call those master builders) working in harmony for a common result. It is only under these conditions that great designs are possible.

Die Ausgrabungen auf dem Forum Romanum, 1902-1904. Von Christian Hülsen. (Römische Mittheilungen xx. 1.). Rome: Löscher. 1905.

One of the best features of the journal of the German Archæological Institute at Rome used to be the publication from time to time of Dr. Hülsen's reviews of recent work on the topography of ancient Rome. The cessation of this series was a cause of earnest regret to many readers of the *Mittheilungen* on this side of the Atlantic, as in Europe. Three years ago the series was resumed in a somewhat more limited form, being confined in subject to recent discoveries in the Forum; but Hülsen's article filled an entire number of the journal, and was later issued in a separate form. The present article is of similar extent, and is illustrated by four plates and fifty-two cuts in the text, some of them reproducing early views and drawings, otherwise practically inaccessible Between the publication of these two accounts Hülsen has also issued an invaluable little hand-book on the ancient remains in the Forum, which has been mentioned in these columns and has just appeared in a second edition. It is shortly to be published in an English translation by Prof. Jesse B. Carter of Princeton University and the American School in Rome.

The wide interest that the recent extensive excavations in the Forum—more far-reaching, more scientifically carried out, and more richly productive in results for history than any earlier work in the same region—have awakened among intelligent travellers, makes a brief summary of Hülsen's judgment on a few of the especially controverted matters not without interest for other than special students of the subject.

There has been a unanimous wail from students at a distance from Rome that the official journal of all excavations carried on by the Italian Government, the *Notizie degli Scavi*, is so preternaturally slow in publishing full and authentic accounts of the discoveries in the Forum. It may be that Commissioner Boni is too busy with digging to study and write. But prompt publication is as much the duty of the archæologist as active and careful digging, and such work as that in the Forum ought not to be treated as a purely Italian family affair, in which outsiders need not interfere. Prompt and authentic news of the work we need and have a right to request with some degree of insistence; rhetorical and other more scientific discussion can await the excavator's greater leisure. It is some comfort to notice that Hülsen shares in the widespread criticism of the pen's delay in this matter, and some satisfaction that, since his remarks were printed, a fourth report on the prehistoric cemetery has actually appeared in the *Notizie*.

The identification of the piece of hewn native tufa behind the Umbilicus Romæ with the Ara Volcani is, according to Hülsen, not proven, while Lanciani's statement that the altar was discovered in 1548 is shown to be an error. The Græcostadium, which Hülsen himself, like others, formerly assumed to be identical with the Græcostasis, is now ascribed to a situation south of the Basilica Iulia, on the ground actually occupied by the hospital and church of S. Maria della Consolazione. The author also takes serious issue with Richter upon questions connected with the rostra, as set forth by the latter in his programme of 1903, especially on the identification of the Hemicycle with the rostra of Cæsar, and the belief that the rectangular structure is of later origin, clinging to his own earlier belief that the steps behind the Hemicycle served as the original approach to the contemporaneous (rectangular) rostra. Yet he concedes that further excavation is necessary to settle certain difficult points. The church of SS. Sergius and Bacchus is shown, by the help of two previously unpublished drawings, to have stood further to the west than has generally been supposed, its apse near the three standing columns of the Temple of Vespasian, its nave extending to the portico of the Temple of Concord. The modern street now covers the site. Hülsen repeats, with reasons, his belief that the archaic *cippus* under the "black stone" was mutilated and covered at the time of the Julian-Augustan changes in the Forum and Comitium, and argues at some length his points of disagreement with Petersen, in his 'Comitium, Rostra, Grab des Romulus,' previously noticed in these columns, and with Studniczka, in the Yearbook of the Austrian Institute. He doubts decidedly the accuracy of the designation *equus Tremuli*, assigned to the recently unearthed foundation near the Heroön of Cæsar, and suggests, though acknowledging difficulties, that to this structure may belong both the Augustus inscription (CIL. 6. 3747), and the Lucius inscription.

He repeats, with additional argument, his criticism of Boni's declaration that the *cuniculi* of the Forum were constructed for use in games given in that place, and disagrees with Boni further in his declaration that the column hitherto called that of Phocas is really a *columna Diocletiani*, though he is inclined to agree with Boni regarding the identification of the *equus Domitiani*. But he is in doubt concerning the proper interpretation of the archaic, or archaistic, vases found in the base of the last-named monument.

A full list is given of the paintings in the church of S. Maria Antiqua, and of the character and contents of the graves thus far opened in the ancient necropolis. Hülsen is utterly unconvinced by the arguments of Boni and Vaglieri that the Arch of Titus originally stood further to the north, and was removed to its present site to make room for Hadrian's temple of Venus and Rome, pointing out that the one strong argument in favor of that view is totally upset by the fact that the concrete foundations of the Arch of Augustus, which certainly was never moved, were in similar manner planted on an earlier street pavement.

The entire article, so richly filled with information, is characterized by the author's wide knowledge and sanity of judgment, and by his well-known steady determination to declare nothing certain which can be proved only by such lively work of the imagination as distinguishes some of the otherwise excellent Italian archæologists, and makes distant scholars smile and doubt.

Common-Sense Gardens: How to Plan and Plant Them. By Cornelius V. V. Sewell. New York: The Grafton Press. 1906.

The title well describes this book, if seemingly a little arrogantly since the shelves are now full of books upon gardens and gardening; and now comes one which professes to deal with the whole subject from a common-sense point of view. What is the matter with the rest of the shelf? The author presents to the owners of small estates and even much more humble holdings useful suggestions as to making the best outlay of time and money in beautifying the home grounds *with* or without the help of the landscape architect. Nearly all the other works on this topic assume that the householder is to do all his own planning with little aid outside of the book in hand. Now making a garden is very much like buying a horse. If you use your own knowledge acquired solely from reading about the desirable points of the ideal beast you want, you are in a fair way to acquire a large amount of experience with great rapidity and mortification. A little assistance at the outset goes a long way towards success in either of these enterprises. But, nevertheless, one must be on his guard against following all advice too closely. The author says: "Architects, garden and otherwise, have a way of talking their clients into doing or allowing them to do many things that the clients do not desire. It is part of their profession, and the more languages they can use, the more successful they are." But, on the other hand, "consult a garden architect of good reputation, one whose work you have seen and know to approach more or less to your ideal; but do not let him do more than offer a few suggestions at a time concerning the points about which you are most in doubt. . . . The architect will be useful in suggesting the shape of the garden and the best materials to use for the enclosure, and he may be better able than you to see the

possibilities of the natural features of the land, because his eye is trained to such work and is ever on the alert." That is common sense. And now, "Do not follow his suggestions about planting, however, but do that, the first year at least, yourself." And that, too, is common sense. There is very sound counsel, also, in the direction to beginners to patronize (1) nurserymen near one's home, for these will willingly advise you and perhaps make good your occasional losses of plants; and (2) if you have to buy your plants from a distance, try to get them from some place farther north than your place, since these will probably prove more hardy.

There are some interesting words to be met with, here and there, throughout the book, for instance, "cuppy," as applied to clayey soil in which shell-like horizontal cavities form, collecting too freely water that stays too long. And there are many pleasing turns of thought, rather out of the conventional line. Thus, an account of moving large lilac-bushes is well presented, closing with, "I have moved lilacs when in flower, and they have gone on blooming just as if they were used to a carriage drive every day."

The instructive volume is illustrated by good reproductions of photographs, and decorated in excellent taste at the beginnings of the chapters. It is almost too well printed upon too fine a paper for a Garden Handbook, but our modern *éditions de luxe* of Country Life have accustomed us all to the very best. Therefore it is perhaps well that this work, with its good common sense, should be issued in a highly attractive form, that it may be more likely to fall into the hands of those who need it most. Among those who would do well to heed its precepts are the thoughtless ones who are guilty of erecting gas-pipe fences, and with this citation of good counsel, we commend the book to all:

"The most ungainly fence that has ever been devised is made by running lengths of gas-pipe through upright wooden posts, and coupling them together. From an æsthetic point of view, such a fence has not one redeeming feature; its ugliness stands out uncompromisingly and detracts from whatever beauty the house and grounds may possess. It is strong and easy to construct, and is quite cheap, considering its substance, and it has a smug appearance that many people cannot resist. They excuse the use of it by saying that they intend to cover it quickly with vines. They may cover it, but they cannot hide it; the most luxurious [*sic*] tropical growth would be unable to veil its protruding personality. You would know it was a gas-pipe fence if it was boarded up and vines trained over the boards, and you would shudder when you passed it and instinctively anathematize the plumber who invented it. If men are known by their works, you would recognize a man who built such a fence around his yard or garden as one who, although he might be rich, yet was penurious—perhaps kind to his wife and children, but possessing no real affection; and you would pity his family. You would place him as a tradesman who had risen from the ranks, but who certainly deserved to be degraded again, and sum up by adding that, whatever he was, he possessed no soul; for souls and gas-pipe fencing are farther apart than earth and heaven."

Corporations: A Study of the Origin and Development of Great Business Combinations and of their Relation to the Authority of the State. By John P. Davis. 2 vols. G. P. Putnam's Sons. 1905.

These volumes, as appears from the author's preface, were intended to serve as an introduction to a volume on the subject of modern corporations. Although superficially complete in themselves, they can hardly be regarded as more than a very elaborate foundation for a work which Mr. Davis's unfortunate death cut short. They are inconclusive, and the reader can only surmise what conclusion the author would have reached. They are full of learning and research on the nature and history of corporations of all kinds—guilds, municipalities, ecclesiastical corporations, joint-stock companies, colonial companies, and eleemosynary corporations; but in the end we are left rather in the dark as to the author's drift. The concluding sentence of the book consists in the epigrammatic statement that "citizenship" has been "largely metamorphosed into membership in corporations, and patriotism into fidelity to them," while elsewhere (vol. i., p. 31) he lays it down that a "private corporation" is a contradiction in terms, and "has no place in a sound organization of society." He makes war, as others have done, upon our old fiction—surely a convenient one still—that a corporation is an "artificial person." He calls attention to the "virtual exclusion" of the "small stockholder" from participation in the management, though he seems to fail to see that this is highly democratic—the analogue of the virtual exclusion of the average voter from "the ring" which manages his party and his government. He insists that trade unions show a tendency to approach the status of "true corporations," but does not perceive that they always endeavor to keep themselves as far as possible from the responsibility in law which marks a true corporation.

Altogether, we must regard this book as materials collected with a view to the production of a definite theory, rather than any coherent statement of such a theory.

BOOKS OF THE WEEK.

Auhin, Eugène. Morocco of To-day. Dutton. $2 net.
Baumgarten, Otto. Carlyle und Goethe. Lemcke & Buechner.
Crabbe's Poems. Edited by Adolphus W. Ward. Vol. II. Macmillan Co.
Doughty, Charles M. The Dawn in Britain. 2 vols. Dutton. $3 net.
Everyman's Library. Edited by Ernest Rhys. 50 vols. Dutton. 50 cents per volume.
Farquhar, Edward. The Youth of Messiah. Boston: Richard G. Badger.
Graves, Henry C. Lectures on Homiletics. Philadelphia: American Baptist Publication Society.
Headley, John W. Confederate Operations in Canada and New York. Neale Publishing Co. $2.
Joachim, Harold H. The Nature of Truth. Henry Frowde.
Lamprecht, Karl. Americana. Lemcke & Buechner.
Long, John Luther. The Way of the Gods. Macmillan Co. $1.50.
Marston, E. Fishing for Pleasure and Catching It. Imported by Scribners. $1.25 net.
Seidel's Aus Goldenen Tagen. Edited by Wilhelm Bernhardt. Boston: D. C. Heath & Co. 35 cents.

RACIAL DESCENT IN ANIMALS

By THOMAS H. MONTGOMERY, Jr., of the University of Texas. $2.50 net; by mail $2.70.

A critical examination of the methods of determining racial descent, and an examination of the comparative values of the phenomena to be interpreted.

HENRY HOLT & CO. 29 W. 23d St. NEW YORK

'Every page is absorbing.'—*Chicago Record-Herald*

THE EVASION

By EUGENIA BROOKS FROTHINGHAM

Author of "The Turn of the Road."

F. W. CHRISTERN

(DYRSEN & PFEIFFER, Successors)

16 West 33d St., opposite the "Waldorf," New York, Importers of Foreign Books, Agents for the leading Paris Publishers. Tauchnitz's British authors. Teubner's Greek and Latin Classics. Catalogue of stock mailed on demand. New books received from Paris and Leipzig as soon as issued.

THE STUDIO YEAR BOOK

OF DECORATIVE ART, 1906

4to. Cloth, $3.00 net. Postage 35 cents.

JOHN LANE CO. The Bodley Head, N. Y.

The Principles of Electric Wave Telegraphy

By J. A. FLEMING, M A., D.Sc., F.R.S., Professor of Electrical Engineering in University College of the University of London. With 402 Illustrations. 8vo. $6.60 *net*.

QUAKERISM AND POLITICS

Nine capital essays on Pennsylvania history by ISAAC SHARPLESS, LL.D., Pres. Haverford College. $1.25 postpaid, or at bookstores. Send for catalogue of interesting books of Pennsylvania history and biography.

FERRIS & LEACH, Publishers, Phila.

The Nation.

NEW YORK, THURSDAY, MAY 31, 1906.

The Week.

The deeper the probe of the Interstate Commerce Commission strikes into the management of the Pennsylvania Railroad, the more shocking the revelations. William A. Patton, assistant to President Cassatt, has admitted that he acquired $307,000 of coal-company securities without paying a penny. J. N. Purviance, Mr. Patton's chief clerk, had become richer by $38.500 on the same easy terms. Mr. Patton said that two former presidents of the Pennsylvania knew that he had accepted stock as a gift, and he supposed President Cassatt was equally well informed about a transaction which was "generally known." In fine, it was "generally known" that President Cassatt's assistant was—to employ the language of cheap and illiterate thieves and blackmailers—"out for the stuff." Shippers who wished to get along comfortably with the ruling powers of the Pennsylvania gave Mr. Patton or his clerk nearly $350,000. Hard-headed business men do not fling away hundreds of thousands of dollars for nothing. Mr. Patton and his clerk, we may be sure, made an adequate return. The scheme, indeed, is so simple that a child can understand it. C. A. Buch, general manager of the Columbia Coal Company, gave a detailed explanation of the process. His company was forced to purchase private cars because it could get no cars from the railway. And yet the Keystone Coal Company and the Berwind-White Company—often spoken of as "Cassatt companies"—were relatively well supplied. Five hundred cars a day were arbitrarily set aside for the Berwind-White Company; and, to avoid the possibility of shortage, two hundred cars were kept in reserve nearly every night—and this when all coal operators were begging for cars. In the light of these facts, Samuel Rea, the third vice-president, was willing to concede that men who control the distribution of cars and the purchase of fuel for the railway should not be interested in coal properties. He himself had invested largely in coal stocks, apparently on the theory that tho men who control the men who control distribution and purchase are above temptation.

With a fine mixture of greed and timidity, the Senate Committee on Finance has reported a resolution directing the purchase of all Panama Canal supplies in this country, "unless the President shall in any case deem the bids or tenders therefor to be extortionate or unreasonable." This letting I dare not wait upon I would gives the whole case away. It is a plaintive appeal to American protected interests not to be too rapacious, lest foreign competition be admitted. But that is to accord to a rich government a resource against exaction which is denied to the poor consumer. The latter has no remedy if extortionate and unreasonable prices are demanded of him for the necessaries of life. He has no option but to submit to injustice. No purchases abroad for him, to prevent domestic robbers from taking his last cent. Yet that just relief is exactly what tariff revision would give to American citizens. They would never think of buying from foreigners, in preference to natives, except when natives were trying to gouge them. To this the President need not knuckle down, says the Senate committee, but the average American is to be allowed no remedy. The impertinent lugging in of the President in lieu of establishing a just principle is characteristic of the tortuous methods of the stand-patter.

There is much discussion of the relative claims of a sea-level and lock canal on the Isthmus. Meanwhile, waiting for a plan to be formed is in all conscience sufficiently expensive. Chief Engineer Stevens, for example, is prepared to spend $26,000,000 next year, come high come low. It is true that the uncertainty about the plan has been "something of a handicap," but if he is required he will maintain a furious and non-committal activity pending intelligible directions for the work. We have no desire to plead for haste. In an engineering problem of unprecedented difficulty, upon which the best scientific opinion is very evenly divided, it is emphatically the part of wisdom to take all the time necessary to arrive at a safe and intelligent decision. Evidently, only a minimum of work should be done until the plan is settled upon, and only such work as will fit into any scheme likely to be adopted. But to work around the edges of a ditch still untraced even in the mind's eye is the ungrateful task of Chairman Shonts's staff. This embarrassment is not a reason for haste at the present moment, but an intelligent prevision of the case might well have been a reason for less haste three years ago.

In the intervals of undermining the foundations of our Government, the Senate is having a good deal of fun this year passing bills that nobody expected it to pass. The pure food bill was the first; the free alcohol bill is the latest. It has postponed till January 1, 1907, however, the date when this measure shall take effect. This will give the wood-alcohol interests time to adjust themselves to the change. The spokesmen for the wood-alcohol manufacturers have asserted that, without the profits from this by-product, the charcoal and acetate of lime industries cannot be carried on. Time will show the truth of this assertion, but, as Senator McCumber truly said, the interests of consumers are in any event a hundred times greater than those of manufacturers. Even if free alcohol does not seriously damage the Standard Oil Company, as some of its more ardent advocates maintained, it will certainly bring a train of benefits, small in themselves, but very important in the aggregate. A cheap and convenient fuel for power, an excellent illuminant, and an ingredient in a thousand manufactured products from photographic films to scented soap, the tax on alcohol has been a burden distributed very widely, and its removal will be a boon.

The scheme of Philippine currency which Congress adopted two years and a half ago has reached an ignominious pass, and its authors are now demanding a change. Instead of extending the American monetary system to the islands (as it was rapidly extending itself at that time), they adopted a new silver coin about the size of the Mexican dollar, made it full legal tender and redeemable at the Philippine treasury in bills of exchange on New York, bought a large amount of silver bullion (for which bonds were issued), coined it in the mints of the United States, sent it to Manila, and put it in circulation. These new pesos, commonly called "conants," were to pass as the equivalent of fifty cents of American money, and were redeemable at that rate, but their metallic content was then somewhat less, say, forty-three cents. The men who concocted this roundabout scheme were warned that if silver bullion should rise in the market so that the metallic value of the peso would be more than fifty cents each, the "conants" would disappear from circulation. They would go into the melting-pot, or be exported, as our silver coins disappeared before 1853.

The warning was not heeded; but now that very thing has happened. Silver has risen in price so that the Mexican dollar is quoted in the market at 52 to 54 cents, and Senator Lodge reported a bill to reduce the weight and fineness of the Philippine peso, so as to bring its melting-pot value below fifty cents. The dispatches say that the bill was prepared at the War Department. Very likely! No such measure could have received

the sanction of the Director of the Mint, or of any responsible Treasury official familiar with the history of bimetallism. There is no reason to assume that the new ratio chosen will remain satisfactory. Nobody can guarantee that silver will not rise to any assignable figure, and even necessitate another recoinage before the one now proposed is finished A new coinage is an expensive operation, requiring time and involving loss and confusion to the people affected by it No such operation should be begun at the mere instance of the Bureau of Insular Affairs, or under the direction of the men who have botched their job in the ridiculous manner that Lodge and his advisers did theirs less than three years ago. The whole question should be examined carefully, and the decision reached only after full discussion by economists and financiers, as well as by Congress and the press.

Chasing the devil round a stump is profitable exercise compared with running down a stand-patter. When the Republican tariff revisionists of Massachusetts uttered the complaint that without free hides and other free raw material they could make no headway in the foreign markets, Sereno E. Payne, John Dalzell, and their kind had the answer ready: "The manufacturers of New England do not need a foreign market; the home market, a magnificent domain extending across the whole continent, is large enough." Then the Democrats in Congress showed that some of the most highly protected industries, for example the Watch Trust and the Steel Trust, were so eager for a foreign market as to sell goods there below, the price to the home consumer. Thereupon Representative William P. Hepburn of Iowa kindly explained that the charge that our protected monopolies were cutting prices for the foreigner was a campaign roorback. The next movement in pursuit of the stand-patters was made by John Sharp Williams, who spent the better part of two days in piling up evidence as to low prices on goods for export. And now Representative Dalzell of Pennsylvania comes forward with a frank admission that, of course, the protected interest sells more cheaply in the foreign market, for the excellent reason that there is no other way to secure the business. The practice, said Mr. Dalzell, stoutly, benefits the country by keeping mills going, saving the laborer from idleness, maintaining American wages, and giving this country a foothold in foreign markets, and—to a certain extent—command of them. Having now completed the circuit, Messrs. Hepburn, Payne, Dalzell, and Williams are preparing to start on a new lap.

Representative Landis, who made the stand-pat speech in the House on May 25, is described as "silver-haired." He should be, as his argument was hoary-headed. All that he had to urge against the policy of righting the tariff wrongs of to-day was a pained recollection of the hard times of 1893. "Ah, my rash young friends, listen to me as I tell you of the horrors which followed in my own younger days an attempt to revise the tariff"—horrors that, to be sure, came a year before the tariff was revised. But this mumbling about the evils of a former day will be the stock argument of the stand-patters to the end of time. One can imagine President Roosevelt, become Senator Roosevelt, rising in his place in 1930, with bent form and trembling voice to say, "Yes, Senators, it is true that the Dingley tariff has outrageous features. I felt them myself so strongly in 1904 that I prepared a message to Congress on the subject. But I suppressed it then, and I would not renew it now. No one who remembers the terrible depression of 1893 as vividly as I do will ever consent to touch that tariff which alone saves this great nation, unrivalled in natural resources, preëminent in manufactures, able to give the whole world thirty-love and beat it, from going to the poor-house."

Definite announcement is made by the president of the Equitable Life, and by the voting trustees appointed by Thomas F. Ryan, owner of a majority of Equitable stock, that the right to elect a majority of the directors will be conferred on holders of Equitable policies. The plan, which contemplates a vote of policyholders for twenty-eight out of fifty-two directors, was adopted by the Equitable directors a year ago and accepted by James H. Hyde, who then held the majority stock now owned by Mr. Ryan. The purpose was to amend the company's charter by vote of the directors, so as to authorize in perpetuity this controlling voice by policyholders in elections. Before the experiment could be tried, Franklin B. Lord, a minority holder of Equitable stock, applied to the courts for an injunction against the plan. On May 26 last year, Judge Maddox granted the injunction, on the grounds that no such action was permitted to the directors under the law, and, further, that to deprive a minority shareholder of the right to vote for twenty-eight out of the fifty-two directors would prevent him from exercising one of the essential rights of ownership, and was thus confiscatory and illegal. Part of Judge Maddox's argument has now been met by the new insurance law, which adds to the much-discussed "Section 52" the following proviso regarding the power of an insurance company, having capital stock, to amend its charter:

"It may, by a vote of a majority of its directors, confer upon its policyholders, or upon such policyholders as may have a prescribed amount of insurance upon their lives, the right to vote for all or any less number of the directors in such manner, not inconsistent with any provision of this chapter, as may be authorized by a vote of the stockholders representing at least a majority of the capital stock, at a meeting of stockholders called for the purpose."

Having in view this new proviso, Mr. Cleveland suggests, and Mr. Morton and Mr. Ryan agree, that request be made to the court to vacate the injunction, and that directors and shareholders in the Equitable at once proceed to put the new plan into force.

That this step should have been agreed to is gratifying, though, so far as Mr. Ryan is concerned, it merely fulfils an explicit promise, made in writing last June, in his formal published agreement with the voting trustees. It seems to be assumed that Judge Maddox will withdraw his injunction, though the court's theory of confiscation went deeper than any question of amended statutes. Not much notice seems to have been taken of another amendment to the insurance law, clearly adopted with a view to the Equitable's case. Under the old law, it was generally agreed that purchase of its own stock by the Equitable would be impracticable. But the new "Section 95" provides that any domestic stock life-insurance company may be converted into mutual on condition that an amendment to the charter, providing for retirement of the stock "by the payment of an amount fairly determined to be the present value thereof with reference to its par value," shall have been approved by majority vote of stockholders, by the insurance superintendent, and by majority vote of policyholders, taken by proxy or by mail. Although no pledge to such effect appears in the agreement with the voting trustees, Mr. Ryan, in his letter of June 26, to Mr. Morton, professed his willingness to sell his Equitable stock to the company, if such action were desired by its officers. His price, as then stated, was the figure paid by him, or $2,500,000, with interest at 4 per cent. from last June, less dividends received in the interim.

Having to take our law from judges, we are bound to state that, as the case stands, George W. Perkins was not guilty of larceny. Two judges had held that he was, or, at least, that a jury might have found him to be; but now five judges decide that, "on the depositions before the magistrate," there is no "proof" of criminal intent. The decision is obviously made on narrow grounds, as is quite proper, and does not say what the Appellate Division might have held had the Grand Jury indicted Perkins, and had a petit jury satisfied itself that there was evidence of criminal intent. But there is no use in going

into that. Up to date, the weight of judicial opinion is decidedly confirmatory of Mr. Jerome's brief, contending that Perkins could not be convicted of larceny. The Court of Appeals may come to a different conclusion, though that appears improbable as the case is presented, but for the moment we must recognize that the Penal Code, as judicially interpreted, did not make of Perkins's offence a crime. Its moral and political turpitude, however, is not in the least relieved by the court's decision. Perkins slyly took money belonging to widows and orphans, and applied it to a purpose which he had no reason to suppose they would approve, though he well knew that, if the gift of insurance money to the Republican campaign fund were made public, it would cause a scandal of the first magnitude and defeat its own end. Hence the secrecy observed, the roundabout method of giving the money, and the arrangement to keep the sum off the accounts till after the election. This, the court now says, was not the act of a criminal. It was, at any rate, the act of a trickster. For all this campaign money, the judges plainly intimate, those who diverted it are civilly liable.

The committee of the New Jersey Senate appointed to investigate insurance affairs in that State has decided that its work shall be thorough. Any other course would be politically suicidal. The New York legislative committee gave but little time to the New Jersey companies and did hardly more than scratch the surface. Everybody knows that the Prudential Insurance Company and its ally, the Public Service Corporation, have been deep in the politics of the State. The election of President John F. Dryden of the Prudential to the United States Senate was not a mere coincidence; and his candidacy for reëlection is not an accident. The long and profitable connection between the Republican machine and the large corporations has profoundly stirred the people of New Jersey—as is evident from the rapid spread of the Colby movement for reform. The uprising against the old leaders is nothing but a revolt against grossly commercialized politics.

Sir Andrew MacDonald, a former Lord Provost of Edinburgh, and now a member of the City Council, who is visiting Western cities, has indicated what he believes to be the essential weakness of city government in the United States. Chicago's slovenliness had shocked Sir Andrew, and puzzled him, too. "You Americans," he said, "are the keenest and most capable business men in the world. You have reduced commerce from adventurous enterprise to a science. Yet you seem helpless when it comes to managing a city." Later he spoke of the complete separation of national and municipal politics in Edinburgh. He instanced his own case: "In Scotland I am a Liberal Unionist, but I work side by side with Conservatives and Socialists in civic matters." It is an old truth that the Scotch visitor has observed. When business men are content to turn over a city's government to politicians, they resign themselves to bad conditions; when they take the matter in hand, as was done after the disaster at Galveston, as is being done in Baltimore, and as is likely to be done now in San Francisco, they get a clean, well-conducted city. Municipal ownership is an unimportant detail in comparison with the broader question of bringing the citizen to realize that clean streets do not depend upon the political allegiance of the Governor or the success of high tariff at the Congressional elections.

M. Jaurès, who did more than any other leader to create the Radical-Socialist *bloc*, is the first to rejoice at its dissolution. The election returns, which are now subject only to insignificant changes, show 246 Ministerial Radicals and 77 Republicans of the Left—in all, a Government strength of 323 in a Chamber of 584. In other words, M. Sarrien, barring unforeseen accidents, need not depend in any degree upon the ultra-Socialist factions. The *bloc*, having become superfluous, will presumably disappear. M. Jaurès acquiesces in the fact for the sake of Socialism, to which he believes the coalition was always a dead weight. He will be glad to see the Socialists return to their normal work of opposition. Naturally, the Radical Ministry has no regrets in attaining an independent position. From Waldeck-Rousseau's time till the present the Socialist alliance has been an embarrassment for every French Ministry, the price of support being invariably paternalistic laws of doubtful efficacy but of certain costliness. Indeed, but for such an all-engrossing topic as separation of Church and State, the Radical-Socialist coalition must long ago have broken down. It has served its turn, if merely by strengthening the old party of Republican Defence. It was also something of a merit to demonstrate that political Socialism is by no means the monster of hideous mien it is sometimes represented to be. The recent elections have to all intents and purposes restored the era of Moderate Republicanism.

In censuring the Ministry, as it did on Saturday, and calling for its resignation, the Duma virtually demands a responsiblo Government. Should the Czar retire Premier Goremykin, a precedent would be established, and a long step taken towards establishing the principle of Ministerial responsibility. It is an awkward pass for the Czar and his advisers. If his hand can be forced on a matter of capital importance like this, it would be rash to imagine any limit to concessions. Apparently, three courses are under consideration: to grant the demands, to disregard them, or to dissolve the Duma. The last choice is so hazardous that it will hardly be considered. The policies of acquiescence or drift imply a gradual dissipation of Imperial prerogative. What might save the day—constructive, liberal proposals from the Czar in consultation with the leaders of the Constitutional Democrats—seems a vain hope. Seemingly, nobody with an imaginative grasp of the situation is influential at court. The desires of the Duma are vague and increasing. Already there are indications that the moderate leaders may lose control. The one thing that might unify the clamoring factions—a liberal Imperial policy—is wofully lacking.

In the pause of the argument between the Duma and the Czar, Professor Miliukoff recurs in a despondent article to the everlasting precedent of the French Revolution. Nicholas, he fears, is about to throw away his opportunity as fatuously as did Louis XVI. This is a striking confirmation of a recent remark of that competent student of Russian affairs, M. de Vogüé. He spoke in the *Figaro* of the "obsession of the classic model" which weighs upon all the Russian reformers. They all betray, said this Frenchman, the fact that they keep constantly before their eyes "that terrible model which we gave to all peoples in the throes of revolution." This can be only a disturbing influence, thinks M. de Vogüé. Russians should set their minds intently upon their own problem, with all its distinctive features, and not let their thoughts wander all the time to the *ancien régime* in France and Louis and Mirabeau and Robespierre—not to mention Napoleon. There is, of course, a fallacy in the solemn dictum that history repeats itself; yet there is also a truth in it, and it is probably vain to expect Russians to avoid wholly the fallacy while acting upon the truth. Meanwhile, the reply of the Czar to the demand for general amnesty rests upon the need of preserving order and punishing assassination with a stern hand. So long as crimes of violence, with a political motive, are reported from so many parts of the Empire, the Czar asserts that it is impossible to proclaim full amnesty. His words should remind the Duma how indissolubly reform is now bound up with inviolate peace, as the agrarian relief measure he proposes in the distribution of crown lands should remind them of his genuine desire for the betterment of his people.

GRAFT IN BUSINESS.

Why is everybody so dejected and disgusted at the corruption uncovered in the management of the Pennsylvania Railroad? The reason is not, we think, merely because the repute of a great corporation in which we have all taken pride has now been sadly dimmed. The general uneasiness goes deeper than that. Every man asks his neighbor, Where is this to stop? What business is safe? We have seen the greatest names and the most boastful companies in the insurance world smirched; as if that were not enough, we now behold high officials of what has often been called the model railway of America holding out itching palms, like so many blackmailing policemen; and what branch of private affairs can we believe immune?

This is the ugly thing. The disease which we have complacently assumed to be confined to politicians, we now see infecting business men. When it has been said of a man, "Oh, he is nothing but a grafter!" the implication has been that he is in some public office of trust which he prostitutes for private gain. But that inference is no longer sure. The grafters in business begin to rival the grafters in politics, not only in numbers, but in turpitude. It is an alarming figure, this new apparition in our business life, shamelessly admitting, as Frederick Vroman, Assistant Trainmaster of the Pennsylvania Road, did at Philadelphia last week: "If there was money to be given out, I was there to take it." Add to this the testimony at Kansas City the same day, showing how reputable merchants made large secret payments to railroad officials for secret favors, and it almost looks as if the makers of office signs would find it to their advantage to introduce one, reading, "No Orders Attended to unless Accompanied by the Corresponding Bribe."

It must be frankly admitted that all these disclosures put a new aspect upon the work of grappling with corruption in public life. We have too easily concluded that graft and favoritism and methods that would not bear the light are the vices of politicians. But the evil is shown to be rooted in human nature itself. The corrupt public man is more conspicuous; his exposure causes the greater sensation and his fall the louder echo; but the unobtrusive man in bank or insurance company or railroad or dry-goods house who levies his blackmail, or takes his bribes, is his true brother. The one betrays his constituents, the other only his stockholders; but both are alike in being lost to decency. Of the two, we confess we think the respectable private grafter the more detestable. He not only does what he can to destroy confidence in private virtue, but really fosters public corruption. With his example before them, cynical politicians can sneer at all talk of reform and say: "They all do it. We are as honest as your merchants and railroad men." And the argument of the political reformer is certainly cut into very deeply by the revelations of graft in private business. One of the appeals has been, "Let us apply business methods to politics." But the taunt will now come, "What business methods? Those of the Equitable? Those of the Pennsylvania?"

In part, no doubt, the existence of so much peculation in private business is the seamy side of our prosperity. There would not be so much stolen if there were not so much to steal. The thing might be brazenly fronted out after the manner of Macaulay's dictum that "the quantity of theft is, to a certain extent, an index to the quantity of useful industry and judicious speculation." With that writer we can imagine a boaster about our wonderful prosperity further contending: "That there are ten thousand thieves in London is a very melancholy fact. But, looked at in one point of view, it is a reason for exultation. For what other city could maintain ten thousand thieves? St. Kilda would not support a single pickpocket." But such bravado we shall scarcely see employed. We may be smitten with corruption, but we have at least enough dregs of conscience left not to attempt to defend or palliate corruption. That there remains a strong and even heightened sentiment against dishonesty, whether in public or private life, was testified to by one of the Pennsylvania officials: "These things were not once thought improper. It seems that they are now." What he meant was, we presume, that railroad officials were once expected, if not encouraged, to go into enterprises along their lines which would be of a sort to develop traffic and so swell the company's income. But what may have been comparatively innocent in origin, has plainly become corrupt and oppressive in development. For the taking of such thinly veiled bribes as so many Pennsylvania officials have been shown to have received, for such purchased discrimination, such scheming against rival concerns, such wicked use of a common carrier to ruin one man and enrich another, there is no possible excuse. The guilty men are branded indelibly with dishonor.

Yet they fell before what we must admit is but a besetting sin of the day. If the evil is shown to be more general than any of us thought, the remedy must be equally general. It will never do to stop with laws directed at public officers who accept bribes or claim their rake-offs; the statute against giving "commissions" to cooks and coachmen on their monthly purchases looks almost ridiculous in presence of the revelations affecting their employers which we are getting. Our only hope is in a quickened conscience and a moral toning-up all round. Business men are rapidly putting it out of their power to cast a stone at politicians. It is better to admit that we are all in the same boat. It is evident that the poison has spread through the community up and down; that the politician who discovers that public office "serves well the purposes of private fraud" is only acting on the same principle, or lack of principle, that impels men in private walks to the shameless deeds which now stand confessed. To denounce and withstand and expel this widespread spirit of graft should be the daily business of all who would not see our society and our government fall into the pit.

EMPLOYERS' LIABILITY.

The Senate Committee on Interstate Commerce has reported the Employers' Liability bill, passed by the House. Partly, no doubt, in the hope that it might become law, several proposals to amend the Rate bill with provisions modifying the common-law rule as to fellow servants and contributory negligence were rejected. This was proper enough. The Rate bill was sufficiently weighted, and the measure to fix the liability of employers for personal injuries to their employees is so complicated as to deserve and even require separate treatment.

At common law, an employer could not be held liable for personal injuries to an employee resulting from the fault or negligence of a fellow-servant, or in cases where the employee could be charged with contributory negligence. The disposition of legislatures to protect certain classes of employees from the rigors of this rule became apparent very early. Thus, Georgia in 1856, and Iowa in 1862, by statute entirely abolished the fellow-servant doctrine as applied to railway employees. Wisconsin adopted a similar course in 1875, and, although the law of that year was repealed in 1880, recent enactments have again done away with the fellow-servant doctrine as a defence where the injured employee was actually engaged in the switching or running of trains. Ohio, in 1890, so limited the scope of the term "fellow-servant" that a defence based upon the common-law doctrine became practically impossible. The Virginia Constitution of 1902 abolished the doctrine with reference to a large class of railway employees, and empowered the General Assembly to enlarge the class and extend the rights conferred to employees of any corporation. Maryland, in 1902, by statute fixed liability upon railways and many other employers, notwithstanding the negligence of fellow-servants, unless a certain plan of insurance, outlined in the statute, had been adopted prior to the accident causing the injuries. In our own State, the liability

of all classes of employers was greatly extended by the statute of 1902, which has recently been upheld by the Court of Appeals.

In view of the diligence of State legislatures, it might appear that this is a subject concerning which the Federal lawmakers need not trouble themselves. This would, perhaps, be true if the Federal courts had adhered to their own early rule, which bound them to administer the law of negligence as it existed in the State where the injuries were sustained. But for a decade the Federal courts have held that there is a general law of fellow-servants obtaining throughout the United States, namely, the common law. Thus we have the anomaly of a plaintiff fully entitled to recover in a State court, divested of his rights if the circumstances are such that he must institute his proceedings under a Federal jurisdiction.

The House bill is extremely broad, going a considerable distance beyond the majority of the State enactments. It is limited in its effect to injuries sustained by employees of railways engaged in interstate commerce, and establishes liability of the owners or operators for all damages which result from the mismanagement or negligence of any of the officers, agents, or employees of such railways. It also provides that contributory negligence shall not constitute a defence, where it is slight in comparison with the negligence charged against the employer. It permits the employer to set up against the damages sustained whatever part he has paid over toward any insurance, relief benefit, or indemnity due to the injured person or his representatives. Another proposition which has been submitted to the Senate in connection with this proposed legislation is contained in an amendment to the Rate bill offered by Senator McLaurin, as follows: "In the trial of any case in a court of the United States to recover damages for personal injuries, the court shall be governed, in determining liability or non-liability, by the laws of the State where such injuries were received." This would, of course, merely restore the old rule.

Without discussing the precise form in which action should be taken, a good case is undoubtedly made out for relieving the employees of railroads, and perhaps of all common carriers, from a strict interpretation of the common-law doctrine of fellow-servants. The public requires that trains shall run at high rates of speed, at all hours of the day and night, and the physical and mental strain imposed on railway employees is most severe. In so far as railway corporations have endeavored to meet the situation by contributions to insurance funds and benefit organizations among their employees, they are to be commended, and should be permitted to set off such sums against their liability. But the law-making bodies of the various States have not considered this form of protection sufficient. It certainly is not wise policy to exclude from additional relief, almost universally regarded as necessary, the comparatively limited class of plaintiffs compelled to apply to the Federal courts for their lawful remedy.

MUNICIPAL OWNERSHIP INVESTIGATORS.

English municipal ownership will soon be the most thoroughly investigated thing alive. Band after band of American Jasons are setting out after that golden fleece; and we can but hope that too many of them will not come back shorn. The Civic Federation has given a send-off to its own investigators, doubtless with something of the enthusiasm which marked the sailing of our Olympian athletes. Yet it is not prizes which these other picked Americans will bear back to their welcoming native shores, but articles, monographs, statistics dry as summer's dust, and all about the working of municipal ownership in England. America is to be urged to go in for it, or to keep out of it, according as the investigation shows that Englishmen are miracles of wisdom, or else prodigies of stupidity, for having taken it up.

There is little doubt that English experience will be made to support both sides of the argument with equal conclusiveness. It will look to the American eye as the American eye likes the look. As has been said of the Bible, the English practice will be the book in which each his doctrine seeks, and in which each his doctrine finds. One investigator will observe the London County Council's steamboats plying on the Thames, and will say, "What geese Americans are not to insist that their cities own every ferryboat!" Another will look into the complaints of poor service by the same boats, will scan the balance sheet which shows that they have been run at a great loss, and will say: "Heaven deliver us from such disastrous experiments." So of municipal tramways in Manchester, city electric lighting in Birmingham, Government-controlled telephones, and so on. Their bad and good points will be vociferously and contradictorily explained to the American people, who will be expected to be made thereby wise unto their political salvation.

We by no means wish to disparage the investigation. The investigators at least will learn something. And if they offer us divided counsels, the inference that the whole matter is complicated with difficulties will not be without its uses. We already have a sort of advance agent of investigation in the person of Everett W. Burdett of Boston, whose paper on "Municipal Ownership in Great Britain" is published in the *Journal of Political Economy* for May. Preliminary extracts from it vexed the righteous souls of the municipal-ownership enthusiasts in Chicago. But they could not suppress Mr. Burdett's article, as they did the famous Dalrymple report; here it stands in its 56 pages of type.

Its most valuable part is the statistical information which Mr. Burdett has amassed. His arguments may be combated and his applications parried, but his facts must be at least chewed and digested. We can all draw inferences—even a horse can, as the farmer said, if he "gets a good hitch." But the facts and figures we are to hitch to must first be provided; and those which Mr. Burdett presents are very much what was needed. Some things they put beyond reasonable dispute. Whatever else may be said of the policy of government ownership of electric lighting, power, and traction, English and Continental experience shows that it has a hampering effect upon the development of the electrical industry, and that the practical extensions in the way of public service are not nearly so great as in this country. Mr. Burdett's summary is: "The United States, with less than double the population of Great Britain, has six times the amount of apparatus installed for furnishing electric light and power, sixteen times as much for electric traction, twenty-three times as many miles of electric railway, twenty-six times as many motor cars, and five and one-half times as much money invested in such enterprises."

Such differences are, of course, to be explained in part by differences in extent of area and in the distribution of population and in national customs, but the salient fact remains well established. Governments, like monopolies, are not enterprising. They do not encourage invention because they do not offer the great stimulus of a big money prize to either inventor or promoter. On the other hand, relieved of the pressure of competition, they are not forever turning, as private investors and corporations are, to plans for reducing the cost of production and improving while cheapening the public service. Hence the result which Mr. Burdett's studies set forth so impressively: quite aside from the debate about policy and cost, municipal ownership in Great Britain appears to be demonstrably sluggish in taking up with new processes and in venturing upon enlargements of the service looking far into the future. A city-owned trolley-line, for example, would not push out into the thinly-peopled suburbs—such an extension would not immediately pay. But a private corporation could afford to wait for returns; while its directors, by means of real-estate speculation along the suburban lines, would see their way to making a great deal of money. Americans may be

bled by corporations, but they at least get the service. Englishmen may or may not have to pay more for their municipally owned utilities—the actual cost is in dispute—but they confessedly suffer from what Mr. Burdett calls "the inertia and lack of business enterprise which are inseparable from municipal ownership."

If the Government is a fool and the corporation a knave, what woods are we to take to. Reform your governments, say some, and make them pure enough and capable enough to undertake municipal operation. Short of that millennium, however, there are those who would be content if our governments could be made pure enough and wise enough to regulate public-utility corporations. That would not at once open heaven to us, but it would make earth a little more comfortable; and it would give the people more for their money, while at the same time stimulating inventive genius and managing talent by giving them more for their brains.

HENRIK IBSEN.

The death of Ibsen, which occurred on May 23, removes a figure of commanding interest in contemporary letters. No imaginative writer of his generation, except perhaps Tolstoy, so fixed the attention of the entire Western world. Critics might praise or blame, but they felt that they could not ignore. To many, Ibsen is only the later Ibsen—a realistic playwright who handles social questions without gloves and occasionally runs into symbolism. To some, one would think, he is only the author of "Ghosts"—a pathologist who brings loathsome scientific matters upon the stage. But behind the ruthless prober of modern life, back of the remarkable series of plays that began in 1869 with "The Young Men's League," there is a long history of artistic growth and achievement. It is the history of a romantic poet, a keen observer, and a radical thinker, housed together in the same tenement of clay.

Ibsen was born in 1828—at a time, therefore, when romanticism was still a great fructifying influence. This was a part of his inheritance. His birthplace was the little city of Skien in southern Norway, a country which up to that time had produced no writer of international importance—for Holberg, though born in Norway, must count as a Dane. His father belonged to a line of Norwegian sea-captains who had regularly married German wives, save that one of them, several generations back, had varied the procedure by marrying a Scotchwoman. Henrik's mother and her mother were of German stock. Naturally enough, his mixed lineage has been called into play by his biographers to account for his mental traits. His austerity of mind and his predilection for characters of a ranting, proselyting turn have been referred to the strain of Scotch puritanism in his blood; while the German element in him has been made responsible for his *doctrinaire* bent and his propensity for pushing an idea through to the bitter logical end. Better worth noting, perhaps, is the fact that his first childish view of the outer world at Skien took in a church, a pillory, a madhouse, and a jail. When he was eight years old, his father, who had been a well-to-do merchant accustomed to luxurious living and to lavish hospitality, failed in business and was compelled to give up his fine mansion and face poverty in a shabby cottage. Here was a new order of facts which no doubt quickened the brooding child's nascent feeling for "the something that infects the world." Add to this that the atmosphere of the place was an atmosphere of fervid religious discussion, of anxious wrestling with a sinful world, of ascetic resolve and sectarian strenuousness.

At the age of fifteen the lad cut adrift from his impoverished home and found employment as apothecary's 'prentice in the little village of Grimstad. Here he lived some five years, those years of early adolescence which are usually of the first importance in the development of artistic genius. Seemingly a most unpromising school for a dramatic poet with fire in his veins! Yet it served well enough; for the very monotony of outward things threw him back upon himself and favored that intensity of emotional life which, expressed in rhythmical language, is poetry.

"Es bildet ein Talent sich in der Stille."

As a youth he found himself at war with society, the society of Grimstad. The placid villagers, absorbed in their own little affairs and indifferent to his ideas and dreams, moved him to wrath. He felt like a caged lion. The revolutionary excitement of 1848 stirred him deeply. He wrote a fervid poem in which he bade the Hungarians godspeed in their struggle against tyranny. He composed a string of sonnets to King Oscar, in which he urged that monarch to lay aside all paltry considerations and take the field in aid of Denmark. The verses were not printed at the time, and so, as their author drily observed long afterward, did not greatly affect the immediate course of European politics. But the poet was finding himself and finding his place in the eternal party of the opposition.

Such was the soil from which sprang Ibsen's first play, the gruesome tragedy of "Catiline." How naturally does youthful radicalism select a criminal for its first hero! Ibsen had by this time decided to study medicine, and, in getting up his Catilinarian orations for the University, he found his spirit of opposition provoked by the voluble and ever-virtuous Cicero, whom he began to think of as the wordy champion of a self-complacent majority, thundering conventional morality at a man he did not understand. Catiline's conspiracy and death took on in his imagination the character of a tragedy of political idealism. The vision once caught, the young apothecary proceeded to fix it on paper in glowing verse. The play was written in the long northern nights of 1848-9, and is a nocturnal affair throughout.

One who reads "Catiline" for adumbrations of the Ibsen that was to be, will find but little to reward his search. To be sure, the intuition of the born dramatist is there. There is life, movement, power. But the total impression is one of unreality. Catiline as romantic dreamer, bent on destroying Rome for Rome's good, and finally done to death by the fiendish hatred of the vestal Furia, does not convince. One feels that he is but the mouthpiece of his creator's longings for a wider and more stirring life. There is autobiography, too, in the words of Furia, in the first act:

"Hvor trang en tumleplads for al min fylde
af vide formål og af hede ønsker!"*

In the spring of 1851, Ibsen turned his back on the sleepy Grimstad and went up to Christiania to finish his preparations for the University. "Catiline" had already been rejected by the theatre, but a second effort, a viking play called "The Warrior's Tomb," met with better luck. It was played with some success—enough to dissipate all thoughts of the medical profession. Its author was, indeed, to become a wonderful diagnostician and a far-famed dispenser of bitter pills, but not in the domain of physic. Leaving school he cast his lot with the local journalists, and soon found himself a member of a radical coterie whose business was opposition. He attended the meetings of the Socialists, wrote for their paper, learned their jargon. Presently, in conjunction with two friends, he started a new radical organ called *Manden* (*The Man*), which attacked conservatives and liberals alike. In his disgust with the faint-hearted liberalism of the day he wrote the operetta "Norma, or a Politician's Love," and published it in *Manden*. It was a slight affair, wherein Bellini's characters were replaced by Norwegian politicians. The young Hercules, idealist through and through, had caught his first glimpse of the monster Expediency; and, not yet having found his club, he fired at the beast a paper-wad of satire.

Toward the end of the year 1851, being now a rising man, Ibsen accepted a position in connection with the new theatre at Bergen, and entered upon his duties under a contract for five years at $300 per annum. The works of this period are "Lady Inger" and "The Feast of Solhaug," both romantic plays of the remote Norwegian past, with no suggestion of ethicism or of any bearing upon present-day problems. In this stage of his career, Ibsen appears as a specifically Norwegian writer, carried along by the general enthusiasm for a *Heimatkunst* that should assert its independence of Denmark. He operates with the familiar resources of romanticism, giving to his work a warm local color, and endeavoring to impart to it, as he once said in explaining the mission of the national poet, "those ground-tones that echo back to us from mountain and dale, from hillside and shore, but especially from our own hearts."

In 1857 he returned to Christiania to take charge of a theatre which had lately been started, under the leadership of Björnson, to represent the national principle and focus the opposition to Danish influence. He had lately been reading certain Icelandic sagas, in Petersen's translation, and, attracted by their peculiar savor, had planned a viking tragedy which should reflect the direct speech, impulsive action, and fierce passions of those rude and predatory forebears. He had convinced himself that the romantic conception of them was wrong, and that the conventional iambic verse was not suited to a national theme. Having come to the conclusion that the best form would be a close imitation of the saga style itself, he

*How mean a stage for all my plenitude
Of vast intentions and of hot desires!

wrote "The Warriors of Helgeland," a sombre tragedy of demonic passion, unrelieved by any glint of sunshine. From this time he rapidly lost sympathy with the ideals and conventions of the romantic drama. The moods of the questioner, the skeptic, the satiric commentator, began to prevail. Nevertheless, his public took him for more of a pessimist and doctrinaire than he really was. The entertaining "Comedy of Love," wherein a pair of romantic lovers, begirt on every hand by the prose of betrothal and wedlock, renounce each other lest they too fall from the heights, was received with a chorus of indignant protest as an attack on the sacred institution of matrimony. Ibsen was supposed to have intended a demonstration that marriage is and must be the *coup de grâce* of ideal love; and this although he himself was now happily married, and although the other side of the question is admirably stated in the play itself.

What wonder if he began to feel uneasy in Norway? Conscious of high aims and devoted to his art, he saw his efforts misunderstood and assailed by the local philistines, who insisted on making him out a doctrinaire instead of an artist. His income, too, was pitifully small. In a well-known poem of the period he likened himself to a bear compelled to dance in a heated caldron. One may guess that he already dreamed of making his voice heard beyond the limits of the Northland, for there is surely a personal note in the tragedy of "The Pretenders," in which King Haakon carries all before him, because he believes in himself, while his rival Skule is borne down by the creeping paralysis of self-distrust. Ibsen had faith in his own destiny, but he felt that he needed a *πού στῶ* in the free, wide life of the Continent. A Government stipend, obtained with some difficulty, finally brought the coveted boon within his reach. In the spring of 1864 he left Norway for Italy, to spend the next quarter-century of his life in voluntary expatriation, at first in Rome, then in Dresden, later in Munich.

The first-fruits of the long exile were "Brand" (1866), and its pendant, "Peer Gynt" (1867); the tragedy of fanaticism and the tragic-comedy of easy-going selfishness. In these great poems Ibsen incidentally freed his mind with regard to certain shortcomings of his countrymen. Both heroes are undeniably made to a scheme rather than copied from the book of life; but the largeness and audacity of the scheme, the vigor of the drawing, and the novelty of the situations make the strange poems a never-ending delight to the reader. In Brand we have a character for whom the only merit is the strong will unswervingly devoted to a transcendental idea of duty. The fanatical priest, who has none of the weaknesses that make men lovable, and who sacrifices wife and child and finally himself to the inner *daimon*, is a repellent figure, but grand in his isolation. Brand was conceived as the passionate enemy of all half-and-half natures—all who are a little of this and a little of that, according as the wind blows, and who go through the world talking about consequences, feasibility, and expediency. To regard him as the mouthpiece of Ibsen's own opinions is partly right; only one must not forget that the whole drift of the play is to show how such an iron rule of conduct makes havoc of life. But how futile it is to speak of a fine poem as if its "tendency" were the principal thing! What counts in "Brand" is the poetry of it—its imaginative intensity, its vivid portraiture, its terrible pathos. And the same holds of "Peer Gynt," save that the pathos is here replaced by fantastic humor of a vein new to modern literature.

In elaborating "Brand" and "Peer Gynt," which apprised the world that a new star had arisen in the North, Ibsen had deferred for the time being a dramatic plan of still larger import. His first visit to Italy in 1864 had brought home to his imagination the "glory that was Greece and the grandeur that was Rome," and had suggested the problem of "Emperor and Galilean." This problem was to represent the form and pressure of life at that pregnant epoch when ancient paganism was making its last stand against the religion of the cross. It was a theme to tempt the ambition of a world-poet, but the materials proved intractable, and the final result was a dramatic colossus which is bewildering rather than impressive. It was its author's last experiment in historical tragedy.

Even before the publication of "Emperor and Galilean," in 1873, Ibsen had already begun to work the vein with which his fame is now mainly associated. "The Young Men's League," with its delectable Stensgaard as the representative of demagogic humbuggery and shiftiness, appeared in 1869. Its satire now seems good-natured and innocent enough, but, at that time, the play was fiercely resented by "friends of the people," who saw their favorite doctrines cutting a rather sorry figure. And yet, just as in the later plays, we have to do not with a strenuous pamphleteer pressing home doctrines that are dear to his heart, but rather with a cynic—a Democritus minus his laugh—looking out upon the shibboleths, humbugs, illusions, and hypocrisies, and showing how they work in concrete cases.

In this brief review there is no room for anything more than a passing reference to the great quintet of plays that mark the meridian stage of Ibsen's career, and which may be described—imperfectly, to be sure—as probings of the social organism. Their scheme is to present, under a fair-seeming exterior, a situation that is rotten at the core; and then to make the play disclose the miserable facts and the damage done by trying to cover them up. "The Pillars of Society" (1877), the mellowest of the five, was given a happy ending, which is morally if not æsthetically edifying; Consul Bernick, whose greatness rests on lies, was merely made to confess his sins in public and turn over a new leaf. In "A Doll's House" (1879), the ideal demand of equality and candor in the marriage relation was pushed to a semi-tragic conclusion. In "Ghosts" (1881), Ibsen dipped his pen in the blackest of ink, and paid his respects to the critics who charged him with thinking too meanly of conventional morality. "See," he said, "how your conventional morality works when it is taken too seriously by a high-minded woman who is tied for life to a profligate." In "An Enemy of the People" (1882), the ideal demand of public honesty was pitted against municipal corruption; while in "The Wild Duck" (1884), on the whole the finest of the later plays, the ideal demand itself was made the target of delicious persiflage. Whoso is inclined to think of Ibsen as a preacher only, and to deny him the impartiality of the true artist, should study "The Wild Duck."

In the final phase of his work he became more and more a pathologist. The elemental passions of human nature had by this time become an old story, and in the search for something new he chose to occupy himself with men and women in whom exceptional fortune has produced a mental habit amounting to an obsession. With this tendency came an increasing fondness for symbolism and the mystic association of ideas. The consequence is that his latest works, with all their perfection of technic and delicacy of drawing, seem much less vitally human than the earlier ones. Such plays as "The Lady from the Sea," "Little Eyolf," and "When We Two Dead Awaken," are admirable enough as subtle studies in eccentric psychology, but they will hardly take a place among the masterpieces of dramatic literature. They appeal to the curious mind, but fail to stir the deeps of universal human nature.

One who looks back over Ibsen's long literary career and takes note of the number and heterogeneousness of his productions will be impressed, first of all, with the difficulty of finding any form of words that shall fitly characterize his versatile genius as a whole. We have to do with an evolution in which one stage is not like another, and also with astonishing diversities in one and the same stage. "The quintessence of Ibsenism" is hard to extract and describe—little less so than the quintessence of Goetheism. To search his writings for a coherent doctrine of ethical or sociological import would be futile, for he can be quoted copiously on both sides of every question. This is only another way of saying that his endowment was that of a dramatist—a species of artist for whom the two-sidedness of questions is a fundamental postulate. To discover the real Ibsen behind the opposing tirades of his characters is a difficult matter, just as in the case of any great playwright. And then, he had a way of making one play grow out of another in such wise that the second should be a sort of antidote to the first, or should let the light play upon the old problem from another direction. Such is the relation, for example, between "Brand" and "Peer Gynt"; or between "The Wild Duck" and the plays that immediately preceded it.

But if Ibsen has no very definite philosophy he has temperament; and we have heard that a work of art is a corner of life seen through a temperament. His was a vehement nature, always intent on being itself and going its own way. At no time was he ever in danger of the fate that threatened Peer Gynt at the hands of the lean button-moulder—that of being melted up as mere scrap for lack of a positive individuality. Speaking broadly, one must say that Ibsen's artistic temperament is deficient in humor. Taken by and large, his plays present a rather sombre view of life. The Genius of Laughter brought no gifts to his cradle. He saw the seamy side of things and only that. He heard the discords and the jangles, but to hear them as elements

of a larger symphony was not his affair. There was in him but little of the buoyancy of hope or the tenderness of an infinite pity that pardons all because it knows all. Yet there are sunny scenes of pure romance in some of the earlier plays, and in the later ones there is no lack of sardonic humor in certain situations and characters. Even so savage a critic of Ibsen as Max Nordau has recorded the opinion that Gina in "The Wild Duck" is "one of the profoundest creations in the world's literature"—a female Sancho Panza who falls but little below her Spanish prototype.

Of Ibsen's realism it is necessary to speak with some caution. The fact is that his plots are in the main highly artificial concoctions; only, the grave improbabilities are hidden away in the presupposition. In accumulating his mass of combustibles which it is for the play to explode, he pays little attention to ordinary probability, but brings together and piles up what suits his purpose. His exposition usually reveals an ancient entanglement which in actual life would hardly have come about at all, or, if it had, would have straightened itself out long ago. But given the presupposition and the characters, what one sees and hears upon the stage is a very plausible counterfeit of reality. And how surpassingly clever is the technic! Where shall we find another modern playwright who is such a virtuoso in the management of dialogue? Who else can crowd so much of *Stimmung* into a word or a phrase, or produce such intense dramatic effects by means of what is ostensibly mere conversation?

Will his fame endure? There are signs that outside of Scandinavia his vogue is on the wane, and, truth to tell, he has little claim to the august title of world-poet. He will continue to be played more or less by the theatres and to be read by students of the drama; but it is not likely that his books will be extensively read in translation as "mere literature," because, with the exception of "Brand," they are lacking in all the elements of higher edification. Moreover, "Brand" is so intensely Norwegian that no translation can fully preserve its savor. Indeed, take him as a whole, Ibsen is Norwegian to the core, and at his best where his work is most strongly redolent of his native soil. The superb opening scene of "Brand" is worth a whole volume of exotic imaginings like those in "Emperor and Galilean." But the best of him—his poetry, his suggestiveness, his wonderfully pregnant style, his subtle intensities and illuminative flashes—are to a great extent lost in translation. It would not be very surprising, therefore, if the world at large should decide to neglect him. But in the Northland, and particularly in Norway, where the language that he wrote makes music in the heart, his fame will abide with increasing lustre.

CALVIN THOMAS.

IN BRITISH EAST AFRICA.

KAMPALA, UGANDA, March 18, 1906.

At the present day, a trip to Africa, and indeed to Darkest Africa, has become a very simple affair for the eager tourist. To be sure, an American will have to go to Europe first, unless he prefers the longer road through India; but from Europe itself there are now many and, for the most part, sufficiently comfortable steamship lines to all the principal African ports. Leaving out of consideration the Africa of the north, of the Mediterranean—for in climate, natural productions, population and history, it is not really part of Africa at all, from which it is cut off by the desert—there remain the three other great regions of varying degrees of attractiveness. Of these, the West Coast is not likely, for a long time to come to appeal to the casual traveller. It is too hot and unhealthy, and, though railway building is going on apace, there is still too much difficulty in penetrating well into the interior except by railway and steamer up the Congo—doubtless an interesting trip, but as yet hardly a comfortable one. South Africa is, of course, an old story. The journey from London to Cape Town is simple, and in many parts of South Africa one can find and enjoy all the comforts of civilization if one is willing to pay for them. The railways stretch many hundred miles to the northward, and the great Victoria Falls are now accessible enough to have been visited by the transplanted British Association. Historically, the interest in South Africa has so far turned not so much on the relations of the dominant white race to the black majority, though this is the question of the future, as it has on the struggle between the near-akin Dutch and British elements.

East Africa, broadly speaking, is composed of a series of large territories, belonging to Portugal, Germany, Great Britain, Italy, and France. They have to be visited separately from the coast, as the holdings of France in this part of the world are chiefly confined to the island of Madagascar, and the possessions of the other Powers, though contiguous on the map, have but scant means of communication with one another, except by sea. For the present, at least, the British possessions are the most interesting. They are easily accessible far into the interior, for they have been opened up by a great railway enterprise. They include, among their populations, one of the most intelligent native peoples on the continent, and they probably possess the most resources for future development. They are divided into two separate administrative regions, British East Africa and the Uganda Protectorate, but the division is artificial, and hardly likely to be permanent. Both Protectorates have recently been well described by competent authorities, and in both even a hasty visit enables us to recognize the usual characteristics of British colonial rule. A large savage population is being taught the principles of law and order by a handful of honest, determined, and devoted white officials. Life and property are generally secure, even-handed justice is dealt out, roads are built, production and trade are increasing—all in the way we expect wherever we find the Pax Britannica. These admirable phenomena have been described many times. Here I shall attempt only to touch on two or three features of the country that are peculiar to it.

To begin with, there is the famous Uganda Railway, which, by the way, runs towards but not in Uganda, for it stops on reaching Lake Victoria at a point still distant from its destination, whither we have to proceed by boat. The line constitutes a unique departure in the history of British colonization. In no other case has the mother country made such a present to one of her newest and weakest children. The situation, however, was an extraordinary one. In the early nineties there were many strong reasons for establishing and maintaining a firm protectorate in Uganda. Its people had awakened profound interest in England, and English missionaries had already converted thousands of them, but the country had just been rent by civil and religious wars, there was more than a possibility, on the part of both Germans and French, of attempts to annex it, and it was in serious danger of coming under Mohammedan rule, which would soon have wiped out the promising Christian churches. English public opinion demanded that Uganda be held, but how could it be effectively administered when to reach it from the coast a journey of two months was necessary, through a region in great part almost uninhabited, and where the prevalence of the tsetse fly made the use of pack animals impossible? The cost of transportation was thus enormous, and the only obvious way out of the difficulty was to build a railway. This the home Government, being at that time in the hands of the Conservatives, made up its mind to do. The engineering difficulties to overcome, though considerable, were not very great (the bridges were made in America and put up on the spot by American workmen); but, as there was no native labor available, thousands of coolies had to be brought over from India, and there was difficulty in feeding and supplying them properly. Then, too, a certain number of mistakes were made in construction, so that, when all was finished, the total cost came to the heavy sum of about £6,000,000 sterling. As the receipts have only just begun to exceed the running expenses, it is not likely that much will ever be repaid to the mother country, which may thus be regarded as having made her new colonies a magnificent gift.

Mombasa, the starting-point of the road, was a native town captured by the Portuguese in the days of their greatness, and held by them amid many vicissitudes for over a century, until, after a long siege, it was taken by the Arabs of Muscat. The old Portuguese fort still remains intact, to-day serving as a prison. Later, the city came under the rule of Zanzibar, from which it passed to that of Great Britain. It is a thriving place, with some twenty-five thousand inhabitants, many of them Hindus. The harbor is small; but, three miles away, on the other side of the island, is the splendid port of Kilindini, where the larger steamers anchor. The ride by rail to Kisumu on Lake Victoria takes a little less than two days. About halfway up, we come to Nairobi, the capital of British East Africa, a raw settlement of no particular natural attractions. Soon after leaving the coast, the line begins to rise, and runs henceforth through an elevated region, mounting and descending several times. At its highest, it is over eight thousand feet above sea-level. The scenery from the car windows is often really fine. In some places, much of the formerly uninhabited land close to the line has been taken up by white settlers, and the natives are gathering in increasing numbers, especially about the stations. It is true, the

warlike, picturesque Masai have a tendency to withdraw from the approach of civilization, which has deprived them of their chief occupation, that of raiding their neighbors. The rest, attracted by the new opportunities for wealth created by the stranger, do not shun contact with him, even if they have not yet accepted all his ideas, especially as regards clothing. At the stations the traveller frequently sees most astonishing costumes, or the lack of them. Among the Kavirondo, a tribe on the northeast corner of Lake Victoria, the head dress is often very elaborate; the spear still commonly serves the men as walking-stick, a series of bracelets about the limbs and body seems to be a favorite form of female attire, and in the market-places at Kisumu one can view hundreds of both sexes, ornamented, but in a state of complete nudity, or so arrayed as to show that their garments have no connection with our ideas of decency. Except when approached by a camera (a thing some of us also object to), the Kavirondo appear perfectly unconscious that there is anything uncommon in their appearance, and they have the reputation of being decidedly more moral than the average.

Interesting as are the curious people visible along the Uganda Railway, to some travellers the wild animals are more attractive still. As game is protected to a certain distance on both sides of the line, it has got used to the iron horse, which does no harm to it. Especially along the Athi plain the spectacle is extraordinary enough. Of course, the old resident will tell you that the animals used to be far more numerous and you must not expect too much. There are no elephants within a good many miles of the track, and you are not likely to get a look at a rhinoceros even if one did charge a train a year or so ago; the buffalo have been killed off by cattle plague; you go through the giraffe region at night, and do not pass near enough to any lake to catch a glimpse of a crocodile or hippopotamus, though all these beasts abound. The leopards, too, a plague of the country, seldom show themselves when they can help it. On the other hand, you can count on seeing numerous flocks of ostriches and herds of zebra, also the great hartebeest and deer and antelope of many kinds and sizes by the thousand. They all mingle together with perfect freedom, forming a charming picture. On the approach of the train they will, if near the track, be startled into running a few dozen yards, but they soon subside again and look at the strange monster with the carelessness of familiarity. In addition to these peaceful creatures, if you are in luck, you may get a view of a prowling hyena or even of the lion himself, for there are plenty of them about. East Africa is indeed "a sportsman's paradise"—a fact the authorities are well aware of, as they show by their strict game laws. A shooting license costs a stranger fifty pounds, not to speak of many extras, and the number and kinds of animals he may kill, except for noxious ones like lions and leopards, is strictly limited. Even the colonists have not much more freedom, though their licenses are cheaper. These wise measures, besides bringing in the Government a tidy little income, keep alive the goose that lays the golden eggs.

There is one question which can be applied to but few thoroughly tropical regions, but which is of the utmost importance for the future of East Africa. Is it what is generally called "a white man's country"—that is to say, a land where the white man and particularly the Anglo-Saxon can not only live himself, but rear children who will not degenerate? East Africa is situated directly on the equator, and the low-lying coast is obviously as unsuitable for the reproduction of the white race as it is everywhere else in the same latitudes; but the interior is made up of mountain and plateau, several thousand feet above the sea-level. To be sure, there is no winter, but the nights are cool; indeed, if you go high enough up, really cold. Also, the native population is so sparse that there is plenty of room for immigrants. It has thus been enthusiastically proclaimed, and by competent authorities, that here, in the heart of the tropics, is a future home for the virile development of millions of Englishmen. Nay, more, not long ago the Jews were offered a district in which to found a new Zion, though nothing has come of the idea. On the other side, it has been urged that because land is high it is not necessarily healthy. Marshes, noxious insects, and fevers can be found at very lofty altitudes, and though drainage may effect a great deal in time, deluges of tropical rain and a sun that beats down vertically on the head are not phenomena which can be modified by man. Altogether, there is room for diversity of opinion, and the question is one which can hardly be settled definitely for two or three generations, if then. Even the passing tourist can notice two things in this connection—first, that there is already a considerable white immigration, part of it from South Africa, and, second, that there is plenty of fever about.

The Uganda Protectorate in any case, even if much of it has an elevation of two or three thousand feet, is not, nor will it ever be, "white man's country." In compensation it contains within its borders perhaps the most promising negro people on the whole African continent. We must keep in mind, by the way, that the kingdom of Uganda is only a part of the Protectorate, which is an artificial creation, including many different territories and tribes. Its northern portion along the upper Nile is one of the hottest regions in the world. Uganda proper is extremely interesting. The scenery, with its rolling country and wealth of tropical vegetation, even if it is not difficult to match in these parts of the world, is none the less a never-ceasing delight to the stranger. The inhabitants are obviously superior to any of those we have seen on our journey, the last of whom were the naked Kavirondo. Here, in the depths of the continent, the first explorers, Speke, Stanley, and others, found to their surprise not only a State with a real organization, but men scrupulously clothed, a nation intelligent, quick and anxious to learn what the newcomers could teach them. That was a generation ago. Now that the country is well known and under British sovereignty, there is no reason to accuse the earlier travellers of undue exaggeration in their reports. The progress since that time has been remarkable. A mass of converts have been made by French and English missionaries; in fact, it is hardly too much to describe almost the whole people, with the exception of a certain number of Mohammedans, as at least nominally Christian. The King Daudi is a bright, attractive little boy of nine, under the charge of an English tutor. During his minority, the Government is carried on by a regency and the different districts are administered by the native chiefs, who are said to be active and intelligent. The public peace is maintained, justice is dealt out, roads and bridges are built and kept up, all with very little English intervention. European articles of many sorts are being introduced or imitated. Schools are increasing in number, and the children are bright as well as anxious to learn. There is even a beginning of literature. Altogether, though the phrase "the Japanese of Africa," which has been applied to the Waganda, is, of course, inflated, they are certainly a well-endowed people, from whom the friends of the negro may hope for much.

There is, unfortunately, another and terribly dark side to the picture of life here. Within the last quarter of the century the population has decreased from perhaps four millions to one. There have been devastating wars, entailing great loss of human life, but now, in times of peace, the diminution still continues. The land is too full of marshes to be healthy, even for the natives; there has been a certain emigration; and then the birth-rate is very low. This may be due, at least in part, to the widespread immorality prevalent, as was the case already before the coming of the white men. The Waganda kept up their numbers by carrying away the women of their weaker neighbors. Now that this source of supply has ceased, they are declining. To crown all, we have the terrible "sleeping sickness." Coming probably from the Congo, it was first noticed at Lake Victoria in 1900. Although its ravages have been confined chiefly to the lake and only to the northern portion of that (for it has not yet penetrated into the German sphere), it has counted its victims by the tens and perhaps by the hundreds of thousands. The once thickly settled Sesse Islands are now, many of them, practically uninhabited. The disease, as has been recently discovered, is communicated by the bite of a kind of tsetse fly. The victim may live two or three years, but there is no known case of recovery. As yet, only three or four white men in this vicinity have caught the malady, but it hangs like a pall over the region.

It would be a pity, however, to end these remarks in a sombre tone. To the traveller this part of the world is too beautiful, too fascinating for him to be easily pessimistic about it. The "sleeping sickness" may go as suddenly as it has come, or modern science, which is studying it actively, may discover some remedy against its ravages. There is fever here, but health depends largely on proper precautions, and, as compared with most other tropical climates, that of Uganda is delightful. The tide will turn, too, in the decline in population, for the race is strong enough physically; and improved morality under Christian teaching, together with improved hygiene, will strengthen it still more, while its mental qualities, already most promising, ought to develop quickly under the stimulus of the contact with civilization.

In the meanwhile the country is well worth a visit and is easy enough to reach. Mombasa is hardly further than Bombay from Europe, the interesting railway journey from the coast is not uncomfortable, the steamers on Lake Victoria are excellent, the scenery about the shores is delightful. Entebbe, the seaport of Uganda and the residence of the British commissioner, is a new, pretty town, with pleasant English society. A few miles inland is Kampala, perched on seven hills, with its royal palace and its Christian churches, built, and well built, by native labor. There are a few white missionaries, officials, and others, and some keen Indian traders, but around and about it is Africa, the real Africa we have read of in our childhood, the great Dark Continent only just opened out in full to the gaze of the white man.

ARCHIBALD CARY COOLIDGE.

TOPOLOBAMPO AND THE FUERTE VALLEY.

FUERTE, MEXICO, March, 1906.

Topolobampo is something more than the port of entry for the rich valley of the Fuerte River. It is a strategic point in international commerce. Its importance was appreciated by the founders of that communistic colony which undertook to establish a mundane Paradise upon these shores some twenty years ago, and yet had the temerity to risk contact with the openly selfish outside world by projecting, and feebly beginning, the trans-continental railroad which later was revived and pushed with energy by Mr. A. E. Stilwell, a promoter of rare judgment and ability, ably seconded by the financial strength and skill of the accomplished governor of the State of Chihuahua, Don Enrique Creel.

Kansas City is very nearly the geographical centre of the United States, and the natural distributing and assembling point for commerce between the Eastern States and railroads leading towards Latin America and the Orient. This long-recognized fact, and the existence of an important virgin area through Indian Territory and Texas to the Mexican border at Presidio del Norte, led to the adoption of Kansas City as the northeastern terminus of a new transcontinental trunk line (the Kansas City, Mexico and Orient Railway), developing also a very rich agricultural and mineral district in Chihuahua and Sinaloa, ending at the superb harbor of Topolobampo, on the Gulf of California. This is the shortest possible railroad route between any point on the longitude of Kansas City and the Pacific Ocean; and the continuation by steamer route to Australia and New Zealand is almost directly on the line of a great circle connecting Kansas City with these antipodal centres of trade. The advantage does not lie with Topolobampo so far as ocean trade with China and Japan is concerned, the arc of the great circle carrying the steamer route within less than a day's steaming from the California coast. The saving in rail haul, however, where costs per ton mile are, at the smallest ratio, three times those by steamer, throws the advantage distinctly, though not heavily, in favor of the Mexican port. The advantages of port dues, through concession of the Mexican Government, also weigh conspicuously. It will be seen, accordingly, that Topolobampo has possibilities as a rival of San Francisco and the newly created port of San Pedro, the "young hopeful" of eager Los Angeles. Its importance, and the peril of it, were sufficiently great to awaken the Southern Pacific Company to bide their chance to make a clever move in this game of international trade, by securing a concession for the West Coast Railway through Sinaloa and Tepic to Guadalajara. This line, aimed partly at future possession of Topolobampo, if possible, will cross the Fuerte River at the lowest point on its course compatible with safety to its permanent way. It is manifest that the most feasible crossing, keeping in view the desire to pass near to Topolobampo, is just above La Constancia.

Topolobampo is one of four important Pacific ports, the others being San Francisco, Guaymas, and Mazatlan, which possess in common the peculiarity of being deep bays surrounded by isolated groups of volcanic mountains on the edge of low-lying coastal plains. Of the four, San Francisco and Topolobampo are the most remarkable. These are two of the finest harbors in the world. The entrance to Topolobampo harbor is along a tortuous but ample channel from 400 to 600 feet in width, on a general northeasterly course, veering northward at the straits, where a deep channel, entirely free from rocks, and averaging 500 feet in width, leads for a mile around the great bulk of Mt. Joshua to the wide expanse of the inner bay, called Ohuira, the latter affording fully one and three-quarter square miles of anchorage in forty feet of water. Beyond Ohuira Bay north and east the plains stretch level toward the Sierra de San Blas, unbroken save for low, isolated, conical hills about twenty miles away, known as Los Mochis, which in the Mayo Indian dialect signifies "the turtles." From the same tongue comes the name of Topolobampo, meaning "hidden water," a most appropriate appellation, for no one would guess, viewing these rugged mountains of Navachiste from the sea or from the land, that so splendid a sheet of water was surrounded by their protecting heights. No stream leads the way to Topolobampo. It seems as if when the forces of nature lifted these mountains they caught up a portion of the sea along with them. Tradition credits the Fuerte River with once having emptied into Obuira Bay, and some ox-bow lagoons and other evidences point that way, but one of the advantages enjoyed by the port of Topolobampo is that there are no streams bearing silt to choke it. Thus it will remain always a deep harbor without dredging. The vulcanism that once was active here subsided long before the outburst of the rhyolites that heaped up their great terraces on the Sierra Madre. Since the andesites of the Navachiste range were ejected, they have been tremendously eroded, and the sea had cut deep fjords with towering precipices, which in turn formed each its talus. In the course of millenniums these taluses have grown until they have rounded off all vestiges of the ancient cliffs to their very tops, except the high pinnacles of Fernandez y Leal, which rise rugged and impressive 1,300 feet out of the sea.

The sheltered bays and coves of Topolobampo, teeming with fish and waterfowl, and abounding in oysters and clams, have from ancient times been the abode of man. The present railroad town is built upon a vast accumulation of kitchen-middens, stretching for more than half a mile along the water front in solid beds from two to five feet thick. On the northwest side of the narrow neck of land on which the town is situated, is a mangrove swamp, and just where this gives way to open water was an ancient canoe landing, by a level spot on which the heaps of shells and charcoal are piled from ten to twenty feet deep down to the water's edge. The existence of these splendid middens seems to have awakened no curiosity, so that the ethnologist still has here an attractive opportunity. For the most part the heaps consist of clam-shells, with great quantities of oysters, whelks, and winkles.

Remnants still remain of the former communistic colony disillusioned by the volcanic outbursts of the old Adam which demolished their idyllic hopes of peaceful association in a common effort to banish poverty, and disrupted the enterprise. Most agreeably disillusioning, perhaps, was the discovery which most of them have made that individual initiative, forbidden under the ordinances of the Crédit-Foncier Company, with which they originally cast their fortunes, is the surest course to peace and prosperity. That they have prospered, and in many cases grown fairly rich, in a land hitherto devoid of modern transportation facilities, starting as they did without funds, is a proof of the natural advantages of soil and climate which have favored their unaided efforts.

The staple crop of the lower part of the Fuerte valley is sugar-cane. Three large plantations with modern sugar-mills are now in operation at Los Mochis and Ahome, and near La Constancia. The cane yields an average of 16 per cent. saccharine matter, and in practical work a normal output of 175 pounds of washed sugar and 5 litres of 96 per cent. alcohol is obtained per ton. The small planters market their cane at the factories, receiving $4 Mexican silver per ton.

Extensive plantations of *mezcal* are also being established. In this general term are embraced several species of agave, all remarkable for their excellent fibre, commonly known as sisal hemp, and many of them famous as a source of alcoholic distillates. The use of the name *heniquen* for the same plants is becoming common, and incidentally confusing, since this is a liberal extension of the old Spanish name of *jeniquen*, originally applied exclusively to the *Agave rigida*, var. *sisalana*, grown solely as a fibre plant in the States of Vera Cruz and Yucatan. The varieties yielding both fibre and liquor are mostly *Agave Americana* and *A. lurida*, though others are used, all being species of the genus Agave, next to the cacti the most characteristic and conspicuous plants of Mexico. The experience of planters has shown that the cost of setting out 500 plants to the acre amounts to $115, and that the cost of subsequent tillage averages about $11.43 per acre each year for the seven years needed for the plant to reach maturity. The gross yield of fibre alone is worth about $250 per acre, showing a net profit of over $7 an acre per annum. It is certainly one of the most attractive new industries now inviting the attention of agriculturists in

Mexico, particularly for those who acquire lands at the present prices, the highest of which are only $2 gold per acre.

The leading products of the Fuerte valley, aside from sugar and mezcal liquor and fibre, are corn and cotton, and extensive vineyards are being established. The climate is in no sense tropical, in many respects resembling that of southern California, with the difference, decidedly in its favor, that the winter rains are light, while the largest precipitation occurs during the growing season, from the middle of June to the middle of September. During the last two years the rainfall has been excessive, occurring inopportunely through all seasons, to the dismay of the corn-planters, who have suffered severely in consequence. This phenomenon is doubtless related to the extraordinary precipitation throughout the southwestern portions of the United States for the same period, which has broken the seven years' drought that had reduced large areas of that region to a more waterless desert than ever before, and had even threatened southern California with financial disaster.

The aspect of the Fuerte valley is singularly pleasing. The broad alluvial lands by the sea are broken here and there by isolated hills, growing more numerous toward the east, where the rugged cliffs of the San Blas range stand like a gigantic palisade separating the coastal plain from the rich *vegas* and rolling uplands of the interior, which extend beyond Fuerte to the base of the Sierra Madre at Choix. The great wall of the mountains makes an eastern sky-line of diversified contour, and ever-changing aspect of light and color. The vision northward is likewise limited by mountain peaks, tumbled in confusion along the border of Sonora, culminating in the aspiring cluster of perpendicular walls and turrets, like a natural fortress guarding the silver treasures of far-famed Alamos.

Though fortune has never cast her fleeting smile upon the Fuerte as it did upon her sister city of Alamos, she has been blest with a greater abundance of fertile land, and more than silver mines has the unfailing flow of precious waters in her river brought prosperity and the certainty of a still more brilliant future. Still, she is not without her mines. The San Blas range is attracting attention as a source of copper. Placer mines are reported in the very heart of the valley. Choix has long been known in the mining world as the source of very showy copper ores, which have been mined in desultory fashion for many years by *gambusinos*, and shipped abroad through the port of Agiabampo, which is a shallow roadstead, within shorter striking distance by mule train than the harbor of Topolobampo. The unstable and commonly low gold value in these ores, with the bunchy habit of the copper deposits themselves, has repressed enthusiasm in the past for this isolated mining district, but an American corporation has now entered the field with a promise of development to demonstrate whether it can be made a reliable producer of copper on a commercial scale. Just over the State line in Chihuahua, but economically as well as geographically linked to the Fuerte Valley of Sinaloa, is a new gold mining district, which has started off with the pyrotechnics of bonanza conditions, the chief interest centring in the Lluvia de Oro mine, a name which to-day replaces the former synonyms for wealth and power—Rosario, Trigo, San José de Gracia, which once held thrall the imagination of the West Coast Mexican. The gossip in the stores and on the streets of the cities and towns turns so persistently to mines that the newcomer would scarcely appreciate how undeveloped is the mineral industry of the region. Every man has a rock in his pocket, which he calls a "sample" of his mine. The favorite specimen is a liver-brown jasper, gayly streaked with apple-green chrysocolla. This is not saying that it all comes from the same generous hole-in-the-ground, for in this part of the valley the rocks exposed pertain almost wholly to a very ancient basal floor of andesite, through which and on top of which were poured the later rhyolites and basalts so conspicuous farther east in the Sierra Madre; and the great uniformity in geological conditions over an immese area, particularly favorable for the formation of copper and silver veins, might easily lead to the repetition of almost identical ores in widely separated localities. An English company is expending a vast sum in the erection of a custom smelting-plant not far from Choix, which displays a very venturesome spirit in view of the extremely undeveloped condition of the mineral claims in the surrounding country, the general apathy of the Latin-Americans in the matter of sustaining such enterprises by steady and energetic production, and the question of transportation, recently complicated by the entrance of the Southern Pacific Company, as a foil against the schemes of the Kansas City, Mexico and Orient Railway, and all that depends upon them.

The mining promoters, of a sort which the rich Easterner has not yet learned to avoid, have woven their webs and entangled various unsuspecting capitalists, while the West Coast looks on with a smile, awaiting the inevitable dénoûment. The crashes will necessarily injure the reputation of the district; but where so many small mines for so many decades past have contributed perceptibly to the world's stocks of copper, silver, and gold, it is reasonable to suppose that intelligent exploration and prudent management, under trained and experienced mining engineers, may establish a notable mineral industry upon a sound basis.

In spite of so much mining talk, Fuerte will strike the most ordinary observer as essentially a rural city, entirely innocent of the thrills, excitements, and extravagances of a mining centre. Such it has never known. Its people have manifestly counted carefully the cost, and—paid it! Their mansions have never seen better days. The town has grown rich slowly, steadily, surely, ministering to the wants of an agricultural community; also in no small degree absorbing the lands after the exhaustion of long-continued credits extended to the planters. The architecture of the place possesses nothing noteworthy, unless it be the sad decline of the purer and more artistic architectural instincts of the early days, as shown in the bizarre municipal palace now being built. The old church has a well-proportioned tower; the plaza is ample, and not quite as over-bedecked with parterres as the Plaza de Arenas in Culiacan; there is a noble *panteon* or tomb, prominent on a neighboring hill; and an ideal date-palm avenue by the river on the way to the ancient mission of Ocolomi. Above all, there is a large circle of wholesome, genial, well-educated gentlemen who are the chief ornament of the commercial capital of the Fuerte valley, worthy to take their places among the leaders of the new industrial order that is being inaugurated in this fertile region.

COURTENAY DEKALB.

Correspondence.

THE ASSOCIATED PRESS AND GERMANY.

TO THE EDITOR OF THE NATION:

SIR: My attention has been directed to a letter which appeared in your issue of May 17, signed by Dr. E. Schrader of Spokane, Wash., in which he says, among other things: "Does it not look queer that, of all the news spread broadcast over the world by the Associated Press during the recent years about German political affairs, more than 90 per cent. was absolute falsehood, or, to call a spade a spade, lies, made up for no other purpose than to stir up distrust and hatred against Germany!"

I do not know this Dr. Schrader, and I have no idea that you would care to be responsible for his utterances; but since they are published in the *Nation*, may I ask you to say for me that this statement is absolutely groundless, and that no one would more promptly bear witness to its falsity than every important member of the German Government, whether in Berlin or among its representatives at Washington or New York.—Sincerely yours,

MELVILLE E. STONE,
General Manager.

THE ASSOCIATED PRESS, 195 BROADWAY,
NEW YORK CITY, May 27, 1906.

EPISCOPAL INTOLERANCE.

TO THE EDITOR OF THE NATION:

SIR: Your correspondent "E. L. S.," in the *Nation* of May 17, praises Socrates for upbraiding his friends for using false words in regard to his burial. This is all very well and praiseworthy, but was not Socrates under the condemnation of the Dicastery for plain and truthful talking? So is Dr. Crapsey under the displeasure of the Standing Committee, and will be unfrocked unless he lie to please the powers that be. Plain and truthful statements are not always profitable.

Just at present the Episcopal Church, in western New York at any rate, is in an intolerant mood. It seems to regard its *credo* as more sacred than the Scriptures themselves. And the virgin birth is especially sacred, as if such a belief were of any consequence. What boots it whether Christ were born of a virgin or sprang from the head of Jove? His ethics are the same. Thaumaturgy no longer holds the high place it once held with any one, and is a stumbling-block to many.

There seems just one way out of the dilemma that confronts the Church, and that is to let the creed stand. It is histori-

cal; it is the connecting link between the present and the past; it is the bridge that has brought us over. It has comforted millions, and is a present comfort to many. So let it stand just as the Scriptures stand, but let each individual interpret it just as he does the Bible. Not even the Standing Committee would ask Dr. Crapsey or any one else to cling to Adam as an historical fact, nor would they insist on eternal punishment of the kind once meted out to sinful creatures. Then why consider the virgin birth so vital? How many vital points have been given up since the time of Copernicus! And the Church is greater than ever. It commends itself to thinking men more when it stands for human needs than when it stands *on* ancient legends.

Again, the Episcopal Church ought not to be too touchy on the question of heresy when her very foundations were heretical. Is not the Anglican Church the church of Henry, of Edward, and Elizabeth, notwithstanding all the logic of the Tractarians? The Episcopal Church may expel Dr. Crapsey just as a sister church expelled Dr. Briggs, but another and nobler place will await him. Culture and true virtue are not afraid of heresy when that heresy comes from one of high ideals and genuine purity. J. A. Bartholomew.

Naples, N. Y., May 22, 1906.

MEYER'S 'MUNICIPAL OWNERSHIP.'

To the Editor of The Nation:

Sir: In your issue of May 3 your reviewer concludes a review of 'Municipal Ownership in Great Britain' with the words: "It is unfortunate that skilful bargaining on the part of companies is characterized as 'enlightened self-interest,' while equal vigilance on behalf of the towns is persistently ascribed to the 'greed' and 'stupidity' of the 'municipal politician.'"

Nowhere in the book in question is there any discussion or characterization of "skilful bargaining on the part of the companies"; and the words "enlightened self-interest" are used only once, to wit, in the last sentence in the book. That sentence is a statement as to the relative reasonableness of the charges made respectively by the American public-service companies and the British municipalities. Finally, neither the word "stupidity" nor the word "stupid" occurs anywhere in 'Municipal Ownership in Great Britain.'

Your reviewer states that 'Municipal Ownership' is based all but exclusively on official evidence; and he adds that he has not himself examined that evidence. It is true that the evidence, as presented in 'Municipal Ownership,' reveals a state of affairs well-nigh incredible. But that fact does not justify your reviewer in intimating, without previous investigation, that the evidence has not been presented impartially and fully. The evidence is easily accessible to any one living within reach of the libraries of Boston and New York; and the subject discussed in 'Municipal Ownership' is of such importance to the American public that the reviewer is not justified in turning the public mind against the book without having made an examination of the evidence upon which the book purports to be based.

The very high esteem in which I hold your journal, emboldens me to ask you to publish this rejoinder.

I am, your obedient servant,

Hugo R. Meyer.

Denver, May 12, 1906.

[We supposed that what Mr. Meyer calls "the prices charged to us by our companies under the stimulus of enlightened self-interest" (p. 331) were an instance of skilful bargaining—the expression, by the way, was our own, and was not attributed to Mr. Meyer. So far as we recall, almost every attempt on the part of a British municipality to safeguard what it believed to be its interests, is assailed by Mr. Meyer in vigorous, and sometimes offensive, terms. "Greed," "brazen and shameless attitude of mind," "brutality," are a few of the epithets applied (pp. 85, 228, 324). A second reading of the book shows that Mr. Meyer is right in saying that the word "stupidity" does not occur in it. In characterizing the "bureaucrat" or the "bureaucratic mind" he usually employs stronger terms, so that our review did less than full justice. We gave Mr. Meyer credit for having made a thorough study of his sources of information, and expressed the opinion that his arguments could not be lightly answered. At many points, indeed, his views coincide with our own. It is true, nevertheless, that the question is not so simple and so one-sided as he supposes.—Ed. Nation.]

THE COMMON VOTER'S "CIVICS."

To the Editor of The Nation:

Sir: If the results of the "Test of Civics" applied to college students are distressing to our political optimists, what words could describe their despondency if the same tests were applied to the common every-day voter, the man in the street—the man who in the last analysis determines our public policy? Imagine the male passengers in a street car taken at random and subjected to Professor Shaper's tests! How many of them could say offhand whether or no the executive made the laws? How many of them could explain what is meant by the unconstitutionality of a law? Or, imagine that they could be inveigled into a psychological laboratory and a record could be made of the reasons which induced them to vote for or against So-and-So as judge in the last judicial election; or why they voted for or against Jones for alderman. Exactly what did they expect would be the immediate outcome of municipal ownership, if the ticket carried? How much sentiment, how much cold reason, and how much accurate knowledge was there in their minds when voting on the tariff or the silver question? If the results of such investigations could be graphically formulated and thrown on a screen for the benefit of some of our sanguine patriots with high foreheads, bald heads, and pale blue eyes—our amiable vox-populi-vox-Dei, all-men-are-born-equal fanatics—we should then undoubtedly see the beginning of an effective demand for a limitation and revision of our political creed long since needed.

Professor Shaper has given our national self-complacency an unpleasant but stimulating "jolt." It is to be hoped that more are forthcoming.

E. L. C. M.

Notes.

In course of publication in parts by B. G. Teubner, Leipzig (New York: Lemcke & Buechner), are two handbooks of commercial discipline, 'Der Deutsche Kaufmann' and 'Der Deutsche Groskaufmann,' the associated product of many competent hands, with copious illustrations.

To enumerate the fifty volumes of "Everyman's Library" before us (London: Dent, New York: Dutton) would require much space, and the publishers will send a prospectus on application. The form is eminently for the hand, the print good, the binding neatly ornate. The standard texts reprinted are introduced and more or less edited by eminent writers, presided over by Mr. Ernest Rhys. The result is a very desirable library at the moderate cost of half a dollar per volume. Here one may find represented Scott, Jane Austen, Bulwer Lytton, Trollope, the Kingsleys, Charles Reade, George Eliot, Boswell, Coleridge, Charles Lamb, Carlyle, Emerson, Tennyson, Browning, Lockhart, Macaulay, Borrow, Speke, White of Selborne, Sir Thomas Malory, F. W. Robertson, Huxley, Hans Andersen, even Balzac ('Peau de Chagrin' in translation). We can go no further in analysis or description; but since, in addition to Coleridge's 'Biographia Literaria,' we have his poetic anthology by Stopford Brooke—'The Golden Book of Coleridge'—we will remark on one example of the compiler's avowed license in leaving out "stanzas and lines which seem [to him] to injure the impression of the whole." We refer to the "Christmas Carol," a torrential invective, with specifications, against war, worthy to be taught by rote in every public school. By an almost jingoish selection, Mr. Brooke has reduced it to a sort of three-stanza hymn, perfectly abstract, with the moral power quite gone out of it.

The handsome reprint in three volumes of 'Kaempfer's History of Japan' (the Macmillan Co.) is an event of high literary interest, and it deserves the space usually granted to a body article in a quarterly review. To treat it fairly, not only should one make comparison with the facts of today, but an expert should annotate, showing how far he could assent to Dr. Kaempfer's assertions and speculations. On the subject of Shinto, for example, the work is both obsolete and misleading, for it deals with Riobu or Buddhaized Shinto; yet even here Dr. Kaempfer is valuable as historian of opinion. His derivation of the Japanese as "an original nation" from Babylon, by direct migration, can hardly be called science. Apart from what in the book is manifestly of slight importance, the general contents are of such value that, for a student of Japan, it would be hard to overpraise them. It is not probable that the European world in 1729 was able to appreciate what Kaempfer, during his twenty-six months' residence in Japan, in 1691-

1692, had acquired. We have here the original book-matter, account of translator, introductions, maps, diagrams, illustrations, appendices, and index. The chapters on Siam, voyage to Japan, reception at Nagasaki, local government, the Portuguese in Japan, journey to Yedo, papers on the moxa, tree plant, etc., are unabridged. For the reference library and the philosophical student of the Japanese, the work is invaluable. Mechanically, there is little to be desired.

A revised edition of Sir Edward Ridley's translation of the 'Pharsalia' comes to us from the press of Longmans, Green & Co. Pompey, Lucan's choice between the two contestants, was not a suitable hero for an inspiring epic, and Lucan's qualifications as a poet were decidedly inferior. "Oratoribus magis quam poetis adnumerandus," was the opinion of Quintilian, and, bearing in mind that Quintilian does not imply that he was really a good orator, one can hardly better the criticism. It follows that a faithful translation can hardly give a very inspiring poetic result, and, aside from furnishing a scholarly avocation to a cultured English judge, we fail to see that the effort was worth while. To go back to Nisard as to the substance of the poem: "For philosophy, for the knowledge of man, for the understanding of his passions, of his interests, of his inclinations, the 'Pharsalia' is a dead work; there is nothing to be learned there." Work on Lucan since the appearance of the first edition of this translation, ten years ago, has not been quite as scant as Justice Ridley imagines. At least one of the books within that time which has escaped his notice, that of Oskar Schmidt, on the use of metaphor and simile in the 'Pharsalia,' might have furnished valuable suggestions for the revision of his translation.

'In the Desert' (London: Edward Arnold), by L. March Phillips, is an attempt, first, to give the impressions received during a journey in the Algerian Sahara. In this the author has been more successful than most travellers. His descriptions of the first glimpse of the vast wilderness from the great gorge known as the Fum es-Sahara, the Door of the Desert, the sunrise, the storm, the oases and the nomad tent-dwellers, are vivid. In addition to these pictures are brief accounts of two or three towns including Kairwân, the Mecca of North Africa. This leads Mr. Phillips to show the civilizing results of the French occupation, their general methods of government and development of the hidden resources of the sands through well-sinking and railway construction. His main object, however, is not merely to reproduce his travelling notes, but to demonstrate that the Arab is the true child of the desert; its instability is the marked feature in the Arab's character. Hence a sketch of his history from his first appearance in the Western world to the present time, and an exhibition of the way in which the desert and its life are reproduced in his poetry, his architecture and his religion. The chapter upon Mohammedanism dwells at some length upon the two great divisions of the followers of the prophet, the Sunnites and Shiites, but makes no mention of the peculiarly African sect of the Senussiyeh, whose influence has been and still is great in Central and Western Africa. The book is interesting and suggestive, though the style is at times somewhat discursive and it is a little difficult to follow the author's train of thought. The excellent illustrations are mostly of desert landscapes and architectural details.

A new handbook for campers, 'Camp Kits and Camp Life' (Scribners), comes from the pen of Charles Stedman Hanks, otherwise known as "Niblick." To this writer successful camping does not necessitate so complete a reversion from civilization to nature as some insist upon. He names just forty-eight different articles of food and seasoning as the desirable equipment for two men and two guides for an outing of one month. The book is copiously supplied with instructions to the novice for specific emergencies, but there is a tendency to assume agencies not at all likely to be at hand, since most people do not go into the woods fitted out on the scale indicated by the varied table supply already mentioned. Directions for firing at a bunch of birds imply that Mr. Hanks is not abreast of the ethical development of sportsmanship. The man who deliberately fires into a bunch of birds, possibly crippling several in his eagerness to bring more than one to his bag, has a better claim to the title of pot-hunter than to that of sportsman. The list of possible guns from which the hunter may choose is also too inclusive for the highest ideals of sportsmanship. The chapter on bass fishing indicates but little experience with that particular fish, and the description of a dime's worth of line and hooks, to be used with any rod which comes to hand for the capture of the great Northern pike, is conclusive against any experience in pike fishing at all. Mr. Hanks is at liberty to disdain any particular fish, but that does not excuse seriously misleading statements in a handbook of this kind. His directions for preparing a pot of baked beans in the woods, however, are so obviously excellent as to cancel all minor faults and deficiencies.

Mr. M. N. Tod and Mr. A. B. J. Wace, the Assistant Director and a student of the British School at Athens, have made an excellent 'Catalogue of the Sparta Museum' (Oxford: Clarendon Press; New York: H. Frowde). The policy of the Greek Government is to bring the most important movable antiquities to the great National Museum at Athens, excepting the objects found at Olympia and at Delphi. Small museums are maintained for less important objects at Sparta, Corinth, Argos, etc., in less prominent places, being in general only a room or two in the basement of a school building, and the schoolmaster being often the keeper of antiquities. The museum at Sparta is perhaps the oldest of the local museums, and has retained some sculptures and inscriptions of great interest, although the ancient Spartans were not devoted to either art or literature, and only slight remains of sculpture or architecture have been found in their land. The golden cups discovered in a tomb at Vaphio were pre-Dorian. Still, the numbers in the accession-list of the museum at Sparta run above eight hundred—more than twice as many objects as this museum contained when the only previous catalogue was published in the second volume of the Athenian *Mittheilungen* in 1878. The new catalogue was much needed. Knowledge of the contents of the smaller museums of Greece is not easily obtained without a visit. Concise introductions in part remedy for the students in another land the inconvenience of following the order of the inventory or accession-list, which is retained because of its importance for the visitor and student in the museum itself. More than eighty figures in the text save many words in the descriptions.

Dedicated to President Roosevelt and prefaced by M. d'Estournelles de Constant, the book of M. Jacques Dumas on 'Les Sanctions de l'Arbitrage International' (Paris: Pedone) exhibits this originality, that it handles for the first time the whole problem of the sanctions of arbitration. The author, who is a French magistrate of note and an active "pacifist," has treated his subject with great thoroughness from the standpoint both of the historian and of the jurist. In this very readable volume of 450 pages he first reviews the whole history of sanctions—material, civil, penal, and political—as applied in past cases from Greece down, and then examines their efficacy in relation to the problems of the future. His main principle is to discard absolutely any form of sanction implying the return to the barbarous sanction of war. This book, which ought to be in the library of every believer in the practicability of arbitration, will be invaluable when the Hague tribunal begins seriously its great work, and faces the tremendous problems that will come before it.

The director of the Royal Art Gallery of Turin, Alexandre de Vesme, has issued a catalogue of the Italian painter-engravers of the seventeenth century, 'Le Peintre-Graveur Italien' (Milan: Hoepli), which is intended to supplement Bartsch's standard work that ends with Marc Antonio and his followers. M. de Vesme has covered a period not previously treated, one of decadence, it is true, but which includes sixty-one well-known engravers and etchers, among them Salvator Rosa, Carlo Maratti, Villamena, Della Bella, and Pietro Testa. The author has made a long and careful study of his field, and has succeeded in supplying a work which will be of great service to students and amateurs of its subject.

Dr. A. Keysser, the director of the City Library of Cologne, whose pamphlet on Belles-Lettres and Libraries was noticed in these columns last year, has issued another small but weighty contribution to library literature, under the title 'Das Bibliothekswesen als Gegenstand der öffentlichen Verwaltung.' In discussing the library as an object of public administration, the author takes up the questions of Management by Experts, Finances, Literary Resources and the Work of Collecting, Caretaking and Utilization, Regulations for Use, National Organization. At the outset he states with great emphasis that the work of managing a library must be entrusted to a trained or experienced librarian, and he deplores the tendency to give precisely the leading positions to men without the slightest technical qualifications, quoting from Dr. Nörrenberg: "If my tailor understands his business ever so well, there is no reason why I should order my boots from him; and a thoroughly competent teacher or scholar is therefore not yet a librarian." In the concluding chapter Dr. Keysser advocates a common organization of all German libraries as

the best way to efficiency. A similar proposition is made in another pamphlet, by Dr. E. Reyer of Vienna, 'Kritische Studien zum volkstündlichen Bibliotheks-wesen der Gegenwart,' otherwise chiefly devoted to discussions of statistics. Dr. Reyer recommends the preparation in every city of a general card catalogue of all the books in the more important libraries, interlibrary loans, and a division of the field of literature among the various libraries, so as to avoid duplicatlou.

Under the heading "Books as Merchandise," Mr. C. W. Andrews offers in the May number of *Public Libraries* some reflections on the market value of collections of books, based on his experience as librarian of the John Crerar Library. "The problem is not an academic one," he says, "for this value should be included in the statement of the assets of every public library." Present practice in this respect seems to be simply to add up the total amount expended for books, which can hardly be accounted a statement of assets, since few books retain their market value after having been on the shelves of a public library. The formula which Mr. Andrews recommends "should allow for a depreciation of about 50 per cent. on all purchases upon receipt; then for a slow depreciation, say of 3 or 5 per cent. annually—this depreciation to continue indefinitely on the individual books, but stop after a time on periodicals; and the result thus obtained should be increased by a percentage, small at first, but larger for each 100,000 volumes in the library, provided the collection is kept up to date and its sets of periodicals maintained in perfect condition."

In the same number, Dr. J. H. Canfield writes about certain young women with library training who left their positions at the Columbia Library to take up work with commercial houses and law firms; their duties in their new places being to keep files of papers and records in order, or to have charge of office libraries. It seems that this class of employers appreciates the value of trained help better than Columbia University, inasmuch as each of the young women in question received at once an increase in salary of from 50 to 100 per cent., and in a short time considerably more. Attention might here be called to a letter to the editor, written by Miss Irene Warren, and protesting against the plan of increasing the first year's dues to the American Library Association from $2 to $3. She alleges that this raise, small as it may seem, adds a considerable percentage to the professional expenses of a class of workers who are, as a rule, very poorly paid, namely, assistants in the lower grades of even the larger libraries, and librarians of the smaller. "It is strange," Miss Warren exclaims, "that many of these men who are standiug for college-trained workers are placing the salaries of their staff at the lowest possible rate. . . . The conversation and action of some 'library employers' sometimes suggest that their economies and bargains extend to the realm of human lives, and that is a dangerous field." Miss Warren's letter and Dr. Canfield's confessions, taken together, offer much food for thought.

The *Geographical Journal* for May opens with an article, by Mr. S. Green, giving many details in respect to the wrecks of the Spanish Armada on the Irish coast. The one fact of general interest brought out is the remarkable kuowledge the Spaniards had of the coast, due to their close intercourse with Ireland, which went on for centuries prior to the days of Elizabeth and of which many traces still remain. In the year immediately before the sailing of the Armada, Sir Humphrey Gilbert reported to the Queen that there were 600 Spanish fishing-boats on the coast, besides permanent fishing establishments. On the accompanying map the places of twenty-five different wrecks are noted, and there are pictures of some of the most interesting localities. Prof. Scott Elliot describes the effects of certain water-plants in Chili in changing the geographical configuration of the land, as, for instance, in the formation of pampas in what was once a sea. In the discussion following the reading of this paper before the Society, Col. Church, the great authority on South American geography, referred to the gigantic amount of silt carried by the river Paraná, at least a cubic mile in every twenty-two years. "If you could turn the river across the Isthmus of Panama," he said, "it would cut the Panama Canal down to sea-level in about nine months—a great pity for the United States Treasury that it cannot be done." The persistent homogeneity of population and social life in the Levant is ascribed by Mr. D. G. Hogarth to the geographical conditions. The Greeks, Armenians, the so-called Turks of Anatolia, and the Syrians all have similar facial types, quick intelligence, and instability of purpose. In the fact that the eastern Mediterranean lands have ever been open to the inroads of steppe and desert nomads, he finds some explanation of those characteristics of restlessness—superficiality and individualism.

The eighteenth report on the public records of Massachusetts by the Commissioner, Robert T. Swan, necessarily traverses old ground, but, as usual, repays reading. His circular chapter of "Don'ts" in particular merits the attention of all who have to do with the making or custody of records, public or private. The discussion of the relative resistibility to fire of vaults and safes is timely. Mr. Swan exposes a swindling concern pretending to have copies, and sometimes the originals themselves, "of nearly all the church and town records of New England prior to the year 1800." Mr. Swan declares that not a single town in that section "has had all of its records copied," and otherwise brands a falsehood concocted for credulous genealogists. He closes by bespeaking bequests for fireproof town-record offices, as well as for the safe-keeping of historical relics.

It is often said by Southerners that they would, if left to themselves after the war, have done their duty in elevating their black fellow-Americans. This may explain, as pure jealousy, the social tabu maintained to this day against white Northern instructors of the blacks, even in training-schools for nurses; but it does not account for a recent experience in Louisville. There it was desired, in conformity with the caste spirit, to establish a colored branch of the public library. Difficulties arose with white householders, who (as one may read in the *Courier-Journal* of April 8) "seemed to be under the impression that their property might be desecrated by such use." Finally, a colored citizen gave up the ground floor of his own residence for the library. Its frequenters "have no hesitation in expressing their preference for books by and about their own people," though 'Uncle Tom's Cabin' is not specified. (Are they allowed access to it?) Oddly enough, George Eliot's works are in great favor.

In the *Nuova Antologia* Professor Dall' Osso, the head of the Naples National Museum, describes an important fresco recently discovered in Pompeii. It symbolizes the origin of Rome, and is divided into four scenes, each representing a leading feature in the great event. The first is laid in heaven, and in the left corner of the picture Helios is represented as ascending the horizon in his sun-chariot, while Mars stands in the middle in golden armor, a lance in his right hand. The second shows the King's house in Alba Longa, and on the right the King's daughter, Rhea Sylvia, lying asleep near the temple of the priests of Mars. The third depicts the punishment of Rhea Sylvia, who is to be drowned in the river; while the fourth exhibits the course of the river Tiber, on the banks of which Mercury is giving the twin boys to the shepherd, Faustulus. Dall' Osso is convinced that the composition is not an original product, but a copy of an old Greek painting.

The international exchange of professors is not to be limited to the plan now being realized between Berlin and America. German papers report that a similar project is being matured for the purpose of bringing France and Germany into closer contact educationally. With the consent of the Cultus Minister of Prussia, a Paris professor has been invited to teach his mother tongue conversationally at one of the higher schools of Schoeneberg, near Berlin. The city council is expected to furnish the funds for this new venture.

The Second International Congress for School Hygiene has been called to convene in London from the 5th to the 10th of August. On the whole, the programme, as announced by the General Secretary, covers about the same ground as the first congress did that met in Nuremberg in 1904. The work will be divided among ten sections. An exhibition of plans for model school buildings, school furniture, etc., will be held in connection with the congress.

The International Astronomical Association, of which Prof. H. von Seeliger of Munich is president, has sent out invitations for the next general convention to be held in September of the current year in Jena, in accordance with the resolution passed two years ago at Lund. Announcements of papers, attendance, and the like, should be sent to Jena, where the Observatory will be the official headquarters of the congress.

The Medical Faculty in Paris recently engaged to publish a technical 'Universal Lexicon of Pharmacology,' in nine living languages. At the earnest recommendation of a number of savants, it was decided to add Esperanto as a tenth language.

—The June *Century* offers some choice bits of copiously illustrated description. Corwin Knapp Linson contributes a few paragraphs on sunset effects near Jerusalem, accompanied by two brilliant color

drawings, his own rendering of what he calls "a whirlwind of scarlet and gold and crimson, of violet and blue and emerald, flecked with copper and bronze and shreds of smoky clouds in shadow, a tempestuous riot of color so wild and extraordinary as to hold one spellbound." Wladyslaw Benda describes a tract of mountain territory in the highest part of the Karpathian system, between Galicia and Hungary, with his own drawings, reproduced in half-tone. The Pennells trace the Marne from its source to Paris, with nearly thirty varied bits of scenery depicted in Mr. Pennell's well-known style, the characteristic note being that of a shrinking, pastoral stream, flowing as through the Lotus Eaters' land, and able to retain its shy charm even through one of the busiest parts of rich, prosperous, and hard-working France. Of a different order, but intensely interesting, is Ernst von Hesse Wartegg's account of the trolley line which has been gradually working up to the Jungfrau from Interlaken, and is to end, possibly in five or six years, at a point only a little over 200 feet from the summit, with an electric lift to raise the tourist right through the gneiss rock to the very top. William H. Tolman writes of some of the European "Museums of Security," an institution scarcely yet known even by name in this country; its purpose being to display the various devices for promoting the health and safety of the people, and especially of those engaged in occupations involving any particular danger.

—Frederick Trevor Hill appears in the opening pages of *Harper's* with a plea for a reversal of the popular verdict against Aaron Burr. It is not difficult to show from the records that the specific charges against Burr were not sustained by any evidence produced by the prosecution, but the instinctive condemnation of Burr goes deeper than the occurrences upon which the theory of a treasonable conspiracy to divide the Union was based, and Mr. Hill attempts a hopeless task. Charles Henry White, of New York, writes of Philadelphia in the well-known humorous strain. Old Chester and Dr. Lavendar have become so fixed a feature of the magazine that an article on an Old Chester without a Dr. Lavendar is liable to produce temporary bewilderment in the reader's mind, until he recalls the older Old Chester of Roman Britain, which Mr. Howell takes as the subject of his English paper for this month. Mr. Howells is not favorable to any further disturbance of later structures in order to unearth Chester's Roman foundations. "To be sure, if one knew they underlay New York, one would gladly level all the sky-scrapers in the town that they might be given to the light. But in Chester it is another matter." The monthly discourse from the Easy Chair is humorous and suggestive as usual, taking its text this time from the inquiry of a perplexed correspondent who wishes to know "why a second-class writer cannot sell his best work, while he can dispose of his worst." An appreciation of the work of Mr. Howells by Mark Twain is one of the announcements for the July number.

—'A Treatise on American Citizenship,' by John S. Wise (Northport, N. Y.: Edward Thompson Co.), is the title of a convenient handbook dealing with the primary rights, duties, and privileges of the American citizen, and analyzing the peculiar dual system—Federal and State—under which he lives. It is fortified by a large collection of decided cases. The author has ranged over the field, not only of citizenship, but of constitutional law, and the result is that here and there the boundaries are not made distinct. This is especially observable in his enumeration of "rights, privileges, and immunities." The privileges and immunities guaranteed by the Constitution to "citizens of each State" in "the several States" have never been exactly defined, but, from what is quoted from the decisions, they seem to mean those ordinary civil rights for the protection and preservation of which governments are instituted; and Mr. Wise refers to the Virginia Bill of Rights as a good example of a formal declaration of them. In the national Declaration of Independence we find another enumeration of them. Mr. Wise classifies rights, privileges, and immunities granted or guaranteed to the citizen by the Federal Constitution and amendments under sixty-two heads. Among these we find, of course, the right to trial by jury and habeas corpus, but also a right "in each State to equal suffrage in the Senate," and an "immunity" from any State law impairing the obligation of contracts. The first of these is surely a right vested in the several States, and not in the citizen; while the unconstitutionality of statutes impairing the obligation of contracts enures to the benefit of all parties to such contracts, whether citizens or not. As a popular summary of the more important features of our system, the book will be found useful. It is marked by great fairness and freedom from bias of any kind.

—The "History of All Nations" series (Philadelphia: Lea Bros.) continues to put forth its imposing volumes, and has now reached the Napoleonic period. Without rehearsing what has been said by us already regarding this work, it must suffice to indicate the character of the latest instalments which we have received. Volume XV., by Dr. Martin Philippson, is entitled 'The Age of Frederick the Great,' from its dominant motive, though, like its predecessors, it considers the development of Europe comparatively and with reference to every leading country. Beginning with the origin of the Seven Years' War, it covers that great contest, the First Partition of Poland, and the era of the enlightened despots. Dr. Philippson's contribution to this series has been extremely considerable. Here, as before, he indicates precisely his own point of view, and writes with a directness which will be grateful to the reader. To take a single instance, he frankly denounces the idea that Germany was only harmed by the French Revolution, and would but for it have developed more peacefully and rapidly along the lines of moderate liberalism. "Were not all the former attempts at reform, however simple and necessary, foiled? Were not the efforts of the Emperor Joseph in this direction completely baffled? Had not even a Frederick the Great to content himself with mere abolition of serfdom? And did not this institution continue to prevail almost everywhere else in Germany? There was nowhere the least indication that any one thought of abolishing the degrading system of caste, and giving the people a direct interest in public affairs, or of abrogating the inequalities of taxation and military service." Volume XVI. embraces Professor Flathe's 'The French Revolution and the Rise of Napoleon.' In a sketch extending from the convocation of the States-General to the creation of the Empire, he finds some space for the concerns of Europe at large, despite the almost irresistible tendency to make everything pale before the meteoric career of France during the fifteen years in question. If we may make a rough comparison, there is more of France in Flathe's book than of Prussia in Philippson's. However, little fault can be found with the perspective in the narrative of the Revolution, and enough space is allowed to admit the insertion of much lively detail. Vol. XVII. also by Flathe, covers the latter part of the Napoleonic era, and is written from the standpoint of the German patriot who not only looks upon the Emperor of the French as a wanton tyrant, but thinks that France was far too well treated at the Congress of Vienna. As before, the volumes are copiously illustrated, and in some cases facsimiles of documents have been introduced.

—The discussion over 'Il Santo' and the Index calls attention to the appearance of a third edition of the Abbé Bethleem's handbook of literary morals, as one might call it, 'Romans à lire et Romans à proscrire.' The book was put through the press in advance of the condemnation of 'Il Santo,' whose author is simply included by the Abbé among worldly writers "who take so many liberties with morality or truth that they are to be considered as more or less under suspicion, and cannot be read without danger except by those who have had previous warning and are of mature age and judgment." 'Il Santo' in particular is a work of art and religious criticism "assaisonnée de rosminianisme, d'américanisme, de murrisme et de spiritisme," written with the apparent purpose of indicating alleged reforms needed in the Catholic Church. Octave Feuillet has delightfully idealized family life in "le grand monde," and has displayed profound psychological insight in depicting various things, including the heart of woman, but his hooks are generally dangerous because they set one to dreaming too much, and "exhale a perfume of sin." Gorky is also of the worldly, primarily the romancer of vagabonds, his characters denuded of all moral sense and his teaching revolutionary. Kipling's Jungle books are delightful in spite of a few shocking oddities, but, aside from them, he "celebrates the brutality of English Imperialism," even such books as 'Stalky & Co.' and 'Captains Courageous' being simply "jingoist morals in action." The writings of Alphonse Daudet are divided into three classes, those which "les tout jeunes gens se contenteront de lire," those which "les plus grandes pourront lire avec prudence," and finally those which "ne sont pas tous inoffensifs, même pour les grandes personnes." Tolstoy, George Meredith, Bret Harte, Camille Flammarion, are included along with Ouida, Anatole France and Gabriele D'Annunzio in the class "à proscrire en vertu de la morale chrétienne." Some thirty pages are given to the romances under

the ban of the Congregation of the Index, and something more than one-third of the volume is devoted to works which are unhesitatingly recommended as safe. It would be interesting to know just what one of the various classes of books noticed will get the most advertising value out of inclusion in these lists.

A DEFENCE OF MR. FROUDE.

The Life of Froude. By Herbert Paul. Charles Scribner's Sons. 1905.

Mr. Herbert Paul, who is well known on both sides of the Atlantic as a brilliant essayist and critic, gives us in this biography of James Anthony Froude a piece of work marked by his usual force, point, and vivacity. There is much wit in it, many happy dicta, and some good epigrams. It is highly controversial, defending Froude from the attacks of his numerous critics, and carrying the war into the enemies' country by attacking the critics themselves. This warlike atmosphere was perhaps unavoidable, for Froude led a troubled life, always saying or writing things which incensed other people and brought onslaughts upon himself. His life could no more be written without noticing these conflicts than Gen. Grant's could be written omitting all the battles. It was also the more natural for Mr. Paul to devote much of his book to such matters because he had not the advantage of a mass of correspondence upon which to draw for an account of his hero's thoughts and occupations. There are a few, but only a few, letters given in these pages, and though they are always forcible, often characteristic, they have no such eminent merits of thought or style as to make us long for more. Neither does Froude seem to have kept a diary. Neither have any of his more intimate friends made any contribution to the volume in the way of personal reminiscences or characteristic anecdotes. Thus the materials, except the few letters already referred to, are comparatively scanty; and Mr. Paul has been obliged to rely upon the facts supplied to him by some members of Froude's family about his early life, and upon the books and articles, abundant indeed, which proceeded from a fertile pen during a long life.

The book necessarily lacks that which makes the chief interest of the lives of literary men—inner lights on their methods of thinking, bits of their own familiar writing; but for this the biographer is not to blame. It is open to the charge of occasional repetition, saying the same thing about Froude over and over again in almost the same words—a defect which seems in this instance due to haste in composition, for Mr. Paul's literary essays are free from it. He is not always accurate in details, though the errors we have noted are not of sufficient magnitude to be worth enumerating. But the book is interesting, and it is honest. Mr. Paul is no doubt a vehement partisan. His object seems to be to prove Froude as much as possible in the right, and even more to prove his antagonists always in the wrong. In pursuing this object he says a good many things not only about his hero, but also about history, which startle us. To defend Froude from the reproach of not being a scientific historian by saying that "if history be a science, no less and no more, he must remain outside the pale in the company of Thucydides, Tacitus, Gibbon, Macaulay, and Mommsen," takes one's breath away. If Thucydides and Mommsen, for instance, are not scientific historians, who is? And what have they, exact and accurate students, in common with Froude except that all three are good reading? His partiality for his hero, natural indeed as it is in a biographer, is so pronounced that we suspect it may set his readers the other way, and prove less effective than a more sober and moderate statement of the facts would be. But let us repeat once more, this eagerness to defend Froude, while it takes the form of declamation, or explanation, or palliation, never leads to any perversion or coloring of the truth. Mr. Paul is perfectly upright, and with laudable candor sets out facts which tell against the subject of his admiration. Neither Froude's mistakes, nor his violent partisanship, fatal as both are to the proper writing of history, excite his wrath to anything like the same degree that they have done that of most of Froude's critics. But both defects are admitted.

James Anthony Froude was the son of an archdeacon of the Church of England, who was also a Devonshire landowner in easy circumstances. He had the misfortune at the age of five to lose his mother, and his boyhood was thereafter a wretched one, for his father grew stern and cold, and the discipline to which he was subjected by his aunt and his elder brother was harsh. Neither was he fortunate in his schools and schoolmasters. A more dismal childhood, and one more likely to blight a man's character and give him a twist towards cynicism for all the rest of his life, can scarcely be imagined, if the picture here presented be a true one. In 1836, being then eighteen, he entered at Oriel College, Oxford. He brought with him a bright, keen intellect, which had assimilated much from reading many books, but had received no regular training and very little of classical scholarship in the higher sense of the term. His first years at Oxford were far from studious, but he ultimately "pulled himself together" (as they say), won a high distinction, the Chancellor's prize, for an English essay, and was elected to a Devonshire fellowship at Exeter College. It was a condition of this fellowship that the holder of it should, after a time, be ordained a minister of the Church of England, or else lose the emoluments, which were of course a matter of importance to a young man who had no other profession and such scanty private means as to be really dependent on his father. Froude had fallen under the influence of John Henry Newman, who was then in the zenith of his power; and although it would seem from Mr. Paul's account that theological doubts had already begun to invade his mind and unsettle his convictions, still he was not so far actually a disbeliever in Christianity as to do any great violence to his conscience in being ordained a deacon, which he was in 1845.

At Newman's instance he contributed to a series of Lives of the English Saints a life of St. Neot, of which Mr. Paul says, "He told the story as legend not quite as Newman wanted it. 'This is all,' he said at the end, 'and perhaps rather more than all that is known of the life of the blessed St. Neot.' His connection with the series ceased" (p. 34). We have seen or heard the story of the conclusion of the book somewhere told, but cannot now say where, in a slightly different form, viz., "This is all that we know, and more than we know, but less than the angels know, of the life of the blessed St. Neot." Anyhow, the disciple was not quite up to the standard of his master, who shortly thereafter quitted the Church of England, and, as every one knows, became after long years a cardinal of the Holy Roman Church. Froude presently found his position as a clergyman and a tutor of his college increasingly difficult. In 1848 he wrote a book called 'The Nemesis of Faith,' highly unorthodox, of which Mr. Paul says:

"It is not a novel, it is not a treatise, it is not poetry, it is not romance. It is the delineation of a mood; and though it was called, with some reason, skeptical, its moral, if it has a moral, is that skepticism leads to misconduct. That unpleasant and unverified hypothesis, soon rejected by Froude himself, has been revived by M. Bourget in 'Le Disciple' and 'L'Étape.' The 'Nemesis of Faith' is as unwholesome as either of these books, and has not their literary charm. It had few friends, because it disgusted free-thinking Liberals as much as it scandalized orthodox Conservatives" (p. 46).

The immediate effect of its publication was to cause the senior tutor of Exeter College, the Rev. William Sewell, to burn it during a lecture in the College Hall, and to lead the rector and fellows of the college to request its author to resign his fellowship—fellowships in Oxford colleges were in those days subject to theological tests—backing their request by a threat of expulsion. Froude yielded, and went out into the world to try his luck as a man of letters. He was not, however, altogether inexperienced, nor had 'The Nemesis of Faith' been his first literary venture. Some little time before—Mr. Paul is rather sparing of dates, and does not give this one—he had produced two short stories, published anonymously, of one of which Mr. Paul says:

"'Shadows of the Clouds' is a valuable piece of autobiography. Without literary merit, without any quality to attract the public, it gives a vivid and faithful account of the author's troubles at school and at home, together with a slight sketch of his unfortunate love affair. Froude was a born story-teller with an irresistible propensity for making books. The fascination which throughout his life he had for women, showed itself almost before he was out of his teens; and in this case the feeling was abundantly returned. Nevertheless, he could, within a few years, publish the whole narrative, changing only the names, and then feel genuine surprise that the other person concerned should be pained. He was not inconsiderate. Those who lived with him never heard from him a rough or unkind word. But his dramatic instinct was uncontrollable, and had to be expressed. The archdeacon read the book, and was naturally furious" (p. 37).

The archdeacon was Froude's father, whose character is traced in the book with a candid hand. Mr. Paul seems to us to do less than justice to the literary quality of 'Shadows of the Clouds,' which struck us, when we read it years ago, as showing a real though as yet undeveloped gift for style. But his explanation of this strange freak is no doubt the true one. There are persons whose impulse to express themselves to others, in print, is uncontrollable. A late well-known and very popular writer, him-

self a clerical dignitary, published a volume of poems, among which there were not a few addressed to a young lady who had shortly before broken off her engagement to him. Rousseau is the extreme case of men of this type.

From this time onward Froude was unweariedly active with his pen. Only once again did he venture into the field of fiction. His 'Two Chiefs of Dunboy,' published in 1889, was not a success, though much of it is excellently written. Otherwise he devoted himself partly to magazine journalism, editing *Fraser's Magazine* for some years and contributing articles to various monthlies or quarterlies, partly to the historical composition. About 1852 (the exact time is not given) he began working on the reign of King Henry the Eighth, impelled to this subject by his interest in the English Reformation, an interest which in its turn was due to his violent recoil from the "Tractarianism" or Neo-Catholicism of J. H. Newman and his Oxford High Church followers. In 1856 he published the first two volumes of his 'History of England,' and finished it with the publication of the last of the twelve volumes in 1870. This book involved him in acute controversies; and those aroused by his next work, 'The English in Ireland,' were still more bitter. Many Americans will remember the refusal of Irish servant girls to remain in some houses where he was received as a guest during his lecturing tour in the United States in 1872, the lectures being upon the relations of England and Ireland, a subject selected with more courage than judgment. The first volume of the book appeared while he was actually in America delivering the lectures. It is an attempt to justify the conduct of the English, not by concealing the tyranny and cruelty so often perpetrated in Ireland, but (to put it shortly) by arguing that the Irish deserved nothing better, and that severity, however harsh, was the best way of treating a race entirely unfit for self-government. Froude would in fact have governed Ireland in a purely autocratic way, much as Spain governed the Philippines. He had been a great deal in Ireland and had lived there for some years, so he felt all the more confidence in his opinions. His view of government and politics in general had for many years been profoundly influenced by Thomas Carlyle, to whom indeed he bowed down as being not only a great man of letters, which everybody holds him to be, but also a great philosopher, which nobody now thinks him. Of Froude's Life of Carlyle, and his handling of the Carlyle documents altogether, we have left ourselves no space to speak. Mr. Paul does his best to defend Froude's behavior, and does it gallantly, but, in our judgment, with scant success. Perhaps Prof. Charles Eliot Norton, who knows the matter more thoroughly than any one else, may have something to say on the subject.

Once only did Froude enter the field of practical life, when Lord Carnarvon sent him on two missions to South Africa in 1874 and 1875. He did no good there, but that may be said of so many others that it reflects no discredit on him. He was, however, so utterly wild in all his ideas of government, and talked such silly rant about English politics—Mr. Paul himself admits that "in politics he never looked very far below the surface of things" (p. 28)—that one wonders how he ever came to be selected for an extraordinarily difficult task.

Mr. Paul, who seems to be fascinated by Froude's brilliance of style almost as Froude himself was fascinated by Carlyle's, will hardly alter the estimate of Froude's merits as a historian or a man which those who have read his writings, including those on Carlyle, have already formed. But he has given us a bright and interesting book, and his account of Froude's early life does suggest considerations not to be forgotten when judging some of the things, and especially the apparent enjoyment of cruelty, which shock us in his histories.

TWO BOOKS ON IRRIGATION.

The Conquest of Arid America. A New and Revised Edition. Illustrated. By William Smythe. The Macmillan Co. 1905.

Irrigation in the United States. By Frederick Haynes Newell. Revised Edition. Thomas Y. Crowell & Co.

The "conquest" is a feat of which, when accomplished, those who planned the campaign and those who effected the victory may well be proud. It will mean the recovery from aridity to fertility of several millions of acres, most of them in the region of perpetual summer and sunshine; accordingly, the enthusiasm of those who have been promoters of the great national movement may be forgiven when, like Mr. Smythe, they sometimes overstep the limits of calm judgment. He assures us that "the superiority of the Western half of the continent [the dividing line being the 97th meridian] over its Eastern counterpart may not be expressed in a word"—whatever that may mean! The statement that "there is no Eastern State that compares with almost any of those great commonwealths of the comparatively unknown West in anything save present development, which includes, of course, population, wealth, and political influence," reads like exaggeration. While there is undoubtedly a fascination about the West, and while the agricultural possibilities of the small proportion of its total area that can be brought under irrigation, and therefore cultivation, are great, it is irrational to pretend that these few millions of acres, won in small patches from so vast a territory, will ever create and support communities rivalling in political or commercial influence such States as New York and Pennsylvania. Nevertheless, already California, Colorado, and Montana, in the value of their mineral and agricultural productions, and even in the number of their population, have outstripped some of the smaller Atlantic seaboard States. And then, a little exaggerated sentiment and glorification of one's self are potent factors in stimulating pioneers to attempt such feats as Mr. Smythe describes in the closing chapters of his book.

Irrigation has always been practised in every State and Territory of the Rocky Mountains, and some private irrigation works of considerable extent have been built and are supplying large tracts of private lands and are selling water to settlers; and, under the Carey act, Idaho is reclaiming a large area of land, which had been withdrawn from the public domain and turned over to the State Board of Reclamation. But it was not till the agitation for national control of Western waters and the abrogation of the Desert Land laws and of all laws which might permit irrigable lands to be acquired in large blocks, culminated in the Newlands Reclamation Act of 1902, that the Federal Government, acting through the Secretary of the Interior, undertook the task of winning the Western Desert to fertility by storing wasted waters and diverting them over the thirsty soil. How vigorously the difficulties involved have been faced, if not yet solved, may be judged from the summary of work, planned and partly completed since 1902, to be found in a recent publication of the United States Reclamation Service.

"The total sum," we read, "set aside for all classes of projects is $34,270,000, and the amount of land to be irrigated is 1,909,000 acres. The average value of irrigated land in the United States is $47 per acre. This acreage will, therefore, add $89,723,000 to the taxable property of the United States in land values alone. According to the census report of 1900, the average annual income from irrigated land is $15 per acre. On this basis an income of $28,735,000 per annum will be added to the nation's wealth."

Under the regulation of the Secretary of the Interior, the Government lands to be thus irrigated may not be sold in tracts of less than 40 acres or more than 160 acres; and no waters shall be provided for private lands owned in lots exceeding in size 160 acres, unless the lands are actually occupied by bona-fide residents. The lands which will thus be reclaimed by operations now in progress should support a population of between 200,000 and 300,000 families, or about a million individuals. The number seems small compared with the magnitude of the proposals, but the schemes are nearly all capable of expansion. They include very diverse systems of storage, and will probably result in varying degrees of success, for it would be presumptuous to expect that no mistakes and no miscalculations have been made or will be made in planning and constructing so many and such extensive engineering feats, some of which at least are more or less experimental. The dams across the Rio Grande and the Colorado obstruct streams that carry down at all times vast quantities of suspended solid matter, which is so fine that it probably can be discharged, as it accumulates, through sluice gates, as the deposit of Nile mud is disposed of through similar discharges in the Barrages at the head of the Delta and the dams at Assuan and Assiut, Even there, however, more or less sand is carried down during high Niles, which causes some anxiety to the Egyptian Irrigation Department; but the spring floods of even the Rio Grande and the Colorado are torrential as compared with the gentle, periodical rise and fall of the Nile, and the Nile silt is as thistle-down compared to the heavy material which these Western rivers in their impetuosity carry down from the mountains of Colorado, Utah, and Wyoming. On the other hand, such streams as the Salt River in Arizona present totally different problems for solution. Some of them, quite dry except in certain seasons, after heavy rains become roaring tor-

rents, carrying down from the adjacent mountain ranges, as though it were mere driftwood, incalculable quantities of rock and sand, which will sooner or later fill the reservoirs with solid débris, and will require for its removal more force than that exerted by running water. However, the dam at Roosevelt on the Salt River will be flooded on an area of 15,000 acres, or a sheet of water twenty-two miles long by one and one-quarter miles wide—so vast that the heavy material carried into these artificial lakes will settle at the feed end and there form a barrier behind which may accumulate the deposit from subsequent floods. More security would be felt if storage were effected in reservoirs built off the streams, and which could be filled with water deflected from the main channels.

These objections do not apply so strongly to such magnificent projects as that of the Truckee-Carson system, of which Lake Tahoe, with 200,000 acre feet, is the primary storage reservoir, supplemented by the further storage reservoirs of Alkali Flat and Lower Carson, each of greater capacity than Lake Tahoe. There will thus be secured an ample and unfailing supply to convert half a million acres of the great Nevada Desert into a garden. On a small scale such schemes as these carry out the dream of Willcock and other Egyptian engineers, who have proposed to dam the outlets of Victoria Nyanza and Lake Tsana in Abyssinia, so as to secure uniformity in the annual inundation of the Lower Nile country. We may trust to the skill of our engineers who are building them that the dams to restrain the flow of these impetuous rivers, or to bear the pressure of deep volumes of water, will be constructed with a safe margin of strength. They have before them the fate of the Walnut Grove Dam in Arizona and the Johnstown Dam in Pennsylvania, and of many another artificial obstruction to nature's force. Nevertheless, at the present moment they are almost powerless to stop the flow of the Colorado through the Imperial Canal into the Yuma Desert, where it has already engulfed the salt works at Salton, and, instead of irrigating the desert, is, in its uncontrollable rush, converting it into an inland sea. This same region is to be the field of one of the most promising of the schemes, that of building a dam across the Colorado above Yuma, and irrigating from it a section of the large basin of the Yuma Desert which lies below sea-level in California, and also sections of its extension into Arizona.

There is no question as to the fertility of the soil and the warmth of the climate. Land, water, and sunshine will combine to create an oasis; but though now, owing to the extreme dryness of the atmosphere, the summer heat is tolerable and the difference between the sensible and the thermometrical temperatures is very notable, when large areas are under cultivation and the air is moist and swarming with mosquitoes, the condition of human life will not be so idyllic. There will also be disappointment for a time in certain regions from the large amount of so-called alkali in the surface soils. These salts, which are the nutrients of plant life when supplied in moderation, are destructive when present in excess; but through persistent irrigation they are washed out of the upper layer and stored at a depth within reach of the roots of plants. Hence the long-continued, though by no means perpetual fertility of certain desert lands after being brought under water. Mr. Smythe refers to the chief town of the lower valley of the Pecos in New Mexico, now called Carlsbad, but formerly named Eddy. It was the scene of an irrigation project with which the former name was associated. Alkali killed it, but perseverance in irrigation restored it to life under other auspices.

The projects already outlined are but the forerunners of others in the West which will not only add other millions of fertile acres to the public domain, but will increase the number, it is hoped, of small, independent farmers owning and cultivating every acre to its limit of productiveness. For, whatever the benefit of consolidation, coöperation is better, and, in all irrigated regions, coöperation by the beneficiaries of the common but limited store of life-giving water is one of the desirable consequences. Moreover, the advantages of irrigation in the arid region will educate the country at large to the benefit of securing by artificial means a more uniform supply of water than the changing seasons supply to the land within the fertile zone.

Mr. Newell, as a hydraulic engineer and chief of the hydrographic branch of the United States Geological Survey, under which department of Government both the investigation of water sources and their utilization are conducted, has rewritten his book on the same subject as Mr. Smyth's. It is a popular treatise on the rainfall of different sections of the country; the artificial methods of storing and distributing water in the arid and semi-arid zone; the advantages and drawbacks of irrigation. Further, it describes the various projects completed or being realized under authority of the Reclamation Act. It is a more concise and thorough, but perhaps less entertaining, story than that told by Mr. Smyth in his enthusiasm. One defect is noticeable in both books, viz., that neither devotes any space to what other and older countries have done in the use of irrigation, or to regulations for the conservation of water which are so stringent in their character and rigidly enforced in Spain, Lombardy, and Chili. At present, in many sections of the West, water, despite its scarcity, is ruthlessly wasted by ranchers near the source of supply. If the vast expenditure now being made is to yield its full legitimate return, rules to control the supply, and laws to punish disregard of regulations, will have to be framed and enforced.

Lectures and Essays. By Alfred Ainger. The Macmillan Company. 1905.

The late Canon Ainger, who is best known, perhaps, to the general reader for his excellent editing of Charles Lamb, was the happiest combination of the man of letters and the ecclesiastic. We say ecclesiastic rather than divine, because, though his sermons were little masterpieces of eloquence, as all will remember who heard him preach in the Temple, it is not by those that his memory will live. He was, however, a dignitary of the Church, and his preaching used to be one of the social events of a Sunday in London, but it was the personality of the man, his rhetorical power, that drew, rather than any depth of doctrinal fervor. He was a born actor, and as one reads these lectures, one realizes how much they lose in lacking the living voice, the peculiar gestures, the histrionic effect that fascinated Ainger's hearers.

Ainger is the type of the ethical critic. Perhaps this was partly due to his profession, yet a sympathy so catholic as his (which could, for instance, pass tenderly over the errors of Burns) was never tainted by the narrowness of the clerical mind. He was of Matthew Arnold's school; not that he approved of the jargon that the modern critics have caught from Arnold, but, like him, Ainger is always on the lookout for "tonic" passages, for the grand manner, which he seeks in utterances of the sententious kind.

These two volumes are edited by Canon Beeching, who should be known to all for his poems, 'Hours of Idleness.' The essays range in date from a contribution to *Macmillan's Magazine* in 1859, when Ainger was a Cambridge undergraduate, to a paper on Mrs. Barbauld written in 1901. The lectures were nearly all delivered at the Royal Institution, several, like those on Swift, and Shakspere, in a sort of trilogy. The three studies of Shakspere's art are the best reading in the first volume. In them he describes the spring, summer, and autumn of Shakspere's creative faculty in the years from 1591-1612. What Ainger is interested to trace is the gradual development of the dramatic from the lyric poet. "Love's Labour's Lost" represents the most lavish poetic period of writing. It was a study in euphuism by one who despised the mannerisms of Lyly's day, yet could not keep his own feet from the snares of verbal trickery. The euphuism was to drop away gradually; and so, too, in the later plays of this first period, 1591-1598, "as human feeling and passion assert themselves, and the poet himself is stirred by the pity of it, even in the dilemmas and cross-purposes of poor Hermia and Helena, rhyme drops off from his style." So in Juliet's soliloquies rhyme disappears. For the second stage the "Merchant of Venice" marks a transition. In this play "the battle of blank verse against rhyme is lost and won." Ainger's argument is not affected by a slight inaccuracy. He says on page 36 that, save in Portia's speech, the rhyme couplet disappears from the "Merchant of Venice" from the second scene of the third act. As a matter of fact, however, the very last speech in the play, Gratiano's, is in rhymed couplets. Ainger gives an interesting sketch of the changes in the stage traditions of the character of Shylock, "the Jew that Shakspere drew." Though Shakspere's humanity overruled the convention which made the stage Jew a low-comedy character, yet it was long before this was recognized. Ainger thinks, indeed, that at first Shakspere himself set out to draw the stock Jew, such a figure as Marlowe's Jew of Malta, but, as the character grew under his hand, he made Shylock's own utterances neutralize the language used about him. Here, then, as elsewhere, Shakspere's "humanity"—Ainger is never tired of using the word—drove out the "fashions and artificialities of the stage." Ainger has some good things to say on the satire in "As You Like It," of the pastoral mania—that "intellec-

tual influenza" which, after the rediscovery of Theocritus and Virgil at the Renaissance, had infected all literatures. The best commentary on the pastoral dream is Touchstone's speech on the shepherd's life in this play.

In his essay on Falstaff, Ainger gives the history of Sir John Oldcastle, Falstaff's original, and points out in the plays the marks of the character's origin in "my old lad of the castle." Oldcastle was a Lollard, and Shakspere gave his audience a picture of the popular idea of a Lollard. So he puts in Falstaff's mouth the Scriptural phraseology that might be expected to remain with a broken-down Lollard "who had been spoiled by bad company," while his voice had given way from "hallelujahing and singing of anthems," as he is made to say to the Lord Chief-Justice. "And thus the worn-out caricature of an Oldcastle, just as it was on the point of coming to an end, makes a new Sir John Falstaff."

In the essay on "Euphuism, Past and Present," Ainger gives the history of affectation in diction first in Lyly's time, then by the imitators of Pope and Johnson, down to the founders of euphuism nearer our own day, the euphuists of the romantic reaction. Euphuism is the imitation of a manner, and Scott, Byron, Dickens, Carlyle were all in turn responsible for euphuism because they inspired those who wrote with ease to copy their manner. Tennyson summed up the history and moral of euphuism in that fable of the flower and the seed which was written in a fit of irritation against his own imitators. As for Arnold, he has left us a prose euphuism:

"This language is familiar to us all. We know that whatever new poem or new play it is that is being criticised, we shall find the changes rung on the old glossary, we shall meet the old substantives, adjectives, and adverbs—'work' (this artist's 'work'), every other line; 'intense,' 'supreme,' 'subtle,' 'precious,' 'distinctly,' 'accentuated,' 'convincing,' 'incisive,' 'value,' 'charm.' This is the language of culture which we have all more or less caught from Matthew Arnold."

It is true that we are all in this respect euphuists; but the fashion will pass like the earlier jargon of a cult, and meanwhile the critic finds the diction of Arnold useful, expressive, and easily understood. After all, the only difference between the Arnold euphuists and Ainger is that he was always scrupulous in putting his Shaksperian phraseology in quotation marks.

We have said that Ainger is peculiarly an ethical critic. This is especially shown in his criticisms of the "Paolo and Francesca" of Mr. Phillips. "It does not contain, from end to end, a single abstract sentiment. No one character in it utters a single comment or reflection on human life. . . . There is no single line in the play that could be separated from its context and be made welcome as an addition to our stock of moral ideas in daily life. The play seems always to be aiming at the pathetic and never reaching it; and the lack of the ethical touch must surely be the reason for the failure." On the other hand, "the very soul of pathos was in Dante, just because he never stands aloof from the moral aspect of suffering." It was reserved for Ainger, as far as we know, to give this, the best, explanation of the barren atmosphere of the dramas of Stephen Phillips. Leigh Hunt gave his own 'Story of Rimini' a subtitle, "The Fruits of a Parent's Falsehood," which was to fly too far in the other direction.

Those who were interested in certain recent references in these columns to "Macaulay's New Zealander," and the effort made to trace his idea to its source, will find more evidence in Ainger's essay on Mrs. Barbauld. He points out that Macaulay's prediction, in his review of Ranke's 'History of the Popes,' that the Roman Catholic Church would still exist "in undiminished vigor when some traveller from New Zealand shall, in the midst of a vast solitude, take his stand on a broken arch of London bridge to sketch the ruins of St. Paul's," was written thirty years after Mrs. Barbauld's poem called "1811." In this she had foretold the day when some visitor

"From the Blue Mountains or Ontario's Lake"

might curiously trace the crumbling turrets and the broken stairs of London;

"And, choked no more with fleets, fair Thames survey
Through reeds and sedge pursue his idle way."

Ainger thinks that Macaulay's idea was an unconscious reminiscence of Mrs. Barbauld, but it really is a commonplace of literature, and it matters little whether we trace its original use to Walpole or Gibbon or Ranke or Mrs. Barbauld. Ranke, however, whom he was reviewing, certainly has the first claim to have inspired Macaulay's version.

It is hard to refrain from further description of Canon Ainger's literary remains as we have them in these volumes. He is a charming writer, one whom no reader "can afford to neglect," if we may use a phrase that he detested as borrowed from the Arnold jargon. There are few errors of editing. On page 152 of volume i., for père *Garcot* read *Goriot*.

The Secret of the Totem. By Andrew Lang. Longmans, Green & Co. 1905.

If Mr. Lang thinks that the secret of the totem can be disclosed by an announcement tantamount to a glorification of his own ingenuity, he is much mistaken and deceives his reader, who might at least have hoped to be initiated into some "secrets" not hitherto known to all students of sociology. The somewhat arrogant claim of the title is not modified by what Mr. Lang says in the course of this rather dull volume. Those who are apt to expect a flippant readiness on the part of the author—for Mr. Lang, though often wrong, is usually clever—will also be disappointed. The book presents as the "secret" a fact known for centuries, and but lately worked out into a sober monograph by two Russian scholars. Further, Mr. Lang, in order to the upholding of his thesis, which, in a word, is simply that the totem was a kind of *Schriftart*, as Picker and Somlo called it in the monograph referred to, has to ignore all the recent facts collected in defiance of his theory. This he does with his customary coolness. The savages of Central Australia do not support his view, so he calmly advances them in the scale of civilization, and regards them as too advanced to be usable—for his theory. Mr. Frazer, who first revamped his old theory of totemism into a clumsy adaptation of modern views, subsequently, in several illuminating articles in the *Fortnightly*, threw over the notion that matriarchy necessarily precedes patriarchy; but this result Mr. Lang in turn throws over, for, as he admits, it invalidates his argument. Inheritance of the totem does not always come first from the mother—then away with the vile body which indicates this; or, in Mr. Lang's words, "I am unable to accept this tribe as an example of the most archaic state of affairs extant."

Mr. Lang's "results," as set forth by himself, are that groups called each other by the names of plants and animals, which became stereotyped, their origin being forgotten, until people began to guess at the reason why they had such and such a name. The "usual reply" was that there was kinship between men and animals of the same name. This kinship with animals was sacred because mysterious. Hence tabus; "among others, that of totemic exogamy." Mr. Lang writes so many fairy-stories and does so many bright things that it is inexcusable for him to be so reconditely funny as to call this theory an explanation of the great secret which has so long puzzled students. Despite the serious tone of the book, we can but regard it as an example of humor new to Mr. Lang, but familiar to Americans. The dazzling stroke, the glitter of retort is no longer seen. A sombre earnestness appears on the surface, but beneath this Mr. Lang is surely laughing at us when he announces so seriously that he has found the 'Secret of the Totem.'

Totemism resembles caste in this, that both have been referred by many scholars to some one explanation, whereas each has been produced by various means, though blending at last—the several forms of caste or of totemism—into one apparently homogeneous phenomenon. It is quite possible that a young brave's vision may have given his tribe as well as himself a totem—at times; but visions do not explain all the systems of totemism. So, too, Wolfsons may be referred to a nickname—at times. Some savages of Central Australia say they were called "opossum-men" because their chief article of diet was the opossum. Totemism in this case was originally an economic institution to procure food-supply, with all the development into mysticism common to most savage institutions. But no one theory can give away all secrets unless the secrets can be shown to be identical and all shown to fit the theory. Hitherto no one has succeeded in inventing such a theory. People are called by animal and plant names without any trace of totemism, and totemism exists without these names. For example, there is no essential difference between an opossum-man and a sun-man, as far as the superstitious feeling of the Central Australian is concerned. The relationship is spiritual. The mysterious rite of totemism is not a recognition of blood-kinship between animal and man, but a means of propagating more opossums or sunshine. If Mr. Lang had been content to assert that he had rediscovered one probable means of instituting totemism, a means long since exploited, his book would have been less exciting to open, but the reader would not carry away with him the sense that he had been duped by a title.

The Scots Peerage. Founded on Wood's Edition of Sir Robert Douglas's 'Peerage of Scotland.' Edited by Sir James Balfour Paul, Lord Lyon King of Arms.

With Armorial Illustrations. Vols. I-III. Edinburgh: David Douglas. 1905-1906.

The antiquity of the Scottish nobles is attested, among other evidences, by the following passage from the "Massacre of the Macphersons":

> "Fhairson had a son
> Who married Noah's daughter,
> And nearly spoiled ta Flood
> By trinking up ta water,
> Which he would have done,
> I at least believe it,
> Had ta mixture peen
> Only half Glenlivet."

We once saw an East-Anglian pedigree which was carried back to Balder, but there is nothing the English do that the Scotch cannot outdo. Should the inhabitants of the southern part of the island ever succeed in establishing their connection with the Ten Lost Tribes, we may feel sure that discoveries will soon be made across the border to establish the descent of the Scots from Khufu and Khafra. The Chronicle of Rastadt deduces the origin of all the leading families in Germany from the *Gens Anicia*. This, however, is but a small achievement to surpass.

It has been pointed out with a note of pathos that the destructive criticism of the present day has not spared even the peerage. Sir J. B. Paul himself says regarding his predecessors: "While the information of Wood and Douglas, so far as it dealt with their own times or the generation immediately preceding, was, on the whole, commendably accurate, the particulars regarding the earlier centuries were scanty and too frequently untrustworthy." It is for these earlier centuries, where the imagination of the magnate is apt to run riot, that the present edition will prove most useful. Douglas published his 'Peerage of Scotland,' in one volume folio, as early as 1764, and Wood's edition, of about double that size, appeared fifty years later. During the past two generations Scotland has had her own historians and antiquaries no less diligent than those of other European countries—no less diligent than they would have been had there never been a union of the two kingdoms. Accordingly, for the period before 1600, it is now possible to distinguish between history and legend, and to place the origin of Hamiltons, Grahams, and Campbells upon something like solid ground. Sir J. B. Paul really does little more with Douglas and Wood than make them a point of departure. The accumulation of data has rendered specialized labor necessary, and, by adopting the coöperative plan, the character of the original work has been fundamentally altered.

A good example of the way in which 'Douglas' has been brought down to date is furnished by the article on Murray, Lord Elibank. The old 'Peerage of Scotland' cites as authority for the descent it accepts a Great Seal charter, but this document "does not contain, as we are led to suppose, any allusion to the family of Mr. John Murray in whose favour the lands of Blackbarony were granted." Later editors of genealogical works have not only taken over this statement from 'Douglas,' but misquoted it in the process. Where capital mistakes of this kind could creep in for a period as recent as the beginning of the sixteenth century, what chance was there of securing accuracy in the case of the Douglases or the Campbells, beside whom Hapsburgs and Hohenzollerns are mere mushrooms? "According to Hume of Godscroft, the first Douglas was 'a certain nobleman,' who, in the days of Solvathius, King of Scotland, attacked and routed the army of Donald Bane, a pretender to the throne, in a battle which took place in 767." Unfortunately, Solvathius and the original Douglas must both be relegated to the era of prehistoric peeps, but, as a matter of fact, the first historical Douglas appears towards the close of the twelfth century, when Donald Bane revolted against William the Lion and rallied to himself a good many Celts from Ross and Moray. For the Camphells, charter evidence is not reached until the latter part of the fourteenth century, while it must be a source of satisfaction to the Ogilvies that the most authentic evidence gives "the bonnie House of Airlie" a lead of two centuries upon the hated dynasty of Argyll.

Items such as these any reader may discover among the elaborate genealogies which are here furnished by Sir J. B. Paul. We wish to point out, however, that in some cases rather long biographical notices of famous personages are woven in with a sketch of the family annals. Thus, the exploits in South America of Admiral Cochrane are chronicled under "Thomas, tenth Earl of Dundonald." From time to time (and this will show the exhaustive nature of the present edition) English families are introduced, merely from the fact that, through the caprice of a sovereign, they have been given Scottish peerages of more recent creation than their original English patents. By way of exception the House of Cary was given a Scotch peerage by James I., and did not get an English barony till 1832. Though the family originated in Devonshire, Sir Henry Cary received a Scottish title, and a title which was even taken from a royal palace in Scotland.

The 'Peerage,' whether English or Scotch, is less interesting as literature than the 'Dictionary of National Biography,' but it has a place of its own on the shelf of the historian, and does not exist merely for the benefit of the fashionable world. Sir Walter Elliot, of Kellynch Hall, who never read any other book if he could help it, found comfort and consolation in the 'Baronetage.' This definitive work of Sir J. B. Paul should not be used solely as a book of reference. Considered philosophically, it can be made to throw light on the evolution of the Scot, and embedded in it will be found many curious and entertaining facts.

The Russian Court in the Eighteenth Century. By Fitzgerald Molloy. 2 vols. Charles Scribner's Sons. 1905.

Mr. Molloy has manufactured a very readable book out of familiar materials. He has not gone further afield in his "reading-up" than the easily accessible memoirs of foreign ambassadors to the court of Russia in the eighteenth century, those of Catharine II. and her friend the Princess Dashkoff, Catharine's letters to her French correspondents, and similar sources, all known in the published originals or (in the case of the Russian contributions) in translation. But the combination of these offers a vivid picture of the lighter, not to say the scandalous, side of life in Russia. The serious side, including the power in diplomacy exercised by the rulers of that epoch upon European history, and the really great things accomplished for her adopted country by Catharine II., are so slightly noticed that they hardly form even so much as a nebulous background. All shadow and no light is as fatal to a just portrait of a country as all light and no shadow (insisted upon by Queen Elizaheth of England) is to a personal portrait. And here it may be said that the eighteen illustrations, finely reproduced from historical portraits of the principal actors in the drama, form the most unimpeachable feature of the book.

Mr. Molloy has no first-hand acquaintance with Russia or its language. The results are often confusing (aided by imperfect proof-reading which converts *name* into *man*, and *Esthonia* into *Ethonia*, for example), partly by reason of varying spelling in nomenclature (Naruishkina, Narichkin), and partly by reason of the writer's ignorance of localities. Thus, few would recognize the famous Ukraina in *Ukarin*, and Suvaroff in *Suivaroff*; while "Our Lady of Kassanskoy" and "Pavlovsky" offer specimens of false names produced by the use of the adjective forms derived, respectively, from Kazan and Pavlovsk. Even more confusing is the ill-advised adoption of Catharine the Second's familiar manner of referring to her intimates by their Christian names alone, or those names joined to their patronymics, as "Leon" (meaning Narishkin), and "Ivan Ivanovitch" (meaning Schuvaloff), at long distances from the surnames. Mr. Molloy's history is defective when he asserts that Alexander I.'s brother and heir presumptive to the throne "voluntarily resigned the crown to his younger brother Nicholas" "because he was aware of the hatred in which he was held by the army"; and a slip of his pen (or of the proof-reader's pencil) leads to the substitution of "Paul" for "Alexander"—a serious blunder in the narrative of the Emperor Paul's tragic end. Occasionally Mr. Molloy indulges in comments, with amusing effect. For example, in speaking of Catharine the Second's search for a suitable bride for her son Paul, he says: "Her glance fell upon Germany, whose daughters, like herself, were then as now accommodatingly ready to make heroic sacrifices on behalf of their impoverished families, and, in abjuring their own faith in favor of another, to abandon the prospect of an eternal crown in favor of the fleeting joy of Russian rubles." Out of the four eminently proper and laudable "conversions" (on the part of brides with a prospect of prominent thrones) to the State churches of their future kingdoms which have taken place within the last dozen years, two have been to the Roman Catholic faith by others than Germans, exactly counterbalancing those of the two Germans who entered the Greco-Russian Church.

We cannot forbear a reference to Mr. Molloy's English, of which here are some assorted samples: "Such a catastrophe could be averted only in one way, to deprive him of the crown in favor of another, his son if he had one, his wife in lieu of an heir." "To her there seemed no person more reliable than her chief lover, Sergius [meaning Soltikoff, who has not been properly mentioned by his surname for ten

pages], who therefore accordingly waited on Bestuzhev." "The bride . . . looked beautiful in a robe of cloth of silver, blazing with jewels which the Empress had fastened on her head and arms and shoulders." "As his aide-de-camp also fell in love with her, he besieged and won her affections, on discovering which Schouvaloff's anger was unbounded, and dismissing Gregory Orlof, he swore that he would use all the influence of the Empress to have him exiled to Siberia."

A History of Modern Liberty. By James Mackinnon. Vols. I. and II. Longmans, Green & Co. 1906.

So many reviewers will assail Doctor Mackinnon with more or less pertinent references to the late Lord Acton's contemplated work of the same title as his, that he may as well, for once, be spared. It need only be said that, by accumulating one hundred definitions of his subject, Acton proved, by an opposite method, just what Doctor Mackinnon unconsciously does. Liberty is well-nigh hopeless as a subject for a thesis, because it is an unstable concept. The only definition of it that will apparently stand the test of every possible application is this, that Liberty is a well-reputed rhetorical expression much used at times of political stress, and frequently associated with a struggle for the preservation or increase of civil rights. The trouble lies with the word. When used in a restricted connection—for example, in relation to the manumission of slaves—it may carry a specific sense, but the moment it is used for a general idea it becomes such stuff as dreams are made of. Other words are in better case, *toleration*, for instance; but liberty is essentially an oratorical property that cannot in the nature of things suit the historian.

If the nineteenth century, Darwin's century, has taught historians anything, it is surely that history is the observation of a series of changes of conditions that never exactly repeat themselves, and that ever tend towards further and unfathomable changes. Suppose liberty for a moment to be a definable condition, where are the examples of that condition to be found in history? Searching the past, we should doubtless fall back on the traditional example of the barbarian Teuton while he still lived in untrammelled tribal felicity; searching the present, we should doubtless agree on the dweller in New Zealand, Switzerland, or Oklahoma, with the rider that, for perfect liberty to be achieved, certain abuses that may be assumed to exist even in those favored spots should be legislated away. But how can our minds correlate the perfect freedom of the barbarous Caucasion of the year one with that of his sophisticated descendant of the year 1906—the conditions of tribal Germany with those of our industrial democracy? Which is another way of saying that it is not so much the business of the historian to give us a so-called history of Liberty, which is impossible, as it is to give us an examination of the evolution of human conditions. This, in despite of his title, is about what Doctor Mackinnon does for us.

In the two volumes that form the present instalment of his work, he reviews the conditions of Europe from the time of the fall of the Western Empire to the close of the sixteenth century. The stress is laid on the constant movements of revolt that form so large a part of the history of the Caucasian race. The author is on the whole judicious and scholarly without attaining real distinction. His book will not add to our sum of knowledge and will not open new avenues of thought; yet it may be read with profit, for it approaches the familiar problems of the history of the Middle Ages and Renaissance with vigor, sanity, and independence.

The Making of an Orator

With Examples from Great Masterpieces of Ancient and Modern Eloquence

By JOHN O'CONNOR POWER
Sometime M. P. for the County of Mayo.

Crown 8vo Net $1.35

The object of this book is to indicate in popular language a course of practice in oratory, based on the writer's observation and experience, in the House of Commons, at the Bar, and on the platform. It is intended for students, young and old, who have had no practice in public speaking, and for speakers who are not unwilling to consider suggestions.

The various examples have been selected as models of the form and structure of great speeches, and will, it is hoped, appeal to all lovers of noble eloquence as well as to those who aspire to oratorical eminence.

The Nation.

NEW YORK, THURSDAY, JUNE 7, 1906.

The Week.

The Beef Trust has no friends. Next to the Standard Oil, it is probably the most cordially disliked monopoly, and the one safest to attack politically, in this country. The fact, however, that the packers are so justly held in disrepute should not be used as a warrant for doing them injustice, or, in order to punish them, for establishing a pernicious principle of government. The report of the President's investigators must be accepted as uncovering very bad conditions in some of the packing-houses. It does not, to be sure, include the more scandalous charges which have been bruited about. To those, Messrs. Neill and Reynolds did not choose to put their names; they were apparently willing to leave that field to imaginative writers. But what they do certify to is repellent enough. The lack of sanitary appliances in the packing-houses, the disregard of the health and comfort of the employees, the careless and confused and dirty ways of handling food-products, with the inadequacy of the present methods of inspection, are shown with shocking concreteness and detail. The President truly describes the picture as revolting. But to jump from that to putting the United States in charge of the packing-houses is to cover a tremendous distance with an agile *non-sequitur*. The beef report makes out an excellent case for rigid inspection and control by the State of Illinois or the city of Chicago, but what has the national Government to do with local exercise of the police power? Other States and municipalities are all the while attacking as grave abuses in factories and sweatshops. The list of laws for the State inspection of workshops and manufactories is growing every year. Consumers' Leagues are pressing this fight for health of workers and soundness of product in a thousand localities. In cities all over the land the Health Departments are exerting themselves to remedy the very sort of hygienic and moral outrage detailed in the beef report. Why should the President propose to make an exception of Illinois and Chicago, telling them, in effect, that they need not clean up their own filthy premises since he means to step in and do it for them? We will say nothing now of the propriety of his acting on ex-parte exposure by Government officials as if the packers had been tried by jury and convicted.

Another rebate case, in which the Government won, on Thursday, involved the Milwaukee Refrigerator Transit Company and half-a-dozen railways. The Refrigerator Company held transportation contracts from the Pabst Brewing Company and other producers, whereby it controlled shipments to competitive points. It withheld shipments from railways which refused to turn over to it from an eighth to a tenth of the freight money, and gave the traffic only to the railways which yielded. In other words, the Refrigerator Company bludgeoned the railways into granting rebates. The transactions were still further complicated by the fact that a majority of the refrigerator stock was owned by stockholders in the Pabst Company; but the Pabst Company could not be held as party to the illegal contract between the Refrigerator Company and the railways. The finding of the court against the defendant was obtained, of course, under a law which was a dead-letter until President Roosevelt began to push the enforcement as part of his campaign for a Rate bill. The new law, which is still in the conference committee of the two houses, will—if the promises of its sponsors be fulfilled—make it still easier to obtain convictions.

The Gaines campaign-publicity bill, reported by a House committee, instead of taking a middle ground between the more and less radical measures proposed, goes further than any of them. It is almost startlingly sweeping in its application to the election of all officials of whatever sort chosen at the same time as Presidential electors or Representatives, and also in its prohibition of political contributions not made to organized political committees. We know from the experience of various States that corrupt-practices acts designed to "bear lightly" on candidates and campaign managers have usually failed absolutely in their purpose. The Gaines bill, if constitutional, would prevent two of the most obvious methods of evasion. It would not be possible, for example, for a corporation, instead of giving $50,000 outright to the National Committee, to send a thousand-dollar check to the candidates for Dairy and Food Commissioners in every State, thus escaping publicity because it was not using money in the national campaign. Furthermore, it would be illegal to employ private individual disbursing agents.

Standpattism is daily mounting to new heights of unreason, resembling mania. Like the defenders of slavery just before the war, protectionists are making a religion of their practice, and every man who dissents from it is an infidel and a heathen. In that spirit, Secretary Shaw on Saturday denounced Gov. Cummins of Iowa for daring to say that a single Dingley schedule might be revised. The whole tariff has now become sacred. Any rash Uzzah who dares to lay a hand upon it may expect to fall dead. But Mr. Shaw's proof of the inviolate nature of the tariff was bizarre. He appealed to the President as a sort of high priest of protection. Not once since his election in 1904, solemnly averred the Secretary, has Mr. Roosevelt lisped a syllable about tariff revision. The inference is that any Republican who does is no better than a traitor. In fact, Secretary Shaw plainly drew it in the case of Gov. Cummins, whom he accused of being really a Democrat, and read out of the party. By the same token, Gov. Guild of Massachusetts will have to go, and along with him two-thirds of the Republicans in that State. But we do not know what Mr. Shaw would have said if some one in the audience had challenged him about President Roosevelt's tariff-revision speeches of 1902, and his suppressed tariff-reform message of 1904. To be consistent, he would have had to admit that the Republican President, like the Republican Governor of Iowa, was indulging in "repudiation of the Republican policy of protection." With the very high-priest a heretic, Shaw's isolation in tariff orthodoxy is truly splendid.

Secretary Shaw's Philippine parable, delivered before the graduating class of the Kentucky Wesleyan College on May 30, was in his best vein.

> "I have," said he, "a neighbor that has caused me trouble for years. . . . I settle the disturbance, but when I come back I have a little baby in my arms. . . . To keep and educate him seems the only thing to do; . . . but the first time I take him he begins to yell and kick and squall and bite. Spank! spank! spank! The little fellow is well satisfied now. The other day when I recalled his nurse, Judge Taft, he looked up and cried."

Our only complaint is that the Secretary does not carry on the parable. He does not tell, for instance, how the nurse's plea that the little boy be allowed to have a garden of his own and sell his radishes and green peas to the family (removal of the tariff), has been disregarded, nor how his adopted parent has planned to devote several of his weekly pennies to putting new gravel walks through the little boy's garden (subsidized railways), nor, finally, how the good of the family compels him, after a little while, to pay the hired man high rent for a wheelbarrow which the next-door neighbor would let him have for a song (coastwise shipping laws). If this is what Mr. Shaw means by "helping" our adopted baby, which, he says, our

people will do "so long as they have red corpuscles in their blood," then we must consider the Secretary's parable less apt than one we have heard before. It is that of the compassionate elephant, which, taking pity upon a nestful of young birds abandoned by their parents in the jungle, sat down on the nest to keep them warm.

Our nursling republic of Panama is making more trouble. The group that got themselves into power through a pretended revolution, found that they themselves were endangered by a revolution, and called upon their great and good friend at Washington to save them. Of course, the President could not have revolutions going on in his own little revolution-proof republic of Panama, and the would-be revolutionists were so informed. Thereupon they proposed to out-vote the oligarchs in the coming elections. This was a terrible prospect, and the opéra-bouffe officials in Panama immediately appealed to the United States to intervene to prevent what they called "daringly illegal" voting. They themselves confess that they have no power to enforce the laws or do anything but cry aloud to President Roosevelt. Apparently, their prayer has been heard, and our reinforcement of 600 marines will presumably act as election-inspectors—a novel duty, certainly. Secretary Taft feels free to intervene, on the ground that electoral disturbances will interfere with digging the canal. By the same token, he might intervene to prevent the Senate debate on the type of canal that is to be dug.

What threatened to become a serious international row has been settled by the appearance of Mexican troops at Cananea, and the prompt coöperation of United States and Mexican authorities. By contrast with the Cripple Creek troubles of 1904, when the Colorado authorities and the labor organization behind the striking miners both lost sight of the necessity for suppressing rioting first and discussing the merits of the case afterwards, the Cananea outbreak has been admirably handled. Mexican miners have the right to strike for better wages whenever and wherever they please, but when they resort to violence they are, very properly, regarded merely as lawbreakers; Gov. Ysabel and the War Department at Washington are agreed on that. The mere fact that American miners were involved in the trouble, however, did not justify the first hysterical demand of our Consul for American troops. As well might the Italian Consul in New Orleans have asked Rome for soldiers at the time of the massacre. Our promoters who go across the borders and take with them American workmen who are scornful of "Greasers" and intolerant of Spanish customs, are inviting race conflicts. Until we learn that there is a difference between the brow-beaten Mexican of Arizona and southern California and the people of Chihuahua and Sinaloa, we must expect such clashes.

Lynchers have been accused of various crimes, from murder down, but never before have they been arraigned for contempt of court. Yet the action of the Supreme Court on May 24, in granting Attorney-General Moody's request that a rule be issued to each of the known Chattanooga lynchers of last March, compelling them to appear next October and show cause why they should not be punished for "contempt of this honorable court," is to be commended. It is one way in which the long arm of the national law can reach out to a crime which is a national disgrace. The Chattanooga lynching was peculiarly flagrant. What brings the crime within the scope of the Supreme Court is the fact that it had entertained an appeal in behalf of the accused man. This was only to assure him all his rights under the laws and Constitution of the United States; but the mob could not endure that orderly process, and took advantage of the culpable negligence of the sheriff to break into the jail and murder the prisoner. This was, of course, a violation of the laws of Tennessee; but the grand jury would not indict a single one of the lynchers, though strongly urged to do so by the presiding judge. Now the Attorney-General means to see what Federal justice can do in the premises. He names twenty-seven men in his application to the court. A Chattanooga dispatch states significantly that ten of these are "officials, the sheriff and his deputies." Thus does race hatred—of course, the man lynched was a negro—turn even sworn guardians into lynchers.

The Missouri Democratic Convention has endorsed Mr. Bryan for the Presidency, and this action will probably be followed by the Indiana Democratic Convention. Ohio Democrats are also for him, Tom Johnson declares. Putting these political signs with the talk that many Eastern Democrats are now ready to "take Bryan," we get pretty good proof that his candidacy will, barring accidents, have to be reckoned with. This is a striking tribute to Mr. Bryan's popular qualities—his good nature, his gift of serious and eloquent speech, and the impression he makes of being absolutely honest personally. But it is a still more striking testimony to what President Roosevelt has done to rehabilitate Mr. Bryan. Any Republican who, after following Roosevelt, should object to Bryan as a radical, would simply be laughed at consumedly.

Though the reform Republicans showed a vast amount of enthusiasm for a regenerated Pennsylvania at the convention of the "Lincoln Party" in Philadelphia on Thursday, they were timid in translating their ardor into action. For Governor, Lewis Emery, jr., was nominated, and, as was predicted, Mayor Weaver did not contest the honor. With a caution that would better become a meeting of the hated machine Republicans, however, the convention notified Mr. Emery and his fellow-nominees that they could not withdraw from the ticket after July 10. By that time, of course, the organization Republicans will have settled upon their candidates; and if the reformers approve the choice of the regulars, it will be for Emery and his mates to withdraw. On reassembling, with the same officers, the Lincolnites' convention would then endorse the candidates of the Penrose faction. In effect, therefore, the convention in Philadelphia amounted merely to a threat that the reform Republicans will really be independent unless the Penrose crowd show a chastened spirit. This compromising attitude is discouraging. "Reform within the party" has been given up in Philadelphia as impracticable; just why the Lincolnites expect it to take place all over the State is hard to see.

The chief impression which the Mayor's review of the city's borrowing capacity will produce on the public mind, is painful consciousness of a confused and hardly intelligible fiscal system. For good and sufficient reasons, the State Constitution forbids a municipality to go into debt for a greater sum than 10 per cent. of its assessed valuation. As we have approached uncomfortably close to this limit, we have adopted the expedient of assessing property at the estimated market value, instead of the traditional 70 per cent. of such value. Thus we have at once acquired and made use of an opportunity to increase the city's indebtedness. There is nothing irregular or improper in the change, but it clearly introduces an artificial element into the debt-limit question; and, moreover, it creates a further danger against which Mr. McClellan, even while searching for means of justifying large debt expansion, warns the city. The Mayor very sensibly points out that a debt-limit, fixed by assessment at market values on the crest of a "boom" in real estate, may easily lead to a position where, with a "crash" in realty speculation, assessment even at market values would leave the city with its constitutional borrowing power actually exceeded.

This is one illustration of the looseness of the present system. Reference might also be made to the new plan of

issuing city bonds against the amount of uncollected and uncollectible back taxes —another expedient authorized by law, but in its nature an obvious pretext and evasion of the original debt-limitation principle. One may fully agree with the Mayor's assertion that the city's financial strength is "perhaps unequalled in any municipality in the world," and with Mr. F. A. Vanderlip's recent assurance that the existing debt "ought to be regarded as a small obligation for a city of such resources and with such a population"; and yet one may properly dislike and criticise the system or accounting now in vogue. The city's balance-sheet, its income and expense exhibit, are statements so complicated that it is doubtful if a dozen unofficial citizens have ever gone to the bottom of them. Not only so, but the city's own fiscal officers, having taken the plunge into that sea of figures, rarely emerge in agreement with one another as to what the figures mean. This we consider an absurd and inexcusable situation—notably so when the United States Treasury, with all the ramifications of its business, is able to make public every day, in a form so clear as to be intelligible to a schoolboy, the income, outlay, and actual financial condition of the Government.

It is fairly obvious that the first step towards remedying the highly dangerous conditions which the Citizens' Union and other investigators have exposed in the storing and handling of explosives in this city, must be to get rid of the men under whose lax and incompetent control such a state of affairs has been tolerated. The removal of Superintendent Murray of the Bureau of Combustibles at Fire Headquarters ought to be only the first step toward maintaining really efficient safeguards for the future. For if this praiseworthy act of Fire Commissioner O'Brien is not followed up, Murray might almost as well have been left where he was. If ever a city was in a mood and in a position to protect itself from future disasters through explosions, it was New York when, after the Park Avenue calamity had closely followed upon the Tarrant explosion, Mayor Low appointed a commission of high character to consider the whole subject. Yet it is a fact to be faced that in five years the good results of the work then begun have nearly or quite disappeared. The Municipal Explosives Commission (until recently a master plumber, a furniture dealer, and a fireworks salesman) commands respect neither from the public whose interests it is supposed to protect, nor from those engaged in work with explosives. The regulations already made by it, moreover, have been notoriously disregarded. It is generally believed, though categorical proof has not yet been offered, that the "certificates of fitness" issued by the Bureau of Combustibles have been freely bartered about and regularly sold to men who could not secure them at first hand. However this may be, it is notorious that the legal precautions are neglected in setting off blasts.

If the latest revelations as to the looting of the Mutual Life do not put prison stripes on some of the highest officers of the McCurdy administration, the robbed policyholders will be bitterly disappointed. According to the testimony being presented to the grand jury, the methods by which the money was stolen were simple in the extreme. Bills for supplies were padded, and the excess was turned over to Andrew C. Fields, head of the supply department. Thousands of dollars were paid nominally to phantom firms, but really to Fields. He used these vast funds presumably for maintaining the infamous "House of Mirth" at Albany, and for influencing in other ways legislation in which the Mutual was interested. Whether any of this stream of corruption was diverted into the pockets of officers of the Mutual, does not yet appear. Certain it is that this elaborate system of plundering the company could not have been put into effect without the collusion of various men in authority. These supply bills were audited by Fields's immediate superior and by the committee on expenditures; and then they were paid by the cashier. If none of these men detected the trick, they were either very stupid, unfit for positions of trust, or else they deliberately closed their eyes. Whatever may be urged in behalf of the eminent and virtuous gentlemen who approved the fraudulent bills, somebody, through their ignorance, indifference, or connivance, was guilty of theft.

Increasing if still vague talk of an Anglo-Russian alliance calls attention to the fact that outstanding disputes between Great Britain and Russia admit of ready settlement. If there is no real community of interest that would justify an alliance, there are matters pending to warrant an *entente*. It would clear up the international situation, for example, if Russia and England should agree as to the delimitation of their respective spheres of influence in Persia and on the Afghan and Tibetan frontiers. The time is also presumably ripe for England's formal abandonment of the dogma of Turkish integrity, and for some acknowledgment of Russia's especial position in that relation. In short, there is room for reconciliation between two countries which have suffered from exaggerated mutual distrust. To reach an adjustment should not be difficult when the really more complex motive of the Anglo-French *entente* is considered. One may readily believe that Sir Edward Grey has something of the sort on the cards, if only to meet the hackneyed jeer that the Liberals are duffers in foreign politics. But anything like a new triple alliance against Germany is merely a product of the journalistic imagination foreseeing the dull season.

A tariff war, with all its delights, is threatened between France and Spain. The new Spanish tariff is made up on the German plan of two columns; one containing the minimum rates, to be applied to the goods of those foreign nations which make satisfactory reciprocal arrangements; in the second, the maximum rates to be put in force against all others. By the law, the Government is made the judge of the adequacy of the concessions offered to Spanish exports by other countries, and Señor Moret has intimated that the French concessions are not sufficient. This news has caused a flutter among French exporters. They recall the former war of tariffs between Spain and France, so harmful to both countries. While it raged, during the nineties, the exports of Spain to France fell off $40,000,000, or nearly one-half, while the sale of French products to Spain dropped from $60,000,000 to $30,000,000. Other causes doubtless contributed to this diminished trade, but competing tariff taxes were mainly responsible. With that unhappy experience in mind, the sensible men in either Government must surely agree not to plunge into so senseless a commercial strife again.

The Austro-Hungarian situation has this constant feature, that, while Vienna and Budapest may be simultaneously storm centres, peace at one capital invariably means trouble at the other. We are assured, for example, that the Emperor has arrived at a good understanding with the Hungarian Independents, only to observe a change of Ministry and general clamor at Vienna. The Magyars are no sooner appeased than the Germans cry treason, and so it goes. The moral of the situation seems to be that it is dangerous to trade too much on the present good feeling in Hungary. The Wekerle Ministry was formed merely to establish a *modus vivendi* and provide for a new Diet elected by universal suffrage. Clearly, the task of settling the fiscal, army, and language questions lies with the future Parliament. It is difficult to see how the project of universal suffrage and the general suspicions of the truce at Vienna can seriously affect the Hungarian bargain, if it is carried out promptly and in good faith. But time is of the essence of the compromise. To keep the present provisional Diet too long in session, and to reintroduce the old contentious matter, might seriously impair the *entente* between the followers of Kossuth and the Emperor-King.

THE GORMAN TYPE.

The death of Arthur Pue Gorman removes one of the ablest members of the United States Senate. To his contemporaries he was not merely the representative of Maryland in the upper house of Washington and the leader of the Democratic forces in that body, but the type of a politician common to all ranks, from board of aldermen to Senate. He was the flower of his kind. He achieved all that was possible for a man of his character; he won the appropriate rewards.

He went into politics early, and went in to win. His only motto seems to have been that the way to succeed is to succeed. Of course, he cast in his lot with the dominant party of his State—the Democratic. He was in turn a collector of internal revenue, a member of the House of Delegates, then of the State Senate, and finally of the United States Senate. His prominence set many people to talking of him as a candidate for the Presidency. The qualities which carried him steadily forward in office might conceivably have secured him the nomination for the Presidency in a convention dominated by politicians. But he himself was shrewd enough to know that a campaign under his name would be foredoomed to failure; that his deserved reputation as a skilful manipulator of men and marshal of the forces of corruption had created deep popular distrust. Running against any man who could even pose as a constructive statesman, Gorman would have been beaten from the start.

His career furnishes food for thought for all practical politicians. If politics be regarded merely as a means of livelihood, his success at the trade should be an encouragement to thousands of aspiring men who have more brains than moral scruples. He was able to wield much influence, to secure a certain social position, and to live in comfort. These are commonly reckoned among the good things of this world. But if politics be viewed as an opportunity for public service, his years have been barren of achievement. Couple his name with that of Carl Schurz, whose record as an officeholder is comparatively brief, and every man sees instantly whose tomb should bear the epitaph "Failure."

Men who are keen and active, and who have no principles as impedimenta, often find the path of politics easy. It requires only mediocre ability to construct a personal machine in a city ward or even a district which elects representatives in Congress. Moreover, the control of a Legislature is not difficult for one who has the resources and the stomach for such an undertaking. While Thomas C. Platt and Chauncey M. Depew are United States Senators from New York, and John F. Dryden from New Jersey, no man whose capital consists of either vulpine cunning or corporation backing need despair of a similar honor. While convictions can be improvised or else changed as easily as a coat, no one should fear greatly the ups and downs of political life and the changes in party leadership. Votes are always to be had by him who will pay for them, and henchmen will remain devoted to the distributor of patronage. With a thick skin and without ideals, your professional politician can go a long way.

But not to the end. Sooner or later his character overtakes his reputation; in some critical moment he finds it impossible to be both saint and devil. For Gorman, the hour of revelation came when the Wilson tariff bill was before the Senate. Confronting the alternative of loyalty to a principle or to a purse, he chose the latter. That great betrayal stripped him naked in the presence of the whole country. After that episode no one had confidence in him. His dexterity as a parliamentarian, his readiness in debate, his cleverness in organizing and running machinery, his ingenuity as a political schemer—all these have counted for little or nothing.

It is not pleasant to say these things of the dead. But it is at the moment when his death lifts him—probably for the last time—to a conspicuous position that the bitter truth should be spoken. Here and now the lesson is open for young and old. With capacity that might have gained him a sure place in our roll of patriots and statesmen, he deliberately wrote his name in water.

WAYS OF "REGENERATING" BUSINESS.

Senator Beveridge, in one of those mouth-filling phrases which pass with certain orators for thought, declares that his meat-inspection amendment marks the beginning of the "moral regeneration of American business." That much American business is in need of a new birth, we presume few will deny. Too many unregenerate specimens have been on exhibition lately. If there is any way of removing their hearts of stone and giving them hearts of flesh, we are all interested in both process and result. But it is well not to run off after false lights, or to be deluded by conversions which are only skin-deep or purely for advertising purposes. We may wisely distrust any form of regeneration that sounds a trumpet before itself in the streets. And to the spectacular, grandiloquent preachers who tell us of some new and easy short-cut to regeneration, avoiding the old painful road of repentance, restitution, and a sober and godly life, a deaf ear had best be turned. Our business disease is not to be cured by some Senator lifting his hand to high heaven and rolling out great swelling words of vanity, but by going humbly down into Jordan to wash and be clean.

Laws can do something for us. But, to accomplish anything, they must be conceived in common sense and so drafted as to be constitutional and enforceable. Senator Beveridge's law is already found to be neither. The lawyers of the House have discovered that it is too carelessly drawn, that the amendment itself must be thoroughly amended. In the face of Supreme Court decisions to the contrary, it goes upon the presumption that Congress can "regulate" the manufacture of articles produced in any State and intended for interstate commerce. But till the products are actually turned over to a common carrier, for shipment across State lines, the power of Congress does not apply. This is the fact which, combined with other considerations, makes it desirable that the work of meat-inspection, in Chicago or elsewhere, should be done by municipal or State authorities, and made as drastic as any man could wish. Indeed, the packers themselves ought to invite and welcome such inspection. They ought to do it for the shrewdest business reasons. To be able to announce to the world that the whole process of transportation of animals to the Chicago stockyards, their slaughter and preparation for distribution in every form, was under the most stringent sanitary regulation, would be worth everything to the packing houses. By printing on their labels and in their advertisements a copy of the statute compelling them to have all their output rigidly inspected, they could do much to restore confidence in the honesty of their methods and the purity of their wares.

We must not imagine, however, that in legal enactment lies the only remedy. Natural law still reigns in the business world. Punishment falls of itself upon abuses; short-sighted greed has penalties to pay. News from abroad shows that a swifter loss than any restraining legislation could possibly inflict upon the packers, they are in a way to suffer by the falling-off in their trade consequent upon distrust of their business integrity. In France there is something like a boycott of American meat products forming. English consumers are also reported to be concerned and determined to withhold orders. If half the current rumors are true, the sales of canned goods in this country are being deeply cut into. This is one of the finest ways of "regenerating" a sinful business known to the theologians.

Adulteration, false weights, goods below contract, skimping, disregard of the health both of workers in the manufacture and consumers in the market—all these things are an abomination to business as well as to the Lord. They are "bad business," as all men can see when the exposure comes. In the highest standards of business honor, in products

kept up to grade, the highest profits are to be made, taking the years together. It is not necessary to invoke an avenging Government; angry consumers, tricked customers, buyers frightened away will execute punishment. For even American humor must fail to see the joke in impure food. The curmudgeon squire who sent spoiled beer out to his laborers in the fields asked them how they liked it. "That was just right for us, sir," was the reply. "If it had been any better, you wouldn't have given it to us, and if it had been any worse, we couldn't have drunk it." People are in no mood to take their provisions in that spirit. They will insist upon knowing what they are getting, and why it is not the best possible. And the producers who can most securely guarantee the purity and healthfulness of what they have to sell, will most speedily get a business both regenerated and profitable.

SPREAD OF THE REFERENDUM.

The Oregon election this week is noteworthy for the number of propositions submitted to the people under the referendum amendment adopted four years ago. While the people of Utah and Nevada, the latest States to adopt the initiative and referendum, have apparently made no use whatever of their new privilege, Oregon is applying it freely to most of the questions of local interest. In 1904, local option, the direct primary, and a change in the provision for State printing were put on the ballot and carried through by popular vote. This year the ballot bears five constitutional amendments initiated by petition: extending the principle of the referendum to local laws, giving cities and towns the right to amend their own charters, and altering in some details the method of submitting amendments.

These amendments have been proposed by the People's Power League, the aggressive organization which carried on the original campaign for the referendum. It also has initiated this year an anti-pass law. Besides the League bills, the Equal Suffrage Association has filed a petition for a Constitutional amendment giving women the ballot; the State Grange initiates a corporation tax bill, the owners of toll-roads seek in this way the purchase of their property by the State, the State Liquor Dealers' Association has initiated amendments to the local-option law of two years ago, put on the ballot by the Prohibitionists; and, finally, one of the regular State appropriation bills which was held up last spring by the filing of a petition, comes up now for ratification. The list thus includes not only what may be called the "stock" reforms—those which have everywhere been seeking a hearing for years—and such minor constitutional changes as every State has to make rather frequently, but also matters which, outside of a referendum State, would remain absolutely in the control of the Legislature.

There is probably an element of truth in the very natural suggestion that the State is enjoying the referendum now with the zest everywhere aroused by a new game, and that interest will flag later on. Still, an awakened interest in the referendum has not been confined to Oregon alone. The interesting "news bulletins" which the People's Sovereignty League has been issuing lately, abound in items showing its spread. The Massachusetts Senate defeated a "public opinion" bill after the lower house had voted for it by an overwhelming majority. The Kansas Democrats have declared in their platform for a similar law; both parties in Maine are reported likely to do the same. In Texas, Georgia, Florida, and a dozen Western States there are organized efforts to bring the Legislatures elected this fall in line for the referendum. In advance of Statehood, the movement is being carried into Oklahoma and Indian Territory. The custom of submitting long-contested laws to the people by special referendum, as was done in Wisconsin with the direct-primary law, also seems on the increase, as is undoubtedly direct legislation in local matters, especially as regards taxation. Seattle, following the lead of Los Angeles, has gone so far as the "recall" applied by popular vote to misbehaving officials.

A singular feature of the case is that the referendum, based as it is to some extent upon the theory that the interests and beliefs of legislators and constituents are diverse, has thus far been used chiefly to secure for new States measures that have been elsewhere adopted by ordinary Legislatures. Thus, the referendum gave Oregon the direct primary which Minnesota and Illinois had received at the hands of the Legislature; also, local option, which a score of States have achieved in the usual way through their representatives. The woman-suffragists jump at the chance of employing the initiative petition, though in the States where they actually have succeeded they did so by convincing the Legislatures first and securing popular ratification afterwards.

The referendum programme naturally associates itself with the direct primary. The one is no more a complete cure for bad legislation than the other is for bad nominations, but both may perhaps be of great value as preventives. There are many men in public life who could not stand the test of the direct primary, just as there are many laws on the statute-books which could not stand the test of the referendum. Both are merely devices for facilitating the expression of public opinion; and where sound opinion does not exist, both are somewhat worse than useless. Already the direct-primary States and cities are bringing out many times more citizens to take part in making nominations than ever appeared at the old caucuses. In 1904, upon seventeen important referendum propositions and Constitutional amendments in eight States, a bare half of the voters taking part in the elections expressed themselves at all. This ratio will have to be radically changed before the referendum becomes a really active force for good in our political life.

FOR CONTROL OF ANARCHISTS.

When President Garfield was assassinated, Gen. Grant exclaimed, on hearing of the crime, "For my part, I am in favor of having the civilized nations put down anarchists with a hard hand." It was the natural expression of a blunt and simple nature; and we hear it echoed every time there is an anarchistic outrage. After McKinley's murder, it was the common talk. Congress was to be required to enact such laws as would free our rulers from the haunting and daily dread of being struck down by anarchists. That died out; but similar ideas are put forward now in consequence of the fiendish attempt upon the lives of the young King and Queen of Spain. How to keep anarchists under surveillance and control is declared to be a pressing question. Andrew D. White would have an international bureau of police to run down bomb-throwers. It is said that the Italian Government is ready to call a congress of the nations for the purpose of taking effective measures against the assassins who call themselves anarchists.

No one would say a word in disparagement of any plan which might contribute to even the fancied security of men in high place, but we have to face the fact that murderous anarchism is an evil very difficult to deal with successfully by police regulation. Something may doubtless be done to make the co-operation between the police of different countries more effective. Suspicious persons may be more closely shadowed, their records kept, their movements noted; and, when they pass from one land to another, timely notification may be given. Precautions of other kinds may very well be extended to advantage. But when all is done that human ingenuity can compass, anarchists will go on slipping through the police net and putting governments to their wits' end in devising means to suppress this constant peril to all in great station.

This will remain true so long as anarchists remain of their present temper, since there is no sure way of spotting an anarchist on sight or of depriving him of weapons. There are, of course, anarchistic "groups" which have their meeting-places and their more or less open propaganda. Upon them the

police can keep a watchful eye. Their members can be identified and traced. But anarchism is not a label; it is a frame of mind. Unsuspected and undetected, the mildest-mannered and most philanthropic appearing of mortals may suddenly display it, and throw his bomb or plunge his dagger. This is the unpleasant truth which makes all the suggestions of international surveillance of anarchists seem necessarily disappointing. If anarchists were all of one race; if they looked alike and had a distinctive dress or loudly proclaimed their tenets and their plots, it would be easy enough to hold them in check. But murder in the heart cannot be read on the face. A man may take ship as an inoffensive citizen and step ashore an anarchist—that is, if he happens to have an ill-balanced brain, which gets upset by brooding or reading or conversation on the voyage. Nor is there much more hope in restricting the knowledge and sale of explosives, and so depriving anarchists of their terrible instruments. As the case of the Madrid bomb-thrower, Morales, shows, a smattering of chemistry, easily obtainable from accessible books, is enough to equip the anarchist. Besides, he is just as likely to be successful with ordinary weapons as with high explosives. Our three murdered Presidents fell before bullets, not bombs. So did King Humbert. A dagger took the life of the Empress Elizabeth. If Kings and Presidents are allowed to appear in public at all, there must always be the chance that some one undreamed of by the police will get near enough to at least attempt assassination. As King Alfonso is reported to have said when congratulated on his escape, "Yes, but it will come again." The risk is always there.

Anarchism being the defiance of all reason, it is impossible to cure or crush it by reasonable methods. What the world has to count upon, apparently for an indefinite future, is the existence of a class of men whom we must regard as a noxious by-product of civilization. The sight of wealth and power awakens the tigerish instinct in their hearts. It does no good to prove to them that they are stupid as well as inhuman, that organized government must go on, and that, as President Roosevelt said in his first message, men will always be found to step forward and take the place of murdered rulers. Anarchists care nothing for that argument, since their chief aim is to create terror and produce an immense sensation. If a way could be devised of robbing their crimes of publicity, it might have a deterrent effect. If it were possible for the press to agree to suppress all but the barest mention of a murder by anarchists, their great aim of causing a world-wide horror would be partially defeated. But anarchism would remain. We should still have these men ready to scuttle the ship in order to wreak their sullen vengeance. They reck not of their own lives. The ordinary penalties of the law mean nothing to them. Extraordinary measures taken by the authorities, they will be able sooner or later to circumvent. So for the present there is little for us except, after having done everything humanly possible to guard our rulers and to watch the suspect, to reckon calmly upon the fact that the occupation of King or President is extra-hazardous. The anarchist lurks by the path and may strike with poisoned fangs. We may hope that some day such reptiles will disappear; but they are with us today, and orderly society, while extirpating as many of them as possible, must not allow the survivors to intimidate, though they may momentarily appall.

THE INDEFINITE A.B.

The June number of *World's Work* celebrates the degree-conferring season by a searching inquiry into the meaning of the usual collegiate degree. It returns from the investigation with the rather disheartening news that the letters A.B. mean so many different kinds of education that they mean practically nothing. Formerly the bachelor's badge indicated at least that its wearer "had spent four years in a cultivated and learned society, where he had been brought more or less in contact with two dead languages, a little stale philosophy, and some higher mathematics." To-day the degree implies no common standard of discipline, is granted for courses ranging from Sanskrit to metal-working, and for terms of residence ranging from two to five or more years. With its usual bent for the practical, *World's Work* is for abolishing so vague a designation, and makes the "honest" suggestion that we substitute for a degree a certificate giving in outline the college record of the individual student.

Such a certificate would clearly be beyond suspicion in the matter of honesty, but its alleged practicality dwindles under inspection. One may doubt if a bank officer employing a college graduate would give this certificate either an intelligent or even a patient reading. Who is to decide whether a third assistant receiving-teller requires a surplus of "polly con" or benefits by a shortage of compendious fine-arts? College presidents in their wisdom have decided that it is impossible to establish any educational distinction between the numerous subjects qualifying for a mere academic abstraction—the baccalaureate degree; how, then, shall simple employers decide what combination of lectures and recitations makes best for practical efficiency? The day is probably far off when a practising broker will accept or reject a diplomaed office boy because the applicant is a little too long of Romance philology and a trifle short of physiological psychology.

If the suggestion of replacing degrees with certificates is, like most very "simplo and practical" proposals, more complex and difficult than it seems, it at least calls attention to the confusion that reigns in collegiate education. At institutions like Harvard and Johns Hopkins the A.B. merely means that its possessor has for an uncertain time studied something or other. Although the slender resources of the small colleges do not permit them to spoon out quite so variegated an educational haggis, they are hastening towards the prevailing impressionistic indefiniteness as fast as their means permit. At many colleges the A.B. may have spent most of his time in linguistics or in laboratory courses in the natural sciences; he may freely have substituted quantitative analysis for Greek tragedy, elementary Italian for logic, descriptive geometry for English lyrical poetry, and so on. In such depths of unreason the theory of the complete equality of educational values, as between different subjects of instruction, has landed us.

"But," some downright soul will say, "we must call the miscellaneous output of this many-mouthed mill something. What's the harm of calling it an A.B. or a Boojum? Things, not names, signify." It is precisely because things do signify that one desires an academic nomenclature which does roughly correspond to existing educational facts. We cannot hope to restore the old uniform college curriculum, but no discerning observer of the present educational confusion can fail to see that a kind of order is already establishing itself. The main line of cleavage between studies chiefly historical and those chiefly scientific is as valid as ever. It is already true that the classics of France and Germany are doing for the average student of humane letters what those of Greece and Rome did for his predecessors; but there has been practically no approximation between those branches of learning which regard the past of man as their field, and those which regard primarily the present phenomenal world. By misleading figures of speech we speak of scientific methods of historical, linguistic, or literary research; the prevailing lack of standards leads us to impute exaggerated cultural value to the experimental methods of the sciences. In both instances the possibilities of formal instruction are vastly over-estimated, and those of life in the world unduly depreciated. We take it that the cloistered student of books must pick up the much-vaunted experimental method as he goes, whereas the graduate of the laboratories will, if he be wise, consult life and leisure for his "humanities."

Still, the academic distinction between historical and scientific training remains in force. To-day most college

men are students of the humanities in the wider sense, of the exact sciences in the restricted sense, or of a generally ill-considered mixture of the two subjects. Should not college degrees correspond to this fact? There are turned out annually, under the title of Bachelors of Arts, some thousands of Bachelors of Science, or of mishmash. And since the last name, though eminently descriptive, lacks academic authority, the special certificate for which *World's Work* pleads might be bestowed upon those uncompromising individualists who decline to be fish, flesh, or good red herring. Such certificates are actually granted to those rare unfortunates who fail to fit into any one of the nest of pigeonholes which, by a gross abuse of language, we still continue to call a college curriculum. For the average student a bachelorhood in arts or in science, as the case may be, sufficiently designates his training, and, happily, many colleges and universities still stand upon this useful distinction.

IRELAND AND THE RADICAL GOVERNMENT.

DUBLIN, May 17, 1906.

"Good government cannot take the place of self-government," said Sir Henry Campbell-Bannerman, in one of his first speeches as Prime Minister, when referring to the Irish question. The present Government, like many preceding ones, professes and really has the best possible intentions towards Ireland and the Irish people; but intentions are not always translated into action. At once, on its accession to office, the tone of the Irish administration was changed. The Coercion Act's operation was suspended; its repeal was promised; directions that juries were not to be "packed" were issued by the new law officers; prosecutions initiated by the late Government were withdrawn, and there were to be no more State trials for alleged intimidation of persons who said they were not intimidated, or of country farmers who had their names painted on their carts in Gaelic letters. The Chief Secretary, Mr. Bryce, has more than once expressed his sympathy with and approval of the Gaelic movement. He has promised to reconsider the withdrawal of fees for teaching Gaelic in the national schools, which his predecessor had threatened, and to devise a more effective system of Gaelic instruction than has hitherto prevailed. He has withdrawn the instructions of his predecessor, which limited and retarded the operations of the Land Purchase Act, and, by his conciliatory manner in the House of Commons, in striking contrast to the insolence of his predecessor, he has kept the Irish members not wholly satisfied, but in reasonably good humor. As the representative in Parliament of all the Irish departments, Mr. Bryce has to answer nearly as many questions as all the English ministers together, and he shows a wise distrust of the Irish officials by almost invariably replying not on his own responsibility, but to the effect that the information asked for is supplied by such or such a board or official.

Ireland, however, cannot he administered in accordance with Irish ideas merely by good intentions, and there are already indications that Dublin Castle is getting the upper hand with Mr. Bryce and reverting to its old practices. Within the last few weeks prosecutions for the use of Gaelic have begun again. Once initiated by the police, such cases must he adjudicated on by the magistrates. They might, of course, dismiss them, but the Gaelic movement is a violent irritant to many persons of the class from which the magistrates are drawn. Apart from politics—the Gaelic League invites persons of all shades of politics and religion to become members—it is a protest against the Anglicization of Ireland, against vulgar English plays, comic songs, and "penny dreadfuls," with which Ireland has been deluged. It seeks to interest the Irish people in Ireland, its history, customs, music, and literature; and this appears to the magisterial class as disloyalty. Almost every week Mr. Bryce, in the House of Commons, professes his desire to see the provisions of the Land Act for the restoration of the evicted tenants made rapidly operative; but when a public meeting was held in the County Kilkenny to consider the question, 350 police were sent to attend, and disperse it if it appeared to the police inspector that the speeches were calculated to intimidate any one. As the evicted farms are usually in the occupation of the evicting landlord, any reference to them may be interpreted as intimidation. To make a police inspector judge, jury, and executioner in a case that might be brought before the ordinary courts, was both imprudent and foolish, but it ended in the meeting being held without interruption.

Very fully occupied with his Parliamentary duties, Mr. Bryce cannot be considered personally responsible for the acts of all the officials in Ireland, or for those of the many boards of which he is nominally the head. He is expected to defend them as far as he can if they do wrong or act foolishly, and could hardly disavow their action unless he was prepared to supersede them and personally superintend all the details of administration. As chief secretary, Mr. Bryce is head of the Local Government Board, one of the most important Irish departments, its business being really transacted by three commissioners of the usual anti-popular type. John Burns is president of the English Local Government Board and a cabinet minister. Not many years ago John Burns was convicted, sentenced, and imprisoned for taking part in an illegal assembly and obstructing the police. This was not considered to disqualify him from becoming a minister of the crown. The Galway County Council appointed as rate collector a Mr. Hobbs. He was a magistrate and chairman of a district council. He had heen tried under the Coercion Act, convicted by a packed jury, and imprisoned for taking part in an "illegal assembly," a meeting to denounce the grazing system in Galway, by which vast tracts of fertile land are kept uninhabited. The Local Government Board purported to act on a rule made by itself that imprisonment shall be a disqualification for such an appointment as that given by the County Council to Mr. Hobbs. It appears probable that the rule is *ultra vires*, for, when questioned in the House of Commons, the Irish attorney-general was unable to say whether the board had power under its acts to make any such rule. If there is such a rule, Mr. Bryce is as much bound by it as the other members of the board until it is rescinded, or shown to be illegal, and, notwithstanding the English precedent in John Burns's case, he has so far taken no public steps to express dissent from the action of his colleagues. Yet Hobbs's offence contrasts favorably with that for which John Burns was convicted, for Hobbs was tried under a provision of the Coercion Act which enabled the jury to be doubly packed, first by the jury panel heing selected from a special class, and next by the unlimited exercise of the Crown's privilege of objecting to jurors who could not be trusted to convict. At the time, the Irish party called attention in Parliament to the trial as an outrage on justice, and Mr. Bryce, then out of office, supported them in the Division Lobby.

If good government is synonymous with government in accordance with Irish ideas, it is impracticable under existing conditions. The system is at fault: the Chief Secretary can give little real or personal attention to the details of administration, and can for official purposes only know what his officials tell him. Almost the entire Irish bureaucracy are hostile to all popular government, and the general impression is that Mr. Bryce is more and more falling under their sway. Cardinal Logue, the Catholic Primate, expressed this feeling in a recent speech with reference to some promised inquiry into educational matters. He said: "We have had changes of Government and new Ministers, but my experience since I was a boy—and it is a very long experience now—is that it matters very little to Irishmen, and matters even still less to the Irish Catholics, what Government is in power in England. . . . We find that we are still under the blight of Castle rule, and still subjected to the withering breath of ascendancy in this country." Mr. Asquith, the Chancellor of the Exchequer, when in opposition, supported Irish protests against the overtaxation of Ireland, but gave no effect in his Budget to these pious opinions. His excuse, like Mr. Bryce's, is that the Liberals have been too short a time in office to make any radical change in the policy or practice of their predecessors. The good intentions of the Prime Minister, the Chancellor of the Exchequer, and the Chief Secretary are unquestionable; but it is to be remembered that twenty years ago they thought Home Rule the most urgently pressing public question; and that the only difference in present circumstances is, that there is not an alarming agitation on the subject. It was well known that for this year, at any rate, there would be no Home Rule legislation, but it is supposed that the Government is preparing some measure of reform in Irish administration for next year.

The Under Secretary for Ireland, Sir Anthony MacDonnell, took some part in preparing the "Devolution" scheme put forward last year by Lord Dunraven's Reform Association. It was over this that Mr. Wyndham, who was supposed to have approved in private what he denounced in public, fell. The proposal made was: (1.) To establish a Financial Council, of twelve elected and twelve nominated members, to which should be entrusted the expenditure

of such part of the Irish revenue as should be held applicable to purely Irish purposes; (2.) To create a statutory body, composed of Irish peers and members of Parliament, which should have power to promote Irish legislation, but not to pass it; and to consider and advise Parliament on such Irish matters as might be referred to it. So far as this scheme has been discussed in public, it was rejected by the Unionists and by the Nationalists. It did not seem calculated either to relieve Parliament of Irish business, or to place the responsibility of real self-government on the Irish people. "Devolution," however, may mean many different things, and it is quite possible that next session a scheme of a different character, but under the same title, may be introduced by the Government. It would, as hitherto presented, be neither good government nor self-government.

AN IRISHMAN.

THE OLYMPIC GAMES.

ATHENS, May 5, 1906.

Ten years ago this city witnessed the first celebration of the modern Olympic Games, and though the festival had been organized at only a few months' notice, in which time it was utterly impossible to complete the restoration of the Stadium in marble, and not a few other deficiencies in the arrangements made themselves felt, the remarkable enthusiasm of the Greek people and the wonderful setting of the festival afforded by the Stadium and the glories of the Attic landscape turned all shortcomings into a brilliant success. Since then the Olympic Games have been celebrated twice in other lands—at Paris in 1900 and at St. Louis in 1904, as had been arranged by the international athletic conference of 1895; but it was generally acknowledged that both celebrations fell far below the success of the 1896 meeting. This was not due merely to the fact that in both cases the athletic gathering was but an adjunct of a World's Fair; there was lacking that indefinable something which distinguished the Athenian festival from ordinary athletic contests, and which apparently cannot be found elsewhere. If one were asked to give that something a name, one would not hesitate, after witnessing the festival of 1906, to describe it as the subtle influence of climate and tradition which must have inspired the apotheosis of athletics in ancient Greece.

The King of Greece, at the banquet which he gave to the Olympic victors in 1896, expressed the hope that Athens would become the permanent home of the revived Olympic Games. This did not, of course, have much weight with those who had set their hearts upon celebrating an Olympic festival in their own countries; and the Graeco-Turkish war of 1897, with its reverses and humiliations, precluded any further action in the matter by the Greeks. Even the restoration of the Stadium was interrupted for some years after the war, and resumed only in 1902. But after the St. Louis games had proved hardly more successful than those in Paris, the Crown Prince of Greece, who had taken the matter very much to heart, believed that the time had come to venture a decisive stroke, and soon the Greek Parliament legalized the Olympic Games as a national institution, to be held in Athens once in every four years, and to be open to all nations. And the results have fully justified the measure.

Once more Athens has celebrated the Olympic Games, this time in a Stadium completed and resplendent in white marble, and with a measure of success far surpassing that of 1896, though some of us who attended that first festival will ever look back to it as a revelation in itself, of which all subsequent festivals can be but repetitions and amplifications.

One important factor of this year's success was the excellent work done by the various national committees, in Athens and abroad. In most foreign countries the highest political personages lent the weight of their influence to the work of preparing as large and as strong national athletic contingents as possible; while at Athens the Olympic Games Committee, aided by several sub-committees, accomplished the task of preparation with praiseworthy energy. In this connection one must do justice to the indefatigable activity of the General Secretary, Prof. Sp. Lambros of the University of Athens, upon whom the greater part of the work devolved. But perhaps the hardest workers for the success of the Olympic Games, both as regards the preparatory stage and during the entire festival, were the King of Greece and the Crown Prince Constantine. To their efforts one cannot but attribute, not only the participation of so many heads of foreign States in the work of the respective national committees, but more especially the attendance of King Edward and Queen Alexandra, with the Prince and Princess of Wales, at the opening of the games. The presence of these royal visitors added greatly to the splendor of the celebration and to the general interest felt in the Olympic Games throughout the world, while among the Greeks themselves King Edward's visit aroused great enthusiasm, and was taken as a mark of special friendship for Greece and her people.

Certainly Athens has never yet seen so large and enthusiastic a concourse of visitors, Greek and foreign, as during this memorable celebration, and the city's accommodations have been taxed to the uttermost. Every language of Europe could be heard in the happy crowds that streamed daily into the Stadium, or surged along the brilliantly-illuminated streets every evening. The red fezes of the Greeks from Macedonia, Epirus, Thrace, and other parts of the Turkish Empire dotted these gatherings by the thousand. To these children of "enslaved Greece," as they call themselves, it was all like a beautiful dream, fraught with patriotic emotion, after the repression and tyranny under which they live ordinarily. Tourists, old and young, and correspondents of many nationalities, crowded the hotel lobbies or pranced abroad furiously with cameras, to the delight of the country-folk come into town for the fêtes, or beset the venders of flags, Olympic pins, and picture postcards. Imagine these throngs of people all in the best of humors for ten consecutive days and nights, with hardly a policeman to be seen, and yet no drunkenness or disorder, or even jostling and pushing.

A notable instance of this characteristic good nature of a Greek crowd occurred every afternoon, when some 50,000 people might be seen waiting in perfect order for their turn to pass through the four narrow exits of the Stadium at the close of the day's games, often making way courteously for some foreign correspondent who was in a hurry to get out. One reason for this good nature may have been the complete absence, so frequently spoken of by Europeans, of spirituous drinks for sale in the streets, among the numerous cold-water and lemonade stands. Not that Athens is a "prohibition" city, but simply because a Greek crowd prefers a glass of cold water to any other beverage.

The great variety of sports on the official programme, of course, made it necessary to hold many of the different contests simultaneously at various points. The Stadium was reserved for the athletic events proper; the other contests taking place elsewhere, mainly in the forenoon, so as to give all contestants an opportunity in the afternoon of being present in the Stadium, where it was but natural that the chief interest should centre.

Since 1906, imitations, more or less faithful, of the Athenian Stadium have been erected in various foreign cities, usually of iron and concrete; but it is safe to say that he who has not seen the Stadium at Athens in all its magnificence of white Pentelic marble, with the glorious Attic sky for a canopy, has no idea of what such an amphitheatre can be at its best. The imposing spectacle on the opening day of the games, as the Kings of England and Greece, with the other royalties, proceeded up the arena to their seats at the circular end, as the athletes of so many nations marched in procession past their majesties, and as King George formally welcomed the foreign athletes and declared the opening of the "second" Olympiad, amid the enthusiastic applause of the vast audience of 60,000 spectators, cannot easily be forgotten. The scene on the day of the Marathon race was even more memorable, and only those who witnessed the wild enthusiasm of the audience in 1896, when a Greek won this race, can imagine what would have happened if a Greek had been equally successful this time. The popular disappointment over the loss of the event can be estimated only by the way in which dwellings, shops and counting-houses, hotels and cafés were deserted on that afternoon in Athens and Piræus. Fully 200,000 people were crowded in and around the Stadium and along the streets leading to the Marathon road, in painful suspense, as the hour approached for the runners to appear. It was therefore the severest possible strain that could have been put upon the sporting spirit and sense of hospitality of the Greek people when Sherring, a Canadian-Irishman, ran into the arena, a full quarter-mile ahead of the next runner. But the people rose grandly to the occasion, and Sherring could not have been cheered more loudly nor lionized more enthusiastically than he was by the Greeks, from that moment of victory in the Stadium to his departure from Greece several days later. This Marathon race has taken such a powerful hold upon the imagination of the Greeks, both high and low, that it has come to be regarded as the national prize *par excellence*, and it is even proposed to confer the citizenship of the demos of Marathon upon every winner of this race.

The ceremony of awarding the prizes to the victors on the last day of the festival, by the King of Greece, was perhaps the most imposing of all the gatherings in the Stadium. After an exhibition of gymnastic drill by 6,000 Athenian schoolboys, King George stood for two full hours in the hot sun, presenting branches of wild-olive and other trophies to the numerous *Olympionikæ*—firsts, seconds, and thirds in each event. Each victor, as he mounted to the royal platform and bore away the much-coveted *cotinus*, or wild-olive, brought specially for the occasion from the Altis at Olympia, was loudly acclaimed by the spectators, and the climax of applause was reached when, last but not least, a special trophy, sent by the city of Rome to the Crown Prince of Greece (a handsome bronze representing the historic wolf suckling Romulus and Remus), was presented by the King to his eldest son, who had been the chief organizer of this successful festival. Then the close of the Olympic Games was formally proclaimed, and King George, who had presided over the daily gatherings in the Stadium with unwearying endurance and interest, was given a special ovation as he led the way with Queen Olga down the arena and out through the entrance colonnade.

It would be tedious, if not impossible within reasonable limits, to enumerate the various contests and to name the victors in each and all. Suffice it to say, that, in track and field athletics, the American and English athletes practically swept the board. Out of twenty-five first prizes, Americans won eleven, English four, Greeks three, Swedes two, Austrians two, Finlanders, Germans, and Danes one each. Of the second prizes in the same events, America won six, England six, Sweden four, Greece three, Hungary three, etc. In gymnastics the Norwegians and Danes tied for first place, the Swedes being *hors concours;* in swordsmanship, France was preëminent, winning three firsts to Germany's two, Belgium's two, and Greece's one; in shooting the Swiss won five firsts, the French four, the Norwegians three, the English two, the Greeks two. In swimming there were two English firsts, one German first, and one Hungarian first. France won the canoe regatta, Italy the two-oared, four-oared, and six-oared boat races, and Greece the sixteen-oared man-o'war's boat race. In the bicycle races, Italy took three firsts, England two, and France one. In football the Danes beat the Greeks; in tennis France took three firsts, Greece one. In all, counting the pentathlum and hexathlum contests, France took twenty firsts, Italy thirteen, America eleven, England and Canada eleven, Germany ten, Greece nine, Switzerland five, Denmark four, Norway four, Austria three, Hungary three, Sweden, Finland, and Belgium each two, and Bohemia one. Counting firsts, seconds, and thirds together, France leads with forty-four prizes, Greece forty-one, Germany thirty-two, England twenty-six, America twenty-three, Italy twenty-one, Sweden fourteen, etc.

Of course, this latter classification is hardly a fair criterion of the athletic prowess of each nation, for one can scarcely compare the winner of the revolver contest, for instance, to the winner of the Marathon race. Nor can one easily dissociate himself from the Anglo-Saxon conception of athletics, which was also that of the ancient Greek world; and in this conception such sports as swordsmanship and marksmanship have no place, though bicycling may fairly enough be offset against the chariot race. Nor can weight-lifting be considered a very noble sport; although a Greek won this event, more than one Greek was heard to speak of it as a "porters' match," and to wish that Greece might have won any other prize instead. Nevertheless, it would be difficult to exclude all these un-Olympian and un-English sports from a modern international programme; and, this once conceded, it follows that all must be regarded as useful and honorable contributions to athletic life. *Tempora mutantur nos et mutamur in illis.* Let us only hope that the day will never come when automobile races will be admitted to the Olympic programme.

He would indeed be hard to please who should deny that these 1906 Games have been a great success from every point of view; and much credit is due to the organizing committee for having improved so greatly upon the arrangements of 1896. Let us trust that in 1910 the experience gained this year will eliminate whatever shortcomings may have been noticeable in the festivities that have just closed. First and foremost, a central bureau of information for athletes and press representatives is a prime necessity. Something, too, might perhaps be done towards further condensing the preliminary heats of the various athletic contests. Thought should be more especially given to the better arrangement of the final prize distribution. Great inconvenience was experienced, and the spectacle lost much of its impressiveness, owing to the miniature size and unfortunate location of the royal platform with its narrow side-stairs; while the single herald with his megaphone was utterly unable to keep one-fourth of the audience informed as to the name and nationality of each victor. A large platform raised on the final day in the arena, where the straight sides commence, with the athletes grouped in a semi-circle below, and *four* heralds, one on each side of the platform, to proclaim the names of the victors, would give the spectators in every part of the Stadium an equal chance of hearing and seeing. And at the close, the crowned victors should follow the pleasing precedent of 1896, of marching completely around the Stadium, to receive the acclamations of every section of the multitude.

If one might add further suggestions, it would be well to return to the full classic precedent and award the wild-olive trophy in the form of a *wreath,* not as a branch, which can hardly be said to represent anything. The pleasing classic illusion would be further heightened if the victors, when being crowned, should appear in their athletic dress, not in their "Sunday best" frock-coats and silk hats. There should also be a certain forethought exercised by the Olympic Games Committee as to the special prizes; while donors have a perfect right to offer grand trophies for comparatively unimportant events, the Committee should fill up the blanks, so to speak, by providing analogous trophies for the more important events that may have been overlooked.

If all nationalities enjoyed the recent Olympic festival in the Greek capital, they cannot fail to feel a special interest in the effects of these celebrations upon the country whose guests they were. To use Swinburne's words:

> "How should we lament not, if her spirit sit in prison!
> How should we rejoice not, if her wreaths renew their flowers?
> All the world is sweeter if the Athenian violet quicken;
> All the world is brighter if the Athenian sun return."

Long centuries of cruel political vicissitudes have numbed the old athletic spirit of the Greeks: but the Olympic Games of 1896 and the princely gift of a restored Stadium by Avéroff have awakened their inherent love of athletics. The Games of 1906, while surrounding the athletic life with a still greater halo, will have another and more beneficent effect upon Greek athletics by opening the eyes of the people to the necessity of earnest, constant, and methodical training as the prime condition of success. And if the Games of 1896 called forth Avéroff's munificent liberality, those of 1906 have evoked an equally public-spirited offer, by two rich Greek merchants of Alexandria, of a great gymnastic institute at Athens, for training the Greek youth after the Swedish system and laying the foundations for a new athletic life in the classic home of athletics.

In America, athletics and athleticism have come to mean, to many people, the opposite of intellectual progress—nay, something bordering on the brutal and animal side of human nature, and hence something to be deprecated and discountenanced. That this view is not without some show of reason, as regards American athletics, cannot be denied—the climax has already been reached in college football; but all athletic life in America appears to have degenerated more or less into a mere scramble for prizes. England is perhaps the only country where the true athletic spirit of the ancient Greeks appears to have survived. With the institution of quadrennial Olympic Games on Greek soil, let us hope that the ancient Greek traditions and ideals will infuse themselves into the world's athletic life, and raise its moral tone and standards, so as to make athletics once more a great and noble power for what is good and beautiful.

D. K.

Correspondence.

DR. CRAPSEY ONCE MORE.

To the Editor of The Nation:

Sir: Your correspondent, J. A. Bartholomew, in your issue of May 31, seems to have a very erroneous idea of the Crapsey trial. He asks, "What boots it whether Christ were born of a virgin or sprang from the head of Jove? His ethics are the same." Mr. Bartholomew's ethics, like Dr. Crapsey's, seem to be very hazy. He advises to let the creed stand, but to disbelieve it. That is simply to be dishonest. The second part of the Apostles' Creed contains no statement of dogma or doctrine, but asserts as facts certain occurrences which are either historically true or untrue. When Dr. Crapsey stands up in

his chancel, twice every Sunday, and in the face of God and of the congregation solemnly asserts his belief in the truth of those facts, and then, fifteen minutes afterwards, from the pulpit, tells the same congregation that those alleged facts are no facts, he is guilty of the grossest immorality, and is not fit to be a teacher of ethics in the Episcopal or any other church. He should at least qualify his statements with the words "in a Pickwickian sense."

I think it was Sydney Smith who said that Newman's Tract 90 was an ingenious argument to show how a man could hold a benefice in the Church of England while teaching all the doctrines of the Church of Rome. Dr. Crapsey seems to me to be struggling to retain his position as rector of an endowed parish while denying the creed upon which his church is built. R.

Notes.

Mr. George Haven Putnam resumes authorship with a work which his own firm will publish in the autumn, viz., 'The Censorship of the Church, and its Influence upon the Production and Distribution of Literature.' Messrs. Putnam further announce the second volume of Prof. W. A. Cooper's translation of Bielschowski's Life of Goethe, of which the MS. escaped destruction in the earthquake havoc at Leland Stanford University; and Ernest Babelon's 'Manual of Oriental Antiquities,' translated by B. T. A. Betts, of the Department of Egyptian and Assyrian Antiquities at the British Museum.

The Salem (Mass.) Press Co. is nearly ready to print a bibliographic index to the literature on Massachusetts local history, in one stout volume of 600 pages, coming down to the present year. This 'Guide' has been prepared by Charles A. Flagg, head cataloguer of American history at the Library of Congress. His researches have gone into unpublished works in manuscript, and to important newspaper articles.

'The Letters of Charles Lamb,' in the charming pocket Newnes-Scribner series, embrace 273 epistles, so many to the poets (with so much of his own verse) that the little book is especially apt for the lover of verse and the student of poetic criticism to carry about and dally with in an idle hour. But the proofreading should have been better—witness the foot of page 43. Like converse will also repay in the companion volume of the 'Sacred Poems of Henry Vaughan'; and the 'Lyra Innocentium' of John Keble will have its devotees, if to a waning extent.

To the "Royal Library" of Arthur L. Humphreys, London, belong two distinguished-looking volumes, tastefully printed on a fine handmade paper in bold black type, with broad margins, in paper covers (or boards). The one, Pierre de Nolhac's 'Marie Antoinette the Queen,' an octavo, represents the historical division, while John Morley's 'Literary Essays,' a small quarto, exemplifies the belles-lettres; and there is still a third division, the ethical, of smaller dimensions and cheaper. Few publications are better fitted to be read by artificial light. Morley's Essays are on Byron, Carlyle, Macaulay, Wordsworth, and the Study of Literature.

A series of "The Great Etchers," similar in form and get-up to "The Drawings of the Great Masters," and by the same publishers (Newnes-Scribner), is initiated with the 'Etchings of Van Dyck.' The text, by Frank Newbolt, is more significant than has generally been the case in the books of the companion series, giving, in brief compass, a fair idea of the position of Van Dyck as an etcher, and of his share in each of the plates that bear his name. The reproductions are excellent, and exhibit, in several cases, different states of the same plate, so that one is enabled to see just what happened to the etchings in the hands of the engravers who took them up when Van Dyck had done with them. The only one entirely completed by the artist himself, the portrait of Vorsterman, makes us the more regret the collaboration admitted to the others, nor can we agree with Mr. Newbolt that this plate would have been finer if "all the figure below the collar had been merely indicated by a few lines," as is the case with the first state of some of the others. The brilliancy and color given by the costume are, to us, a distinct gain, while the freedom of the line is entirely in harmony with the magnificent handling of the head. Lest we should be unjust to the ability of the engravers, two or three plates are introduced to show what they could do when they were not hampered by the impossible task of reconciling their precise burin work with the play of Van Dyck's needle. There should be many people capable of appreciating fine etching, but unable to own original proofs, and to such this volume will be greatly welcome.

The publishers of the "Langham Series" (Scribners) should have secured some one to write the monograph on 'Rossetti' who knew more about art and the history of Pre-Raphaelitism than Mr. H. W. Singer. The editor's occasional note of disagreement is not sufficient to discount the blunders of the author, and the calm assumption that Rossetti was "the chief founder of the Pre-Raphaelite school," and gave it the "first impetus," is calculated to arouse once more that wrath at the world's injustice which Holman Hunt has recently vented in two mighty volumes. The little book is distinctly below the standard of the series.

Another of the ever-growing list of books whose excellent intention is the instruction of the world at large in the appreciation of art, comes to us in 'How to Look at Pictures,' by Robert Clermont Witt (Putnams). Its contents are marked by tranquil common sense. There is nothing in it which is not true, and nothing, perhaps, which may not still be novel to some part of the great public. We are willing to concede to it a probable usefulness; and, at least, it is a presentable volume with a number of reproductions of well-known pictures sufficiently well executed to be capable of giving pleasure.

There are a good many people who like to have at their command all possible sources of information in regard to the subject-matter of their recreations or their more serious avocations. Such persons, if inclined to play with gardening on a small scale, will read with interest a little volume entitled 'The Seasons in a Flower Garden,' by Louise Shelton (Scribners). The directions in this book for amateurs are not vague; on the contrary, they are rather explicit, although partaking of the general style of the information given in most good plant-catalogues. The task of preparing the soil, selecting the kinds of plants for different times of blooming, and their treatment throughout, must certainly be made easy by the care which the author has bestowed upon this unobtrusive record of her own work in the garden. It could be wished that the descriptions of the plants themselves might have been more detailed and less vague, but the information given is not misleading. The book supplements, but cannot replace, the formal garden handbooks.

We extend to William Crooke's 'Things Indian' (Scribners) a restricted welcome. The *Things* books ("Chinese" and "Japanese" began a series continued with this volume) are not altogether satisfactory. Arranged like an encyclopædia in alphabetical order, they give the effect of a torso. The little essays under each selected head are usually accurate, and as a complement to the revised *Hobson-Jobson*, of which Mr. Crooke was editor, the present 'Things' has its use. But at best such a book is a rather disjointed collection of observations, and seems more like fragments of a larger work than a complete whole. We sincerely hope the series will not be continued. In this particular case, Mr. Crooke has eked out his profound knowledge of present-day conditions with more or less superficial historical studies, and the result is not quite pleasing. Thus we find "Baid" but "Veda," though both should begin with the same letter. Under the head of "Idolatry" it is stated that the "images in Vedic times" included "one of Rudra specially mentioned," which is incorrect. Under "Irrigation," the "artificial" water supply of the Rig-Veda should be referred to. Under "Rosary" it should be said that the Buddhists borrowed the use not from "the Hindus," but from the Shiva sect. For cannibalism one has to discover what the author wishes to say under H(uman Sacrifice), without cross-reference, and then one finds no mention of the best-known cannibalism (traditionally preserved by the word Piçaca), and none of the very interesting case of commutation (the crucifixion of a monkey substituted for a man) given separately under the head "Monkeys." Under "Horse" there is no mention of racing (Vedic and epic). Nevertheless, Mr. Crooke's volume, if one does but regard it as a complement of the 'Anglo-Indian Glossary,' is full of valuable matter, especially in all that appertains to modern India. Instead of a second edition (for which some Sanskritist should act as collaborator), it were to be desired that the work might be extended. There is real need of something less inclusive than Balfour and more complete than 'Things.' As the work now stands, it attracts more attention to its defects than to its very real excellences. Almost any one interested in anything may find something in 'Things Indian.' The student of religion will find much, the student of the drama will find a little, the student of art and custom will also be benefited. But it is pot-luck at this scrappy table. One is never sure whether the all-important sub-

ject is to be represented or not. A wider circle of subjects, more intimate acquaintance with Sanskrit literature, and Mr. Crooke's unrivalled knowledge of India as it is would produce a work of very great value.

The Asiatic Society of Japan sends forth Part II. of Volume XXXIII., containing two important articles, on Village Life in Japan, by Prof. Arthur Lloyd, and the Ten Buddhistic Virtues, by Rev. R. W. Atkinson. Before 1868, village government under the head, or mayor, was a hereditary despotism. Now, the village head is elective, but the common sense of the Japanese peasants has discarded the tumultuous and factious party methods of the first new years of freedom, and they choose their magistrates on business principles, and not on party lines. As a rule, the villager, on all social anniversaries at least, clings to the old calendar. A specimen constitution of a carpenters' guild in a village, with notices of birth, marriage, and funeral customs, is given. A Buddhist sermon preached in 1773 shows that Buddhistic and Christian ethics are very similar. The fundamental doctrine of Ingwa—cause and effect, recompense and retribution—is set forth as an immutable law of Nature and Providence, with many taking popular illustrations.

When, in 1894, by the Shimonosekl Treaty, Formosa was ceded by China to Japan, instead of easy occupation, four months of fighting were necessary. Employing 135,000 men in all services, the Japanese found resistance by the Chinese and savages, who were aided by mandarins on the mainland, more desperate than in Mantchuria, and their losses were greater. Their peaceful work having begun December 1st, 1894, the results, as tabulated in English in the bound book of 79 pages entitled 'The Progress of Taiwan (Formosa) for Ten Years, 1895-1904,' seem wonderful. Colored maps and diagrams, with statistics under fifteen heads, aid the eye. Within a coast line of a thousand miles, and on an area, including all the islands, of 58,000 square miles, there are twenty prefectures. The copper-colored aborigines, formerly head-hunters and the terror of civilized commerce, are now for the most part, like the Chinese and Japanese, in day schools. The 2,577,104 inhabitants live in 573,038 dwellings, and there are 53,365 Japanese, or 18.30 in a thousand. There are twenty-seven cities having a population of over 5,000. Taihoku is the model in cleanliness, water supply, hospital, etc. The vital statistics are very full and detailed; infectious diseases leading, those of the respiratory organs coming next, and kakké, or beri-beri, surprisingly in the rear (964 cases in 1904). Agriculture, industries, commerce, and communications show astonishing expansion. In railways, postal service, public sanitation, telegraphs, education for Japanese, natives, and aborigines, the progress is fair. Casualties from attacks of the mountain savages show steady reduction (681 in 1890 to 394 in 1900), most of the victims being Chinese natives. The revenue rose from 2,616,660 yen in 1896 to 22,333,115 yen in 1904. The statistics of penology and administration are also interesting. Gen. Kodama, who directed the strategy of the war with Russia, and was military administrator of Formosa, has been called to office in Tokio, but Dr. Goto Shimpei continues as civil governor.

We remark in the April number of the *Pennsylvania Magazine of History and Biography* "The Masonic Chronology of Benjamin Franklin," compiled by Julius F. Sachse, and Mr. Charles Henry Hart's call for a search for the Franklin family portraits, indicated in several extracts from the correspondence. Also, the certification of the burial-place of the novelist, Charles Brockden Brown, in the Friends' Burial-Ground, Arch and Fourth Streets, Philadelphia (the mound now obliterated); and a local item of July 24, 1825, in the same city, recording the imposition of a fine of 67 cents on one John Walker, "for firing of a cracker or Squib on this day on the Publick Street"—a most commendable precedent.

Interest in education in England at the present time is not confined to the subjects treated in the bill now before Parliament. What is and what is not suitable for the reading of children is a question which has recently been decided by the London County Council. It has revised the list of books to be given as prizes to the pupils of the public elementary schools, and among the books to be removed as not proper for the perusal of children are 'Hypatia,' 'Pendennis,' 'Romola,' 'Dombey and Son,' and 'Great Expectations.' To the revised list have been added 'Little Women' and 'What Katy Did,' a noteworthy tribute to American authors. A writer in the *Guardian*, while regretting that the works of Kingsley and Dickens should give place to those of Miss Alcott and "Susan Coolidge," believes that the replacing of 'Romola' by the 'Rose-colored 'Bus' will be hard on the rising generation.

The "Waldschulen" are a new educational experiment now making in Germany, on the progress of which there was a very favorable report at the recent convention of the Berlin Vaterländischer Frauenverein, under whose auspices the innovation has been introduced. The purpose is to provide in the woods, under proper medical and hygienic care, schools and homes for children physically not in a condition to attend the public schools. The first school of this kind was started in the West End of Charlottenburg in August, 1904, and this school alone now numbers 240 pupils. The selection of the children is made by the regular public-school physicians; and the course of study, which is not quite as heavy as that of the ordinary schools, is also determined under the supervision of medical men. The report states that, both from a sanitary and a pedagogical point of view, the experiment is an entire success, as the first year showed a remarkable improvement in the health of 62 per cent. of the children, and 25 per cent. could be declared perfectly cured. The children on the average gained 8½ pounds each last summer. The total cost of the Charlottenburg school for the six months' course was 17,000 marks. The movement is spreading into other parts of Germany, but not extensively as yet.

In the Leipzig *Daheim*, No. 29, we find an instructive and finely illustrated article on the recent first international bookbinders' exhibition held in Frankfort. In the article accompanying the illustrations the writer states that this is the outcome of a movement traceable no further back than 1895; further, that, in view of the exhibits at Frankfort, the Germans must confess that both the French and the English have done superior artistic work in binding, and must take a lesson from them. Germany had nothing to show that could be called a "Meisterwerk."

The Germans are to make another and more determined attempt to erect a monument to Heine, this time under the auspices of the Hamburg Literarische Gesellschaft, consisting chiefly of representatives of literature and the theatre. An appeal for funds has been published, which is signed also by the three presidents of the corporation, prominent merchants, and other representative men.

The *Tribuna* of Rome reports that in the near future a geographical mission will go out from that city to Tripolis, with a view to making exact geographical researches in the latter region.

On the 30th of August of the coming year it will be fifty years since the first railroad was opened for business in the Argentine Republic. The Government has decided to celebrate the anniversary by an International Railroad Exposition in Buenos Aires, to be opened on the date mentioned.

—Secretary Trueblood, of the American Peace Society, writes in the June *Atlantic* of the Hague Conference and the future of arbitration. The fact that the armaments of the great Powers are larger and more burdensome than ever, should not blind our eyes to the fact that the vast majority of international disputes are no longer settled by these armaments, but by arbitration, which will soon begin to make inroads on the armaments themselves as it has already done on their use. For the coming conference Mr. Trueblood expresses the earnest hope that it "will not be allowed to degenerate into a sort of war congress for the mere regulation of campaigns and battles, of the kind of bullets and explosives which armies and navies may use in the killing of men and other similar details of the barbarous art of fighting." Prof. T. N. Carver of Harvard discusses possible methods for the distribution of wealth, showing the advantages of that which is based upon a free field for individual effort, acting under an adequate legal guarantee of equality of opportunity. Of course, this involves the prohibition of methods of competition not based on service rendered, but on such unfair and underhand advantages as have been brought to the attention of the public by the discussion of the relation of railway discriminations to the building up of some of the great monopolies of the present time. Arthur Symons contributes a critical paper on Landor as a poet, arriving at the conclusion that one must go to his prose rather than his verse for his most sincere feeling, though the best things in his prose are due primarily to the fact that his genius is essentially that of the poet. In either medium, however, his relation to his subjects is always external. "No one in prose or in verse has written more finely about things; but he writes *about* them, he does not write them."

—The best things in *Scribner's* are of a light and interesting type, in harmony

with the approach of the vacation season. Louise Imogen Guiney, in a sprightly little essay, penetrates the barriers of the alleged "English reserve" only to find that the fortress has long since been deserted. "The average Englishman, certainly, is still; and he is so not because he is a paragon of restraint, but because spiritual inertness is the basis of his being." The real life which Englishmen have been superstitiously regarded as holding in careful reserve, slipped off to America with the early emigrants, and when it does occasionally appear in the old home it is in the breast of the bareheaded Virginian or New Englander, "talking and sparkling in a London gallery full of sepulchral hats and monocles." Life can exist but as it expresses itself, and the only hope that still remains to our English cousins is to develop what vital germs remain to them by casting off the empty shell of reserve and cultivating the fruitful habit of self-expression. The editor discusses in a half-humorous but seriously suggestive vein the circus element in American drama. As with the circus which Barnum devised and perfected decades ago, the underlying motive in the contemporary drama is the doing of amazing "stunts." The society play exhibits the dauntless American maiden doing the social "limit" unscathed, and received finally into the waiting arms of some good American, after the lairs of a foreign nobility and the cunning devices of a complex social code have been passed in safety. Another series of Mr. Curtis's Indian photographs is presented, dealing with the tribes of the Northwest plains. The tints used in reproduction have been brightened considerably, as compared with those of the May number, but we do not feel that the change is an improvement. There is room for still further experiment if the remarkable work of Mr. Curtis with his camera is to be presented to the public in its most effective guise.

—The second volume of Dr. Elroy M. Avery's 'History of the United States' (Cleveland: Burrows Brothers Co.) maintains in general the level of its predecessor, and in some important respects shows improvement. There is the same skilful choice of incident and the same orderly arrangement of topics. The literary style, while still at times exuberant and overdone, is better, though rigorous pruning is still necessary if this ambitious work is to rank as a successful literary performance. The numerous illustrations are admirably chosen and, as a rule, finely executed, though some of the portraits are poor. The maps cannot be too highly praised. In short, so far as mechanism and apparatus are concerned, the volume is a notable piece of book-making; and the text, notwithstanding its literary shortcomings, is certainly readable. The period covered by the volume—substantially the first sixty years of the seventeenth century—does not admit of much novelty in arrangement or treatment in a popular work; and one can only hope that Dr. Avery's success in dealing with comparatively simple situations may not forsake him when he comes to more complicated happenings. The text shows, as a whole, unusual accuracy, though a few errors, some of them not easily explicable, have crept in. The statement, for example, that "the transition from the proprietary and corporate colony to the royal province is one of the most characteristic features" in the period covered by the volume (p. 31), is of course true, not of the period before 1660, but of the period after that date. The omission of any account of Cromwell's colonial policy from the otherwise important chapter on "The Evolution of a Colonial System" is singular; and the indication of the party positions in the conflict in Maryland, in 1653-55, is both confused and misleading. Berkeley could not have been a Carolina proprietor in April, 1661 (p. 194); and Virginia did not hold all her territorial claims under the charters of 1609 and 1612 until 1788 (p. 53), but until 1784, when the western lands were ceded. Special mention should be made of the notes accompanying the list of illustrations. We wish that the author would not assert his theories of historical writing so stridently in his preface; it adds nothing to the value of his book, and the theories themselves are neither novel nor illuminating. This 'History,' like every other, must speak for itself, whatever the author may think about it; and we are glad to see that it is, on the whole, speaking very well.

—The alphabet has been kind to the two final volumes of the 'Jewish Encyclopædia' (Funk & Wagnalls Co.), and has enabled it to close in not only characteristic picturesqueness, but also definite value. Besides the general mass of journeyman and even apprentice articles, biographical, geographical, Biblical, ritual, and antiquarian, the following stand out: French Sanhedrin, the Jewish high court convened by Napoleon to determine whether Judaism created an *imperium in imperio;* Saul of Tarsus, a very queer document, in which the extremest conclusions of Van Manen are pressed into Jewish service; Scroll of the Law, which shows several excellent illustrations, and Seals, which has a long series of most suggestive impressions. Shabbethai Zebi gives an account of the external events only of the life of that extraordinary claimant of the Messiahship—his cabalistic basis might have been dealt with; Spain has a long article of melancholy reading, as indeed are almost all the local histories; on Spinoza there is also a long and readable article well illustrated (the frontispiece of the volume is from a portrait painted by Wallerant Vaillant); Statistics gives elaborate details on Jewish population; on Synagogue there are twenty pages well illustrated; a compound article, almost twice as long, deals with Talmud. Temple, Title-page, Tombs, Typography are full and most strikingly illustrated; inserted in the last is Steinschneider's list of printers in a shortened form, but still filling fourteen pages; of countries, Turkey and the United States are naturally most detailed. The last prominent articles, except for a five-page biography of Zunz, are suitably those on Zionism, and on the cabalistic theosophy of the 'Zohar'—a dream of the future and dreams of the past for a people whose national existence has been and must be so much a dream. One dream realized, however, is this completed encyclopædia; on it we extend our congratulations to editors and publishers.

—It had been the intention of Count de Castries to write a history of Morocco, for which, at first sight, the bibliographies on that country suggested an ample accumulation of accessible material. But he soon found that the bibliographies failed him, and that essential material was still in MS. Yet "history," he quotes from Mark Pattison, "cannot be written from manuscripts." This comes close to saying that history cannot be written at all; to have to print a *corpus* of documents before writing a history, would mean that none but millionaires could write history. Such a Moroccan thesaurus, however, he has now attempted under the title 'Les Sources Inédites de l'Histoire du Maroc de 1530 à 1845' (Paris: Ernest Leroux, Vol. I., pp. xvi., 684). His period and his collection he has divided into three: the Sa'dite dynasty, 1530-1660, and the Filalite, 1660-1757 and 1757-1845. The documents are classified in each of these divisions according to the countries where they are found, the present volume embracing the first half of those in the French archives and libraries bearing on the Sa'dite dynasty, and extending to the fatal defeat of the Portuguese at el-Qasr el-Kabir, in 1578, when Sebastian vanished in the rout like James IV. at Flodden, leaving strange tales, and Morocco was freed for three hundred years. That great event balanced Lepanto in one way, and supplemented it in another. The European attack on north Africa was checked, and Portugal fell to Spain till 1640. Almost half the volume is given to narratives of it; it is probably the one battle on Moroccan soil which all European date-books give. If this series, then, is carried out, it will be possible for the first time to write its story and learn how Portugal finally collapsed after its golden century.

—Except for the apparently unavoidable but practically most cumbrous division of documents according to their present habitat, Count de Castries's plan seems excellent. The documents are given with diplomatic exactness, accompanied by French translations when Arabic or Dutch—some might have preferred translations of the Portuguese papers. There are sufficient introductions, abstracts, and notes. The rendering of Oriental names is a sore subject everywhere, and the editor here is at least intelligible. He has added a full equipment of maps, tables of dynasties, and a facsimile of a Moorish letter, palæographically interesting. But it is not only the Arabist or the student of Morocco who will find his interest here. Every browser in sixteenth-century history of the broadest will almost certainly be able to pick out his plum. Morocco was no hermit country then; threads from it ran through all Europe. Elizabeth of England was in correspondence with its princes, and Francis I. in treaty. Sir Thomas Stukeley, gentleman of Devon, Marquis of Leinster, Duke of Ireland, what not, ended his checkered career fighting beside Sebastian, and George Peele celebrated him in his "Battle of Alcazar." That the volumes of this thesaurus may increase must be the prayer of every student of history.

—One wonders if the figures some writers

have given us showing a marvellously low percentage of disease in the Japanese army have really been accurately compiled, or at least if they are comprehensive of all diseases, when he reads the preliminary report of Dr. Maxmilian Herzog, a Philippine Government pathologist who was sent to Japan to study beri-beri in the military hospitals. He says that "the total number of cases of beri-beri which developed in the Japanese army during this period [beginning of war to end of 1905] is to be placed at a minimum of from 75,000 to 80,000." He was sent to Japan when reports of the spread of beri-beri in the Japanese army in Mantchuria reached the Philippines, where this disease is quite common, though not so common as in some other parts of the tropical and sub-tropical Orient. He himself credits the Japanese medical corps with having succeeded in preventing any serious outbreak of typhoid, typhus, dysentery, or scorbutus, and having prevented entirely the appearance of cholera and plague in the rank and file of their fighting forces. Beri-beri, however, gave them a serious problem by the end of 1904, as the hospital figures indicate; soldiers incapacitated by this disease being sent home in increasing numbers during late 1904 and early 1905 "to so great an extent that probably no outside observer, during the progress of the war, had any conception of it." Dr. Herzog gives tables showing, during 1904, 50,340 cases developed in the field, of which 1,024 died, while 3,337 cases developed among soldiers in Japan, 44 dying.

—Dr. Herzog says, however, that it would be "a great injustice to blame the Japanese army medical corps for this great epidemic. . . . Beri-beri is a disease the etiology of which is ill understood at the present time. We neither know its specific cause, nor by what route the specific poison, whatever it may be, enters the body. It is a well-known fact that, given certain conditions, no ordinary means of hygiene and sanitation will prevent the outbreak and spreading of beri-beri. Such conditions are encountered in a particularly susceptible race, especially when they are crowded together, and in certain localities. When these factors are present, nothing less than the abandonment of the locality which is apparently infected and the dispersion of the susceptible individuals will prevent the continual spreading of the disease. Of course, such measures as these could not be very well resorted to in the case of an army in the field and in the presence of the enemy. To repeat, given certain environments and certain compulsory conditions, *kakke* (beri-beri's Japanese name), in the present state of our knowledge, cannot be considered to be a preventable disease." Several of the Japanese doctors now believe they have segregated from the blood and urine of patients the specific micro-organism which produces beri-beri, and Dr. Herzog's experiments with them were in part corroborative. It is interesting to note that, "in the Japanese military service, autopsies can be held only after special permission from the family of the dead person is received, and this permission is only very rarely given." This preliminary report of Dr. Herzog is published in the second number (that for February last) of the new *Philippine Journal of Science*, published by the Bureau of Science at Manila.

HENRY SIDGWICK.

Henry Sidgwick: A Memoir. By A. S. and E. M. S. Macmillan Co. 1906.

The authors of this biography of Sidgwick—his brother and widow—have considered that their object would be best attained by a narrative largely consisting of extracts from his own letters. These letters, they think, sufficiently resemble his talk to bring his personality vividly before those who knew him, and in some measure before readers who never saw him. As to the latter class, we fear that the object has been but imperfectly attained; and for the reason that the letters, as here given, do not sufficiently resemble his talk. That this was incomparably delightful appears from the testimony of many witnesses of the highest competency. So much cannot be said of the letters as a whole. Many of them are not greatly above the level of ordinary epistolary communications, and many disclose little of what was actually going on in their author's life. Thus, to take a wife is, even for a philosopher, an important transaction. He cannot be supposed to be quite superior to the feverish condition known as falling in love; some degree of emotional excitement is implied in forming the union. Without indelicacy, it would seem possible to intimate that the thought of entering the matrimonial state occupied more than a momentary interval of time, and gave rise to some serious reflections. Yet the matter is dismissed in a few lines, and, so far as we are told, involved no more attention than is commonly given to the selection of a wall-paper.

We are far from insisting that it is the duty of a biographer to give particulars concerning relations which refined people regard as having a sacred privacy. On the contrary, it seems more dignified to say as little as possible about them. But, if this course be adopted, it is not easy to bring a personality vividly before readers—too much has to be left out; and, in Sidgwick's case, as nothing was more conspicuous than his scrupulous, even fastidious, regard for the feelings of others, so his biographers have omitted from his letters every sentence, every word even, that might wound a living soul. How much this means we cannot tell; but it probably means a good deal. A man keenly alive to the humorous, possessing a most alert and subtle wit, in constant attrition with people who incessantly maintained irrational and contradictory propositions as sacred truths, must have freed his mind to his friends in language that gladdened their hearts. Again, we do not contend that such things should be repeated. They cannot be repeated in a memoir that appears immediately after death; but if they are not repeated, the personality must lose in vividness.

We hasten to say that these strictures apply in the main to the first third of the book, covering Sidgwick's life till he was some thirty years old. A good deal might have been omitted here, and the book thereby improved, for the interest of these early years is not so great as to demand this disproportionate treatment. When the biographers adopt the narrative form, they succeed admirably, and the later letters tell us far more of the thought and achievement of the man than the earlier ones. During his later years, too, Sidgwick kept a journal, intermittently enough, it is true, but it is of the greatest value as showing what was really in his mind and nearest his heart. Here, again, we are helped by an occasional letter addressed to him, and by the posthumous estimates of his friends. From these materials it is possible to obtain a pretty complete knowledge of the man, as a philosopher and as a citizen. We can hardly say so much of what we learn of him as an educator or as an organizer. His influence upon the higher education of women must have been very great, but it is not easy to estimate it properly from what we are here told. We know that he gave generously to Newnham College; generously of his money, and even more of his time and energy. We know that the results were gratifying, that the success was even splendid. But just how it was brought about is not so clear as we should like to have it; and the same is true to some extent of his relations to his own college and university.

These, however, are comparatively unimportant particulars. We have enough evidence before us, in Sidgwick's writings and in what is here told, to enable us to understand his character. He was a man of singular, almost superhuman, perfection. With himself and with his friends he was absolutely candid; with others his candor was limited only by his courtesy. He had the experience common to educated Englishmen of the last generation, when the new wine of free discussion was put into the old bottles of religious orthodoxy. To discard the creed in which one has been nurtured, which has entwined itself with the very heartstrings, which is sanctified by the sweetest associations, and which satisfies the most sacred longings, is not easy. It is easier for most people to avoid the struggle, and many consider it right not to disclose their loss of faith. Nothing of the kind was possible for Sidgwick, although we find no evidence that he suffered the agony of which we know so many pathetic instances. But the process was peculiar. For many years—his only wasted time—he strove to find some basis for the Christian religion in the study of Arabic and Hebrew. This quest failing, he turned to the investigation of the phenomena of what we call spiritualism; not, in this case, altogether unprofitably.

The motive for this inquiry was in some sense twofold. As a man he longed, as mankind has always longed, and perhaps always will, to find some empirical evidence for immortality. When he was at last convinced—not till he was nearly fifty—that no such evidence existed, the crisis was a serious one. He had been inclined, with Kant, to "*postulate* the continued existence of the soul, in order to effect that harmony of Duty with Happiness" which seemed to him indispensable to rational moral life. He could not comprehend the state of mind of those who, like his friend J. A. Symonds, do not *desire* the continuance of their personal being; but he was even more affected as a moralist than as a man.

We must quote a few lines to explain his position:

"If I decide that this search [for empirical evidence] is a failure, shall I finally and decisively make this postulate? Can I, consistently with my whole view of truth and the method of its attainment? And if

I answer 'No' to each of these questions, have I any ethical system at all? And if not, can I continue to be professor and absorb myself in the mere erudition of the subject? . . . •I have mixed up the personal and general questions because every speculation of this kind ends, with me, in a practical problem, 'What is to be done here and now?' That is a question which I must answer; whereas as to the riddle of the universe—I never had the presumption to hope that its solution was reserved for me, though I had to try."

Perhaps we should explain his position more fully. He had aimed to establish morality not "somehow," but logically, as a reasoned system, and he had argued that this could not be done if we were limited to merely mundane sanctions, owing to the inevitable divergence between the individual's duty and his happiness. If empirical proof failed, did any rational basis remain? The only basis, at all events, was the demand of the soul, the inextinguishable hope, so nobly expressed by Tennyson in the lines beginning—

"If e'en when faith had fallen asleep,"

which Sidgwick could never read without tears. In them he felt "the indestructible and inalienable minimum of faith which humanity cannot give up because it is necessary for life; and which I know that I, at least so far as the man in me is deeper than the methodical thinker, cannot give up."

Such degree of faith he retained, holding the beliefs in God and immortality to be vital to human wellbeing, and though not demonstrable, still not irrational. The Christian religion was another matter, and while he came to regard it as, from a sociological point of view, indispensable and irreplaceable, his intellectual alienation from it was strong. At the same time his relations with many of the clergy were most intimate, and nothing could be more genuine than the affectionate testimony of these friends to his admirable character. We cannot resist quoting a few words from a sermon preached at Trinity College by Bishop Westcott:

"Hope born in a time of doubt from an unfaltering belief in the reality of truth was, I think, one of the most conspicuous features in Professor Sidgwick's nature. Great in range and exactness of knowledge, great in subtlety of analysis, great in power of criticism, he was still greater in character. He offered the highest type of a seeker after truth, more anxious to understand an opponent's argument than to refute him; watchful lest any element in a discussion should be left unnoticed; patient, reverent, ready to the last to welcome light from any quarter; a champion always of things just, and pure, and lovely."

We might well close with this tribute, but it seems desirable to say a word concerning some misconceptions of Sidgwick's character and his method. Prof. Alfred Marshall sneered at him because he had but a handful of men in his lecture room, while T. H. Green drew a crowd. This led Sidgwick to enter in his journal his own view of his failure to attract men on a large scale. He applied to himself Bagehot's comment on Clough—whom in many respects he resembled: "He saw what it is considered cynical to see—the absurdities of many persons, the pomposities of many creeds, the splendid zeal with which missionaries rush on to teach what they do not know; the wonderful earnestness with which most incomplete solutions of the universe are thrust upon us as complete and satisfying." Feeling that the deepest truth he had to tell was by no means "good tidings," he shrank from exercising on others the personal influence which would make them like him as much as they might men more optimistic, who aimed at exercising such influence. Hence as a teacher he desired to limit his teaching to those whose bent or deliberate choice it was to search after ultimate truth, and to these he tried to tell all he knew; as to others, he wished to train their faculties without guiding their judgment. He neither would nor could say anything which would make his philosophy popular.

Man, as Dean Swift said, is not a rational animal, but at most only *capax rationis*. One who, like Sidgwick, will teach nothing as truth unless it is supported by reason or is not in conflict with it, can have few disciples. One who, like him, will do nothing that reason does not justify or at least not condemn, will seem to the world to waste himself in subtleties. The thought and the life of most men are almost wholly unrational; their acts are the result of feeling, of prejudice, of habit and custom, and they have little patience with the few who never do anything without consulting reason and conscience. Doubter or not, few men have done more enduring work in philosophy than Sidgwick, and his 'Methods of Ethics' will remain the final word on the fundamentals of that science. His own criticism of his work and his doctrine brings out the paradox that makes his personality so fascinating. Morality, as he taught, cannot subsist rationally without some supernatural basis; yet he, who was compelled to abandon the basis on which most men build, was the incarnation of exalted morality. His modest words of parting—commending to the love of God with silent prayer the soul of a sinful man who partly tried to do his duty—point to the solution of the paradox. Religions may come and go, but the moral law endures like the starry heaven; and, with or without the sanction of reason, men will continue to try to do their duty.

COLLINS'S STUDIES IN POETRY AND CRITICISM.

Studies in Poetry and Criticism. By John Churton Collins. London: Bell; New York: Macmillan. 1905.

It is about five years since the *Ephemera Critica*, 'Plain Truths about Current Literature,' shook the complacency of certain of those whom Mr. Churton Collins sarcastically called "Our Literary Guides." At least, it must have been nervous work for Messrs. Le Gallienne and Saintsbury and Gosse and W. M. Rossetti—to put together for the moment names which represent far from equal values for the student of literature—to have to encounter the remorseless evidence of their lack of care or lack of scholarship which Mr. Collins showed up with equal gusto and accuracy. We doubt whether the slashing Quarterlies in the days of their tyranny were ever quite so destructive as Mr. Collins. They usually damned their victims for modes of expression, their criticisms were chiefly æsthetic, and the writer, if he had any backbone, was able to retort the *J'ai plus de goût que vous*, which a Frenchman has called the last word of æstheticism. But when Mr. Collins goes forth to the chase, his game is not so much the author as the critic. He is the critic's critic, a second Aristarchus, and very few modern critics have sufficient training to pass his examination in the matter of scholarship.

In the present volume we have him in a milder mood. "The lion smiles," as a scholiast said of Thucydides when, for the moment, the great historian had come down to his level and could be understood. No sensitive writer need fear to read these essays, though perhaps Prof. Rhys Roberts may suffer a slight pang when he finds that Mr. Collins has devoted the one appendix in the book to pointing out a few errors of scholarship in the well-known edition of Longinus. The seven essays are not exactly book reviews, though most of them were inspired by issues of editions of books. They are rather independent expressions of the very valuable views of Mr. Collins—the impeccable views we had almost said, for he is a rare case of a critic clothed in the armor of sound and wide erudition.

It is all the more pleasing to find him refraining from the vindictive manner. The studies here collected are not, we are informed in the preface, merely reprints, though all save one have appeared in print before. They have been enlarged and revised, and in any case will now appeal to a circle of readers who will always instinctively prefer to have their literary criticism, when it is not ephemeral, in book form. The articles on "The Poetry and Poets of America," which first appeared in the *North American Review*, were, we believe, the first just and not patronizing estimate of American poetry that ever came at any such length from an English pen. They should have some effect on the American anthologists of the future, partly in making them more reserved, more cautious to select only the best, since a 'Meleager's Garland' is worth more than a 'Palatine Anthology.'

The essay on the thirteen-volume edition of Byron published by Murray under the editorship of Prothero and Coleridge may wound the feelings of Byron's admirers—those at any rate who see their Byron through Matthew Arnold's eyes. Arnold made Swinburne's fine phrase, "the splendid and imperishable excellence of sincerity and strength," the keynote of his essay which prefaced his selections from Byron. Where he dwelt on the poet's hours of sincerity, Mr. Collins emphasizes his insincerity, the note of falsetto. Arnold took Byron's word for it that he habitually wrote in haste, and with none of the patient labor that the true artist bestows on his work. Scott's truly Philistine saying that Byron "manages his pen with the careless and negligent ease of a man of quality"—words which poor Byron would have accepted complacently—Arnold turned against him as evidence of artistic inferiority. But since Arnold's day we have the more complete revelations of the Journals and Letters, and we find, as Mr. Collins points out at some length, that Byron's morbid anxiety that the public should believe that he composed without effort or deliberation was simply a pose. His shipwreck in 'Don Juan,' for instance, "constructed out of passages dovetailed from Dalzell's 'Shipwrecks and Disasters at Sea,'

Hartford's 'Remarkable Shipwrecks,' Bligh's 'Narrative of the Mutiny of the *Bounty*,' and his own grandfather's 'Narrative,' shows to what patient drudgery Byron could sometimes submit." Mr. Collins adds still more to Mr. Coleridge's notes on this part of the poem to illustrate Byron's indebtedness, and adds: "It would indeed be quite impossible to exceed the scrupulous particularity with which, even to the most trifling minutiæ, Byron has drawn on these narratives, owing literally nothing to invention." Drudging industry is a characteristic which was wholly alien to Arnold's famous portrait of Byron, and his essay loses much of its value in view of the notes of Prothero and Coleridge. This is a fact which Mr. Collins does not point out, but it will occur to any of his readers who may be familiar with Arnold's preface.

We may carry the comparison of Arnold and Collins still further. The former places Shelley's poetry far below Byron's, and thought that the " 'Essays and Letters' of Shelley would finally come to stand higher than his poetry." But the estimate of Mr. Collins allows Byron no ear, no "music in his soul," no repose, harmony, balance, or measure. He explains Goethe's extravagant praise, which ranked Byron next to Shakspere, as partly due to the fact that Byron appealed to Europe rather than to England; "he is the laureate of the scenery of the Continent, the rhapsodist of its traditions, the student and painter of almost every phase of its many-sided life," while his flaws and limitations are not so likely to be detected by readers not of his own nation. And he is not to be placed, as Arnold placed him, in the first rank of English poets; at least five names must precede his, and that Arnold would never have admitted.

Mr. Collins devotes two essays to a panegyric of Mr. William Watson and the late Gerald Massey. The former is a poet whom all esteem, but few read—*laudatur et alget*. He has never taken hold on the English public, you never hear a single verse of his poetry quoted, and we doubt whether, in spite of Mr. Collins, this state of things will change and Mr. Watson receive due recognition. Mr. Collins thinks that there are "more elements of permanence in Watson's poems than in those of any of his present contemporaries." He goes on to say that Mr. Swinburne will have more to fear from sifting time. But, for all his "enthusiasm without wisdom and æstheticism without ethics and spirituality," Swinburne is *known*. His verses haunt men's ears and refuse to be forgotten. The highly respected Mr. Watson is a name. We defy any half-dozen general readers in any company to quote off-hand six verses from his poems. The gift of making people read your poetry and desire not to forget it, has never been his.

Gerald Massey is another mediocre poet, of golden mediocrity, no doubt, but one whom no praise, however judicious, can resuscitate, because in his own day his poetry never truly lived. He was the son of a canal boatman, and his childhood was spent in grinding poverty, first as a child slave in a factory, then, in the early forties, as an errand boy in the streets of London. He is perhaps best known today as the original of 'Felix Holt.' He became a Chartist editor and poet, and for the rest of his struggling life managed to exist by his pen. Landor discovered his merits more than half a century ago, but even his enthusiastic praise did not convince the English reader that here was poetry he could not do without. Miss Hain Friswell, in her 'In the Sixties and Seventies,' which has just appeared, gives an interesting portrait of poor Massey, whose daughter was her schoolfellow. Mrs. Massey was a clairvoyant, and went through life in a sort of trance, led about by her husband, who treated her as a child. The whole scene, as Miss Friswell describes the visit of the Masseys to her school, is most pathetic, and reveals a side of Massey omitted from Mr. Collins's study.

The sixth essay, on 'Longinus and Greek Criticism,' is a valuable contribution to the study of Longinus, and should be in a collection of classical studies such as will no doubt one day be made from the writings of Mr. Collins. He goes thoroughly into the question of the authorship of the 'On the Sublime,' and thus supplies a distinct lack in the edition of Prof. Rhys Roberts. The world of classical philology lost much when Mr. Collins diverted his great critical gifts and knowledge of the classics to the field of general criticism. He belongs to the vanishing race of scholarly critics who reject all purely æsthetic criticism as waste of words, and insist always, as Arnold insisted, on some principle that shall lift literary criticism out of the regions of vague chatter to the level of philosophic work.

Impeccable in scholarship, Mr. Collins has not in this volume avoided one or two minor slips of style, probably due to careless proof-reading. On page 120 we find cacophanies for cacophonies; page 230, Gorgias of Leontium for Leontini; page 224, "the last century A. D.," a date that has not yet been reached, is assigned as the period of the composition of the 'On the Sublime'; on page 133 we find a rare thing with Mr. Collins, a sentence that defies grammatical analysis: "As fastidious an artist as Petrarch and Milton, as Gray and Tennyson, it might have been expected that much of what is familiar to us in the old texts would disappear." This seems to be a horrible case of the nominative absolute.

MUSICAL BIOGRAPHIES AND OTHER BOOKS.

Brahms. By J. Lawrence Erb. E. P. Dutton & Co.

The Life of Johannes Brahms. By Florence May. In two volumes. London: Edward Arnold.

Theodor Leschetizky. By Annette Hullah. John Lane.

Life and Letters of Chopin. By Moritz Karasowski. Scribners.

The Story of Organ Music. By C. F. Abdy Williams. Scribners.

College Songs. Compiled by H. R. Waite. Oliver Ditson Co.

Twenty Songs by Stephen C. Foster. Oliver Ditson Co.

Deutsches Liederbuch für Amerikanische Studenten. Boston: D. C. Heath Co.

Biographies of Brahms are in vogue; three of them have appeared within the last few months. The most useful of these, for the general reader, is Erb's, which contains within less than two hundred pages an excellent résumé of the important facts in the composer's career, the genesis of his works, and critical opinions for and against them; nor does the author omit the best anecdotes illustrating his hero's wit—a rather caustic wit for the most part, it must be admitted. For summer reading nothing could be better than this book.

Much more elaborate, yet no less edifying, is Florence May's biography of the same master. It gains much in interest from the fact that the writer was for a considerable time a pupil of Brahms, and is, therefore, able to describe him at first hand. Her personal recollections take up the first forty-four pages of Volume I. She declares that, after a few weeks of work with him, her hands had completely changed, having lost their angular appearance, while the knuckles seemed to be disappearing. She had many opportunities to hear Brahms himself play. He was particularly fond of Schubert, whose longest pieces he found none too long; and Bach, whose music he did not believe should be played in a simply flowing style. "In the movements of the suites he liked variety of tone and touch, as well as a certain elasticity of tempo," and in suspensions he gave the fullest possible effect to the dissonance. In playing the other old masters —Scarlatti, Mozart, etc.—also, he "did not hesitate to avail himself of such resources of the modern pianoforte as he felt helped impart" the true spirit. Sometimes he played enchantingly, on other days quite the reverse; and, as years went by, his touch became hard and his technique insufficient. His disposition, too, became rougher. While the writer always found him kind and simple, "his manners were described with unanimity, by those not within his immediate circle, as difficult, sarcastic, and arrogant." He abhorred Berlioz, Liszt, and most of the modern masters, but not Wagner. For him "he had a respect amounting almost to veneration." He had studied his scores exhaustively, and used to call himself "the best of all Wagnerians." For readers of Max Kalbeck's 'Life of Brahms' there is not much that is entirely new in the bulk of Miss May's pages; but, pending the translation of that exhaustive work, American admirers will find here the most complete accessible depository of Brahms lore.

Theodor Leschetizky is the subject of the latest volume in the "Living Masters of Music" series. He is one of the "grand old men" in music, having been born seventy-six years ago; sixty-two years ago he began to teach, and teaching is still his daily occupation. He has long been the most popular piano teacher in Europe, and the "Leschetizky method" is a daily topic of conversation among musicians. Our author devotes a chapter to it, although she admits that "to describe a pianoforte method by the pen does as much good to the pianist as the 'Absent Treatment' of a Christian Scientist does to his patient." Example is what is needed: "Nearly everyone can do something well if told exactly what to do." Nothing gives Leschetizky greater satisfaction than to find the remedy for some unusual defect. In the chapters

on "The Lessons" and "The Class," there is much to interest and benefit all students of the piano. For them, indeed, no book more attractive and helpful has been issued since Miss Amy Fay's 'Music Study in Germany.' Like that, also, it is full of anecdotes and personal touches. One of the illustrations is a group of Leschetizky pupils, among whom is one of the daughters of Mark Twain.

Before the appearance of Niecks's Life of Chopin, the most elaborate work on this composer was that by his countryman, Karasowski, which appeared in 1877, and was soon followed by a second, revised and augmented, edition. An English translation, by Emily Hill, based on this second edition, appeared in 1879; it has been out of print for some time, and the new edition will therefore be welcomed by lovers of the greatest of the pianoforte composers. It contains many letters of Chopin, and is eminently readable.

Three years ago, 'The Story of the Organ,' by Abdy Williams, was issued. The same author now adds one equally admirable complementary volume, on organ music, which cannot be commended too highly to all organists. It is the product of a scholar who knows how to write clearly, and an expert who is bubbling over with information. Italian organ music receives attention first, and France, Spain, and England obtain their share; but Germany is naturally treated at greatest length, the author being convinced that "the history of organ music all revolves round one gigantic personality, J. S. Bach; for the earlier compositions of Italy, Germany, and England seem almost to have only existed in order to make his possible, and since him no organ composer of any eminence has existed who has not been largely influenced by him."

Many others besides students will welcome the new and enlarged edition of Mr. Waite's 'College Songs,' which is one of the best in the market. Equally welcome to thousands will be the collection of Foster's best songs—which are more and more being regarded as true American folksongs, equal to any that Europe can boast. If Foster's harmonic sense had been as keen as his melodic gift, America might have had its Schubert long ago. The editor has revised the accompaniments to adapt them to the modern pianoforte. The songs contained in the 'Deutsches Liederbuch' were compiled from the best German sources, with good judgment. It is intended to be a happy mean between a 'Volksliederbuch' and a 'Commersbuch.' From German collections of student songs, the present one differs in that, of the 95 songs included, no fewer than 73 are arranged for mixed chorus, in view of the fact that most Western colleges are coeducational.

Ancient Legends of Roman History. By Ettore Pais. Translated by Mario E. Cosenza. Dodd, Mead & Co. 1905.

The discovery of very early remains in the Roman Forum, linked in a remarkable way with stories of old Rome handed down by such writers as Varro and Dionysius, has started afresh the slumbering controversy as to the authenticity of early Roman history. On the one side stand those who carry Roman history back into the days of the kings, and who believe that there is a basis of historical fact for the familiar legends. On the other side is the critical school tracing its lineage to Lorenzo Valla and Beaufort, recalling Niebuhr and his folklore theory, Schwegler with his ætiological myths, and in recent days Mommsen, finding in these discredited stories elements of a constitutional character which he accepts as reliable. A mistaken idea as to patriotism has for many years led to the falsification of Roman history. Livy found with disgust that the ancient annalists were unreliable. Ligorio and Pratilli dishonored Campanian epigraphy by their forgeries. In Italy to-day political ambition and personal aims and interests interfere with the complete and scientific study of the remarkable discoveries of recent years. Ignorance and dishonesty offer inaccuracies and misrepresentations to the learned world. We are pleased to find among Italian scholars an earnest champion of the truth. Prof. Ettore Pais was trained under German influence, was a pupil and intimate friend of Mommsen, and, being a thorough scholar possessing a love for truth which rises superior to his affection for his native land, he has become a leader in the critical school of Roman historians. We are already indebted to him for his 'Storia di Roma,' which has done much to dispel the mists of romance and tradition. He has, however, aroused violent antagonism among those of his countrymen whose stock in trade he has so ruthlessly destroyed. He has, therefore, turned to other countries for sympathy, and, because of the warm welcome he received in America, he has written the volume we are considering, "under the shadow of the great universities" which he visited, and offers it to the English-speaking public through the translation of his young compatriot, Mario E. Cosenza, an instructor in the College of the City of New York.

In this work we find a collection of essays, many of which examine with keenest criticism such legends as those of the Horatii, the maid Tarpeia, Lucretia and Virginia. There are two introductory chapters, one devoted to the critical method to be pursued in the study of ancient Roman history, another on the importance, for most ancient Roman history, of the excavations in the Roman Forum. One chapter is assigned to the topography of the earliest Rome, and there are six brief excursus on subjects bearing on topography and on the legendary history of the city. In his consideration of the topographic discoveries in the Roman Forum, Professor Pais aims to prove that they do not date back to the very early period to which the opponents of critical studies would assign them. But what does Professor Pais think of the archaic inscription and the monument under the black stone? Believing that the fragmentary word Sora stands for Soranus, a god of the dead, he claims that the inscription is a record of ceremonies in honor of the dead and under the direction of the *rex sacrorum*. The fact that a large part of the Forum valley has been shown to be a great cemetery, is strongly in favor of this view. Because of the location of the stele on a stratum later than the Gallic fire, and the uncertain testimony of the palæography of the inscription, it is impossible to decide whether the stone is of the sixth or of the fourth century. He follows Studniczka's theory as to the monument, and dates it in the period between the fifth and second century.

In the various essays on the legends, Professor Pais sets forth the results of his examination of the numerous different versions which demand critical study. This criticism is not negative:

"To trace the various discordant passages of the ancient authors, to investigate the causes of the formation of the different versions, and to ascertain which version is more ancient and which the more recent—such criticism is constructive, for it discovers the persons and facts which give vigor to the ancient traditions. It reproduces the general atmosphere that gave rise to such inventions, and reconstructs the history of the era which gave them birth. Finally, it explains the conception of the ancients regarding their own primitive history—the history which they had built up and narrated."

In such a spirit Professor Pais investigates a number of the legends closely associated with Roman history and topography, and, as a skilful yet unsparing surgeon, he cuts cleverly and deeply, looking for reliable facts on which to build his new structure. As a result of this study he forms the fundamental theory that Roman history appears as an adult organism from the very origin of the city because of the influence of Hellenistic civilization. Roman historiography mirrored the rhetorical historiography and the historical epos of the Greeks. Hence it is the Greek influence which we must emphasize, for the Greeks were the first narrators of Roman fortunes, and they participated in the compilation of the Roman national history.

"The study of the most ancient Roman legends proves that they are, more or less, imitations of similar Hellenic stories, well known to the Greeks who first narrated the history of the Latin city. It is, then, very possible that in speaking of Tarpeia—the personification of the hill whence the guilty were hurled—they localized upon the Capitol one of the many myths of women who failed in their loyalty to their country. . . . The various elements of such legends spring from the force of circumstances which differ much among themselves. They may spring from some topographical data, or from data offered by monuments, and, as in the case of Tarpeia, those of the Tarpeian Rock and of the Porta Pandana. They may arise from etymological reasons; or, finally, from the mere reproduction of an element borrowed from some other legend."

This critical analysis of the versions of legendary history, and the recognition of the great importance of the Greek civilization in Roman story and history, will find acceptance even though the deductions made by Professor Pais may not be generally approved.

An excellent illustration of the application of our author's theories is seen in his essay on Servius Tullius. Here he reiterates his view that the last three kings of Rome are quite as legendary as Romulus and Numa. The partiality of Roman tradition, which endeavored to show that Rome was mistress of Latium even in the kingly period, and the recording of narratives of Roman history by Greek writers as early as the fourth century, have absolutely destroyed the value of the history of this time. The domination of the Etruscans is turned into a story of friendly and hospitable relations through the Tarquins. Hence King Tarquin is a misty figure, represent-

ing the actual domination of the Etruscans over Latium. Servius is a Latin conception belonging to a solar cult, and associated with a group of legends to which belong Virbius of Aricia, and Hippolytus, Pelops, and Hippodamia.

All this is very alluring and most interesting, but it is not always convincing. In fact, Professor Pais's own teaching would lead us to view with incredulity many of his theories. Moreover, his style is not such as to attract the general reader or even to detain the scholar, for it is very involved, and is lacking in logical sequence; which tends to make a difficult subject still more difficult by reason of the ambiguity. The translation is very well done, although the paragraphing is often bad. There is little to suggest the mere transfer of Italian phraseology into English. On page 25 "semi-uncial" is contrasted with "Latin writing," where the evident intention is to refer to half-uncials and capitals. On page 142, the sentence, "Another divinity was still more intimately connected with Diaua Aricina—namely the *Nemus*, that is, the grove of Aricia," is unintelligible. Probably Virbius is the divinity thought of. We note also *viscus* for *vicus* (p. 17), *Camesa* for *Camcses* or *Camcsene* (p. 143), *finestra* for *fenestra* (p. 149), *memorensis* for *nemorensis* (p. 144), cyclops "were" for "was" (p. 158), *Sanherib* for *Sennacherib* (p. 162), *examing* (p. 163), *word* for *work* (p. 226), and *Palatuar* for *Palatium* (p. 226). The book closes with sixty pages of notes in fine print which serve as valuable corroboration of the statements in the text. The index, which is indispensable in a work of this kind, has been omitted.

The Mecklenburg Declaration of Independence, May 20, 1775, and Lives of its Signers. By George W. Graham. New York: Neale. 1905.

The periodic revival of discussion of the Mecklenburg Declaration of Independence is once more upon us, and the zeal of the advocates on either side of the question has been quickened by the appearance of a clever forgery, somewhat stupidly put upon tbe market, and therefore denounced before disposed of at a high price. In hls book Dr. Graham claims to present new evidence in favor of a Declaration. This evidence is (1) a poem, dated 1777, called the "Mecklenburg Censor," in which mention is made of a "rabble":

> "In congress, they, the very first,
> Their independence to declare."

(2) a child born twelve years after the alleged Declaration and called "my Independence Boy"; (3) deeds for land which date from 1775 and not from 1776 as the year of independence; (4) a schoolboy's declamation in 1809, mentioning the Declaration, and (5) a dlscussion of how Martin and Gardner obtained their information of the paper. Dr. Graham believes that the resolves dated May 31, which have been accepted by historians, were adopted May 20, and were additional and supplementary to a true Declaration of Independence.

However interesting as a discusslon of authorities this plea ln favor of a Declaration may be, lt does not carry convlctlon. Because Martin and Gardner associated wlth men who were present at a convention in Mecklenburg ln May, is no reason why they should have discussed the matter with them or obtained original material. The resolves of May 31 suspended all royal commlssions as null and void, and placed all legislation and executive powers in the Provincial Congress. This was in some degree a declaration of independence, and the reference in the "Censor" and in the schoolboy's oration could apply as easily to these sections as to a separate and distinct Declaration. Further, the schoolboy was a pupil of the Rev. Dr. Caldwell, who married the daughter of John McKnitt Alexander, secretary to the meeting, and had thus been under the influence of one interested in maintaining the existence of a Declaration. The fact that the resolves of May 31 were widely copied, while the more noticeable Declaration has left no trace in contemporary newspapers, is a difficult point against the passage of the latter, and is not to be lightly solved by general assertions. Nor does Dr. Graham's mode of treatment inspire confidence, for under his hands a supposition soon becomes a certainty. Martin, at the end of his chapter on the Declaration, gives as his authorities, "Records, magazines, gazettes." Martin told Dr. Hawks he had found a copy of the Declaration in the western part of the State prior to 1800. To this statement Dr. Graham adds: "Whether it was a manuscript or newspaper copy ls not stated, but probably the latter." A few pages later, our author states positively that Martin had read the *Cape Fear Mercury* of June, 1775!

This *Cape Fear Mercury* is not known to exist in any collection; but lt is entirely gratuitous to suppose that a copy was abstracted from the British records by Andrew Stevenson, when minister plenipotentiary at the Court of St. James. There is nothing in his official correspondence to show that he had made any discovery ou so important a question, and to justify belief that in 1837 the followers of Jefferson were so jealous of his fame that they would employ Stevenson to destroy evidence of an early Mecklenburg Declaration. It would be much more to the point to discuss contemporary records, which have not yet been entirely exhausted.

For instance, why did it require only twelve days for the news of Lexington to reach Williamsburg, Va., and nearly twenty-one days to go further south and west to Mecklenburg, N. C.? Yet the news is said to have reached Mecklenburg while the convention was sitting, and led to the framing of the Declaration. Then, too, the supporters of the Declaration say that four copies of this important paper were sent by special messenger to the Continental Congress, and the receipt was acknowledged and encouragement given by Hancock and by a joint letter of the Carolina delegates. Yet the letter-book of John Hancock does not show any such letter, the joint letter has never been traced, and the two men in Congress most interested ln obtaining every support for independence, Adams and Jefferson, had never seen or beard of the Declaration until it was first printed in 1819. Jefferson believed it to be a forgery, and in an unpublished letter to him Adams echoed his opinion:

"It appeared to me utterly incredible that they should be genuine; but there were so many circumstances calculated to impose on the public that I thought it my duty to take measures for the detection of the imposture. For this purpose I instantly lnclosed the *Essex Register* to you, knowing that if you had either seen or heard of these resolutions, you would have informed me of it. As they are unknown to you, they must have been unkuown to all mankind. . . . But who can be the Demon to invent such a machine after five and forty years, and what could be his motive? Was it to bring a charge of Plagiarism against the Congress in '76, or against you, the undoubted acknowledged draughtsman of the Declaration of Independence? Or could it be the mere vanity of producing a *jeu d'esprit*, to set the world agasp and afford a topic of conversation in this piping time of Peace? Had such Resolutions appeared in June '75, they would have flown through the Universe like wildfire; they would have elevated the heads of the inhabitants of Boston, and of all New England, above the stars, and they would have rung a peal in Congress to the utter confusion of Toryism and timidity, for a full year before they were discomforted [discomfited?]."

And a few days later he again wrote:

"If these resolutions were genuine, they ought to be published in every Gazette ln the world. If they are one of those tricks which our fasbionable men in England call hoaxes and boares, they ought to be printed in all American journals, exposed to public resentment, and the author of them hunted to his dark Cavern. For although you and I should as easily believe that a flaming Brand might be thrust lnto a Magazine of Powder without producing an explosion, as that those Resolutions could have passed in 1775, and not been known to any Member of Congress ln 1776; and if they were not known to you, as I am very sure they were not, lt ls lmpossible they could have been known to any other Member."

Tbe absence of any record ln the journals of the Congress of their receipt ls not conclusive, as Thomson had not yet perfected his method of noting papers and reports coming to the Congress. We may therefore accept the traditlon that Captaln Jack was sent to Pbiladelphia. It does not follow, however, that he was the bearer of a Declaration or even of the resolutions of May 31, and it ls surprising that attention has not been called to an entry ln the Journals of June 26, of resolutions on the State of North Carolina, recommending the good people of the colony to associate, establish a militia, and support the "American Association." In the original Journal the entry does not sbow that it was on North Carolina, and the corrected Journal supplies that information. This action must have been suggested from North Carolina; and as Congress had been for days sitting as a committee of the whole on the state of America, the delay in adopting the resolves has no significance. Could not Jack have brought this suggestion, and in after time his journey have become associated with the alleged Declaration? Could not Jack have taken back to North Carolina the joint letter, dated June 19, of the delegates of that colony in the Continental Congress, urging the people to greater exertions and to embody a mllltia? And would not Hancock have transmitted the Congress resolves of the 26th in a letter? These are quite as reasonable suppositions as those put forward by Dr. Graham, and answer to known dates and circumstances more definitely and satlsfactorlly.

Congress of Arts and Sciences, Universal Exposition, St. Louis, 1904. Edited by How-

ard J. Rogers, Director of Congresses. Volume I.: History of the Congress, by the Editor; Scientific Plan of the Congress, by Hugo Münsterberg. (Philosophy and Mathematics.) Boston: Houghton, Mifflin & Co. 1905. 8vo, pp. 627.

In every future history of the human mind the signal success of the St. Louis Congress must be commemorated. Justly to distribute the credit for it would probably be impossible at present. We certainly shall not attempt such a task. Speaking in the rough, as men usually speak of the credit for great achievements, the idea was the creation of Professor Münsterberg, and it was a creation such as few men are privileged ever to make. The history of its evolution will be found narrated in this volume as minutely as possible by Mr. Rogers, while the plan is explained by Professor Münsterberg. This first volume contains twenty-five papers read to the philosophical and mathematical sections of the Congress by some of the men of all the world whose words on such subjects best commend themselves to our attention.

The introductory address, by Professor Newcomb, is very properly a blend between an ordinary presidential address and an oration, and is very accurately in taste. Custom calls for the suggestion of a scientific idea in a presidential address, and an idea of wide scientific appeal. If Professor Newcomb had a hundred such jotted down in his note-book, he could not have selected one of more pressing importance or of more evident truth than the idea he chose, while in its whole philosophical scope it has certainly been treated hitherto with something like disdain; so that those who for many years have been preaching its salutary effects and consequences must be gratified to find their idol taken up by a man so prominent in the world of science as Professor Newcomb. The idea is, that while it may be true that all evolution, be it physiological or physical, intellectual or spiritual, individual or social, proceeds without any strict breach of continuity, yet it is universally found that in every development there are at least two extraordinary leaps. Professor Newcomb only mentions one, which he illustrates in the launching of a ship; but we venture to point out that the laying of the keel is another such great step. So in the development of an individual animal, one step takes place when, the unit-cells of two progenitors uniting, a third life suddenly appears, while another step takes place when the new being is launched and breaks its way into the element it is to inhabit. Now the evolutionists never cease to tell us that we are to look at the life-history of the individual to find there a miniature record of the past history of its race. If this be so, the logic of science commands us to begin with the hypothesis that there have been at least two cataclasmic epochs in the development of the race, and forbids us to surrender this hypothesis until inductive inquiry has fairly ascertained its truth or falsity. There is a natural presumption in favor of something like the doctrine of universal continuity, but upon uniformitarianism, which goes further, there lies a heavy burden of proof.

We can here mention only one or two among at least a dozen strikingly instructive papers that the reader will want to ponder long before he will have sucked their juice. It is a curious classification which adds mathematics to the usual list of normative sciences, æsthetics, ethics, and logic; and since a reviewer's *métier* is infallibility, we will curtly say that it is a confusion of thought to class mathematics with the *theory* of reasoning simply because its business is to say what conclusion would necessarily follow from each given assumed premiss or premisses. One of the most interesting communications in the volume is a discussion of the definition of mathematics, by Professor Bôcher of Harvard University. Like all others who have discussed the question, he seems to have quite overlooked a definition which one would think would have been insured against neglect by being embedded in one of the most famous of all philosophical writings. We refer to the definition of mathematics as the science of order. It is Descartes who puts it forth. He, indeed, says "measure and order"; but it has been for many years well known that quantity *is* nothing but ordinal sequence. We mean that this is well known to those who are versed in the subject, but not that it is well known to all those who ought for their own sakes to understand it; nor that it is well known to the whole indolent breed who call themselves "thinkers."

But, to return to the juxtaposition here of philosophy and of mathematics, the comparison that it compels between the general state of intellectual development of the two groups of students is one of the most impressive lessons of the whole volume. Yet mathematics is not as well represented in the volume as is philosophy; and particularly the expression of all that semi-logical department of mathematics which keenly interests every variety of pure intellect is, excepting in Bôcher's paper, distinctly weak. In applied mathematics, Boltzmann and Poincaré continued at St. Louis a controversy—a very uncontroversial controversy, it is true—which was not really of a mathematical nature and which had been quite exhausted, as far as they were concerned, years before. The subject should lie fallow until some new point of view is found.

A congenital defect of such a congress, in the province of philosophy at any rate, is that the principal speakers must be very few. At St. Louis there were two only for each section. To select the best two, the selector should add to a superhuman insight an absolutely complete and thorough acquaintance with all the young philosophists. For it must be the young men, if any, who are to open our eyes. Their elders have been tried and found wanting. The selection that naturally gets made is that of the men who, in the later of the previous years, have put forth the most prepotent ideas. But it is just these men that we have no need of hearing. The old tune is still running in their heads; they will harp on the one old string. The man who in silence and obscurity has been creating some strange, beautiful, and illuminating conception is the man from whom we desire to hear, but from whom there is little chance of hearing in such a congress. Some of the old leaders, and some only, express themselves in this volume, together with a few who, if not old leaders, have recently so expressed themselves that all philosophists would know what they had to say. The truth is, that the personal *rencontres* were of liveliest interest, but the record of what was said is considerably less so.

Geology: Earth History, Vols. II. & III. By T. C. Chamberlin and R. D. Salisbury, Professors of Geology and Geography at the University of Chicago. Henry Holt & Co. 1906.

That geology is not yet an exact science, and that many of the commonly accepted views of the earth's history rest in the last analysis upon undemonstrated assumptions, is emphasized in a striking manner in the above work. Contrary to the plan of other text-books on the same subject, marked attention is paid to the hypotheses of the origin and early phases of the earth, and several alternative views are discussed in considerable detail. For a number of years past, Professor Chamberlin's studies have led him to consider these fundamental problems connected with the origin of the earth, and have convinced him that neither the commonly accepted Nebular Hypothesis of Laplace nor the Meteoric Hypothesis of Lockyer and Darwin can possibly meet the demands that later discoveries put upon them. For example, these hypotheses presuppose an original crust with somewhat definite chemical and physical characteristics, such as no great basal formations are now known to possess. Indeed, recent studies in Canada, the United States, Great Britain, Scandinavia, and Finland have demonstrated that great granitoid areas of the Archæan rocks, which were previously supposed to be a part of that crust, were intrusive, and that they had been forced into rocks which were formed on the surface at a period much later than the original crust. Professor Chamberlin has been led, therefore, to develop the "planetesimal hypothesis," in which "it is assumed that the parent Nebula of the solar system was formed of innumerable small bodies, planetesimals, revolving about a central gaseous mass, much as do the planets today." He finds in the numerous spiral nebulæ, with coiled arms or streamers, with luminous centres and knots of light on the streamers, and which present a *continuous* spectrum, some reason for assuming that such planetesimal systems exist in great numbers. By this hypothesis, "the evolution of the system consisted in the aggregation of these innumerable small bodies into much fewer larger ones." "The earth is supposed to have started as a nebular knot, acting as a nucleus, and to have grown gradually to its present mass by accessions" of the scattered planetesimal masses.

This hypothesis calls for a relatively slow growth of the earth—cold at first, but with a rising internal temperature developed in the central portion, chiefly through compression, and creeping outward. The young earth is believed to have had no atmosphere until it attained about one-twentieth of its present mass, owing to its inability by the force of gravity to attract and hold to itself the light atmospheric gases against their high molecular velocities, which would carry them off into space. But when the growing earth reached the requisite mass, an atmosphere was gradually accumulated by contributions from the free atmospheric

molecules which came within range of its attraction, and from the occluded gases which were extruded, probably chiefly by volcanoes, from the earth itself. This conception of the primitive atmosphere is fundamentally different from the orthodox view, which postulates a vast hot and heavy gaseous envelope, containing all the water of the globe, all the carbonic acid now in limestone and that corresponding to the carbon in coal, peat, lignite, and other organic substances, and all the oxygen since shut up in the rocks by oxidation; in direct contradiction, notably, of the discovery of air-breathing animals far back in geologic history and early flying insects with structures incompatible with a heavy atmosphere, to say nothing of positive evidence of widespread glacial conditions in India, Australia, and South Africa on the very border of the tropics towards the close of the Palæozoic period, and in China in latitude 30° N. in the early Palæozoic.

Under the Laplacian hypothesis, the interior heat of the earth is assumed to be mainly residual from its original molten condition, and on this assumption serious limitations have been made by physicists to the age of the earth, based upon the probable initial temperatures and the rate of cooling—limitations which greatly restricted the time exacted by geologists for the earth's subsequent evolution, and by biologists for the beginning and development of life in the pre-Cambrian age. The planetesimal hypothesis meets this objection, and affords an undetermined lapse of time between the stage when conditions congenial to life were first possible, and the Cambrian period when the first fairly legible record was made.

In many respects these new views are nothing short of revolutionary, and although various aspects of the problem have been discussed by Dr. Chamberlin in numerous papers during the last ten years, the first complete statement is made in this work. A consistent effort has been made "to carry through the interpretations of the whole history parallel systems of doctrine built on the diverse hypotheses recognized." Such a treatment, while perhaps at first confusing to the beginner, in reality acts as a stimulant and prevents the unquestioned acceptance of theories on the mere basis of authority and custom. The question of geologic climates, particularly of the glacial climates which in the Cambrian gave rise to glaciers in latitude 30° in China, in the Permian brought about widespread glaciation at low altitudes in India, Australia, and South Africa at the borders of the tropics, and in the Pleistocene covered much of North America and Europe with a series of far advancing and retreating ice sheets with long periods of mild interglacial climate, receives exhaustive discussion. In considering the life of the various geologic periods, exceptional attention has been given to the evolution of faunas and floras and to their migrations, while much less attention has been shown to individual forms, however strange and uncouth they may have been.

Unsolved problems are frankly recognized, and the need of further investigation and revised interpretation freely indicated. Such, besides those already mentioned, are the widespread occurrence of red beds with few faunal remains, the accumulation at certain horizons of extensive beds of rock salt and gypsum, the preservation of great masses of vegetation as in the Carboniferous and Cretaceous, the extraordinary and widespread lava flows and volcanic eruptions of the Tertiary, and the great extent as well as the complex history of the glaciers of the Pleistocene, particularly when contrasted with the genial climate of circumpolar regions in the preceding geologic period.

The question of the antiquity of man in America receives more elaborate attention than is customary in works on geology, and rightly, for in so far as human relics are found imbedded as fossils, the determination of the age of the enclosing formation is essentially geologic. The authors conclude that "no relic found in fluvial material can, with full safety, be referred to an age older than the last stages at which the stream flowed over its surface." Since nearly all the supposed evidence of glacial man has been obtained from gravel deposits which have in every case been reworked, in part at least, since their deposition in the glacial period, the presumption seems to be against his existence, particularly when the absence of authentic evidence from caves, glacial tills, and interglacial deposits is considered. In the present state of knowledge our authors advocate a suspended judgment.

While designed primarily as a textbook for advanced courses in college and graduate schools, many chapters of this treatise invite the attention of the non-professional reader as well as of the scientist. All might do so but for the inherent difficulty of the subject-matter, as, for example, the complicated problems of internal and atmospheric dynamics, rather than because of the authors' method of treatment.

China and Religion. By Edward Harper Parker. E. P. Dutton & Co. 1905.

Mr. Parker must be undoubtedly counted as a Chinese scholar, but his method of composition is peculiar and his literary graces are not very great. He seems to have learned most of his Chinese on foot, for he has been a mighty perambulator in China, meeting with all kinds of people. For all his apology and explanation, which does not explain, of his peculiar list of authorities, the unprejudiced reader, whether acquainted with Mr. Parker's five or six other volumes or not, would be very glad if, in his list of fifty or so monographs or papers, there were not quite so many as twelve or fifteen signed by E. H. Parker. Despite his unappreciative reference to mere "translators and opinionists," one would not have objected to more references to and quotations from such men as Dr. Legge, and to such scholars as Groot. Still, one must be thankful for this study of the elements which make up religion as it is known in China, for, on the whole, it is cool, clear, impartial. Mr. Parker sets forth with unique illustration and fulness the relation of the Chinese Government, or political system, not only to the primitive traditions and ceremonies and the three systems of Laocius (Lao-tse), Confucius, and Buddha, but to Parseeism, Manicheism, Nestorianism, Islam, the Jews, the Roman Church, Protestantism, the Orthodox (Græco-Russian) Church, and Shintoism.

One cannot feel, after reading the book through, that he has found in it any notable accretion of knowledge, or been greatly aided in insight. The author is particularly strong and felicitous in restoring the features and figures of Lao-tse and of Confucius, and in showing the points of likeness and difference in their personalities and systems. The one is set forth as "the rugged, radical denouncer, of the Jeremiah or Carlyle type"; the other as "the man of comfort, order, reverence, and courtliness." Mr. Parker's critical knowledge of the age of documents is excellent, and he understands well how to appraise modern manifestations of ancient ideas. He writes:

"The degenerate but harmless priests seen nowadays in the Chinese towns and villages no more represent the noble abstractions of Laocius than the negro beanfeasters in America or the dancing revivalists in London depict the simple charity and democracy of Jesus Christ; yet in both cases there is a pedigree, and the charitable may admit an honest attempt to do well according to dwindled lights."

The horse-riding peoples between China and Western countries and civilizations were the chief purveyors of ideas, ritual, scriptures, and influences modifying the original bald system of rites, which even Mr. Parker calls a "religion" only in brackets. One could wish that instead of furnishing, as he has done, little more than raw materials, however abundant, he could have shown in orderly sequence the evolution of primitive rites and ceremonies into the highly philosophical system, through the conditioning influences of these outside religions. Undoubtedly Buddhism is still the faith held by the unthinking masses, while Confucianism is the creed of the scholars; yet it is doubtful whether The Sage, could he return to China to-day, would recognize his own system any more than could Jesus discern in European or American popular Christianity his own teachings and simple principles. Nor is it at all probable that the medley of pantheism in the modern beliefs associated with the name of Confucius could ever have become what it is except for the doctrines imported from India. One of Mr. Parker's best chapters treats of Nestorianism, giving also a fine reproduction of the Nestorian stone, with Syriac inscription at the foot. Although translations of the text differ, it is plain that the Christianity introduced into China in the eighth century was not that of the Greek or Roman corporation of to-day. "No stress is laid upon damnation, the sacraments, confession, repentance, the sanctity of marriage rites, the Immaculate Conception, the Crucifixion, Passion, Resurrection, life everlasting, and many things inseparable from the belief of most of the Christians of the present day."

The story of the Chinese, Jews, and Mohammedans is brought down to our time, and there is an original translation of the 'Tao-teh King,' one of the best things in the book; for Mr. Parker's phraseology makes it clear that Laocius and Confucius drew their ideas from extremely ancient books that inspired both, so that virtually the one gives the speculative, the other the materialistic expression of the same simple rule of gratitude to Heaven.

The illustrations, both literary and his-

torical, concern not only Chinese, but also Japanese, Korean, and Burman architecture, and are full-page reproductions of photographs. There is a full index.

More Famous Houses of Bath and District; being the Second Series of that work. By J. F. Mcehan, with an introduction by Egerton Castle, M.A., F.S.A., illustrated with about fifty reproductions of original drawings and rare prints in the possession of the Author. Bath: B. & J. F. Meehan. 1906. Pp. xvi., 248.

Four years ago we noticed the forerunner of the above volume. The houses now discussed are numerous, perhaps thirty, although the presence of chapters which are not primarily associated with any house whatever, and which deal exclusively with a local tradition or a local celebrity, makes an accurate count very difficult. In a plate opposite page 180 appears the building in which are the Assembly Rooms made famous by Mr. Pickwick's visit. The Bishop's Palace at Wells is shown in the photograph of what must be a very valuable print, dated 1733. It is as faithfully topographical as the work of Hollar, though far less attractive. Marston House is copied from a print of about the same epoch, but it is less interesting, the matter which excites the student being the placing of the village church in a little paddock at the very door of the park rather than anything in the architecture of either. Cold Ashton Manor House is an Elizabethan mansion "from an original drawing by H. V. Lansdown." Newton Park is a square mansion of no great size, in the smiling English park which gives it its name. Wick, or Wycke, called also Wycke Court, is declared to be in wonderful preservation, having been cared for and saved from injury and renovation alike, but the picture has no attractiveness whatever except to trace the plan of the garden set close about the house like a formal centre to the irregular park grounds. Two or three picturesque ruins also are included, such as that of Farlegh or Farley Castle, which is shown with its modern house close adjoining it, from a print dated 1733, and Nunney Castle (called also Nunye Castle) from a print of the same date.

Among the local illustrations are scattered many portraits, as of John Arthur Roebuck, the famous M.P. of the mid-nineteenth century; Robert Southey, Gen. Wolfe "of Quebec," and several persons whose celebrity is less impressive to-day than the fame of their portrayers, Gainsborough, or Allan Ramsay. The curious portrait of Lord Nelson in his youth, attributed to Gainsborough, is contrasted with an old print of the man in his maturity, covered with orders and without his right arm. But the subject which will most attract American readers, perhaps, is that of Major André. There is a long record of André's life and the strange conditions in which he became so famous; and there are anecdotes here which we have not seen elsewhere, both credible and incredible, accompanied by the statement, a little odd to the American reader, that "André's story is the one overmastering romance of the Revolution."

No student of architectural art need approach this book, but there is one bit of architecture, at least, which any one might be glad to possess, the curious gateway of Bellott's Hospital, with its very rich armorial adornment above the doorway itself.

BOOKS OF THE WEEK.

American Poems, 1776-1900. Edited by Augustus W. Long. American Book Co.
Barr, Robert. A Rock in the Baltic. The Authors and Newspapers' Association.
Carpenter, Edward. Days with Walt Whitman. Macmillan. $1.50.
Denis, Ernest. La Fondation de l'Empire Allemand. Paris: Armand Colin.
Duke, Basil W. Morgan's Cavalry. Neale Publishing Co. $2.
Early Western Travels. Edited by Reuben G. Thwaites. Vol. XXI. Cleveland: Arthur H. Clark Co.
Friend of Marie Antoinette, A. Translated by Frédéric Barbey. Dutton. $3 net.
Girl Graduate, The. Designed and Illustrated by Louise Perrett and Sarah K. Smith. Chicago: The Reilly & Britton Co. $1.50.

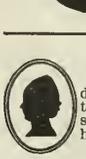
THE EVASION
By EUGENIA BROOKS FROTHINGHAM
Author of "The Turn of the Road."

CAROLINA LEE



Hannah Logan's Courtship
Told in the diary of the lover of this stately daughter of Penn's famous secretary. Beautifully illustrated. $2.50 postpaid, or at bookstores. Send for catalogue of interesting books of Pennsylvania history and biography.
FERRIS & LEACH, Publishers, Phila.

RUSSIA AS IT REALLY IS
By CARL JOUBERT
J. B. LIPPINCOTT CO., Philadelphia.

A SHORT
History of Freethought
ANCIENT AND MODERN
By JOHN M. ROBERTSON
2d Edition Revised and Greatly Enlarged
2 Vols. 8vo. Net $6.00.

This is the first attempt at a comprehensive treatment of the subject with which it deals. It is the writer's aim to show that freethought—reaction against traditional religious doctrines—conditions the progress of the race, and that through such a reaction runs the road that leads toward the goal of humanistic endeavor. The author has a firm grasp of his material and disposes it effectively. His keen interest in his subject has vitalized his book. The narrative moves on steadily and rapidly. The style is sound and vigorous, and humor and satire point, brighten, and enliven it.

The Nation.

NEW YORK, THURSDAY, JUNE 14, 1906.

The Week.

The mounting enthusiasm among Democrats for Bryan, with the prospect of his nomination for the Presidency in 1908, should be furnishing Mr. Roosevelt and other Republican leaders "food for thought." A good mouthful was certainly tendered them by the declaration of the Indiana Democratic Convention on Thursday in favor of "that wise and *conservative* statesman, William Jennings Bryan." "Conservative" in comparison with whom? That is the question for Republicans to chew upon. Who is it that has made the firebrand of 1896 seem a cautious and steady man in 1906? All answers, as the advertisements say, should be addressed to the White House, Washington, D. C. Mr. Bryan's popularity and swelling political support supply food for thought also to William Randolph Hearst's paid manipulators. That they are thinking about this, in their fashion, appears from their careful hiding away of the facts in obscure corners of the Hearst newspapers. Perhaps the men who are tapping that ample purse feel that it would never do to let its owner discover that there is any way to secure delegates except to go out and buy them. Or it may occur to them that the peculiar audience before which they are every day "throwing fits," must not be allowed to know that a distant leader, who has pronounced against Socialism, is winning away the Democratic heart from the only man who has a full assortment of Socialistic nostrums in his pocket or up his sleeve. Be this as it may, it it not a bad thing to see that the mass of Democrats still prefer to be led by a man who has brains (his own, not hired) and character.

The burning issue which has been raised over the President's railway fare seems likely to be settled in a common-sense way by having the Senate put a $25,000 item for travelling expenses into the Sundry Civil bill. In that event the House conferees are hardly likely to stand out against it. There is nothing complicated about this question, nor very much excuse for a difference of opinion. The President, if for no other reason than self-protection, has a right to travel with somewhat more of comfort and privacy than the less conspicuous citizen. Most, if not all, of our Presidents have in the past accepted special trains from the railroads (which were glad to offer them) without feeling that they incurred the slightest obligation in so doing. Now that the feeling has grown throughout the country that the chief executive ought to be under obligation to no private or corporate interest, Congress has wisely declared against his acceptance of free transportation in the future. If it meant to circumscribe his travelling, it should have declared so specifically; but, since it did not do so, common sense and justice demand that he have a travelling allowance. As one Congressman said, "it is not proposed to increase the President's compensation, but to prevent its reduction." It is absurd, to be sure, to say that the country requires its President to live on $50,000. He receives also an establishment costing several times as much. But certainly no economy justifies niggardly treatment of the head of the nation.

The need for the new naturalization law which was passed by the House on Tuesday week is concisely expressed in the statement that, while all the conditions of immigration and citizenship have changed radically since 1802, the naturalization law has not been reformed since that year. Congress has never exercised its specifically granted power to promulgate a uniform rule of naturalization. The House bill is drawn in accordance with the general recommendations of the commission appointed by the President last year to investigate this subject, but does not follow it in details. Its method of preventing citizenship frauds is, essentially, the establishment of a central bureau at Washington in which a duplicate copy of every application for citizenship shall be filed and be compared with the data furnished by the applicant to the immigration authorities on his arrival in this country. Our Government already has such data on file for all arrivals since 1900, but the House amended the bill so that it should apply only to foreigners arriving after its passage. It may be noted that the House retained the system of "first papers" or "declaration of intention" for aliens. The commission found that this did not furnish any adequate safeguard against fraud, and one of the most plausible reasons for retaining it is that a number of States allow residents to vote on their "first papers," and would have to amend their laws if these certificates should be abolished outright.

Aside from the inevitable criticism that national control of this subject meant the creation of another huge and expensive bureau at Washington, the chief objection made to the bill was that, since immigrants are bound to keep on coming, putting up the standards of citizenship would leave great numbers of arriving foreigners practically without a country. As Bourke Cockran eloquently phrased it: "I consider such a deliberate creation of a large alien class in the heart of our population a vicious departure from the liberal and distinctively American policy of a century, which up to the present has been fruitful of nothing but benefit." The greater part of arriving immigrants to this country undoubtedly want to become American citizens, and the requirement of some knowledge of English as a condition precedent would, of course, be a strong inducement for foreigners to learn our language. There are, to be sure, some cases in which the new law would seem a hardship. The Swede, described by one Western Congressman, who files a homestead claim, and must live on his land to take title, thus putting him out of the way of picking up English speech, is still a desirable citizen, and much better qualified to vote than many who can meet the requirements of the new bill. Yet it is not altogether a bad thing to make American citizenship a prize worth striving for, and we shall at least be saved the spectacle of our warships dispatched to protect the rights of "Americans" who never belonged in fact to this country, or who secured their papers through fraud.

Whether the bill to amend and consolidate the acts respecting copyright can be got through Congress at this session, we do not know, but we hope so. The bill represents a vast amount of labor. It is, in the main, a codification of existing statutes. Merely as such, it would be highly useful. But it also contains some amendments. It changes the period during which copyright may run, providing three terms according to subject-matter. It makes, too, some relaxation of our stupidity in the matter of copyright. It embodies, for example, the new *ad-interim* copyright for foreigners, good for two years in the case of a book printed abroad in a foreign language. Far short of going over to the Berne Convention, which our labor unions will not let Congress do, this is yet an enlightened step forward. Of course, the Typographical Union still insists that permanent copyright of books printed in English shall be granted only when the type is set in this country. The lithographers also made a gallant stand for American lithography for Americans, but finally relented so far as to except lithographs "where the subjects represented are located in a foreign country." This was really handsome of them, for they might have demanded, in case (say) a lithograph illustration of St. Sophia were wanted for a book of trav-

els, that a carefully protected American workman be sent over to do the work.

An infallible "Government," in the person of Mr. Neill, got some rude blows in the cross-examination by the House Committee on Thursday. He had positively asserted the employment of tuberculous workmen in the packing houses; how did he know? "I thought so," answered this personification of Government. He had been told so by doctors. "The fact was established to my own mind," he added. "I can only say that I believe it." He had also charged that the employees were infected with other diseases; what ones? "I am not willing to state." Finally, however, came the proof: "There were smells of medicine on these men that you get in dispensaries for certain diseases"! In some other respects, a "Government" which cannot be mistaken fared badly at the hands of searching inquirers. Representative Henry of Connecticut made a gallant attempt to stay this terrible *lèse majesté*. He reminded the Committee that the report which was being so roughly handled came, not simply from Mr. Neill, but "directly from the President," and that, in his opinion, it was "highly discourteous to question it." We wish that newspapers could thus "establish" facts on their say-so, and then have all dissent treated as treason.

Friends of the Indian are becoming more and more practical in their efforts to aid the reservation dwellers. The latest report of the Indian Industries League, formed to encourage home industries and self-support among the more backward tribes, is in strong contrast to those old sentimental appeals that called upon the civilized world to rise up in protest against the wrongs suffered by our red brothers. Where nothing but stern justice was once demanded, the League now asks funds to teach the Navajos to cleanse their wool before weaving it into blankets, and to vary the size of their woven rugs. The Pueblos are to be taught that glazed pottery has a better sale in New York than the old kind, and that it can be shipped more successfully. In the League's memorial to the Commissioner of Indian Affairs and Congress concerning the Campos and other Mission Indians of California, it is recommended that a number of arable ranches adjoining the reservation be bought and prepared for Indian occupancy. "The crime of the century," the ruthless pushing of these non-resistant tribes out upon the desert by crowding whites, is mentioned without excessive heat. Tools, tubs, spinning-wheels; tips on the blanket, basket, and lace market; a job for the Indian man near his home—these are some of the prosaic, specific things that have distracted the practical Yankee's attention from his national dishonor. It is a work of repentance in which he ought willingly to join.

Nineteen years ago, on receiving the nomination of the Democrats of Maryland as Attorney-General of his State, ex-Gov. William Pinkney Whyte said: "The Attorney-Generalship would be an excellent way for me to close my public career." Mr. Whyte was then a youth of sixty-three. At the expiration of his term in 1891 he retired to practise law and enjoy his reputation as Maryland's most distinguished citizen. His choice now by Gov. Warfield as Gorman's successor in the United States Senate is an admission that even at eighty-two Mr. Whyte is still the State's foremost Democrat. If the new appointee lives to complete his term, in 1909, his public career will have extended over sixty-two years, for he first went to the Maryland Legislature in 1847. His first appearance in the Senate, when he was appointed by Gov. Swann to the seat made vacant by the resignation of Reverdy Johnson, was in 1868. A term as Governor, a full term as United States Senator, and two years as Mayor of Baltimore preceded his election to the Attorney-Generalship in 1887. If, as "Mr. Dooley" asserted, "th' enthrance of Beveridge into th' Senate at th' age of six reduced th' average age of that body to 92," Mr. Whyte's reappearance will help to restore the former impression of maturity. Still, he is nearly two months younger than Senator Morgan, and more than three years younger than Senator Pettus—Alabama's two wise counsellors who blithely talk of reëlection in 1907 and 1909, respectively. Dr. Osler has evidently left Maryland for good.

The elimination of Addicks in Delaware has long been regarded as certain, but it is a comfort nevertheless to record his final defeat in the Republican caucus on Monday night. The State is to have two Senators again, and Addicks is not to be one of them. Thus the long assault of the most notorious and despised corruptionist of his day is at last beaten off. His audacity, his resources, his energy threatened to succeed; and for a time even President Roosevelt was ready to accept him on the ground that he was one of the men who "do things"—for example, by corruption eat out the belly of the Republican machine and thrust himself in the carcass. But they now have the satisfaction of knowing that their determined resistance has put a negative upon the schemes of one whose election would have disgraced Delaware by sending to the Senate a member at whom even Platt would have looked askance, and in whose presence all decent Senators would have had a feeling of nausea.

The old "Hail! Hail! the gang's all here," was heard at Harrisburg on June 6 when the "Regular" Republicans, led by Senator Penrose, nominated a State ticket. By naming as its candidate for Governor Edwin S. Stuart, who served as Mayor of Philadelphia from 1891 to 1895, the convention put on the cloak of respectability so far as Philadelphia is concerned. Mr. Stuart is a genial, staid, and popular man, who has a talent for being on every side of every question in order to avoid trouble. But the president of the Union League Club of Philadelphia is no such large figure of virtue that he can make the State believe that the Penrose organization wants to reform. The head of the Lincoln Party ticket has already notified his backers that he does not propose to withdraw voluntarily from the race. What some enthusiastic Lincolnites propose is to substitute the name of Mayor Weaver for that of Lewis Emery, jr., and fight the organization to the end. But it is more than probable that if the Democrats nominate State Treasurer Berry, who has already been chosen by the Prohibitionists, the reform Republicans will flock to his support. Then the unpartisan verdict of last fall's State election may be emphasized by his election as Governor.

An element of burlesque was introduced into the Harrisburg Convention when the "war-horses" of Pennsylvania Republican politics grew enthusiastic over those planks in the platform that applauded President Roosevelt's "regulating" policy, and denounced corporation rule in the State. Here were men like "Dave" Martin, "Jim" McNichol, Lane, and Miles, who for twenty years have lived and fattened on corporation "graft," hotly demanding a State commission to regulate transportation companies, asking for a two-cents-a-mile fare, calling for limited franchises, endorsing the request of the trolley companies to be allowed to carry freight, and ending with an oath of allegiance to the principle of the "square deal." The comedy was emphasized by wordy and fulsome praise of the Pennypacker Administration, and a declaration of standpattism that would have delighted Secretary Shaw. The platform makes admirable reading for those who, like Mr. Chesterton, delight in bringing logic out of obvious paradoxes.

Few will take seriously the petition for Mr. Jerome's removal from office, but many will regret that he had not refuted in advance the charge that contributions to his campaign last year have stayed his hand in the prosecution of corporation delinquents. There was abundance of good reason why the District Attorney should have taken the public into his confidence immediately

after the election. His was a people's victory, won by the people's support; and the demand for publicity in regard to the details of management was entirely legitimate. The amount of money freely given, with the main items of its expenditure, should have been frankly published. Mr. Jerome owed this to his friends, if not to himself; and, apart from this personal aspect of the matter, there was a public good to be subserved by letting the facts be known. They would throw much light on the question how much it costs to run an honest and independent campaign. By so much, they would help in framing corrupt-practices acts, and also in guiding future reform movements—such as the one to elect non-partisan judges this fall. But Mr. Jerome took perverse counsel in the business, and now has to see a formal petition to the Governor recite the charge that, "in consideration of his failure to prosecute, . . . he received for campaign purposes the sum of upward of $50,000." To say that this is a base slander, is only to heighten the regret that Mr. Jerome did not make its utterance impossible.

Publication of the names of the first college professors to take advantage of the retiring pension provided by the Carnegie Foundation shows what a wise and gracious plan that was. Here are some fifty veterans who have toiled long and well, some of whose names have illuminated our academic annals and carried the repute of American scholarship abroad, and who now, in their old age and declining vigor, will be assured of a modest support so long as they live. Of course, as the case stood before, these men were in no danger of being turned out to starve. No college that had enjoyed the honorable services and fame of Professor Young, for example, or Professor Morley, could think of leaving them in neglect when incapacitated. The alumni would cry shame upon it. But it is an undoubted burden upon college funds to retain in a professorship a man whom years have disabled from discharging its duties. For the old teacher himself, also, it has been awkward to go on drawing emoluments which he felt were intended for a younger and more active man. But now a happy solution has been found. A retirement fund which is a badge of honor has been provided; and college endowments may be applied entire to the support of professors in full strength. It is a form of old-age pensions of which all must approve.

According to the Mexican *Herald*, which seems to be in sympathy with the revolutionists, President Cabrera of Guatemala is facing a grave crisis. Gen. Lisandro Barillas, the leader of the movement to displace Cabrera, and his three chief aides, Gen. Leon Castillo, Gen. Salvador Toledo, and Col. Felipe Pinedo, are converging upon Nueva Guatemala from all sides. Castillo has attacked the Pacific port of Ocos, Pinedo has crossed over from British Honduras, Toledo has advanced northward from Salvador, and Barillas himself has invaded the country from Mexico with 700 modern rifles and plenty of ammunition. Toledo's forces, to judge from the most trustworthy reports via Salvador, number 2,000, and, according to Central American standards, they are efficient and well armed. Castillo has been defeated at Ocos, but he means to try again when his forces are increased and when President Cabrera is using his own troops to defend his capital. Contrary to the usual rule, the Barillas movement seems to have been well planned and adequately financed. Guatemala's President has assured his supporters that the revolution will soon be crushed; but the rebels are even more confident of gaining possession of the Government.

The parallel education bills under discussion in England and Prussia afford a pretty striking contrast. The British measure contemplates secular schools in which all sorts of religious instruction are tolerated outside of school hours; the Prussian bill frankly recognizes the sectarian character of the schools, and attempts to supply denominational schools according to the demand of the religious population. The Prussian proposals, which make a special case of each locality, are about what the churchmen of England would like to see effective in British primary education. How deep-seated is the desire to put the duty of denominational instruction upon the State, may be gathered from the fact that twelve thousand "demonstrators" came down from Lancashire to London on Friday to protest against Mr. Birrell's plan of virtual secularization. In a recent debate in the Commons the respective value of home, Sunday-school, and day-school teaching of religion was gravely discussed, and the home and the Sunday-school were badly worsted in the argument. It is a proof of the supreme illogicality which Bagehot venerated in the Briton, that the same people who proclaim the inefficiency of the schools in matters secular are ready to stake their lives that the schools are religion's only teachers, and her best. The British ratepayer is ready to fight lustily for the right of making somebody else bring up his children in the fear of the Lord. Mr. Birrell's plan to make religious teaching a special charge upon the sects is highly unpopular. What the outcome will be, one may hardly predict, but this much is certain: that Parliament will yet spend many a weary hour upon the Education bill without giving attention to its properly educational features.

Just before the adjournment of the Reichstag, on May 28, the Government met with a severe rebuff. Its proposal to establish a Colonial Secretaryship, independent of the Foreign Office, was rejected by a vote of 142 to 119. The debate leading up to the decision was charged with passion. The whole disastrous colonial and military adventure in South Africa came under the sharpest criticism; and the sense of the Reichstag evidently was that, instead of swelling the military expenditure, troops should rather be withdrawn. In fact, the proposed Government credits for South Africa were deeply cut into. Thereupon Col. von Deimling, who was about to go to the colony to take command, made a violent speech, declaring that, no matter what the Reichstag did, he would never withdraw a single soldier "unless my Emperor issues a command to that effect." This led to a stormy scene. The Radical leader, Herr Müller-Sagan, resented the use of such language by an officer. If he spoke for the Government, the Reichstag would know what answer to make. If for himself, the reply was that if it was in the interest of Germany for the troops to be withdrawn, "they will be withdrawn, Col. von Deimling, whether you wish it or not!" The Clericals joined in the rebuke, and the Government had practically to disavow the impetuous Colonel. Even so, it could not get its measures passed, and meekly accepted a return to the old system of a Director of the Colonial Department within the Foreign Office.

Diplomatic relations between Rumania and Greece have been severed, but it is hard to see how these nations can take the logical next step of going to war. Their nearest frontiers are separated by two neutral Powers, their seacoasts can be attacked only by passing the Dardanelles, which by the Treaty of Berlin are barred to all non-Turkish war vessels. The case is grievous beyond record. All except the most fanatical advocates of international peace have conceded that nations must fight on a point of honor. The evident corollary to that dictum is that, in such case, nations should be put in a position to fight it out. We can recall no similar instance where nations in dire debate were restricted to a mere cessation of diplomatic civilities. It is distinctly for the Hague Conference to provide relief for such an intolerable situation. Since the basis of the dispute is largely religious, there might at least be provided a polemical arena for the Archbishop at Bucharest and the Athenian Patriarch. Meantime the Vlachs and Greeks in Macedonia will possibly continue to give a very good individual imitation of the warfare that is forbidden to their respective fatherlands.

THE EFFECT ABROAD.

The lot of the self-respecting American travelling in Europe has not, for the past few years, been a happy one. Scandals at home have pursued him across the sea. Hard upon the exposure of corruption in the public service, with high officials smirched or indicted or found guilty, came the revelations of unsoundness in private commercial morals. The insurance crookedness of last year was followed and accentuated this year by the uncovering of graft in the Pennsylvania Company; now comes the reverberating scandal of the packing business, with every one wondering what reputation is next to fall crashing. The inevitable effect upon European opinion was strikingly set forth in a recent dispatch to the *Sun* from its London correspondent. This was the more remarkable for appearing in a newspaper which has long made a specialty of flamboyant patriotism. To one not only at ease but boastful in Zion, the disagreeable information is given:

"It becomes the duty, however painful, of any conscientious correspondent to inform his countrymen of the indictment which the world at large is bringing against them, and to warn them that it is not corporate criminals alone who are being arraigned. It is the whole American people who stand to-day at the bar of public opinion before their sister nations. Never before has American commercial honor been so attacked abroad. Never before have the American people been so criticised for neglecting their primary public duties.

. . . . . .

"The Old World has come to believe in general terms that American business methods are rotten. It is a sad thing to write of the reputation of one's country, but it is the simple truth, and the truth had better be told without disguise. It will take more than a paper reorganization of the great life-insurance companies and a cleaning of the Augean stables at Chicago to restore European belief in American honesty and fair dealing. It will be a long time before public opinion on this side of the Atlantic will have any confidence in American corporate reform."

To be entirely fair, we must bear in mind the fact that there has been much exaggeration in the dispatches sent to the London press by its correspondents in this country. With English journalism growing yellower every year, its American news becomes more lurid. One has only to look at the telegrams sent from this side to the *Standard*, the *Tribune*, the *Telegraph*, the *Daily Mail*, and the *Express*, to see that their correspondents are expected to transmit whatever is startling or repulsive, without too close scrutiny or too great moderation of statement. Even the London *Times* has been partially swept away. It has, for example, in this very matter of the meat-scandals, credulously printed all the stories and rumors afloat here. For all this, allowance has certainly to be made. If American business dishonor is hurting our prestige abroad more than could the loss of a dozen battles, American yellow journalism, playing into the hands of ignorant or unscrupulous English correspondents, is inflaming foreign suspicion and heightening our national disgrace.

With every deduction made, however, the case is black enough. Americans abroad must be re-reading with new response of soul the lines which Lowell wrote in Europe in 1873:

"I scanned the festering news we half-despise
Yet scramble for no less,
And read of public scandal, private fraud,
Crime flaunting scot-free while the mob applaud,
Office made vile to bribe unworthiness,
And all the unwholesome mess
The Land of Honest Abraham serves of late."

The very quotation suggests a hope. In 1873, the country seemed to be at nadir. Lowell did not exaggerate the impression. All honest Americans felt it, and were ashamed by it. Yet better days followed. In public affairs, a powerful reform movement set many things right. From Grant through Hayes to Cleveland meant an immense toning up. There are signs of similar recuperative forces at work now. Any one with a memory for the ups and downs of American politics during the past thirty years will be on his guard against appearing a "too quick despairer."

Yet the ugly feature of our present situation, causing so malign an effect abroad, is the discovery that commercial immorality is widespread. We have been familiar with political corruption, if not too tolerant of it. In the kinds of business touched by politics also, we have come to expect a certain amount of bribery and stealing. Insurance corruption seemed to go naturally with Insurance Departments to be hoodwinked or "squared," and bosses and Legislatures to be bought. Similarly, the railroad lobby has had its well-understood meaning. All along, too, that organized system of political corruption which we call protection, has been doing its demoralizing work. But we had not, until lately, believed that our standards of commercial honor were low; that business men would cheat and bribe and feather their own nests without being tempted or compelled thereto by politicians. This comfortable confidence, however, has now been badly shattered. We have seen high railroad officials shamelessly taking bribes. We have seen a great business of world-wide scope conducted with callous disregard of health and good faith. This is the sort of thing that makes Europeans suspect us and Americans hang their heads.

"Somebody ought to be punished." True; and the punishment has already fallen. Severer penalties than any statute could inflict have been visited, and will continue to be visited upon the guilty. Correction and amendment are more imperative than punishment. The chance to "do something for the country" was never better for the true patriot; and the way for him to go about it is not to clamor for vengeance upon some conspicuous offender, but to look to himself. What are his own motives? Does he lament the poor opinion of us held abroad simply because it means lowered reputation and loss of trade, or because it means a state of morals of which we all ought to be heartily ashamed? Repentance and reform can never be vicarious. If every man of us would resolve to leave off cheating, whether profitable and undetected or not, and the condoning of cheats, we should be doing what we could to set up our nation in the considerate judgment of mankind.

THE BLESSED WORD, "GOVERNMENT."

We are getting some excellent samples just now of the fallacies which men hug to their bosoms in connection with such ideas as "Government," "Government control," and the like. We frequently observe, for example, an awe-struck use of the word "official." One man says this, another alleges that; but a Government report is printed, and that is "official," putting an end to controversy. People will not look to the man behind the name. If Mr. James Bronson Reynolds comes along on his own hook and declares that he has made such and such startling discoveries, we take it for what it is worth. We know that his testimony may be ex-parte, and so we insist upon hearing others and checking off his evidence in every way possible. But the moment Mr. Reynolds is commissioned by the President to make a report, he at once becomes clothed with the sanctity and infallibility of "the Government"; and not to take his lightest word, or most innocent mistake, as gospel truth is treason and sacrilege. We see how this works when our ordinarily well poised neighbor, the *Times*, begins hurling the words "nullification" and "forgery" at Representative Wadsworth of the House Committee on Agriculture, simply because he sets up his own ideas against those of "the Government"—*i. e.*, Mr. Reynolds.

This is strangely at variance with our practice in Government prosecutions. When a man's property or life is in peril in the courts, State or national, no such sacrosanct character is attributed to what the Government says. After "the Government's case" is put in, it is open to the sharpest scrutiny and challenge and attack by opposing counsel. Because the District Attorney is "official," no one would plead that what he says should close all mouths. We know that he is just as subject to mistake or prejudice as any other man; and lawyers feel it their duty to contest "the Government" vigorously in order that it may clearly appear whether the Government (that is, the fallible men at the moment representing it) is blundering or not. But when some one comes forward in a mat-

ter of public business and says, "This is a Government report, and these facts and recommendations are official," we are expected to sit down like so many Persians under a decree of the Shah, and never dare for a moment to inquire for ourselves or frame our own conclusions.

As we said at the first, we think the report of Messrs. Neill and Reynolds establishes the existence of repulsive and unnecessary evils in some of the Chicago packing houses. They are, indeed, an old story. Local inspection by the Chicago health officers confirms them in part. But they were, in part, impeached by the testimony of Mr. Wilson before the House Committee on June 6. It would seem that Mr. Wadsworth and his colleagues do not think it a crime to ask what the truth is. They talk of going to Chicago to look for themselves. And even if the facts in the Government report remain substantially unshaken, it is not, as some appear to think, the act of a villain to dissent from its conclusions.

One good reason for dissent, or at least doubt, lies on the surface. We are asked to apply the magic of Government inspection to the Chicago slaughter-houses. They must be placed under the Bureau of Animal Industry, affirm the President's investigators. But they have already been under it, and with what result? Why, that its inspectors found nothing out of the way at all! They reported to the Secretary of Agriculture that the charges of 'The Jungle' were unfounded. So we have the infallible Government against the infallible Government. President Roosevelt is said to be very angry that the Bureau of Animal Industry did not discover the abuses which his personal agents found. Yet the latter recommend that the same negligent Bureau be given more power than before! Who will inspect the inspectors?

There is, of course, a natural explanation of the growing tendency to cast ourselves upon the national Government, entrusting it with one new function after another, and comfortably thinking that we are saved and all is well. The national authority seems to carry more weight than city, county, or State authority. To many interests, national in scope, we see it successfully applied, and we jump to the conclusion that it ought to be applied everywhere. Inspection and regulation by the Federal Government present themselves as more efficient than State or municipal. They often are so. But it is also alleged that they are more incorruptible. One form of the superstition that all good is to come from the Government is the notion that our city governments are rotten and our State administrations corrupt, but that energy resides in Washington to purify the national service. Granting, in the face of strong evidence to the contrary, that this might be true for a time, it could not long be true. If the fountain is tainted, the waters cannot flow forth pure; and if we are too feeble or venal to maintain honest local governments, we shall not long have a sound national Government. The same men and systems that produce the one, create the other; the same corrupting forces that attack the one, also assault the other, and if one gives way, for lack of virtue or determination in the citizens, so will the other. The idea that you can take a grafting official, and, by removing the words "State Inspector" from the ribbon on his hat, and substituting "Government Inspector," make him an honest man, is one of the most hideous delusions that have come with the limp dependence upon "Government" as the source of all our strength and hope.

It is easy to propose and even carry through such innovations as the President is urging. "Safeguarding the food of the people!" Certainly. Who dares object? Are you going to raise whimseys about the Constitution and our settled form of government when so great a good is to be done? But those who say this only confirm our point. There is such a prevalent craze about confiding everything to "Government" that people have left off reasoning from cause to effect; refuse to look at the ultimate consequences of a political principle if it seems to minister to their present comfort; and delude themselves with abstractions instead of considering real things and living men. But the reaction will come, and we shall discover again the old truth that if we cannot keep our own yards clean, we cannot make the national domain sweet and pure.

CROP ESTIMATES IN THE MAKING.

"It is in the United States," says the Keep Commission, in its report now published in full as a Senate document, "that the making of crop estimates and expressing the results in figures on a percentage basis has been developed." So we ought, seemingly, to regard the crop estimates, although they are not yet out of the zone of fire in Washington, as a characteristic national institution. It is also one naturally calculated to appeal to Yankee ingenuity. Given something like ten million agriculturalists, distributed over something like three million square miles of land, and spending their time cultivating all manner of vegetable products, find the results of their labors before the crops are actually sold, expressed in bushels, tons, and bales. There was really something appropriate in the atmosphere of mystery which was always thrown about the crop estimates. Reports from over the country dribbled in and were secreted in ponderous safes, a consultation of grave men took place behind closed doors, and in due time there emerged the long-awaited numerals that set the country by the ears and sent the markets up or down—unless there happened to have been an anticipatory "leak."

It has been one of the services of the Keep Commission to tear off this veil of secrecy and show what the grave men were really doing behind the closed doors. It certainly took some hardihood to question in any way the authenticity of the cotton estimates in the face of the assurance that in their making there had been digested the reports of no less than 85,000 people! It took actually more people to make the cotton estimates than it did to make all the bakers' bread in the entire country, a quarter as many as it did to spin and weave the cotton after it was estimated. And yet the Census Bureau dared to set up the work of its 701 paid agents as a standard of accuracy.

How the Commission found the very number of these correspondents, indiscriminately selected and carelessly supervised, a source of weakness rather than of strength in the estimates has been told in the dispatches. Accuracy would be better served by dispensing with the 12,000 township correspondents, the 20,000 individual farmers, the 32,000 ginners, and most of the 16,000 "special correspondents" now on the books. Let the Bureau trust to trained men, pick them carefully, give them the best opportunities for observation, and pay them adequately, and its conclusions will be better entitled to respect than ever. Ten thousand men can make a more effective count of the objects in a large area than ten, but there is no reason why their guess or estimate without an actual enumeration should be even so good as that of the ten, if the ten happen to be experts at that sort of thing.

The Keep Commission's vindication of the returns from the census of agricultural products brings out sharply enough the fundamental distinction that exists between an estimate and a count. It finds that, out of the 102 counties in which the National Board of Trade pointed out that the Census Office had found actually more farm land than there were acres within the county lines, there were only nine cases in which blunders of clerks or enumerators caused the absurd result. The others were either accounted for by "normal error," or by the standing rule that a farm on the county line is supposed to be credited to the county in which its manager resides. The general confidence expressed by the Commission in the methods of the Census Bureau as regards agriculture is the more valuable in view of the amount of editing and working over which these schedules necessarily receive after their receipt at Washington. It is pointed out with approval, for instance, that in the census of 1900 for

the first time separate returns were asked on shelled corn and corn in the ear, with the money value of each, thus providing one more check on the accuracy of returns. The census volume on "Crops and Irrigation" itself tells how the discovery was made that enumerators were lumping "speltz," a bearded Russian grain, with ordinary oats, and how this error could be allowed for. Such necessary shifts of figures naturally occur chiefly in the minor crops, especially those which the census has but recently tried to include in its reports. Thus, the returns for green vegetables were received in every imaginable form, by "barrels," "crates," "bunches," "dozens," and "heads," which, with the expert assistance of market-men, had to be reduced to a common unit. Even the most carefully collected statistical data are very far from self-tabulating.

Some months ago, the Keep Commission raised the question whether advance estimates were really worth while on crops, like cotton, where the census returned annual figures of its own. The cotton estimates, which differed in 1904 by 4.2 per cent. from the census report of the same year, have been accuracy itself compared with some of the other returns. On corn the estimate of 1900 was 78 per cent. of the census return, on wheat 83, on oats 84, barley 61, rye 94, buckwheat—almost a perfect estimate—99, potatoes 84, and hay 68. It is over livestock, however, that the census, if so inclined, would be most entitled to gloat. Mr. Hyde's "statisticians" estimated that there were 13,537,524 horses on January 1, 1900; the census found 18,280,007 on June 1. The Bureau estimated 37,379,356 swine; the Census found 62,876,108. Estimates are valuable for just what they are; but, in the light of the investigations now published, it will not be possible for a long time to come for the public to swallow them as, in any sense, of authority equal or even comparable to those often unappreciated monuments of application, the census volumes.

THE TOWN MEETING FOR CITIES.

Newport adopted last week the new charter framed by the city's Municipal Association and granted by the Rhode Island Legislature last winter, thus in a day passing from a system of ward politics and sectional strife to a modified "town-meeting" scheme which is offered as a model for small cities. For a Council of 20—now made up of 12 Republicans and 8 Democrats—the new plan substitutes a non-partisan body of 195. From each of the five wards of the city 39 representatives are to be chosen, who, in the words of former Chief Justice Shaw of Massachusetts, shall "meet for the purpose of deliberation, instead of the whole body of electors." A Board of Aldermen is retained for executive work, and the powers of the Mayor are largely increased.

This Newport charter is an interesting adaptation of the admirable town-meeting idea that New England has cherished. Since 1855, when Newport formally became a city and gave up the town-council scheme that governed most Rhode Island municipalities, the charter had been stretched and distorted until it no longer satisfied the people. Newport's interests have been subordinated to those of ward politicians. For the past twenty-five years the successive mayors have appealed to the City Council to appoint a committee to draw up a new charter. Last December the Municipal Association was authorized to draft an act that should serve as a pattern for all small cities of the State. The committee that framed the charter was made up of representative men—lawyers, workingmen, and merchants. As explained by one of the most intelligent members, "the aim of the committee was to get back to first principles and common sense. The town-meeting system of old New England was an ideal government, for there was no corruption and no graft."

But in a city of 25,000 inhabitants, it was obviously impossible to bring all the electors together in a single meeting. What was decided upon as an alternative was the selection of a Council big enough to represent every voter, which should elect the city officers and appropriate all money that should be spent by the city. The Council's power should be limited, however, to the appropriation of money; to the smaller Board of Aldermen was to be left the expenditure of the money, but only for the specific purpose indicated by the representative Council. The largest possible freedom of discussion in the latter's meetings was to be encouraged. Any citizen who objected to an appropriation by the Council, or to any of its policies, was given the right to circulate and present petitions to that body. On the petition of 150 electors, a referendum was to be granted on questions affecting the city. In the election of this Council of 195 men, it was provided that no party emblem or attribution should appear on the ballot—merely the candidate's name and address. Instead of a partisan body of 20, therefore, the city proposed to provide itself with a non-partisan body of sufficient size to insure the putting of the city's interests ahead of those of any boss or political clique.

Sectional interests in a city of the size of Newport are likely to conflict; the committee kept in mind the necessity for bringing "downtown" and "uptown" together in sufficient numbers to thresh out their differences in an intelligent way. The hesitation felt by business men of the city in going into politics was to be overcome. Local bosses who, under the old charter, could make a merchant "be good" on threatening him with local legislation designed to ruin his business, would be harmless under the new law. A candidate for this great council was not to be chosen in caucus. Thirty signatures of electors in the candidate's ward and a filing of his nomination paper in the city clerk's office was hit upon as the method for getting a name on the ballot. The most serious objection urged by the genuine doubters was that thirty-nine men could not be found in each ward who would consent to stand for election. But this question was disposed of in the campaign made by the new charter's friends, who pointed to Brookline, Mass., which is of about the same population as Newport, and which retains the old town meeting. There, it was found, the average attendance for purposes of deliberation is about that proposed for the limited town meeting or representative council of Newport.

Simplicity and publicity were aimed at in framing the Newport charter, but it seems to possess, besides, an educational value that cannot be overlooked. In a recent paper by the president of the American Civic Association the ignorance of the average "good" citizen about the most elementary principles of municipal finance was strikingly pointed out. The elector who knows the salary of the mayor of his city is the exception. The assessed valuation of a city, its tax rate, the city debt, and the rate of interest paid on it, the constitutional debt limit, and the valuation of property for purposes of taxation—all these matters, and more, are as unfamiliar to the average city man with the right to vote as are the details of the administration of the Panama Canal zone. In such a body as the Newport representative council, intelligent voters will have a better opportunity to learn how they are governed and for what the money they pay as taxes is spent. This is the sort of knowledge that must precede any effective plan to improve municipal government.

THE WEALTHY LOWER CLASSES.

Whatever the recent anti-capitalistic campaign may have effected, it has at least caused a right-about-face in the general attitude towards wealth. For a matter of fifty years every American boy has been taught both that he was the architect of his own fortunes and that he must build big. The millionaire was held before the barefoot boy as a shining goal. We were unhesitatingly assured that the self-made man of great riches was the noblest work of the American commonwealth, if not of God. Among the ultra-successful there was no doubt of this doctrine. To be sure, there were rifts in the lute of universal adulation. The Goulds, Fisks, and Wards had

occurred, but it was believed that they were highly exceptional. There was nothing to shake the faith of the average millionaire in the exemplariness of his own career. In fact, the acquirement of colossal wealth passed for something like a self-sacrificing virtue. It encouraged the conviction that the cap of every American boy covered a potential millionaire.

How quickly the revulsion has come about may be gathered from the fact that it is only four years since the feast given by our "captains of industry" was widely said to be the most impressive spectacle that America could show to Prince Henry of Prussia. To-day many of these captains are variously under investigation or suspected, universities are rebuked for receiving their money, warrant-servers seek their persons, their hegemony has sunk to that of a world of graft. A "social philosopher" declares in the *North American Review* the inexpediency of any American citizen being permitted to earn more than the salary of the President of the nation. In short, great wealth is now on the defensive, its possession requires explanation if not apology. The virtuous scion of ten generations of clergymen or bank clerks may now turn up his nose and thank Heaven that there never was a captain of industry in his family.

Possibly the moral indignation of the have-nots against the haves is excessive. The well-to-do, and even the poor, frequently enjoy their privileged condition through no merit of their own. The salaried man who is inclined to rejoice inordinately in his superior lot should recall that only accident may have kept the golden bar sinister off his escutcheon—but for the grace of God he might be personally even as the Armours and Rockefellers. In fact, we counsel such a person not readily to give place unto wrath, but to fix his attention rather upon the blessedness of his own condition. Better be a serene retail hatter than a fevered excoriator of the Trusts. The Horatian mood retains its value, and we can imagine an entire generation of folk neither poor nor rich murmuring, *Beatus ille qui procul negotiis*, with a new relish.

Certainly, the delights of the middling lot have received fresh illustration from the recent embarrassments of the unco' rich. The obscure citizen may put his Sunday quarter in the plate without fearing the echo, "Tainted money." He is not subject to the importunity of those who would force free stock upon him, but may select and buy such securities as his judgment approves; he is not liable to the harrassing debate whether his Trust should be fined or his person imprisoned; even his passions and weaknesses are safeguarded by the withholding of his annual insurance dividends, while no such fence against temptation surrounds mere insurance presidents. Finally, the average prudent man may bargain for his services without being enjoined for restraint of trade; he may accumulate "green trading stamps" without falling under the law against receiving rebates; he may kill and even can his own chicken without dread of theorists, chemists, or sociologists. To contrast with this care-free lot that of the millionaire, subject, as it is, to all manner of suspicion and actual constraint, is superfluous.

A further and rarer felicity awaits the man who adroitly steers between poverty and riches. He may fairly aspire to association with gentlefolk—with the unheeded mass among which good manners and the older social amenities have taken refuge. What one may call the gentler pleasures of life are largely forbidden to the energetic persons who manage colossal deals in the morning and symbolically huge motors and steam-yachts afternoons and Sundays. Under modern conditions of business success, it is possible, perhaps, but most difficult, to practise the finest of all arts —that of living. We opine that these considerations should turn wrath against the financial generation now in the pillory into something like compassion. What a positive good fortune, it should seem, to work in a calling where ruthlessness is not the condition of success, and where the over-accumulation of money is uot the goal.

To-day a wise father might well say: "Son, from generation to generation this family has earned its living and paid its bills, it has had the privilege of honest and gentle associations, no member has condescended to be very rich, none has been indecently poor; it is for you to be worthy of this tradition—to keep your family in reasonable comfort and yourself out of the committees, courts, and newspapers." That this would be good advice cannot readily be gainsaid; that it will be universally given may be doubted. Sufficient volunteers will probably be found to undertake the invidious and disadvantageous succession of the present magnates. Many more, we trust and confidently believe, will shake off the cant and cult of mammonism, readjust their standards, and come to a state of mind equally removed from sullen envy of the wealthy lower classes and from discontent at their own humble but highly favored lot.

THE PARIS SALONS.

PARIS, May, 1906.

That there is something wrong with the two Salons, French critics have been assuring us for the last few years. The old Salon continues to be what it has ever been since the unfortunate secession from it of almost all its most distinguished and brilliant contributors; the new Salon is fast sinking, if it has not quite sunk, to as low a level. It was with pleasure, therefore, that I heard of the Société Nationale des Beaux-Arts' proposal to give this spring a retrospective show covering the sixteen years of its existence. For it seemed to me as if in this record of the past might be found a clue to the present demoralization or stagnation among artists, and I waited for the chance of comparison it promised before my usual visit to the two Salons.

Unfortunately, the retrospective show has turned out the greatest disappointment of all. It is held in the two Pavillons de Bagatelle, in the most charming part of the Bois de Boulogne; and if you happen to have a morning or an afternoon to idle away in delightful gardens, with enchanting views from every terrace, the excursion is more than worth while. But if your object is the serious study of modern art, you might just as well spare yourself the long drive or longer journey by train and tram, and remain content with the ten thousand or so pictures and prints in the better-known galleries nearer the centre of Paris. The show has no claim to the name of retrospective except the fact that no new work by the few members of the Society who have a place is shown. The collection is not representative. I cannot imagine on what principle the selection was made, nor can I see that it has any object save to furnish an excuse for the opening of the two Pavilions to the public. The rooms are pleasantly arranged, and this is about the best that can be said for them. The artists appear to have been chosen at haphazard, and in no case is their finest or most characteristic work included.

There are a few not very remarkable examples of Puvis de Chavannes, Cazin, and Alfred Stevens, the usual portrait as a peg for millinery by M. Carolus-Duran and M. Roll. Of the theories and tendencies and movements of the last sixteen years, you can learn absolutely nothing; not as much as a suggestion is to be had of the great development in black-and-white, and the experiments in color-printing that, for long, made the section of drawings and prints the most interesting at the new Salon. Really, I saw little of any importance save three portraits by Carrière, painted in the eighties before he had allowed his mannerisms to grow upon him; a small but strong and beautifully modelled head of a boy by Mr. Dannat—a head that makes one wonder the more at Mr. Dannat's recent excursions into sensationalism and his present absence from contemporary shows; and a head of a girl, wonderfully fresh and charming, by M. Besnard. One other thing I noted—how quickly the painter of fashion goes out of fashion: it is not many years since the death of Duez, a popular portrait painter of his day, and already his large and elaborate portraits of women, two of which are hung, strike one as curiously vulgar and vapid.

It may be, after all, that the clue wanted was to be had in those three portraits by Carrière. A whole room has been devoted to his work at the new Salon. There are large canvases, portraits, the family groups one knows so well—those tragic impressions of maternity—studies and sketches, undeniably a characteristic series. It must be admitted that the result is sadly monotonous, and, though I hesitate to say it, tiresome. Carrière is one of the artists who cannot stand a "one-man"

show. Look at two or three even of his latest pictures, and you see only their beauty and all that is genuine and true in them; look at a number gathered together, and you feel only the convention, the mannerism, to which he yielded until in the end his eyes were closed to everything else. There is all the atmosphere you could ask for in the three portraits of the Bagatelle collection, and in one, of a mother and child, all the tenderness and sentiment. But there is no trace as yet of the mist, the fog, which from that period on began to envelop his pictures, while the figures in them faded into vague, dim phantoms. Put those three portraits in the Carrière room at the Grand Palais, and you could not but realize what Carrière, though he remained always the artist, lost by his absorption in a convention that, springing originally from his very personal way of looking at things, led him eventually to mistake it for nature. Never yet has an artist relied solely upon convention and not been weakened or wrecked by it. And this probably accounts for part at least of the stagnation, as it is described, of modern art. Go the rounds of the new Salon, and you will quickly learn how many besides Carrière have given themselves up more and more to the convention, the mannerism, the eccentricity that may first have made their fame. You can pass over the painters who endeavor to thrive on the conventions of others; you can pass over the painters who in their turn, like Duez in his, are the popular portraitists of the day; you can pass over the weaklings, the amateurs, the sensationalists who ought never to have been permitted to litter up already overcrowded walls. But come at once to the painters of genuine distinction, originality, technical accomplishment, and what do you find?

Take, for instance, M. Boldini: there is no one now at work who has a greater command of his medium, or can give you life itself on his canvas with greater vividness. But how he has let his facility and vivacity run away with him! He shows three portraits this year. One, the usual fashionable lady in the usual fashionable attire—a three-quarters length on an oval canvas—is treated with something like reticence. But the others! On two large upright canvases he has painted, with the directness, the certainty of touch that is so astounding, two women arrayed in the last extreme of the very last fashion. The rendering of textures is amazing—indeed, too amazing; for it is the very dexterity with which the violet-and-rose and the black-and-white "creations" are reproduced in all their elaboration of stuffs and fidelity to the mode, together with the distorted impossibility of the figures, the absurd and meaningless pose of arms and hands, the vacuous expression of the faces, that makes both portraits seem no better than the caricatures of fashion plates upon which, of late years, it has amused M. Boldini to squander his ability and knowledge. Or, take again an artist as different in vision and method as M. Aman-Jean. We are familiar now with his portraits, languid in pose and color, self-conscious in arrangement, but with an unmistakable personal charm. The charm, however, is gradually being lost in the languor. To judge from exhibited results, you might think that M. Aman-Jean could scarcely summon up energy enough even to paint. His canvases diminish in number and size. He has managed to send only three to the present Salon, and these, in their vagueness and pallor, would seem to have exhausted him. From one, a young girl, in pale rose, looks out with a languor less inane, to be sure, but hardly surpassed by the languishing grace of the handkerchief-box beauty. In a second, shadowy figures in shadowy purple draperies move aimlessly and languorously about a tranquil lake in the twilight. All three carry you to a world where the very shadows droop under the burden of weariness.

M. Besnard, who is more vigorous and less mannered, cannot escape the decorative formula that is of such service to him in his mural decorations, but is not so appropriate to his portraits, and this year he shows only portraits. One is of M. Barrère, French Ambassador at Rome, but the painter's interest, it is evident, was all for the splendor of the official uniform and of the spacious room where the ambassador stands, a patient and convenient dummy; the other is a family group against a conventional landscape background, but the mother and her four children, who are arranged on the old pyramidal principle, and seen in the "open air" and gay light of the modern studio, belong less to the actual world than to the land of decorative panels. To this land, M. Gaston La Touche's large "Fête de Nuit" makes no pretence of not belonging. It was painted for the Palais de l'Élysée, and is now placed in a room at the Salon specially prepared for it, where, with his other pictures, it hangs on walls of a neutral yellow instead of the usual red so disastrous to the gayety of his color and the quality of his light. Lovers, in a brilliantly illuminated boat, floating through the mystery of night, or, in a scarlet coach, driving through the falling gold of the autumn woods; a woman (a nude) by a stream in the same woods—these are M. La Touche's subjects. And he sees them in the light that, before now, has shone in many of his pictures; he uses them as motives for schemes of color that threaten to become hackneyed by his own abuse of them. And so it is with painters of distinction like M. Lhermitte, M. Billotte, M. Ménard, M. Sidaner, M. Thaulow, M. Buysse, M. Claus, who repeat themselves until each year's pictures seem little more than a repetition of last year's, with only some slight variation in theme and scale. And some of the younger men of promise, like Mr. Frieseke, are in danger of falling, all too soon, into the same trick of repetition. Mr. Frieseke's women grow more wooden with time, puppets upon which he hangs his delicate harmony of Whistler-inspired color. Or others, like Mr. Childe-Hassam—who has two fresh, bright landscapes and a clever nude, a woman at her toilet seated before a mirror—are too willing to devote their cleverness to reëchoing Monet or one of the other French Impressionists.

It is a pleasure, in the midst of so much that is perfunctory or lifeless, reminiscent or imitative, to come upon the work of Mr. Morrice, who has had the courage to seek new motives under new conditions, and to study them for himself under these conditions, instead of adapting them to a well-worn recipe. He has exchanged the boulevards of Paris and the French seashore for Canada and its snowcovered fields and towns and shops; and he has shown that he can feel no less the beauty there is in the white lonely road under an incredibly blue sky, or the square wooden base of a house perched primly in the cold white wintry landscape, or the little row of houses so like a French village, facing the snowy street. There is nothing of the realistic rendering of snow and ice that astonishes one in M. Thaulow's versions of the Scandinavian winter; Mr. Morrice gives rather the aspect, the feeling of this frozen landscape with its pure cold color, its cold white light, the subtle gradations and effects in its vast expanse of white broken by the swift sleigh, or by the little house, unlovely in itself, but of such pictorial value.

M. Cottet is another artist with the courage of experiment. His Brittany and Bretons have been deserted—for an interval anyway—and he has painted instead three large, full-length studies of the same model, or sitter, under different effects of light. She stands, the background no more than indicated, first in the light of noon, then in a gray light, then by lamplight. It must be confessed, however, that the explanation in the catalogue is necessary, for in no one of the three does the light quite explain itself. It is true, too, that the color is dingy and dirty. But there is character and observation in face and figure, there is the painter's attempt to see something for himself and to solve a new problem. An arrangement of Pont-en-Royans in Dauphiné also has character. The town, climbing up picturesquely from the mountain stream against the grim mountain range, is a contrast in every way to the Breton village or the bare sweep of Breton countryside in M. Cottet's earlier pictures. M. Simon seldom paints a portrait for the sake of the portrait alone, and not also for the difficult or amusing effect of light or atmosphere it may suggest. "Jour d'été" he calls his group of three children, and with reason, for you can see how much less concerned he was with the children than with his study of summer sunshine as it came streaming in upon them through an open window.

It is surprising how few are the good or notable portraits. M. Caro-Delvaille, from whom such great things were expected, hardly justifies the expectation, though his ambition is not at fault in his large portrait groups of three musicians and of Mme. G. D. and her children, and though there are passages in both of rare beauty. Fantin-Latour never did anything better than the vase of roses and the loose sheets of music on the piano in the picture of the musicians. But the piano itself is clumsy; it seems to fill the canvas, crowding the figures into the corner, as if the painter had felt the impossibility of getting anything save its own clumsiness out of it. M. Carolus-Duran has had only men for sitters—one a cardinal—but they have not saved him from the meretriciousness of his later manner. M. Blanche is not at his best, least of all in the portraits of Mr. Shannon and Mr. Ricketts, already exhibited in London; a peculiar luridness in the flesh tints and an exaggerated modelling in the faces are the unpleasant substitutes for expression and character. M. Roll, in a

large equestrian portrait—"Le Dragon"—is melodramatic; Borchardt, in his "Emperor William," who wears what I take to be a hunting costume, is simply comic. Mr. Sargent has nothing, neither has M. Gandara; it is long since Mr. Alexander and Mr. Humphreys-Johnstone have been represented. Other men for whom one always looks with interest are absent. M. Louis Legrand sends no pictures, nor does Mr. Maurer. Though there seems to have been a general exodus of painters to Spain, M. Zuloaga, who is mainly responsible for it, does not appear. M. Anglada is here, however, and has lost nothing of his skill in the rendering of strong, brilliant color. His "Fiancée de Benimanet," in an extraordinary flowered gown, standing by a mule that cannot be seen for the gorgeousness of its trappings, would, less skilfully treated, degenerate into vulgarity and garishness, but in his hands becomes a technical triumph, if little more. As for M. Garrido, in one canvas he repeats himself—this time painting a whole group of children's faces, almost all with the smile that made his reputation—and the State has bought the repetition; in two others, he tries to vie with the grotesques of M. Veber. But M. Veber does this sort of thing with more spirit, and he has a series of his little caricatures of life in paint as reminders of where M. Garrido found his model. When M. Veber uses the same method for an elaborate decoration, as he has done in "Les Contes de Fées" for M. Rostand, it can hardly bear the severity of the test. There is not much else to mention, except that M. Lobre and Mr. Gay are still the leaders for the small pictures of domestic architecture and interiors they brought into vogue, though this year M. Lobre has been working also in the churches of Chartres, but with less success than in his drawing-rooms; that Mr. Vail has some new arrangements of Venice, where he has found so many motives; that M. Storm von Gravesande exhibits for the (to my knowledge) first time as painter, showing several clever little studies of still-life.

The sculpture is even less interesting than the painting. M. Rodin, as if holding himself in reserve for the society of which he is now the president, contributes only a small head, full of character, but catalogued vaguely as "Sculpture." I discovered nothing else of special note. There are signs of lassitude again in the section of prints and drawings, where, only a few years since, was so much life and vigor. Save for the pastels of Louis Legrand, Luigini, and Steinlen, the etchings of Legrand and Maclaughlin—the same he exhibited at the International—the woodblocks of Schmied, there was not much to strike one particularly one way or the other. Indeed, the section of prints in the old Salon, where Sir Seymour Haden and Mr. Pennell show their etchings, Mr. Belleroche and M. Dillon their lithographs, Mr. Wolf his wood-engravings, is now altogether as noteworthy.

The pictures at the old Salon, however, have degenerated more hopelessly into convention or commonplace. M. Harpignies continues to command attention by the dignity of design and solemnity of sunshine in his landscapes; M. Pointelin to move you by the tragedy and serenity of his moorland, though, this year, he has a wooded stretch of country in the morning light that, for him, is almost gay. Mr. Cooper's Philadelphia and New York "sky-scrapers" make, I believe, their first appearance at the Salon. M. Bail paints still-life with his accustomed cleverness, M. Bonnat and the others provide the expected portrait. But the one painting—or series of paintings—I need now mention is the decoration for the Capitol at Toulouse by M. Henri Martin. It is shown with the care a large work of this kind is so apt to receive in Paris. A room apart has been reserved for it, so that some idea can be formed of its effect in the hall for which it is destined. On one side is the long panel representing mowers at work, already hung in a previous Salon and then described by me; on the other, a conventionalized Toulouse, its red brick, warm in the sunshine of the Midi, seen from the opposite river-bank, where people of the town—some of the figures are portraits—wander and linger in strained attitudes that suggest an unaccountable intensity of feeling. The town is well arranged, but to the people, though they gaze upward to heaven or down to earth with an emotion invented to meet the needs of the design, the painter has not succeeded in giving the pictorial interest of his peasants in more picturesque loose shirts and large, broad-brimmed hats, who move with the natural and rhythmical grace of the mower at work. I am not sure that the light and colors M. Martin gets from his broken brushwork and restless technique will prove exactly restful to the Toulousains, who enter the Capitol with eyes already dazzled by the sunshine and glare of their streets and squares.

In the Sculpture Court is the accustomed collection of statues and busts and huge florid monuments, mostly able in execution, but forced and theatrical, so fierce is the competition for applause where craftsmen share such a fair average of accomplishment. Most interesting to Americans is the equestrian statue of Gen. McClellan by Mr. MacMonnies, designed for Washington. It has not the inspired swagger of Mr. Saint-Gaudens's Sherman, but it is restrained and dignified. The General sits well upon the horse, and the horse makes no fantastic, melodramatic leap into space, but stands safely on its pedestal.

Much other good and scholar-like work there may be—and is. But the great evil of modern picture exhibitions is the large scale upon which they are planned, so that the good and scholar-like work cannot always hold its own against the flamboyant performance of the notoriety-seeker and the sensation-monger. N. N.

THE VALLEY OF THE SINALOA.

SINALOA, MEXICO, March, 1906.

A unique geographic feature of northern Sinaloa is a long range of mountains reaching out at right angles from the Sierra Madre in a westerly direction to within thirty-five miles of the Gulf of California, sharply dividing the lower portion of the Fuerte watershed from that of the Sinaloa River. The range is cut through by a low pass near Ocoroni, giving rise to the local distinction of the eastern part of the range as the Sierra de Tasajera, while the seaward extension is called the Sierra de San Blas. Although this divergence of an important mountain range from the axis of the orogenic movements of so great a system as the Sierra Madre, with which it is connected, is remarkable enough, still more so is the close correspondence of its geological structure to that of the mother range. Here are the same vast accumulations of andesites, andesitic breccias and tuffs, overlaid by caps, now deeply eroded, formed by successive flows of rhyolite, all shot through by later dikes of trap. It is a singular phenomenon, this narrow ridge, with so diversified a history of stupendous volcanic activity, rising clean-cut out of the broad plain to altitudes of from 2,000 to 5,000 feet, without foothills or lava steps. Journeying toward the south, one emerges from the pass suddenly into the broad, fertile valley of the Ocoroni. At the same time one is conscious of having reached a climate that is softer and sweeter than the Fuerte valley. The Tasajera-San Blas range is a climatic as well as geographic barrier.

There are no such cotton lands anywhere on the west coast as those along the Ocoroni River, nor is there any region of equal extent so ideally beautiful. The crystal river winds through well-drained bottom lands, reaching thirty miles from the town of Ocoroni to the eastward, where the vista ends in the blue domes and pinnacles of the great Sierra. On the north is the rugged outline of the Tasajera range, while the southern border consists of low wooded hills forming the front of the elevated mesa called the Tabla de Ocoroni. The latter is a broad expanse of gravelly plain, densely covered with a scrubby growth of multitudinous species of acacia and other trees, here and there broken by open grassy savannas, ranged over by herds of cattle. The stage road across this mesa is like a park drive, firm and level, winding through shrubbery resplendent with the yellow bloom of acacias and Brazilwood and the gorgeous pink crowns of *amapas*. But it is a still place, strikingly songless after the bursts of melody from the mocking-birds, larks, wrens, and sparrows of the river bottoms. Now and then a large hare, a *tochi* or a *conejo*, loped across the road, and once a tiger-cat stole into sight, took a hurried glance at the intruders upon his solitudes, and then flung himself precipitately into the hidden depths of the woods. No human abodes are here, for the soil is shallow and poor and the few water-holes are not permanent. From the edge of the Ocoroni valley to the very confines of the city of Sinaloa, broken only by the narrow valley of the Cabrera arroyo, is an uninhabited and most inhospitable wilderness.

At Sinaloa, however, nature is fruitful and generous again. Her bounty has called into being a well-built city on the banks of the Sinaloa River, in a broad valley with flashing canefields, where pillars of smoke are rising at this season from the sugar mills, interspersed with long *potreros* (the name given in Mexico to fields of corn-stubble), now full of cattle nibbling at the remaining stalks. On all sides are wooded hills and rugged mountains, most conspicuous being the Sierra de Mapiri in the east, crowned by the precipitous peaks of Casanate. The river is one of extreme fluctuations between the majesty of roaring floods and the insignificance of a dwindled stream half filtering through expansive gravel

bars. But the fertility of its valley is abundantly evidenced by the signs of agricultural prosperity, and this condition continues down to the coastal plain, where it is joined by the Ocoroni valley at Guasave, the most favored spot, by virtue of its climate and its rich loose loams, in the entire length of the Sinaloan coast.

Sinaloa is a city with a past, both in wealth and political importance, but it does not occupy a commanding position geographically, and so seems destined to play a minor rôle in the future development of the State. It is solidly built, and enjoys the distinction of having water works; but as the intake for the pumping station is so situated as to capture a goodly portion of the city's drainage, this does not constitute a particularly attractive improvement. It is a great stronghold of the Church, and was once an important mission station. The Romanesque tower of the old mission church has resisted the destructive effects of time and flood, and is still an imposing structure, simple but elegant in its perfection of outline and proportion.

To realize the full beauty of this valley one should view it at sunset from the heights of Buena Vista, ten miles east of Sinaloa, when the evening colors lie upon the winding waters in the fertile *vegas*, and the white city, nestling against its hills, is etherealized by the amethystine hue that envelops the distant landscape. From Buena Vista to Bacubirito is a succession of bosky hills, with an occasional glimpse of the red cliffs of Casanate, and one superb vista of the wild Picachos de los Cuates, like another and greater Kremlin with its infinite minarets and domes. At Huera is a lovely cañon, with deep green pools and jewelled cascades, and dripping walls of rock overgrown with such a varied wealth of rare and exquisite plants as make it a veritable botanist's paradise. The abundance of water and the many rich intramontane valleys have resulted in a chain of prosperous settlements all the way to Bacubirito, so that the traveller can obtain plentiful comforts. (The novice in Mexican travel may question the existence of anything in the country districts which may be termed "comforts," but of this more anon.)

Bacubirito enjoys a setting of exquisite beauty as first seen from the heights south of the great bend of the Sinaloa River on which the city stands. Its white buildings, and the tall, white, graceful spire of the mission church of San Pedro, in the midst of a spreading green valley, stand out in brilliant, cameo-like relief against the deep blue wall of the Sierra de Ocorahui, the first of the mighty ridges which mount ever higher and higher to the region of labyrinthine cañons and snowy summits in the Sierra Madre. It is a beautiful picture, and arouses expectations which are not realized on entering the town. The church, though simple and inexpensive, is a model of elegant form, far surpassing anything that would be found in communities of 3,000 people in the United States. The early Spanish missionaries carried with them, and taught in enduring monuments, a fifth gospel of architectural beauty. How far they may be credited with the cultivation of artistic appreciation in other directions it were not easy to answer. That they taught the rudiments of many arts we know, but something must be allowed to the native tendency of the Mexican Indian to express himself in æsthetic form, else it would be difficult to account for the rare modelling and wood-carving that one so often finds among the rude dwellers of the hills who have not even had the opportunity of seeing the prototypes of their own artistic creations. So strong is this tendency that one of the difficulties which the American constantly encounters in directing labor in Mexico is to prevent his carpenters, masons, and machinists from expending undue time in the refinements of detail. The Mexican reaches out after beauty as the flower does after light. He ornaments his person, and bears his finery with grace. He turns his saddle and bridle into works of art; the common arriero's mule-brushes are things to delight the eye by their form and color; when he fences in his cornfield he weaves patterns of beauty with his wattles twisted from post to post; he sleeps on a *petate* woven with artistic designs. The spirit demanding that his works of utility shall combine a charm for the eye extends everywhere, even to the humblest laborers. The factory and the impatient utilitarian foreigner are fast crushing out the expression of this feeling for beauty, and in the name of progress the Mexican may lay aside the arts of his childhood, and, hanging up his guitar, become songless and money-getting; or he may grasp at the culture of civilization behind the first wave of financial development that is rolling in upon his country, and find better and larger means for revealing the soul and talent that lie in him.

Eastward from Bacubirito is a maze of mountains, carved out of the western edge of the elevated plateau known as the Sierra Madre, interspersed with pleasant valleys, so deeply cut by ages of erosion that the semi-tropical climate has been carried back in long lanes from the lowlands of the coast, giving rise to the oft-repeated phenomenon of canefields and gardens luxuriant with bananas and papayas (the *melonzapote* of Mexico) surrounded by towering mountain walls leading within rifle range to pine-clad summits that invite the winter snows. In this region are mining districts still celebrated, like that of San José de Gracia, and the multitude of copper-gold veins being developed promises a revival of mining on a large scale. Through Bacubirito once passed the commerce of the great mines of Trigo, and a considerable portion of that of the world-famous mining town of Guadalupe y Calvo, as well as that of the once noted Guadalupe and San Manuel gold mines at La Cunibre de San Manuel, a district again attracting capital from England and the United States. The copper mines of Mapiri, and the gold placers of the Descubridora arroyo at the very doors of Bacubirito, are also contributing to brighten the future of this decadent foothill city.

Coming now to the question of Mexican comforts, it must be confessed that these are relative. The soft luxuries of civilization have not yet invaded the country districts. A bed in the modern sense does not exist. The wayfarer is expected here, as in Asia Minor and in northern Africa, to carry his bedding. But the good-natured, kindly ranchers will give you a snug place on the *portal* to roll up in your blankets and sleep, and, if you are sufficiently gracious, they may offer a braided rawhide *tarima* (bedstead) to keep you up from the hard ground. The great wide porch, or *portal*, is healthier and no doubt cleaner than a room, but, as a special mark of favor, a *pieza* will often be placed at the stranger's service. The instincts of the Mexican are all for courtesy and hospitality. If not forthcoming, it were well to consider what you may have said or done to forfeit his goodwill, or it may be that you are suffering for the sins of some of your less considerate predecessors. The forbearance of the Mexican in the face of the rude invasion of his premises and the wholesale appropriation of his household conveniences on the part of the average American, without ever a "thank you" or "by your leave," speaks volumes for his innate courtesy and fineness of feeling.

His wife, if encouraged by a proper show of politeness, will find much more to please the palate than *tortillas* and *chile con carne*. Her culinary repertory is by no means limited, and she usually has an embroidered or a drawn-work tablecloth, and some dainty dishes, with which to add grace to the feast for a favored guest. It will not do to judge by the first impressions of a rude and somewhat unkempt Mexican ranch house. These adobe and plastered wattle walls hide unsuspected mysteries of refinement and good taste, which are reserved for the elect. The staple foods are so different from those of other countries that they often seem coarser and less palatable to a newcomer than they really are.

Until one has attained complete indifference to the deprivation of butter and light bread, and looks forward with keen interest and appetite to his next meal of *tortillas*, he is in no proper frame of mind to appreciate either Mexican cookery or travel. The next step in adaptation to his environment is taken when he becomes critical of the finer points in the production of this national bread. When he can distinguish the difference between the mellower lowland corn and the harsher mountain corn, when he knows if the corn has lain too long in the lye, or has been hurried prematurely to the *metate* for grinding, and has learned the advantage of waiting patiently for the *comal* to become sufficiently hot to properly bake the cakes, his discrimination is refined for initiation into the subtler delights of *asadera* and *requeson*, those rare cheeses in which the Mexican housewife excels. The second curds, or *requeson*, obtained by gently heating the whey from the rennet-curds, is a viand of incomparable delicacy, to which a very gracious hostess will add the harmonious flavor of quince preserves. With growing experience the traveller will learn to look for honey, which abounds on every side; for tender cheese fritters with orange syrup; for *guay-abate* and other exquisite fruit pastes; and he will long marvel that a fried egg should remain such a greasy horror in the United States, when in Mexico it is as delicate as if it had been poached. There are good cooks and bad ones in Mexico as well as at home, and those who condemn the Mexican cuisine *in toto* are usually the same who aver that the Mexican speaks a jargon instead of the Spanish language. It raises a grave doubt as to his close acquaintance with either.

The overbearing manner of the average

American in Mexico, with his indiscriminate contempt for the people of every station in life, which he makes no effort to disguise, is not only humiliating, but is bad policy on the economic side. It arrays the people against us, and is responsible for a large share of that extortion which embarrasses nearly every enterprise which we establish in that republic. It is notable that Americans who affiliate cordially with the Mexicans do not suffer in this manner. We are now about to witness an attempt at the commercial conquest of Sinaloa by our people, which can be achieved with mutual good-fellowship to the eminent advantage of both if we are careful to maintain a spirit of fairness and fraternity. But Sinaloa is not California, and the brutal overwhelming of the Mexican population, which our courts and public opinion permitted there, cannot occur under the Mexican flag. The spirit and manners of the Californian pioneer will not aid in our peaceful invasion of Sinaloa, and it must be confessed that these unworthy characteristics are too much in evidence among the forerunners of that invasion.

COURTENAY DE KALB.

Correspondence.

THE SPANISH ARMADA.

TO THE EDITOR OF THE NATION:

SIR: In your notice of the *Geographical Journal* for May (see your issue of May 31, p. 450) you say that, "in the year immediately before the sailing of the Armada, Sir Humphrey Gilbert reported to the Queen that there were 600 Spanish fishing-boats on the coast," etc. Was it not Sir John Gilbert who made this report? Sir Humphrey was lost at sea a few years earlier (1583). HENRY F. WATERS.

MELROSE, MASS., June 1, 1906.

[In our abstract from the *Journal*, we inadvertently wrote "year" for the "years" of the text.—ED. NATION.]

Notes.

Among the autumn publications of the Macmillan Co. will be 'English Literature from the Norman Conquest to Chaucer,' by Prof. William Henry Schofield of Harvard; 'The German Workman: A Study in National Efficiency,' by William Harbutt Dawson; 'Thought and Things; or, Genetic Logic,' by Prof. J. Mark Baldwin; and 'The Romantic Composers,' by Daniel Gregory Mason.

'The Religion of Nature,' by E. K. Robinson, is in the press of McClure, Phillips & Co.

The third publication of the Club for Colonial Reprints (Box 1275, Providence, R. I.) will be 'The American Village,' a poem by Philip Freneau in facsimile of the original New York edition of 1772, which only came to light four years ago. Mr. Harry Lyman Koopman will provide an introduction, and Mr. Victor Hugo Paltsits some biographical data, which will add to our knowledge of Freneau's first printers, Inslee & Carr. The volume will be embellished, and but 100 copies will be printed.

Captain Mahan is directly antagonized in a work, 'Heresies of Sea Power,' on the eve of being brought out by Longmans, Green & Co. The author is Fred. T. Jane.

The seventeenth volume of Collections of the State Historical Society of Wisconsin, edited by Dr. Reuben Gold Thwaites, deals with the French régime in the territory of the upper Great Lakes (1727-1748), in strict continuation of volume sixteen, whose range was from 1634 to 1727. The documents here Englished are of the same character, and have mainly been derived from the several French archives in Paris. They graphically illustrate the efforts of the French to complete their control over the Indian tribes, endangered by the hostility of the Foxes, and to promote their great object of fur collecting and trading. It is a most valuable service to history to have rendered them accessible in our vernacular.

Dr. Thwaites's indefatigable hand reappears in the introduction and notes to the latest volume in the valuable "Early Western Travels" series of reprints (Cleveland: The Arthur H. Clark Co.). Fur still leads him on, for the two Oregon narratives here united had a not remote reference to that trade. John B. Wyeth's 'Oregon' is the humorous and vivacious "short history" of the author's partial connection with his kinsman's transcontinental adventure. In John K. Townsend's sedate and humane 'Narrative of Journey across the Rocky Mountains to the Columbia River,' in company with the elder Wyeth, the naturalist prevails, and his observations of the Indians also occupy a large and interesting space. Townsend (1833-34) was already shocked by the wanton destruction of the buffalo. In a time of thirst, "I perceived that Richardson was masticating a leaden bullet to excite the salivary glands." A similar expedient was resorted to by Melville, of the ill-fated Arctic *Jeannette* expedition, as will be remembered by readers of his grewsome relation.

Mr. James Alexander Robertson's new translation of Pigafetta's relation of 'Magellan's Voyage around the World,' published by the Arthur H. Clark Co., in two volumes, with an additional index volume, is a work of laborious and admirable scholarship which should prove of interest both to professional students of history and ethnology and to the curious reader of travellers' tales. Not content with presenting for the first time in English a complete and unabbreviated version of Pigafetta's narrative of the first circumnavigation of the globe—Stanley's translation for the Hakluyt Society having omitted many passages of considerable ethnological significance—Mr. Robertson has been at the pains of making a literal transcript of the oldest Italian manuscript of Pigafetta, which is conserved in the Biblioteca Ambrosiana at Milan. This he has printed, with exceptional fidelity in the matter of abbreviations, shorthand symbols and spacing, on parallel pages with the English rendering. The tone of the translation is of a simplicity that, without imitating, suggests the naïveté of Hakluyt's men. The elucidative notes are abundant, and generally satisfactory. We have noted but two defects in this commendable undertaking—an over-subtlety of arrangement in the order of sub-entries in a highly analytical index, and the absence of the marginal notes, and even of the descriptive running-titles, which are particularly serviceable in aiding the reader of old voyages to keep his bearings as he follows a garrulous narrator through uncharted and perilous seas.

To their excellent series of "English Men of Action" the Macmillan Co. have now added 'Captain John Smith,' edited by A. G. Bradley. Within little more than two hundred small pages is condensed the variegated career of this remarkable man, whose life—even when divested of the marvellous adventures with which, most likely, his editor tricked it out to win the favor of a wonder-loving public, as Othello courted Desdemona with tales of men whose heads do grow beneath their shoulders—deservedly places him among England's heroes. Mr. Bradley cheerfully accepts the three Turks' heads, the Lady Tragabigzanda, and the rescue by Pocahontas (which Smith ungratefully forgot until sixteen years after his first narrative, by which time the Princess had become a favorite at James's court); nor do we in the least find fault with him for this, for Smith without Pocahontas would be like King Arthur without the Round Table. The whole story is agreeably told, and the book in every way pleasant to read.

Mr. Morton Luce's 'Handbook to the Works of William Shakespeare' (London: George Bell & Sons; New York: The Macmillan Company) seems to be accurate in statement and sound in its literary judgments, generally speaking, yet in looking over it there are probably few to whom the thought will not occur: "How much better a book is the 'Shakespere Primer' of Prof. Edward Dowden!"—to whom, by the way, Mr. Luce has dedicated the present work. To be sure, the 'Shaksnere Primer' needs a thorough recasting to be brought up to date—for the same author's 'Introduction to Shakespeare' does not take its place; yet, even with this drawback, which, as far as school and college use is concerned, a competent teacher can do much to remedy, Professor Dowden's book continues to hold the first place among works of its class. It combines condensation with charm of style to a degree that renders it, in a certain way, a classic. On the other hand, it cannot be said that either of these qualities is conspicuous in Mr. Luce's 'Handbook,' although the style is agreeable enough but for a slight want of logical precision in the more general discussions. About three-fourths of the 457 pages which the book contains is given up to introductions to the individual works—each introduction being divided into two sections, "Historical Particulars" and "Critical Remarks." The same division, practically, is adopted in the preliminary chapters. Apart from the appendices, the work concludes with a chapter on the Philosophy of Shakspere and another on his Art. The author's plan leads to a good deal of repetition, which might have been avoided by a better arrangement.

Introductory matter and appendix constitute more than one-half of a very small volume, a translation from the French,

Paul Sabatier's 'Disestablishment in France' (Scribners). The author already enjoys a certain reputation with American readers; and although this book is less concerned with the past than with the present, it may well attract them. It is scarcely more than a pamphlet, however, and its chief merit is that, in its presentation of some of the facts connected with the disestablishment of the Roman Church in France, it always presents a point of view that is essentially French, if not French of the majority. Its chief defect, for those who are not among the admirers of the writer's earlier work, is, as might be anticipated, its complete failure to attain an historical point of view.

With the publication of the fourth part of Dr. Pope's 'Handbook to Tamil' (Oxford: Clarendon Press; New York: H. Frowde), the series is complete. This fourth part comprises an 'English-Tamil Dictionary,' and may be had separately or bound with the 'Tamil-English Dictionary,' which complements it. Of the excellence of this series there is no need to say more than has already been said in connection with the three other parts. The dictionary is, of course, only a small one, intended for the use of beginners.

Amid the swarm of latter-day Dante scholars, bent upon the investigation of problems historical, geographical, astronomical, theological, or allegorical, there is one—and one of the most erudite—who never can forget that Dante, with all his science and philosophy and literary theories, was primarily a poet. Hence it is always refreshing to come upon a critique from the pen of that venerable *Dantista*, Francesco D'Ovidio. His latest contribution is a solid volume of 634 pages, 'Il Purgatorio e il suo Preludio' (Milan: Hoepli), containing a full account of the narrative of the second *cantica*, with an ample running commentary. The book will be as enlightening to the novice as it is interesting to the expert. While the author by no means neglects the symbolic aspect of the 'Commedia'—which, indeed, is less conspicuous in this part than in either of the other two—he devotes himself rather to the literal interpretation, and still more to the artistic quality of Dante's work. Repeatedly he warns us against allowing ourselves to be led by a too rigid system into the assumption of motives that may well have been remote from the poet's mind; according to D'Ovidio, the all-powerful consideration with Dante is, in every instance, the æsthetic impression to be produced. The main object, then, of this exposition is to make the reader see and feel the various phrases of beauty as the poet saw and felt them. This the author does with a responsive sympathy, a subtlety, a quick imagination which his profound and accurate scholarship has in no wise dulled. Few, if any questions are left unpropounded, and many are, it would seem, definitively answered. Solution, however, is less important to D'Ovidio than speculation; cautious, suggestive, discursive, he is seldom dogmatic. The first canto of the "Purgatorio" is examined in minute detail, and there is naturally a long discussion of Cato. Other topics that lead to amplification are the belief in a purgation after death; the difference between pagan and Christian sin, and between the punishments of Hell and those of Purgatory; the figure of Statius, whom D'Ovidio does not regard as a real guide; the visions of the two German Matildas; and the identity of the maidenly keeper of Dante's Eden with Matilda of Hackeborn. The style, somewhat diffuse, is luminous and graceful. In spite of its size and the great difficulties that beset the subject, the book is not only an attractive but an easy one to read, and is to be commended to all students of Dante.

"The advantages which American libraries offer are, among others, these: Hours of opening extending from early morning to late evening; pleasant and inviting reading-rooms; attendants who are at the exclusive service of the readers; excellent and easily available catalogues; an arrangement of the books which is easily understood; access to the books without undue formality, even in the stack rooms; liberal rules for lending, either without any, or with easily procurable, guarantee; travelling departments; children's departments, closely connected with the schools; schools of library economy." Thus Dr. A. B. Meyer sums up the results of his observations during his visit to this country in 1899, and of his subsequent study of American library literature, in a small volume entitled 'Amerikanische Bibliotheken und ihre Bestrebungen' (Berlin: Friedländer). The chief purpose of his visit was to study the means of protection against fire, and, in general, matters relating to the erection and maintenance of buildings for the use of museums, libraries, universities, etc.; and the reports which he published on his return to Dresden, we believe, have been carefully studied by librarians and museum officials in this country, both in their original form and in the translation which was recently published by the National Museum at Washington. The new book, a pamphlet of 80 pages, is confined to libraries, as its title indicates, but covers the whole field. It is addressed to the intelligent reading public, and the author's avowed object is to spread the knowledge of American library methods among his countrymen. For the benefit of the specialist, Dr. Meyer offers a short but well selected bibliography and numerous notes, chiefly of a bibliographical nature, covering together not less than 25 pages. The volume is illustrated by a photograph of the Boston Public Library's Bates Hall, and has a good index. We have noticed a few, but only a very few, inadvertencies; for instance, on page 9 it is stated that the New York Public Library was founded by the city, and the Astor and Lenox Libraries, with the Tilden bequest, combined with it; on page 11, the paragraph about the Buffalo Public Library reads as if it had been newly founded in 1897; the Newberry Library of Chicago does not collect objects of art (p. 44); the relation between the American Library Association and the Library Burcau (p. 13) is now practically nil.

A checklist of incunabula in the Royal Library and other book collections in Berlin, prepared by Dr. Ernst Voullième, has been published as a supplement to the *Zentralblatt für Bibliothekswesen*. The Royal Library possesses 4,700, while among those in other collections 300 do not duplicate these, thus making the total number of titles in the catalogue exactly 5,000. The majority, or 2,732, are from German presses, Italy being represented by 1,966, and all other countries together by 302; of English incunabula there are none. The arrangement is by countries, cities, and presses, with an alphabetical author-index and a list of Hain-numbers. Bibliographical details have been omitted as being unnecessary in a library checklist. They will, of course, be given in the large catalogue of incunabula in German libraries which is under preparation by a Government commission, of which Dr. Voullième is a member.

The question as to Professor Harnack's work in the University of Berlin since his appointment to the librarianship of the Royal Library has now been definitely settled. He has been excused from delivering two courses of lectures in church history, and a second professorship has been established in this department, which has been filled by the selection of Prof. Karl Holl of Tübingen, a recognized authority in Patristics and the early Christian centuries.

The German Palestine Society is bringing out three publications containing an exceptionally large amount of new material for the scholar and the investigator. The first is a "Karte der topographischen Materialien des alten Jerusalem," with letterpress by Director August Kümmel of Barmen. The chart is on the scale of 1 : 2,500, and on two sheets of 75x100 centimetres gives in red a map of modern Jerusalem, with the remnants of ancient Jerusalem as discovered to date in black, excluding everything that is mere theory or hypothesis. The second work is an exact reproduction of the mosaic map of Palestine found in December, 1896, in Madeba, in ancient Moab, the size being one-sixth of the original. It is issued in ten sheets, with an explanatory text by Professor Guthe of Leipzig. Each lithographic stone plate has been compared with the original by Palmer, an architect of Jerusalem, and as the work, for the publication of which seventy stones are needed, passes through the press, a second comparison is made by Professor Guthe. The third publication is that of a map of the East Jordan country, prepared by Dr. Schumacher of Haifa, in ten large sheets, as a companion and supplement to the map of Western Palestine in 26 sheets, published by the British Palestine Society.

Letters have been received from Dr. Sven Hedin giving full particulars of his journey through Persia, during which he crossed the Great Salt Desert three times. He describes it as like the bottom of a big inland lake, full of salt mud, and having an absolutely level surface, with a western shore as sharply drawn as any strand line. He carefully mapped the country along his route, made panoramic views of the mountains at fifty of his sixty-eight camps, secured a great number of photographs and sketches of typical Persian figures, while his written observations fill 1,200 pages. The plague was raging at Seistan when he arrived early in April. The population of the principal town had been reduced from 2,500 to little more than 300, largely by death. In one village, containing 170 people, 150 had died, and it seemed as if nothing but a miracle could stop the spread of the disease westwards.

Siam is slowly but surely taking a place

among the civilized nations. Among the most recent reforms is the abolition of the gambling farms in the country, which is the more pralseworthy as they have been an important source of revenue. The next step contemplated is the closing of the gaming-tables in Bangkok. In order to do this, as well as to get the funds needed to establish scbools, to improve the sanitary condition of the capital and to build roads into tbe lnterior, the Government is seeking a revision of the commercial treaties signed in 1855, raising the import duties on foreign merchandise from 3 to 7½ per cent. In the negotiations with the treaty Powers most valuable assistance has been rendered by Prof. Edward Strobel of Harvard University, who was appointed in 1903 General Advisor to the Government of Siam, Mr. Westengard, anotber Harvard man, being his assistant. "The ability and tact with which he has discharged the duties of his difficult post," says a correspondent of the London *Times*, "are recognized by all." He has gained the confidence of the King, his foreign employees, and the representatives of the great Powers. The improvement which he has assisted to bring about in the friendly intercourse of the State with tbese representatives "cannot be too highly praised." Germany's increasing influence in Siam is significant. She stands easily first in respect to shipping, with a fleet of tbirty-nine steamers of 62,240 tons, calling at Bangkok, while the railway construction is virtually a German monopoly.

A performance of James Sbirley's "The Opportunity," the first, it is believed, since the seventeenth century, was given by the members of the Alethenai and Philomathean Literary Societies of tbe University of Illinois on Friday evening, June 1. The stage, writes a correspondent, which was built on the south campus, was enclosed at the back and sides with green cloth, with tbe trees showing above. The different scenes were indicated by appropriate properties, brought in and off by young men in crimson velvet doublets, and most of the entrances and exits were made from the sides. To atone for the absence of scenery, which was hardly felt, the costumes were markedly handsome. Tbe text used was about three-quarters the length of the original, cuts being required both by the change of taste and by the time element. The play combines romantic intrigue, based upon mistaken identity, with splendid low comedy, and, in spite of its many conventionalities, it scored a complete success. The plot was unfolded with absolute clearness, even to those unfamiliar with the story. The acting was fully up to the standard set by the performance of "'Friar Bacon" last year.

—The State of Mississippi is printing its Territorial Archives (1798-1803) under the careful direction of Dunbar Rowland, director of its Department of Archives and History. The present volume i. contains all the orders, proclamations, letters and papers of the first provisional governor, Winthrop Sargent, a Boston veteran of the Revolution, and a man of high tone and upright administration as tbe archivist contends against the detraction of his successor's nephew. His appointment by President John Adams was opposed because of his Northern and Eastern origin and Federalist views; both in Congress and in the Territory he was looked upon very much as were carpet-baggers afterwards; but he retained his home in the South and died there. His otber chief troubles arose from the neighboring Indians—beggars and drunkards as opportunity served—and to keep on good terms with them be needed an lnterpreter, whom he found ln one Cæsar, a colored man; but he, being a chattel, was forcibly taken from him at a critical moment to serve the ends of speculators desirous of entering the Indian country. Cæsar he paid $15 a montb, "the higbest Wages I had known to have been given to a Prime slave." Gabriel's Virginia rising ln 1800 shook even the Mississippi Valley. Gov. Sargent gave warning to slaveholders and milltia officers: "Almost every day adds to the number of our Slaves, and (Reasoning from the fine feelings of Man) to the number of our most inveterate Enemies also. 'Tis more than probable that in the Lapse of another year, there will be more Blacks tban Whites within the Mississippi Territory. That we deprive them of the sacred Boon of Liberty is a Crime they can never forgive." The Virginian Claiborne, with whom Jefferson replaced Sargent, had increasing difficulty with the river riff-raff at Natchez as well as with Indians and negroes in liquor. His Council rejected a law to prohibit the importation of male slaves above fifteen. "Common Negro Fellows will generally Command $500 per head," being wanted in cotton-growing, and the Territory seemed in danger of being overrun (in the Governor's words) by the "most abandoned of that unfortunate race." Claiborne needed an Indian interpreter as badly as Sargent. Portraits of both governors are given, and tbere is a good index.

—Mr. Worthington C. Ford's monumental edition of the 'Journals of the Continental Congress' makes commendable progress. The fifth and sixth volumes, covering the period from June 5, 1776, to the end of tbe year, have lately appeared. As in the earlier volumes, there is considerable new matter, other sources besides the manuscript journals being drawn upon for material. Of the Declaration of Independence, Mr. Ford gives, under date of June 28, tbe "first draft" and the "reported draft" in parallel columns; the former being from a manuscript in the handwriting of John Adams, already printed in Paul Leicester Ford's edition of Jefferson's writings, and the latter from the familiar manuscript in tbe Department of State. The changes made in Congress or committee are indicated in footnotes. A third text, that of the engrossed original in the Department of State, with the signatures, appears under date of July 4, though the document was, of course, not actually signed until later. Two forms of the Articles of Confederation are also presented: the first printed text, from a copy in John Dickinson's hand, submitted July 12, with Dickinson's queries about its provisions in footnotes; and a second printed form, under date of August 20, in parallel columns witb tbe first. Tbe "plan of treaties," reported July 18, follows Adams's text, with the addition of notes from a copy by James Wilson and from other sources. The final form was not agreed to until September 17. The instructions for the negotiation of a treaty with France, September 24 and October 16, are a valuable commentary on the "plan." Of the other more elaborate papers, the most notable are the articles of war, agreed to September 20; the report, September 2, on the exchange values of current coins in Spanish milled dollars, printed from a recently discovered Jefferson manuscript in the Library of Congress; and the address to tbe inhabitants of America, "particularly to the inhabitants of Pennsylvania and the adjacent States," December 10, drawn from Force's "American Archives."

—A glance at tbe 'Journals' is enough to show how varied and complex were the matters with which Congress, at its best a loosely organized body, was called upon to deal, and how quickly the demoralizing pressure of war made itself felt. Early in June a Board of War was appointed, the exportation of salted beef, pork, and other supplies forbidden, and disloyal persons committed to the tender mercies of the States. June 17, the employment of Indians was authorized, and rewards offered for prisoners taken by them in the Indian country. The situation ln Canada fills a considerable place in these volumes, as do the affairs of the northern army and the ill-concealed quarrel of Gates, Schuyler, and Arnold. Tbe approval, July 17, of Washington's refusal to receive letters from Lord Howe, and the report of the committee which conferred with Howe in September, recall another familiar episode. The confiscation of the property of British subjects was authorized July 24, and the war carried into the enemy's camp by the offer of rewards to British and Hessian soldiers who should desert. The characteristically elaborate plan for a great seal, submitted August 20, is made the occasion for a particularly valuable note by the editor. There are numerous references to the monopolization of military supplies by individuals, and to the problem, rapidly becoming acute, of keeping full the ranks of the army. December 12 the approach of the British drove Congress, which had been in session since September 5, 1775, from Philadelphia to Baltimore, where it resumed its sittings on the 20th. The last important act of this memorable year was to confer upon Washington practically full powers for six months. The appendix to Volume VI. gives a list of the fourteen standing committees of Congress and their members; notes of debates made by Adams and Jefferson; a speech of John Witherspoon, September 5, 1776, on the message from Lord Howe, the source not stated; a continuation of the bibliographical notes on contemporary prints, following those appended to Volume III.; and an index to Volumes IV., V., and VI.

—Tbe gaps which remain in the biography of the Stuart period are being fast filled up, and there seems to be considerable demand for expensive books on characters like Digby, Falkland, Prince Rupert, and Alexander Leslie. Among members of the royal family, Henrietta Maria long received undue neglect, especially when one considers the fact that her part in the shaping of her husband's policy forecasted the rôle of Marie Antoinette during tbe French Revolution. Both these women, whose lives were rendered tragic by the strifes of their adopted countries, remained alien in spirit to the best aspirations of their contemporaries and were aliens also

on the soil of their husbands' dominions. Both received from nature a slight mental equipment along with some compensating qualities in the firmness they showed under misfortune and in their willingness to undergo personal privations. Without carrying further this obvious parallel, we may say that it is suggested by the appearance in a second edition of Ida F. Taylor's 'Life of Queen Henrietta Maria' (Dutton). The materials for such a work are not only ample, but, so far as the personal history of the Queen is concerned, largely untouched. Here we shall refer only to the letters deciphered by Mr. Everett-Green—the letters of Henrietta to Charles I.—and to her correspondence with her sister, Christine of Savoy, as edited by M. Ferrero. Drawing from these sources and from the chief political records of the time, the present biography sets forth Henrietta's traits with the fulness of detail which a work in two volumes permits. On the whole the personal element is dominant, and it would be by no means impossible for a subsequent writer to sketch the Queen's career from a political standpoint without trespassing much upon the territory that has been preempted by our author. Thus, to take two examples, the dealings of Henrietta with Rome in 1640 and the development of the Army Plot are matters of much more importance in the political development of her career than they are made to seem here. On the contrary, the part of Henrietta's life which succeeds the ruin of the royalist cause is investigated with the utmost minuteness. At the time when the cause of the Stuarts in exile was at its nadir, she showed an almost incredible want of tact in managing the affairs of her own household. Perhaps her most startling blunder was the attempt to force the conversion of her son, the Duke of Gloucester, attended as it was by unmaternal harshness when he refused to enter the Catholic fold. Her relations with Digby and Jermyn likewise reveal the weaknesses which made her an impossible representative of the royalist cause. An inconclusive appendix considers the evidence regarding her marriage with Jermyn. In conclusion, we must call this work a much more finished and interesting performance than the same writer's 'Revolutionary Types.' It would be difficult to appreciate the historical position of Henrietta more succinctly than in the following words: "Unfitted by nature and training to cope with a crisis of almost unexampled difficulty, she was forced into a position she was unqualified to fill; and her errors of judgment, while almost inevitable, invited the condemnation not only of her enemies, but of those of the King's adherents who suffered for them."

—A graceful but slight book is 'The Letters of Richard Ford,' edited by R. E. Prothero (Dutton). It consists of a selection only of those letters which Ford wrote between 1830 and 1857 to his friend Henry Unwin Addington—a very brilliant man to a dull one. Mr. Prothero has woven them together with intercalated narrative, and made their setting fairly intelligible. Yet only the ghost of Ford has passed into these pages, of the writer of the Handbook, the appreciator of Velasquez, and the friend of Borrow. Some sides, it is true, come out very curiously. There is that mixture of high culture and fineness with roistering goodfellowhood and healthy largeness of utterance even to coarseness, characteristic of a man whose life had bridged the gap from Peninsular to early and mid-Victorian days, and whose friends had stretched from Irish half-pay majors stranded in Spain since the war, through the gradation of the mighty Borrow to such as Lockhart and the dandies. He and his world were both broad, and the breadth of both is impressionistically suggested here. We have a touch of the Duke—*der Einzige*—of Seville, Cadiz, and the Alhambra (there Ford camped in state like Washington Irving), with muleteers, brigands, revolutionists, comic-opera consuls, and Spanish magnificos of all degrees. On one side it is plain how Ford came to know the Spanish character and Spanish situation; but, on another, it is not clear how he acquired his immense knowledge of Spanish locality and his book-learning in Spanish history and literature. It may be that the scrappiness of these letters obscures the real width of his itineraries, and, in the case of such genius as his, the book-learning is acquired in unregistered hours. But, even so, the development of the wanderer after Borrow's own heart, the friend of José Maria the king of Andalusian brigands, and the British tourist of mild æsthetic tastes, into the Quarterly Reviewer and Spanish Handbooker who flavored masses of knowledge with the pepper of his style, is at most hinted, hardly conditioned. Yet for the hint we may be thankful; Ford is Ford in these pages—what there is of them. There is a series of very charming illustrations: two portraits of Ford himself; two drawings of interiors in the Alhambra as it then was, by the first Mrs. Ford; portraits of the first and second Mrs. Ford and of Ford's mother; a Velasquez in Ford's possession, etc. They are all very well reproduced.

—To the notice of Celtic scholars may be recommended Professor Kuno Meyer's edition of the Triads of Ireland, the 'Trecheng hreth Fene' (literally, a triadic arrangement of the sayings of Irishmen), being the thirteenth volume of the Todd Lecture Series, Royal Irish Academy (London: Williams & Norgate). The collection has come down to us in nine MSS. dating from the 14th to the 19th century, viz., the Yellow Book of Lecan, the Book of Ballymote, and the Book of Hûi Maine, 14th century; the Book of Lecan, 15th century; two paper MSS., one written in 1575, the other in 1745, and three others but lately discovered, only one of which has as yet been collated. Allowing for omissions and insertions, the text in all these MSS. is identical; they have all been used in constructing a critical text in the order of that of the Yellow Book of Lecan. The Triads appear to be divided into certain groups according to their contents. The first 61 are topographical (*e. g.*, the three dark places of Ireland: the cave of Knowth, the cave of Slaney, the cave of Ferns, or the three rent-paying places of Ireland, Clonard, Glendalough, Louth); 149 to 172 relate to legal matters (*e. g.*, three deposits which need not be returned: the deposits of an imbecile, a high dignitary, and a fixed deposit); of the remainder the majority are general observations on men and manners (*e. g.*, three unfortunate things for the son of a peasant: marrying into the family of a franklin, attaching himself to the retinue of a king, consorting with thieves; three nurses of theft: a wood, a cloak, a night; three false sisters: perhaps, may be, I dare say). A few only have a local application (*e. g.*, three things that constitute a blacksmith: Nethin's spit, the cooking hearth of the Morrigan, the Dagda's anvil). The language may, on philological and other grounds, be described as Late Old Irish (*e. g.*, the allusion to the Viking in § 232). The editor judges that the present collection must have been made some time during the second half of the 9th century. It would be a mistake to suppose that it represents more than a small part of the numerous triads scattered throughout Early Irish literature. If they were all put together they would make a small volume, especially if they included those still current among the natives of Ireland, Gaelic and English-speaking. The popularity of the Triad as a form of literary composition among the Irish is ascribed by some to the influence of the doctrine of the Trinity on the Celtic imagination. Inasmuch, however, as Irish literature boasts not only triads but duads, tetrads, pentads, heptads, etc., Professor Meyer is inclined to prefer another explanation, and to find the model for all these enumerative sayings in those of similar character to be found in several books of the Old Testament.

THE LIFE OF LORD RANDOLPH CHURCHILL.

Lord Randolph Churchill. By Winston Spencer Churchill, M. P. In two volumes. The Macmillan Company. 1906.

For a son to write the life of his father is only a shade less difficult than for a wife to write the life of her husband. In the case of Lord Randolph Churchill, the delicacy of the task is increased by the fact that most of his contemporaries and many of his seniors are still living, and that he was eminently a fighter, a man who excited strong antagonisms, and was constantly embroiled with politicians on his own side just as much as with his opponents. These difficulties have been overcome, if not always with perfect success, yet to a far greater extent than would have been expected, in the biography which lies before us. Mr. Winston Churchill has, of course, as he was bound to do, presented his father's character and career in the most favorable light, but he does not conceal the facts, or try to give them a false color. He does not take occasion for attacks on or sneers at his father's rivals or opponents. He lets the events carry their own moral with them, while no doubt dwelling more than a perfectly impartial biographer might do upon the circumstances which justified, or excused, Lord Randolph's frequently erratic conduct, and saying less than such a biographer might say about the faults to which this erratic conduct was due. No one will blame him for this; nor does the truth of history sensibly suffer, since every one discounts a biography by a near relative just as one discounts a funeral oration. The impression given is, however, not quite the impression which history will record.

As a literary performance, the book deserves the highest praise. It is lively, vivacious, interesting from beginning to end. Readers familiar with the British Parliamentary system will, of course, understand it better and therefore enjoy it more than can those who have not lived in England or studied the singular constitutional machinery and not less singular party machinery of that peculiar country. But those, also, who do not possess that special knowledge will find the portrait of this bold, dashing, energetic personality full of fascination, and will understand the kind of hold which it took upon the rank and file of the Tory party during the ten years from 1883 to 1893.

Randolph Spencer Churchill was the second son of the Duke of Marlborough, an eminently respectable peer of moderate talents and conventional opinions, who held posts in two Conservative Administrations and in one of them was Lord Lieutenant of Ireland. Born in 1849 (his mother being a daughter of the third Marquis of Londonderry), educated at Eton and Oxford, he was a little too wayward and fond of amusement to distinguish himself in examinations, though he made on those who knew him the impression he had made on his own family, of possessing remarkable powers of mind. He entered the House of Commons in 1874 as member for Woodstock, a sort of "pocket borough" (standing at the gates of Blenheim Park, the Duke of Marlborough's residence), which disappeared under the Redistribution of Seats Act in 1885, after which date he transferred his services to the newly created electoral district of South Paddington, a part of London. From 1874 till 1880, his own party being in power, he took politics and Parliament pretty easily, showing his independence and his powers of speech only on some three or four occasions. When the Liberals came into office under Mr. Gladstone in 1880, his chance came. Opposition gave him opportunities, just the sort of opportunities which a bold and reckless spirit knows how to use. He sprang immediately to the front. With three other members, one of whom subsequently attained eminence and became Prime Minister (Mr. Arthur Balfour), he began a series of skirmishing operations which quickly rallied the Tory party from the depression into which the unexpected defeat at the election of 1880 had plunged it. Constantly harassing the Ministry, obstructing their measures, allying himself to any or every discontented section of the House in turn (including the Irish, of whom he was afterwards to be the formidable opponent), he inflicted so much annoyance on the majority as speedily to become the favorite champion of the more ardent, or violent, spirits in his own party.

His own nominal leader was Sir Stafford H. Northcote, an able, accomplished, and experienced man, prudent and wary, but without that love of combat which is so valuable an ingredient in the chief of a party, or an army, or a tribe, or any militant organization. Northcote's quiet and cautious strategy disgusted the militant men. Young Churchill gave them sport, and they liked him for it, and he grew to be more and more a hero among the fighting elements in the party, outside as well as inside Parliament. Mr. Gladstone was the usual object of his attacks, and Mr. Gladstone, who in the exuberance of his strength could never resist the temptation to demolish an antagonist, brought Randolph Churchill more and more into notice by his elaborate replies to the latter's charges. At first, people hardly took seriously the "Fourth Party," as it was called, the party which consisted of these four members, two of them quite young. Randolph Churchill in particular was only a "free lance," who did not (so people thought) much signify. But presently it was seen that he had both a body of doctrine and a settled plan of operations. The doctrine was an appeal to the working class to expect from the Tory party and not from the Liberals, who had theretofore been deemed the advocates of democratic progress and social reform, the legislation they desired. The plan of operations was to popularize the party machine of the Tories and to capture it for his own purposes. The doctrine was really a development, under new conditions, of Disraeli's ideas, first delivered as far back as shortly before A. D. 1840, according to which Toryism was, by supporting and exalting the Crown, and also by appealing to the peasantry, to overcome Whiggism, the party of oligarchy and the commercial middle classes. The plan of operations was borrowed from the organization of the so-called "Birmingham Caucus," which had been built up by Mr. Chamberlain and Mr. Schnadhorst on lines suggested by the organization of political parties in the United States.

Lord Randolph pressed this double scheme with immense vigor. He virtually succeeded in capturing the Tory party machine, and he became the apostle of what was called "Tory Democracy." Both as regards his doctrine and his *modus operandi* he was vehemently opposed by the ordinary Tory politicians, and especially by the Tory aristocracy, who dreaded this new democratic programme and did not wish to surrender the control they had hitherto exercised over the selection of candidates for Parliament and the framing of party programmes. However, he succeeded. He concluded an alliance with Lord Salisbury, although aristocratic doctrines and a hatred of popular methods were typically embodied in that statesman. He procured the deposition of Sir Stafford Northcote from the leadership of the Tories in the House of Commons. He became the most prominent and influential House of Commons member of the Tory Cabinet of 1885. He secured for himself the leadership of his party in the House of Commons when the Tory Cabinet of 1886 was formed after the defeat of Mr. Gladstone's first Home Rule bill, a defeat to which his passionate speeches in the country and tactical skill in the House of Commons had largely contributed. Within six years he had risen to be by far the strongest force in the then dominant Tory party, except the Prime Minister (Lord Salisbury), and his influence with the rank and file of the party was probably greater than that of the Prime Minister himself.

A rise so swift and striking had seldom been seen in English public life. Then came the fall, a fall even more sudden and startling. Being Chancellor of the Exchequer, he desired to produce a brilliant budget, and to effect economies in the public service by reducing the charges for military and naval expenditure. The War Minister refused to reduce his estimates. The matter was discussed several times in the Cabinet, and Lord Randolph thought that he would not get his own way except by playing his last card. He seems to have believed himself indispensable, nor was he alone in that belief. He resigned office. Lord Salisbury accepted his resignation. Many people thought the Ministry would collapse. It did not collapse, but went on very much as before, quietly adopting, after a few months, some of the very economies which Churchill had fought for in vain. This happened in December, 1886. He never entered office again. During the five and a half years which followed (till the Tory Ministry fell at the general election of 1892), he generally supported the Administration he had quitted, though now and then showing his teeth and denouncing some of their acts in speeches not inferior to the best he had ever delivered before. Most people had expected him to try to overturn the Cabinet, but he never seriously tried to do so, perhaps feeling that he could not, for the failure of his resignation *coup* had shown him that his power was less than he had fancied.

The story of the steps by which he climbed and the mistake by which he fell is told with great dramatic skill in these volumes, and though the episode is only an episode, and may not have permanently affected the march of events, it is an episode of extreme dramatic interest. His chance of regaining power would have come in 1895, when the short-lived Liberal Administration of 1892 perished, and Lord Salisbury formed another Cabinet. From that Cabinet it would have been impossible to exclude him. But he had already passed away from the strife. His constitution had never been strong, and he had subjected it to terrible strains. In 1894 he succumbed to a malady of the nervous system, which had shown itself more than a year before.

In the narrative which the book gives us there are some omissions, some questions suggested to which the answer is not, and perhaps cannot, at present, be given. The materials may not be as yet fully available, because in the custody of persons unwilling to show them, or the biographer may have felt himself precluded from using some parts of what he possessed. Moreover, Lord Randolph was often impulsive, sometimes wayward, and, as his conduct was usually unpredictable, it remains in some cases unexplainable. The same boldness, verging on recklessness, which had so often brought success, brought failure when given rein once too often. Never had any statesman more conspicuously the defects of his qualities.

On those beside whom or against whom he strove, some interesting flashes of light are thrown. Lord Salisbury is, of all the leading English statesmen of the last seventy years, the one who has remained least known to people in other countries; and, apparently, he was rather inscrutable even in his own. There are some letters from him in these volumes which show great shrewdness and caution, but less epigrammatic vigor of phrase than his speeches would have led one to expect. His real feelings towards Lord Randolph are never indicated, but they cannot have been

friendly. The latter had heen accepted as a necessary ally, and was got rid of so soon as he had, with surprising imprudence, given the older man the chance for which he was waiting. Some of the references to Mr. Gladstone, though slight, have also their interest. Lord Hartington comes sometimes into the story, and always with credit. Those who ln this city remember Mr. Louis Jennings, who, as editor of the New York *Times*, hore an active part in the anti-Tammany campaign of 1871, will find here an account of the last phases—melancholy phases they were—of his checkered career.

Lord Randolph Churchill was not an original thinker in the sense of excogitating creative ideas. Neither was he an orator, in that sense of the term which makes it denote a man who can rousc the emotions and touch the imagiration. But he was a born Parliamentarian, with an extraordinarily quick eye for a situation, extraordinary resource and holdness in dealing with it. He was a speaker good enough to be not only forcihle and rousing on a platform, hut also cogent and formidable in dehate. But he was also much more than a mere speakcr. Though he brought no general administrative experience to the first office he held, that of Secretary for India, and no financial experience to that of Chancellor of the Exchequer, he seems to have impressed the old officials of both departments as one of the ablest chiefs they had ever known. Had his official career, which extended to only twelve months in all, covered as many years, he would douhtless have made a permanent mark on British legislation. Only a very few Parliamentary reputations survive the generation that saw them in their hloom, and Lord Randolph Churchill's will not be one of those, because it is not associated with any event or measure of first-rate importance, and did not touch the deepest underlying principles of politics. But he played a part striking enough to engage the attention of the historian; and if his career had been prolonged for ten or twenty years, it might have heen one of the most remarkable in the Victorian age in its permanent effects as well as in its transient brilliance.

In Quest of Light. By Goldwin Smith. Macmillan. 1906.

It is all hut a century and a half since Rousseau, speaking through his Savoyard Vicar, argued—

"If I were to have no other proof of the soul's immateriality than the triumph of the wicked and the oppression of the good in this world, that alone would prevent my doubting it. So manifest a contradiction, so shocking a discord in the universal harmony, would make me seek to explain it. I should say to myself: All does not end for us with this life; at death everything returns into order."

This reasoning, which did not save 'Émile' from being hurnt in Catholic Paris and Calvinistic Geneva, cannot be said to have gained strength in the meantime. Darwin has intervened, and the remorseless processes of evolution seem to leave no room for moral inferences hased upon the successive stages of man's unending struggle upwards from the heast. Mr. Goldwin Smith accepts evolution, but he still falls back on the refuge of Jean Jacques:

"Apart from our individual destiny," he says, "is it not sad to think of all the uncompensated suffering which, on the hypothesis that existence ends here, fills the pages of human history? Does death level not only the king with the beggar, but the hest of men and the greatest henefactor of his kind with the worst of tyrants or assassins? If it does, can we helieve in the moral government of the world? If we cannot believe in the moral government of the world, where is the sanction of morality?"

The Darwinian (who points to the equally uncompensated sufferings and misfortunes and arhitrary fates of our brute brethren) finds the required sanction in the code-building of the race. "Take," says Mr. Smith, "any product of human industry, a manufactured article, for instance; trace it hack in thought to the multifarious agencies which in countries and ages widely apart have contrihuted to its production." Is our moral code, it may be asked, any less or otherwise "a manufactured article"? Mr. Smith himself shows us the factory at work:

"The Mosaic law, whatever may be the date of its redaction, helongs in its character to a primitive era, and for that era is a notahle advance in civilization. Recognizing primitive customs, it improves on them. . . . It, however, betrays its human origin in ordaining death for witchcraft. . . . The Decalogue is very high morality for its day, as the continuance of its authority has proved, though its allusion to the Creator shows that it was not inspired by the Maker of the world."

Will the clack of the factory ever cease till a future life (if at all required) shall he humanly viewed as a recompense not alone for the good, oppressed here or cut off untimely, hut for the triumphant wicked, the tyrant, and assassin, equally impotent links in the chain of heredity, and above all entitled to challenge their Creator with

"Man's forgiveness give—and take"?

Mr. Smith fears, and thinks he sees signs of, an impending "moral" interregnum" consequent upon "the collapse of the traditional heliefs on which morality has hitherto largely rested." But no true evolutionist can share his alarm. With all the spread of the Darwinian doctrine saints are still carried in procession to stay the ravages of Vesuvius in eruption, and prayers may any day be put up in our churches for the hreaking of a drought or the cessation of floods. Twenty-five years after the appearance of the 'Origin of Species,' we heard an eminent divine on an ocean steamer solicit contrihutions to the Liverpool seamen's fund in gratitude to God for a safe voyage, and the next night conduct a meeting of thanksgiving that He had spared us the worst consequences of having meanwhile struck on the coast of Ireland. Rousseau himself might quiet Mr. Smith's apprehensions. Foreseeing that he would he taxed with tending to produce a moral slump or "interregnum" hy his "Profession of Faith," he affirmed it to he constructive rather than destructive, adding: "Besides, the people will always have a positive religion founded on human authority."

"Moral responsihility" plays a large part in Mr. Smith's quest of light. In the full sense of the term, he thinks it can hardly exist "without a belief in consequences of conduct heyond the present life." "Apart from individual interest there can only he social responsihility," with insufficlent control. Moral responsibility, however, would seem to have the same standing and social origin as morality itself, and to be dirigihle to the same fount; backward looking rather than forward. Mr. Smith appears to find in it *ex vi termini* an evidence for a moral ruler of the universe. Again, when he says of Ingersoll's lecture on Genesis, that "he destroyed reverence as well as superstition," he gives the impression of classing reverence with moral responsihility among the evidences. He distinctly does so ln the case of conscience.

"Conscience implies the existence of a deity, to whose tribunal it appeals as to that of a power which upholds righteousness and directs all in the end to good." "Consclence has proclaimed that it shall be well with those who do good, and lll with those who do evil, not only in this transitory life." "Does not every man, when he obeys his conscience against his passions or his interest, virtually express a bellef in somethlng heyond this world?" "Is [not] conscience the voice of the Power which rules our world?"

Mr. Smith does not attempt to define conscience, and even allows "that it may be true that conscience, like other parts of our nature, including the scientific faculties, is developed by an evolutionary process. This," he adds, "does not affect its authority." But its authority can, if it be a manufactured article, rise no higher than its source, and the familiar terms a perverted, dehased, tender, supersensitive, even a "New England" conscience denote various stages in the evolution. The individual conscience (all else is an abstraction) is the sum of the constituents of one's sense of duty, partly inherited, partly acquired, ranging from pure self-interest to the very highest philanthropy and self-sacrifice. Its function is moral judgment in this life, not pronouncement as to the future. Mankind has never fixed its connotation, and in these pages it is weighted with an assumption that will he freely contested. Many of the most admirahle consciences of the day are unattended and unsupported hy any belief in a future life or in the existence of a moral governor or cven maker of the universe. Mr. Darwin himself is a case in point; and he ended hy saying: "But man can do his duty."

The "brotherhood of man" is another proof on which Mr. Smith rests heavily. To warrant helief in it, he holds "there must surely be some paternal and consecrating power." "Even in our respect for the sanctity of human life is there not a certain religious element? Could it exist in full force without the idea of a hrotherhood of man, which seems to imply, if not a distinct belief in the fatherhood of God, something heyond mere identity of species?" It was asked of old, "How much better is a man than a sheep?" And the consciousness of human superiority to all dumh hrutes has certainly determined the race in its treatment of what might, Darwinianly speaking, be called lts forebears. The emergence from cannibalism has been succeeded, no douht, by a fellow-feeling transcending the sense of "mere identity of species"; hut we see on every hand proofs that this feeling can he fully satisfied hy humane and disinterested en-

deavor for our contemporaries and for posterity.

There remains the expectation of a redress of the present constitution of the world—which Mr. Smith, like old Omar, would engage to improve upon—in another coveted and therefore assumed existence. Rousseau could give no assurances on this head, and our seeker after light can as little. Spiritualism, which Mr. Smith rejects as sheer imposture (presumably he would not, with a witty Frenchwoman, have one believe in ghosts rather than not in a future life)—spiritualism has never depicted conditions beyond the grave that would appeal even to a suicide. Mr. Smith, by the way, is no stickler for immortality: the idea passes his comprehension. In this he is again at one with the Savoyard Vicar: "Je crois que l'âme survit au corps assez pour le maintien de l'ordre; qui sait si c'est assez pour durer toujours?" Who indeed? But are we not as sure of the *duration* as of the *order*?

Mr. Smith's undogmatic little volume is a contribution to the literature of the "Will to Believe." It is in short chapters, mostly letters to the New York *Sun*, during the decade from January, 1896, to February, 1906. Necessarily there is much restatement of the leading ideas we have touched upon, for the letters are gently polemical. Sometimes they consist of comment also on new books.

Somerset House, Past and Present. By Raymond Needham and Alexander Webster. E. P. Dutton & Co. Pp. 344.

The present Somerset House, one of the finest public buildings of London, has also claims on us as being, in a sense, a relic of Old London. It occupies the site of one of the old palaces, places, or houses of nobles or great ecclesiastics which, in the sixteenth century, stretched along the south side of the Strand, their gardens going down to the Thames. Somerset House owes its name to the Protector Somerset, who fixed on a site whereon to build him a palace suited to his great position in the state. This was perhaps not his first choice. Our authors tell us that certain writers who have charged Somerset with the design to build on the site of Westminster Abbey, "have strained credulity to the utmost in their desire to defame the Protector." Dr. Heylin, however, in his 'Ecclesia Restaurata,' makes the definite statement that the Protector was bought off from the design to destroy the Abbey only by the grant to his nominees of long leases of about thirty manors, including the manor of Islip. Heylin declares that the transaction so weighed upon the mind of Benson, the Dean, that he died soon after. Heylin, it is true, wrote about a hundred years after Somerset, but, as sub-dean of the Abbey, he would have access to documents to which it is but reasonable to suppose that he could appeal in support of his statements. It is not enough to allege improbabilities against these definite statements made by so weighty a writer as Heylin.

Having fixed upon the Strand site, Somerset proceeded to "convey" it to himself. He cleared it of a parish church, three episcopal residences, an Inn of Chancery, and several tenements. Next came the question of finding building materials. Foiled in his attempts to pull down St. Margaret's, Westminster, he blew up the beautiful steeple of St. John, Clerkenwell, and destroyed a cloister and some chapels belonging to St. Paul's Cathedral. Pegge, on whom our authors rely for a vindication of Somerset's proceedings, makes this artless defence:

"Richard Sampson, Bishop of Lichfield, had relapsed into popery and avowed it in the second year of King Edward. Under such a disadvantageous claim to the royal favor, this Bishop would more placidly relinquish gratuitously a part of his possessions to the Duke of Somerset, a zealous Protestant, than hazard impending deprivation by an obstinate refusal."

Here is the defence offered for the appropriation of building materials: "Pulling down one edifice of stone towards the erection of another was the obvious and most expeditious way of obtaining materials." Nor is our authors' defence more tenable when they say that Somerset's faults were largely the faults of his time: "They tell us he was rapacious; but if we reflect that when the Church disgorged her accumulated wealth, one and all of the more power laymen scrambled to become rich upon the spoils, the fault in Somerset is not unpardonable." But brigandage is none the less brigandage because it is widely practised, and the simple fact is that Somerset was one of the worst of the plunderers of the Reformation.

The Protector was in residence at "Somerset Place" in 1547, but the Episcopal houses were not pulled down till 1549. The new palace could not have been carried far towards completion when Somerset fell. "The Duke of Somerset had his head cut off on Tower Hill"—so, under the date January 22, 1552, runs the cold-blooded entry in Edward the Sixth's journal, recording the violent death of his uncle. Somerset House now became a royal residence; here Queen Elizabeth sometimes stayed, and, after her, Anne of Denmark, the Queen of James I. From this royal lady the House was long known also as Denmark House. Inigo Jones was at work upon the palace under Anne, but his chief employment here seems to have been in the following reign. He built a splendid chapel for Henrietta Maria, to whom the palace, described as the finest in all England, was specially assigned. From this time till the Revolution of 1688, with the interval of the Commonwealth, Somerset House, the residence of a Catholic Queen, and its chapel were as a plague spot to Puritanism. Under the Commonwealth "a feminine tub-preacher clapped the Bible and thumped the pulpit cushions" in this chapel. In Somerset House, Cromwell lay in state after his death in Whitehall. At the Restoration, Henrietta Maria once more took up her residence here till she quitted England for France in 1665. It was in 1678 that the politicians working behind Titus Oates selected Somerset House as the supposed scene of the supposed murder of Sir Edmund Berry Godfrey. Here, too, on the authority of the Doctor of Salamanca, Queen Catherine plotted to poison Charles. Catherine was desired by William III. to leave Somerset House, but she spiritedly refused to give up a house secured to her by treaty; she left England in 1692. During the reign of Anne, residence in Somerset House, as to-day in Hampton Court, was assigned to widows and others having court interest. In 1775 a house was settled upon Queen Charlotte in lieu of Somerset House, on the condition that the latter should be devoted to public uses. The old palace was pulled down, and the present building erected by Sir William Chambers. A portion of the building was ready for occupation in 1780. Chambers's design was completed later by the erection of King's College on the east side, and of the new wing on the west.

The new Somerset House has its memories as full of interest as the old. Quarters in the new building were assigned to the Royal Academy, which held here its first exhibition in 1780. The Royal Society and the Society of Antiquaries were also located here. In Somerset House, Reynolds, in the presence of Edmund Burke and of a crowd of notabilities, delivered the last of his Discourses. Here, prior to his funeral in St. Paul's, his body lay in state. The exhibitions at Somerset House have included pictures by the greatest of the English masters. In the rooms of the Royal Society, Sir William Herschel announced the discovery of Uranus, or, as he desired to call it, Georgium Sidus, in recognition of the King's favor to the Royal Society. In Somerset House were also established many Government offices, among others the Navy Office. In his 'Handbook of London' Peter Cunningham repeats a story told him by an old clerk in the Audit Office:

"When I first came to this building, I was in the habit of seeing for many mornings a thin, spare naval officer, with only one arm, enter the vestibule at a smart step, and make direct for the Admiralty over the rough paving-stones of the quadrangle, instead of taking what others generally took and continue to take, the smooth pavement at the sides. His thin, frail figure shook at every step, and I often wondered why he chose so rough a footway; but I ceased to wonder when I heard that the thin, frail officer was no other than Lord Nelson."

The learned societies have long since migrated, and the vast building is now merely a collection of Government offices. Before the construction of the Embankment, Somerset House rose directly from the river. The Terrace, with its superb view of the City to the east, was a retired spot favorable to contemplation and perhaps to courtship. Here, "on fine afternoons in May," Herbert Spencer and George Eliot "paced backwards and forwards, for an hour or so, discussing many things." "There were reports," says Spencer, "that I was in love with her, and that we were about to be married. But neither of these reports was true."

The greatest credit must be given to our authors for the diligence shown in collecting so large a mass of material pertaining to Somerset House. Some of it, relating less to the building than to political history, might perhaps have been omitted with advantage to the book. Indeed, our authors' vehement Protestantism is somewhat too much in evidence. Reference has been made to their treatment of Somerset's misdeeds, none the less misdeeds because they were perpetrated by a pillar of Protestantism. Again, twice over (p. 49 and p. 121), we are told the very doubtful story of the penance alleged to have been imposed by her confessor on Henrietta Maria—a journey, perhaps bare-

foot, to Tyburn, her confessor riding in a coach by her side to the fatal spot, where prayers were made for the souls of Catholics who had died there. There is not a word about Bassompierre's denial of the charge: "Je sçay assurément, messieurs, que vous ne croyez pas ce que vous publiez aux autres pour leur faire croire . . . l'on a trouvé ou forgé cecy hors de toute apparence et vérification." Bassompierre could hardly have told the King's Commissioners that they knew quite well that they did not believe the story if there had been any truth in it.

The book is copiously illustrated. It ought to be a rule to indicate the originals of illustrations. This is not always done in the present case. Three or four illustrations and the matter of two appendices are borrowed without acknowledgment from Pegge's 'Curialia.'

Species and Varieties, Their Origin by Mutation. By Hugo DeVries, Professor of Botany in the University of Amsterdam. Second Edition. Chicago: The Open Court Publishing Co. 1906.

Biological science had scarcely settled down to a general acceptance of the fact of evolution before it was divided into hostile camps on the question of method, and it is sometimes reproached with being further removed from unanimity on the general problems of evolution to-day than during the lifetime of Darwin. The fact must be admitted, but not as a reproach; for this diversity of interpretation is merely an index of the varied character of the data and methods of the current researches in evolutionary theory.

The cornerstone of Darwinian evolution is, of course, natural variability; and the great demand of Darwin's time for a "consistent theory of variation" has not yet been satisfactorily met by field observations, statistical studies or microscopical investigations upon the structure of the germinal protoplasm. That the subject must be attacked experimentally is now generally recognized. Long before the Carnegie Institution established its permanent station for the study of experimental evolution on Long Island, private enterprise had carried on various lines of breeding experiments with these problems in mind. One of the most important of these series of experiments, both in the length of time which they cover and in the exactness of their scientific method, is the work of Hugo DeVries at Amsterdam. DeVries has won general admiration for the precision of his experiments and the insight shown in their interpretation. Thanks partly to his two recent visits to this country, not only his work, but his charming personality as well, is widely known in America; and now his face may become familiar from the new portrait frontispiece to the volume under review. These lectures on the origin of species by mutation were originally delivered at the University of California during the summer of 1904, and were published the winter following. After the lapse of scarcely more than a year a second edition is called for.

There has been some misunderstanding regarding the relation of DeVries's conception of mutation to natural selection and other recognized evolutionary factors, so that it is well to quote a few words bearing on this point from the preface:

"My work claims to be in full accord with the principles laid down by Darwin, and to give a thorough and sharp analysis of some of the ideas of variability, inheritance, selection, and mutation which were necessarily vague at his time. It is only just to state that Darwin established so broad a basis for scientific research upon these subjects that, after half a century, many problems of major interest remain to be taken up. The work now demanding our attention is manifestly that of the experimental observation and control of the origin of species. The principal object of these lectures is to secure a more general appreciation of this kind of work."

The most important result of DeVries's experiments is the analysis of variations into two groups. The first are ordinary bodily variations, generally small in amount, and not appearing in the germ cells. These are termed *fluctuations,* and can play a relatively small part in the evolution of species because they are but slightly, if at all, hereditary. The second group comprises more pronounced deviations from the specific type, which affect the germ-plasm and therefore are transmitted undiminished to successive generations of offspring. These are termed *mutations.* Since they generally appear abruptly and fully formed as "sports," it follows that the evolutionary process is in general discontinuous; species being produced in a fully differentiated form, and not gradually by very small variations (fluctuations), as Darwin assumed to be the rule. Not all species in a state of nature are producing mutations; some are apparently in stable equilibrium, but others, such as the now classic evening primroses, are actively mutating in a great variety of different directions. Natural selection acts upon the potential species thus produced, and only those whose new features are advantageous survive.

DeVries here and in his larger work, 'Die Mutationstheorie,' conclusively demonstrates that in the plant species under investigation new varieties and species are actually produced abruptly by mutation, and he assumes that this is the general method of organic evolution. This latter point, however, is not lightly to be taken for granted. It by no means follows, for example, that species formation takes place in the same way in the higher animals, and from a very careful analysis of the geographical range and other characteristics of certain wild North American mammals Dr. C. Hart Merriman has expressed the conclusion (in the Vice-Presidential Address before the American Association for the Advancement of Science at New Orleans last January) that mutation is not an important factor in these cases. On the other hand, it is very probable that in the mental evolution of the higher animals mutation is a factor of great importance. Automatic actions, originally conscious, but stereotyped by long repetition in the individual, are not likely to be capable of transmission to a second generation; but, as is well known, there is a large class of instinctive actions which are innate and do not require practice for their performance. The physical organization for these actions is transmissible, and this organization is undoubtedly subject to mutation. If it be granted that new instincts may arise abruptly in this way in a state of efficiency without the necessity of the assumption of a gradual perfecting process through infinitesimal gradations, many questions of comparative psychology become greatly simplified. Psychologists of the genetic school will rank the doctrine of mutation along with organic selection (of Baldwin, Morgan, and Osborn) as one of the most important of the recent biological contributions to the problems of the origin and development of mind both in the lower animals and in human society.

Great Japan: A Study in National Efficiency. By Albert Stead. John Lane Co. 1905.

Is this book a prod to British inefficiency, or a genuine investigation into the reality of Japanese progress? The burden of Lord Rosebery's "forward" is that party politics in Britain spell inefficiency. "Inevitable as the fog," they keep out of employment a great mass of precious ability. "Party means the rule of the . . . few fit, the accidentally not fit, and the glaringly unfit." As for Mr. Stead's scrap-book itself—for scrapbook it is—it is rich in long excerpts that seem, on their face, to have been furnished at the Japanese Legation in London, or duly culled from the works of Japanese, who are past masters in the art of putting the best foot forward, and is a treasure-house of information. There is a generous table of contents, and an excellent index to nearly half a thousand pages of text. Twenty chapters treat of the nation's head, patriotism, Bushido, ancestor-worship, true religious freedom, the simple life, education the foundation of the nation, socialism, humane war, the position of woman, Japan as the pioneer of internationalism, etc., etc. The burden of the text is "Great Japan," the language almost unbroken panegyric. Two-thirds of the pages are filled with official utterances and arguments of Japanese writers, skilful not only in the use of words, but of our own delusive phrases. The thesis advanced is, that the Japanese are the happiest, healthiest, most efficient, and broadest-minded people in the world. We are led, by implication all along and by frequent direct statement, to believe that for "twenty-five hundred years" this has been so, that ancestor-worship is the cause of Japan's amazing efficiency in war and peace, that "these influences" of "self-sufficiency and pureness of blood" (p. 2) "are as strong as ever they were, and have not been affected by the adoption of Western ideas," etc.

No critical scholar, however, as we have often had occasion to point out, believes that the Japanese are an old nation. They have nothing worth the name of history of events and persons (though they have data for a study of institutions) before the fifth century. There was no such thing as genuine ancestor-worship in prehistoric Japan; nor any, except as North American Indians or the early autochthonous nations had it. Formulated, real ancestor worship was borrowed from China. The 'Kojiki' does not reveal family life in any but a very rudimentary state of evolution. Mr. Stead says the Emperor is "believed to be descended

from the Sun." So was Tecumseh. Repeatedly we have the mythical statement of "the gift of the Constitution by the Emperor," with not a word said of the twenty-one years' fierce struggle of parties from 1868 to 1889, the bloody insurrections, or the loss of eminent statesmen by assassination. In fact, Mr. Stead has been attacked by that peculiar malady of Japanitis which sets all the charming and delightful facts in the foreground, and suppresses the disagreeable but vital realities underneath.

To talk, as Mr. Stead does continually, about this "pure-blooded people, with no admixture of race, certainly not similar to that resulting from the invasions of the Anglo-Saxons or the Normans into Great Britain," is nonsense. The Ainu, the straight-eyed people with un-Mongolian full beards, speaking an Aryan language, once lived and roamed over the whole of the main island, and the story of their subduing and assimilation is known; while the names of mountain and rivers are still Ainu. The Malays and Negritos filled the southern islands. The Yamato race from Tartary—their traditions reflecting the river-valley life in Mantchuria and their decision in council of "gods" or chiefs to emigrate—the three distinct cycles of tradition in the 'Kojiki' telling of many migrations, form but another close parallel to the peopling of Great Britain, and prove the Japanese a highly mixed people, who had no real nationality until near the tenth century, and then only after four hundred years of known military activity and conquest. In fact, there could have been no nation, such as we see to-day, except for outward alien pressure and inward alien teachings. The Japanese of forty years ago had hardly a practical conception of "Japan." It was Kaga, Satsuma, Aidzu—the clan—not Japan. "Bushido" is, as conceived by foreigners, largely a modern idealization, in sunset clouds of memory, of military customs followed by the Samurai, who constituted but one-tenth of Japan. To say that, in 1871, Bushido was "at hand," is to leave out the teaching for ten years previous of the great teachers from America, who from 1859 drilled their pupils in American notions and in Arndt's poem, "Where is the German Fatherland?" The work of "adapting Bushido to the needs of Japan" means actually incorporating into the minds of tender youth, during a generation or more of public schools, both the ideas and the ideals born in Europe and America, at first by foreign teachers and then by natives. "The social evil is far less than it was" (p. 40). Of course it is, since Christian sentiment in the Diet secured a law which the Salvation Army, in spite of the brutal violence of opposing Japanese, murderous and church-burning Tokio toughs, got enforced, freeing over 12,000 women enslaved in vice against their will.

The chapter on "True Religious Freedom" is almost wholly a mosaic of quotations, chiefly from living Government officials of the constitutional era (and from one called "a Japanese writer," who is an American), and tells just how liberal the provisions of the Constitution of 1889 are. Yet we are left in ignorance of the crucial question, Does Japan grant "true religious freedom" to the native scholar who inquires into the origins of Mikadoism, or who shows how primitive Shinto was deliberately and officially turned into a political engine? How heavily must one discount Japan's boasted intellectual freedom when he recalls the deposition of a professor for dissecting official orthodoxy concerning Shinto tradition, and sees, even in October, 1905, a university professor put out of his chair because of his criticisms of the Portsmouth treaty—that is, of the theocratic ruler and of his divine ancestors. Of course, the Japanese Government, in alliance with Great Britain, freely permits Christianity, but that is not the point. How can there be genuine freedom when (p. 10) concerning the representative of Heaven and of the gods, the "imperial ancestors," the Tenno (Heaven King), one must keep silence or be persecuted? Hear how Marquis Ito, "the framer of the Constitution" and the commentator thereon, lays down the law: "The Emperor is Heaven-descended, divine, and sacred. . . . He shall not be made a topic of derogatory comment nor one of discussion."

Viewed as a manual of plausible and often valuable information, the book is a welcome addition to the library on Japan; but to take Mr. Stead's statements on their face value is to accept a fabric of delusion.

Gregory the Great: His Place in History and Thought. By F. Homes Dudden, B.D., Fellow of Lincoln College, Oxford. 2 vols. Longmans, Green & Co. 1905.

Mr. Dudden's 'Gregory the Great' is the first noteworthy attempt to place before English readers a comprehensive account of the life and work of the great pope whose name is so closely associated with the beginnings of Anglo-Saxon Christianity. It is an ambitious undertaking for so new a member of the guild of historians, for Gregory's career, more than that of almost any other pope, led him into an immense variety of relations, involving, for their due understanding, the widest knowledge of the times. As civil administrator of the City of Rome under the Empire, as monk and founder of monasteries, as resident ambassador of the Papacy at Constantinople, as Pope extending his influence throughout and beyond the Romanized world, finally as preacher and theologian, Gregory developed an activity such as few public men in any age have ever displayed. To grasp all these aspects of his personality and his work would be the problem of a lifetime as long as his own, and the present book is apparently the firstling of its author's historical and theological studies.

With this limitation in mind, we may say at once that Mr. Dudden has made a valuable contribution to historical literature. He divides his work into three books, treating respectively of Gregory's life before he became Pope, of his pontificate, and of his theology. Of Gregory's apparently complex personality Mr. Dudden has, we think, a view quite in accord with the facts, equally removed from extravagant laudation and petty criticism. He sees in him the earliest illustration of that strange compound of hard sense with intellectual distrust of the senses, to which we give the convenient label of "the mediæval man." He has his doubts whether Gregory was quite up to the standard of "sainthood," though he wisely refrains from a definition of that standard, but he fully appreciates his extraordinary executive capacity and energy. Only in a few brief summaries does he attempt any formal analysis of Gregory's character as a whole, but rather lets his narrative tell its own story of personality.

For example: no study of the mediæval man can be adequate which does not in some way explain his relation to the world of miracle. It is not enough to say, as Mr. Dudden does, that Gregory, like every one in his day, lived and moved in this fictitious world. Miracle was not only a mysterious power over everyday minds; it was an instrument in the hands of men who knew how and when to use it. There is a subtle humor, for instance, in Gregory's dealings with the subject of relics. He made no scruple of bringing home some very valuable ones from the East; but when an empress dared to express a desire for some of the precious treasures of the Roman shrines, Gregory's pen can hardly fly fast enough to tell the awful consequences of even approaching so potent charms as these. All this does not touch Mr. Dudden's sense of humor in the least, but we may be tolerably sure that whatever stood for that quality in Gregory's eminently practical make-up was all alive at such moments. When Gregory solemnly reports that, during the reconsecration of an Arian church, the crowd were suddenly aware of a pig running about among their feet and making for the door, a prodigy granted "by the Divine Mercy, that all men might clearly know that the foul inhabitant was departing from the place," Mr. Dudden, with equal solemnity, adds a note: "Those who have been in a great crowd in a Roman church, and know how the children manage to squeeze themselves through it, will be able, perhaps, to make a shrewd guess at the real cause of the phenomenon here reported."

It is surely not asking too much of a modern historical student, fresh from his school, that he should give the most ample and critical account of his sources. This, Mr. Dudden nowhere does. His statement of authorities occupies less than six pages. Chief among them are, of course, the more than eight hundred letters of Gregory himself, and their chronology is a matter of the most vital importance to their use. It is mere shiftlessness, therefore, to say, "All that needs to be said on that question has been said already by Ewald"—without giving us a word as to what that is. It is not enough to say, "Paul the Deacon, son of Warnefrid, compiled the short *Vita Gregorii Magni*"—we ought to know in a work of this magnitude the substance of all that critical scholarship has to tell about such a man as Paulus, if we are to estimate aright his treatment of Gregory. Mr. Dudden has got beyond the stage of invoking "a distinguished German *savant*," but he is still capable of quoting an "Italian" and a "German" opinion, and of grouping his authorities as "English" and "foreign." His style affects the grand manner. He cannot resist temptations to be picturesque, and is fond of imagining the places and the people that Gregory "must have" seen and heard. His stage-pictures, it must be added, are based upon wide and sound reading, but one cannot help re-

gretting the amount of space sacrificed to these literary decorations, and thus taken from what might have been given to a more complete and orderly account of sources and methods.

This criticism applies, however, hardly at all to the last book, that on Gregory's theology. Here the style becomes direct and simple, so that one feels that herein lies the author's real strength. His estimate of Gregory's contribution to theology as the systematizer and popularizer of Augustinian thought seems eminently sound. Here as elsewhere he shows us the great bishop as an organizing talent, not a speculative genius, but rather the mediator of others' thought to the needs of every-day humanity. The age of original thinkers was past and the great reconstruction of the scholastic period was not yet ready. Gregory's mission was one of adaptation rather than of controversy, and he fulfilled it in doctrine as in practice with the materials at hand. Mr. Dudden has succeeded in bringing out in clear relief the truly constructive aspects of his work, and in leaving on the reader's mind an adequate impression of one of the greatest of Christian prelates.

JUST ISSUED

A Novel by the Author of "The Divine Fire"

SUPERSEDED

By MAY SINCLAIR **12mo $1.25**

A story of two strongly contrasted teachers in a fashionable girls' school in London: an old maid arithmetic teacher whose rule-ridden soul finally awakens to the real world of men, women and love, and the "classical mistress," a beautiful and vital woman who tries to help her less fortunate colleague. Despite the pathos of the tale, there is a strong sense of the underlying humor and continuity of things throughout the book, and at the close two of the important characters are "trying not to look too happy." A book notable for its characters, view of life, and perfected literary skill. The author considers it her best work previous to "The Divine Fire."

A POLITICAL HISTORY OF THE STATE OF NEW YORK

By D. S. ALEXANDER. 2 vols. Vol. I., 1774-1832. Vol. II., 1833-1861.
$2.50 net per vol., carriage extra.

Presents a history of the movements of political parties in New York State from 1774 to 1861, and traces the interesting causes and history of the prominent factional political divisions in New York politics. Emphasis has been placed upon the methods and sources of power of such leaders as the Clintons, Hamilton, Burr, Van Buren, Seymour, and Thurlow Weed.

The author is a well-known lawyer and represents the Buffalo district in Congress.

The Nation.

NEW YORK, THURSDAY, JUNE 21, 1906.

The Week.

The usual comment on the new State formed by the union of Oklahoma and Indian Territory is that it waited too long for what it deserved. In the public mind, this rich territory of 70,000 square miles has been knocking none too insistently at the doors of Congress demanding to be taken into the "sisterhood of States." As a matter of fact, if the Fifty-eighth Congress had provided for the union of the two Territories in a single State, some awkward questions would have remained to vex the State Government. It is true that no Territory ever approached these two in the matter of population before admission, but in no Territory was it ever so small a handicap not to have Statehood. The demand to be released from the disabilities of the old status has been really urgent only since the Fifty-ninth Congress met last December. The outcome is creditable to the progressives of Oklahoma and Indian Territory, but in view of the problems that had to be considered we cannot think that the delay was due altogether to the Speaker's stubborn determination to yoke Arizona and New Mexico into the team.

Amazement has been frequently expressed by critics of the Statehood bill that the wishes of some 800,000 people of Oklahoma and nearly the same number in Indian Territory could be ignored. They forget that the increase of population has been sudden. The census of 1900 gave Oklahoma 398,000 population, and credited 392,000 people to Indian Territory. Since then both these figures have doubled. But, however rapidly the white population increased, there was no available magic by which to turn, at once and to their advantage, 80,000 Indians into so many "Statehood or bust" advocates. Add to this the fact that 31,400 square miles out of the 70.430 belonged exclusively to these 80,000 Indians, and it may be understood that patience and skill were needed to effect the combination. Though the separate-Statehood idea never spread very far in Indian Territory, there was certainly a good case to be made out for the "State of Sequoyah." It required a really admirable broad-mindedness on the part of Indian Territory to put herself, temporarily, and probably permanently, under a State government at Guthrie, to agree to a brief limitation of the ordinance of prohibition, and to shoulder a proportionate share of the responsibilities without any near prospect of getting a fair share of political rewards.

Now that Oklahoma is disposed of, what is to become of Arizona and New Mexico? Is the Foraker amendment merely a polite way of keeping out both Territories, or is it, as some of its former opponents now profess, a practical equivalent of the original Two-State bill? Nobody knows. But much of the advance speculation seems to ignore the very radical difference between what the people of Arizona want and what they will take. Nobody has so much as asserted that they wanted to be amalgamated with New Mexico. For several years past one of the chief industries of the Territory has been the dispatching of telegrams to Congress at supposedly psychological moments. Separate-Statehood resolutions have figured prominently among its exports. But why any one should place the slightest confidence in the fact that at the State Fair in Phœnix last year only three Arizonians out of many thousand voted for joint Statehood, is a mystery of statesmanship. Of course, they voted against joint Statehood because the alternative was separate Statehood, instead of, as in the coming referendum, no Statehood at all. When the solicitous parent asks, "Would you rather have me give you a nickel or a dollar?" there is never any doubt what the child will reply. But when it is a question between taking the nickel now and trusting to the chance of getting the dollar at some time in the future, it is a different matter.

Nothing but complete success could justify the President's extraordinary course in the meat-inspection controversy. We say nothing of his abandonment of the Constitutional theory of the independent spheres of Congress and the Executive; he had already left that a thousand miles behind him. But next he came out in the rôle not merely of a dictator, but of a hectorer. In an angry, scolding, and even insulting tone towards a leading committee of the House of Representatives, and, inferentially, towards the House itself, he offered a rude challenge which was instantly accepted. Chairman Wadsworth gave Mr. Roosevelt as good as he sent; convicted him of ignorance of the very bill he was denouncing; and answered his letter with an acerbity and sharp resentment with which, it is safe to say, no President was ever addressed under similar circumstances. It was not doubtful that the House would stand behind its committee and its Speaker, and read the President a lesson. Thus Mr. Roosevelt, not content with having inflamed the Senate against him, rushed into a quarrel with the House.

Chairman Wadsworth repelled with heat, for himself and his colleagues, the President's charge that they had made themselves the tools of the packers. He implied that Congressmen knew what their constituents wanted. In fact, evidence accumulates that the vast farming interests affected are anxious to have the meat-inspection business settled quickly and with as little friction as possible. Representative Williams discovered this on Friday, when, in an attempt to drum up Democratic support for the President, he found that the Texas delegation would fail him, since Texas cattle-growers are demanding the House substitute for the Beveridge amendment. All through the West, indeed, there is a new-born feeling that Trust-busting is not what it was cracked up to be. This docking the cheering spectator 10 per cent. on the price of his cattle makes the spectacle of heroically attacking the Octopus much less thrilling.

Peace has come so suddenly in the cruel meat-inspection war at Washington that many a Peterkin will be asking what the fight was all about. It should be enough that "it was a famous victory"—this time for all concerned. The President won, Speaker Cannon won, Chairman Wadsworth won, and Senator Beveridge beat them all. The obvious fact is that the bill as now agreed upon represents a compromise. Mr. Roosevelt has yielded on at least three points which, in his message and letters, he had said were essential—the payment of the cost of inspection by the packers, the dating of the labels on canned meats, and the making "the judgment of the Secretary of Agriculture" final. On the other hand, the President has succeeded in getting the court-review provision stricken out and putting back the appointment of inspectors under the civil-service rules. The whole adjustment seems fair, and might, one would think, have been reached without all the shouting. It is a capital illustration of Mr. Roosevelt's flexibility as a politician that, after his violent letters to Mr. Wadsworth, he should have sat down in sweet reasonableness and patched up a compromise. All hands seem now disposed to cut the flurry short; and with the passage of the inspection bill, and the fine certificate which the packers will soon get from the committee of veterinarians and pathologists about to investigate their establishments, we shall all be presently acclaiming American meats as the best and purest in the world.

Why the Government is making such a fuss over the freight rebates secured by the packers on their export shipments, we do not quite understand. It would have been simplo enough two years ago, because then the sale of American products to foreigners at a lower price than stay-at-home citizens paid was a reprehensible practice, which no one fell into except occasionally under necessity. But since the country has learned this winter from the speeches of several of the most eminent Republicans that "dumping" our surplus abroad is the rule, and is the best possible thing for home industries, no matter how low prices the foreigner pays, a Republican Attorney-General has not the faintest excuse for interfering with this phase of business. For, if it is a good thing to sell meat or steel rails cheap abroad, it must be a better thing to sell them cheaper still. The greater the reduction in price to the foreigner, the more praiseworthy are the agencies which bring this condition about. If the rebate cuts off another fraction from the price the Frenchman or German pays for his American goods, ought we not, therefore, to encourage the rebate? At home it is different, because we want our countrymen to pay high prices and thereby escape being made "cheap men."

Even without a new law for systematizing the consular service, it is possible for the President to institute about as near an approach to the merit system as he chooses. The sixty-one transfers sent to the Senate on Friday are, we take it, just about what would have been put into effect had the Lodge bill been passed in its original form. Out of eleven consul-generals in the batch of nominations, two are promoted from posts of the same title, but at less important cities; seven are raised from the grade of consul, one from that of vice-consul, while the eleventh man, Mr. Haywood, though not now in the service, has been a confidential clerk in the Department, and had served with distinction as Consul-General at Honolulu. The list of consuls shows similar advances from the grades of vice-consul and consular agent. The whole, which is said to be the result of several weeks' work by Secretary Root and Mr. Carr, the efficient chief of the Consular Bureau, is in every way a splendid beginning for the permanent improvement of our representation abroad. The trouble is that the maintenance of a high standard in the consular service is dependent solely on the will of the Executive. Mr. Roosevelt and Mr. Root have high ideals for this important branch of the Government's work. It is the duty of Congress to place the reform on such a basis that no future officials who may be less particular about this matter can undo the good that has been accomplished.

It is a fine game of cross purposes which the House and Senate are playing in the matter of the Panama Canal. No sooner does the Senate decide to pass a sea-level bill on Juue 21, than the House proceeds to whip through a lock-canal amendment on the Friday previous. This may seem amusing, but it is really tragic. To see a vast Government undertaking so mishandled and left in such a tangle is depressing. What course will the President elect? With the two houses of Congress deadlocked, he cannot act under the authority of either. He himself has expressed doubts of the present adequacy of the original Spooner act. It is said by some that final decision in regard to the "type" of canal may be left over till next session, and that meanwhile work can be done in the Culebra cut and elsewhere of a sort that would be necessary under any plan. Unfortunately for this contention, Chief Engineer Stevens has pronounced against it. He has declared that no more work of any consequence can be done to advantage till the engineering features are fixed. Of course, the $26,000,000 can be appropriated and spent on supplies and sanitation, if it is absolutely necessary to get rid of the money, but that will scarcely advance the real canal. It is a vexing posture of affairs for a President who had to exceed his powers and outrage a weak nation three years ago, because he could not wait another day for that canal.

In voting to purchase Panama Canal supplies in the home market, unless the President regards the prices as "extortionate or unreasonable," the House of Representatives has been lamentably inconsistent. Why, in the name of William McKinley, Nelson Dingley, and all the saints of the calendar of protection, should the Government balk at extortionate and unreasonable prices? The existing tariff laws are framed for the express purpose of allowing manufacturers to wring the last penny from the hapless consumer. The private citizen must pay outrageous bills, like them or not; the Government which has framed the tariff schedules ought equally to abide by them. The burden of decision, we note, is thrown on an omniscient President. He and he alone can tell whenever a price has exceeded the bounds of propriety. In the process of determining the exact line between reason and unreason, he must be guided by benevolent intuition. Obviously, he must leave wholly out of the reckoning the quotations of the foreign market, glutted with the products of pauper labor. The price in the home market may be equally delusive, for it may, in the words of Congress itself, be extortionate and unreasonable. Congress has refused to approve as a standard the "export prices" which our Trusts are asking of the foreigner. Nothing, then, is left for the President but the "inner light."

If Secretary Root's reply to the Panama Liberals who want the United States to guarantee fair play in the coming election is read without taking a breath, it sounds impressive. It is as sonorous and as evanescent, in real meaning, as one of Abraham Brick's eulogies. We understand well enough that Gov. Magoon is to be our "watcher" down there —"will be instructed to look over the situation"; but what, in the name of international diplomacy, are the "usages which obtain between nations" when one hears that election frauds are being perpetrated in the other's territory? Beyond going to the officials of the Panama Government and warning them that he is watching the polls, Gov. Magoon can do nothing; Mr. Root's note will have no terrors for the Panamans. It can be matched in bombastic unintelligibility by the least important among Latin-American officials. However, Dr. Arosemena and his fellow-Liberals will have the advantage of being able to say that President Roosevelt has expressed a deep interest in the election. This could not be construed as "intervention"; and if the moral sense of the electors of Panama is as keen as it should be, the knowledge that "Roosevelt wants a square deal down there" should be more effective even than Mr. Root's note and Gov. Magoon's good-natured and entirely unofficial supervision.

"Unless [our] petitions are answered in a better tone in the future," said Sampel Gompers on June 11 before the International Brotherhood of Bookbinders, "we shall change the request into a demand." We suppose the right to "demand" is a natural offshoot of the right to petition. Certainly, political parties out of power are very fond of "demanding" reforms they want, and organized labor should enjoy the same privilege. But just what is the "tone" which Mr. Gompers insists must be made "better"? About a week before, the House Committee on the Judiciary decided, by a divided vote, not to report any of the anti-injunction bills. This is a committee made up of eighteen of the ablest lawyers in Congress. All but four of them have served on the same committee in previous years, and listened not once, but more than once, to the multitudinous arguments for and against these measures. The whole ground was gone over again this year. If a majority of the committee is not yet convinced of the wisdom of the proposed legislation, there may possibly be some other

reason than over-friendliness to the capitalistic class.

"Perkins, 798; Cummins, 725," is less disquieting to the Iowa progressives than "Perkins, 822; Cummins, 820," would be. While the reform Governor is far behind his rival in the number of delegates pledged, his supporters point out that, in order to divide the vote, Perkins must get 23 more supporters. Whether it will be "23 for Perkins," in the slang sense, cannot, of course be predicted. But it should be remembered that hardly more than a week ago Cummins was farther ahead than Perkins is now. If Shaw turned Scott County's 35 delegates to the standpatter, it is not inconceivable that the Governor himself might work industriously in the eight counties that have still to hold conventions, and triumph finally. It would be a pity to lose Cummins from Iowa politics just now. The real fight should come later, when a successor to Senator Allison is chosen, and when Secretary Shaw himself might become the Governor's rival. To meet the great apostle of high prices and standpattism in hand-to-hand fighting would be to acquire merit; to fight him through Perkins, and lose, would be to submit the "Iowa idea" to undeserved indignity.

The scheme for a national school of fine arts is still pretty much in the air. Apparently, a new organization is planned. Neither the present Art Students' League, with its remarkable record, nor the Academy Schools, with their Columbia affiliation, are felt to carry the desired authority. To create an American École des Beaux-Arts would be an interesting experiment, but the utility of one new mill for the wholesale production of artists is by no means evident. The aspirant who cannot find some sort of teaching to his taste in New York, Boston, or Philadelphia, is surely hard to please. In fact, an observer of our painting and sculpture might be inclined to believe that the facilities for instruction in these subjects were not too scanty, but quite the contrary. It is easy to see how, by the founding of a national school, a very welcome dignity and emolument might be conferred upon a score of our more prominent artists. That in a brief time such a school should enjoy the authority of that of Paris is, of course, out of the question. It is not even certain that such a result is desirable. American art, like that of England, has always been rebellious against authority; it has thriven best along extra-academical lines. If this be our national genius, we had better accept it with all its limitations, than ape the bureaucratic fashions of France. But if somebody must found something, a national school of fine arts affords a fairly entertaining and presumably harmless field for experimentation.

Mr. Chamberlain's cabled prediction that the Liberal Government would not last a year, turns out to have been simply a way of cheering on his constituents at Birmingham. He was exhorting them to be "ready," to make up their minds to give him 1,000 greater majority next time, and he then, in a fine oratorical glow, declared that no man could tell when the summons to battle might come —why, possibly next spring! It is hard even for the London *Times* to take this as a sober prophecy, though it remarks on Mr. Chamberlain's skill "in electioneering questions." He seems, however, to have got into so confirmed a habit of predicting the fall of Mr. Balfour's Government that he has begun it already on Bannerman. It is a little too preposterous. The Ministry is no doubt having trouble with the Education bill, but no quarrel with the Lords or the Church of England on that subject can seriously embarrass it. At most, a recasting of the Cabinet would follow. The trouble with Chamberlain is that he had so freely denied in advance the capacity of the Liberals to form a Government which would hold together a twelvemonth, that he now appears as a prophet to support himself in the rôle of a reviler.

In view of the disposition to regard the revolution in Russia as a fact almost accomplished, Mr. Lionel James's account of an interview with Gekker, the revolutionary leader, in *Macmillan*, is interesting if only for its novelty. Gekker said that "the general strike and the revolution at Moscow have both, in a sense, been failures." Mr. James infers that the objective of the revolutionists is indefinite. Their ideal is that of anarchism rather than of republicanism. The greatest obstacle in the way of the revolutionary movement is the expense of carrying it on. This is felt especially by the Union of Unions, whose "funds are low." In South Russia, for example, this organization levies an inhabited-house tax of a third of one month's rent per householder. The Jewish Bund levies a tax based on a tenement return, and the Social and Constitutional Democracy a poll-tax of about 50 cents a head. Terrorists and anarchists often resort to blackmail for tribute. This naturally tends to make the movement unpopular. But revolutions usually pay their own way, sometimes by the self-sacrifice of their supporters, often by pillage and devastation. Nor is a definite and positive ideal altogether essential to revolutionary success, as was proved by the changing purposes and policies before and during the Reign of Terror.

Mr. Bryan's remark at St. Petersburg upon the patience of the Duma in waiting for the full assertion and recognition of its rights, but echoes the comments of the most skilled French and English newspaper correspondents on the spot. They have several times thought a violent break with the Czar imminent, yet thus far it has been averted. One restraining influence on either side is little spoken of, yet it must have much quiet influence. We mean the critical state of Russian finance, with the great commitments of Germany as well as France in Russian loans. As a consequence, there must be a steady diplomatic pressure upon the Czar not to take any rash step which would mean a default on Russian bonds held abroad. Business relations must also be availed of privately to impress the same warning upon Russians of position in the commercial and financial world. None but the maddest revolutionist, in fact, could wish to see the old régime go down in crash and conflagration, with the sure result of repudiation of Russia's debts and the dislike and distrust of her most powerful neighbors. The financial argument makes strongly for concessions by both Czar and Duma (on Friday, Russian fours sank to 72). It plainly will not bear everything, however. The division of the Duma into social classes shows that there are 200 peasants to 17 merchants and 34 landlords. That suggests the limits of the appeal on the score of public finance.

The deadlock which thus far the Czar and the Duma have contrived to avoid, seems to be approaching. By prorogation, the court can at any time force the situation, but it is unlike Nicholas II. to precipitate a conflict that may be approached by gradual stages. In fact, the break is rather more likely to come from the side of the Duma. Till now it has occupied itself in memorials which could be evaded, and in platonic condemnation of the Ministry, which could be ignored. The moment it passes any broad, constructive law, the issue of obedience between Parliament and Crown will confront the public officials. That moment can hardly be long deferred; and, since the Czar shows no signs of attenuating popular demands by anticipating their formal presentation, the present suspense undoubtedly makes for revolution. Delay is surely no way out of the present *impasse*, when each levy injects seditious material into the army, when the agrarian disorders are reappearing, and a general strike is being seriously planned. But no monarch, we believe, has ever yet taken the fable of the Sibylline leaves seriously, until his name in turn has become an accepted illustration of the classical theme.

THE EXECUTIVE AS LEGISLATOR.

It is always instructive to trace the development of extra-Constitutional practices. In the making they are often more interesting than when fully formed. The great extension which Mr. Roosevelt is giving to the functions of the President as an author of legislation calls attention afresh to the process by which the Executive, whom the Constitution plainly expected to keep his hands off law-making (except for recommending measures), has become the most potent of all in acute legislative crises.

It is, admittedly, of ancient date. Washington not only asked but worked for legislation he thought necessary. When the Senate amended one of his treaties he lost his temper and expressed his displeasure to the Senate in person. Lincoln pushed this prerogative of the President, with many others, to an extreme in the days of the civil war, when so many laws and precedents had to be silent. Grant was influential with Congress, through expressed wish and threatened veto. Cleveland made his daring utterance against the Gorman silver compromise, and smashed it; he wrote his famous "perfidy" letter in the effort to prevent the Wilson tariff bill from being protectionized in the Senate, but failed. McKinley was far less open in his methods, preferring to be confidential and cajoling; but it is probable that no President ever came nearer getting what he wanted from the lawmakers. The names cited show how impossible it now is to raise the Constitutional point against the habit, with any force. The general rule seems to be that when the President interferes to compass legislation which you ardently desire, you are entitled to proclaim his action a patriotic exercise of the powers of his great office; but when he bestirs himself to secure the enactment of laws which you regard as vicious, you have the privilege of denouncing his course as utterly repugnant to the Constitution.

President Roosevelt's innovations in this particular are mainly those of technique. He has surpassed all his predecessors in the openness and directness of his procedure. With an inborn contempt for conventions, he goes straight to his goal. Of what avail would be the White House telephone, unless Mr. Roosevelt could speak over it to the Senate as plumply as if he were on the floor? For him to hesitate to make that use of it would be to refuse to take advantage of the resources of civilization. And during the past two weeks in connection with the meat-inspection controversy, we have seen the President taking charge of legislation with a simple good faith as marked as his somewhat over-confident zeal. To the Chairman of the House Committee on Agriculture he wrote in the imperative tone of a Prime Minister giving orders to a subordinate. He summoned the Speaker. With a member of the House Committee he went over the pending bill, line by line, precisely as if he were himself chairman, licking a law into shape before reporting it. This country has never seen anything quite like that. The President never before so completely assumed the rôle of a legislator.

Mr. Roosevelt is carrying off the part with customary dash. He is, however, uncovering certain awkwardnesses in the double relation. Obviously, when the President of the United States turns his hand to legislation, he has a great advantage over ordinary Representatives or Senators. They may speak in the name of their constituencies or States; he comes forward as the chosen of the whole people. (Of course, it is only something more than half the people at the time of election, but immediately thereafter, by a pleasant fiction, the President becomes the interpreter of the sentiments of every man, woman, and child.) This necessarily carries great weight; but it also lays upon the President the duty of making no mistakes. The infallible spokesman of the infallible people must fall into no blunders. Hence the misfortune of the gross error which President Roosevelt made in his first letter to Mr. Wadsworth, and which he handsomely acknowledges in his second. After saying that "I have gone over your bill very carefully," he had to admit that he did not know what was in it. Now, this would be a sore discomfiture to a debater on the floor of the House; and when the President comes forward as practically such a debater, he cannot escape appearing discomfited also. This is certainly a disadvantage of Mr. Roosevelt's open and slashing style. If he had simply conferred and advised, without rushing too hastily into cold type, he would not have had to make his apology. And an infallible people does not like to see its infallible President forced to apologize.

But Roosevelt the debater rides off on the excuse of a sovereign that the blunder was not his, but that of his advisers. It was Beveridge that misled him. It was Reynolds whose sociological eye failed to find in the bill what the President now confesses was there all the time. Yes, but the President did not say that it was Beveridge and Reynolds who had carefully gone over the Wadsworth bill and found it "very, very bad." He inadvertently used the "I," and that makes it difficult afterwards to say "they." The people in Parliament, under a Constitutional monarchy, are entitled to demand the resignation of the "they"—the Ministers at fault—but we have no way of getting at Beveridge or Reynolds. They may continue to poison the mind of the President. This shows the vice of his frank assumption of the rôle of legislator. Therein he wears the guise of a Prime Minister, responsible to a Parliament; but he does not take the penalties with the privileges, nor resign when he fails.

Persistence in this over-loading of the Presidential office with the burdens of legislation will, we think, be bad for Presidents, since it will expose them to new acrimonies, and so lower their dignity; and for Congress, we are certain, it will be worse. Initiative and informed debate and vigilant watchfulness are rare enough already in our legislators. It would be a pity to take away the spur to the exercise of those qualities by strengthening the habit of looking to the White House for the framing as well as the suggestion of laws. If the tendency goes unchecked, there will be more point than ever to the story of the rueful Representative who said: "I was always told that when I entered Congress I should find my level, but I never dreamed what a level it was."

SECRETARY AND PRESIDENT.

"I wired Des Moines yesterday that I would not accept an invitation to speak at Davenport on the evening of June 13, as it necessitates cancelling two important previous engagements. On receipt of your invitation, I conferred with the President, and have decided to cancel the other engagements and accept yours. I will be with you on Wednesday evening.

"L. M. SHAW."

The obvious inference from this dispatch to an anti-Cummins leader is that, with the express approval of the President, Secretary Shaw was cancelling important engagements in order to take a hand in the Iowa fight. But no; the Secretary of the Treasury ingeniously explains that he was merely trying to circumvent a wicked newspaper correspondent who had asserted that Shaw and Roosevelt are not in cordial agreement. The phrase, "I conferred with the President," would prove to all the world that the Secretary and his chief were at least on speaking terms. To all appearances, however, Mr. Shaw's telegram may make the statement of the correspondent come true. President Roosevelt repudiates in his most emphatic style the idea that he has taken sides in the struggle. He "has sent no message"; he "has not interfered, is not now interfering, and will not interfere."

Into the personal aspect of this rebuff it is hardly becoming for an outsider to go. Sensitive Cabinet officers have resigned on hints not nearly so broad. But we are not the keepers of Mr. Shaw's conscience. If his personal dignity allows him to be held up to Iowa and the country as practically a maker of false pretences, we have nothing to say. A Secretary who likes that sort of thing, would like extremely the telegram from the President exposing him in the eyes of all the world. He would

meet the blow with Christian resignation.

There is, however, a public aspect of the matter which concerns us all. Questions of political as well as personal propriety are involved. The whole relation of a Secretary to a President comes in. Is it permissible that a member of the Cabinet should speak on a question of public policy in tones at variance with his chief's? We know what the wholesome precedent has been. Secretaries have not been compelled to think the same thing as Presidents. Their views of national or even of party policy may differ from his, and they may tell him so frankly. It is their duty to give him conscientious advice, even when it goes counter to his preferences. But in public, it has been understood, the Cabinet officer makes no deliverance which has not the approval and does not reflect the opinions of the President. We exclude, of course, all the minor nothings of Secretarial discourse—the happy "home-coming," with greetings to old friends among whom it would be such a pleasure to live and die; the opening of fairs; the purely ceremonial occasions on which the people are so fond of having a "direct representative of the President" in evidence to say the undisputed thing in the solemn way. No one sees impropriety or anything else that signifies in such speeches. But there is a clear difference when one of the President's official family makes a deliberate pronouncement upon an important measure closely affecting public policy, and sharply debated. In such cases, he ought to speak the mind of the President, or else keep still.

This is precisely the irregularity into which Secretary Shaw has fallen. He has made and keeps on making speeches which he ought not to deliver unless as the exponent of the Administration. Yet the head of the Administration openly repudiates him. He, however, goes on as if that made no difference. The excuse that nothing is involved but "factional differences" among Iowa Republicans is hollow. Behind the contest between Gov. Cummins and Mr. Perkins lies a national political question of the highest import. It is intransigeant Dingleyism vs. tariff revision. In going out to campaign against Gov. Cummins, Secretary Shaw becomes by necessity the eulogist of the high tariff and the antagonist of any man who would cut away an inch from one of its schedules. In that rôle he has, in fact, displayed himself. He has taken a positive and uncompromising position on this burning issue, and one that is known to diverge from the President's. In assuring Gov. Cummins's friends that he would not "interfere" to their prejudice, Mr. Roosevelt made it clear that he would do nothing to oppose the triumph of their tariff-revision doctrines. Thus he put himself radically at variance with his Secretary of the Treasury. Such a conflict is, we maintain, improper and mischievous, if not unprecedented.

The voice of the Administration should be single in all such matters. It ought not to give an uncertain sound. When a Secretary goes out to make a carefully prepared speech on matters in political debate, the people are entitled to regard it as an official utterance. So it has been in the past. When Mr. Hay spoke as Secretary of State, or Mr. Root as Secretary of War, they were rightly taken as being the mouthpieces of President McKinley. One cannot imagine Mr. Shaw's predecessor in the Treasury making slap-dash political speeches, getting rapped over the knuckles for them by the President, and then cheerfully saying it didn't count. The rules of the game cannot thus be lightly set aside. The impossibility of conceiving of Mr. Gage or Mr. Carlisle or Mr. Fairchild or Mr. Sherman or any other predecessor of Mr. Shaw's indulging in his hap-hazard methods, shows how violative of sound tradition they are.

President Roosevelt, we presume, lets it go on out of abounding good nature, and in a sort of "free-for-all" idea. He probably looks upon Secretary Shaw's Presidential candidacy with amusement, and thinks it does not matter greatly what such a man says. But it does matter thus to have a wise rule of official propriety trampled upon. We cannot afford to have the Administration made to appear either happy-go-lucky or at cross purposes. So we think that Mr. Roosevelt should end this Shaw comedy, even if by a sudden exit of the leading actor. There ought, at least, to be no occasion next winter to repeat the Gridiron joke of the last: "Secretary Shaw has induced the President to induce him to stay in the Cabinet another year."

CONGRESSIONAL GUARDIANSHIP.

Two comparatively insignificant items in the Indian Appropriation bill have served in a Senate debate to bring out very clearly the point that, when the regular officials of the Government turn a deaf ear to the grafting adventurer, Congress is too often ready to consider his claim. Like the action of last session, when the $750,000 fee of the Choctaw attorneys was allowed by a citizens' court created by Congress, the two items in this year's bill are illustrative of a system that has had many supporters. In the debate, the Senate conferees, who, with the House managers of the bill, brought in the report that was adopted, confessed that neither the Secretary of the Interior nor the Commissioner of Indian Affairs had approved the items. Nevertheless, the Senate agreed to the report, the bill's backers putting the blame for its defects upon the stubborn House conferees. Commissioner Leupp and Secretary Hitchcock, whose special business it is to investigate such claims, were overruled by the efforts of lobbyists; Congress, the sympathetic mother, nullified the wise disciplinary judgment of the Indian Office.

In the case of Andrew Jackson Brown of the Seminole Nation of Indians in Indian Territory, protesting Senators found much instructive material. The Indian Appropriation bill merely attempted to validate the acts of Brown, acting as administrator *de bonis non* of J. D. Jenkins, a special agent of the Interior Department appointed to disburse some $186,000 among the heirs of "loyal" Seminoles who lost property and money in the civil war. As administrator, Brown paid the $186,000 to those adults and minors who proved their right to share. Then, as a member of a trading company into whose debt many of these Seminoles had fallen, Brown proceeded to pay back to himself some $72,000. Some of this came from the estates of minor children whose liability for the debt was in grave doubt.

A brother of the chief of the Seminoles and a kind of Pooh-Bah of the little nation, Brown paid out and took in with lordly indifference to criticism. After a time lawyers were engaged by the Indians to investigate Brown. A technical defect in his appointment as Jenkins's administrator was found. An investigation of Brown's payments and collections was about to be made. He appealed to the Indian Commissioner and the Secretary of the Interior to cure the defect in his title and validate his acts as disbursing agent. After sufficient investigation, both these officials declined to admit his plea. It was at this point that kind Mother Congress was approached. It was nothing but a lawyers' fight, said Brown and his friends. Jenkins was a good man, and so was his administrator *de bonis non*. Complaisant, the Indian committees took the attitude that it was only a few score Indians who might possibly suffer from Brown's methods, while Brown's friends were bothering them terribly. It was easier to give the man what he wanted than to fight as Leupp and Hitchcock urged be done.

Just as Brown was relieved by the bill from the obligation to prove in court that his actions were regular, so in the other case Congress was asked to recognize, and, by inference, recommend, the payment of a claim that the Indian officials had decided should be left to the adjudication of the courts. In 1891 the Government found that a grant made to the Colville Indians in Washington included a white settlement. It was desired to regain possession of 1,500,000 acres, half of the grant, and Congress concluded that, since the grant had been made only on an Executive order, the Indians had not obtained a valid title. The 1,500,000 acres were,

therefore, opened to settlement. In 1892, a firm of attorneys bargained with the Indians to collect a dollar an acre for the receded land on a 10 per cent. commission. The contract was to stand for ten years. Nothing was done until this year, four years after the lawyers' contract with the Indians expired, when the committees of Congress were convinced that the Colville claim was a valid one. The $1,500,000 was allowed, and the dead contract between the lawyers and the tribe was recognized to the extent of recommending it to the Court of Claims, with a request that the terms be duly considered. Again the officials of the Interior Department were overruled by the lobby.

The theory of the Indian Office is the very sensible one that the Interior Department is capable of looking out for the interests of the Indians. In the Colville case, there was no other difficulty in the way of collecting the claim, once it was investigated, than the delay due to the necessity for not overloading the year's appropriation bill. Neither Mr. Hitchcock nor Mr. Leupp could discover how the lawyers had earned $150,000. But unless the House stands firmer against the item than the Senate did, the Colville case will become a companion exhibit to last year's Choctaw case. When it was decided to break up the tribal holdings in Indian Territory some years ago, 4,000 Choctaws living in Mississippi wanted to share in the division of land and money. Mansfield, McMurray & Cornish, lawyers of South McAlester, agreed to keep these 4,000 claimants out for 9 per cent. of what it would cost the Choctaw Nation to take them in. This cost was estimated to be $20,000,000—a citizenship was valued at $5,000—and when the Mississippi Choctaws were finally ruled out, the lawyers presented their bill for $1,800,000. The Interior Department disapproved the contract, but Congress was appealed to, as usual. For doing what the Department was willing and able to do as part of its regular work, the South McAlester firm was given $750,000 by a citizens' court created to pass upon the claim. In the Senate debate, Mr. La Follette said that "at least one of the members of the court or commission, which was created by special act to pass upon their claim, was a brother-in-law of one of the Senators who supported the legislation establishing the court."

The quality of mercy shown by the Congressional guardians is surely not strained; upon the scheming attorney and the Indian trader it droppeth like the gentle rain of the Cascades. Will the House reject the conference report, and insist upon giving to the decisions of Secretary Hitchcock and Commissioner Leupp the weight they should properly have?

TROUBLING NEW JERSEY.

Jersey Republicans, of the faithful organization type, are looking forward to one of the saddest summers of their lives. Of what avail is it for them to have made an appropriation to keep down mosquitoes, if swarms of Colbyites are to buzz and sting all over the State, from now till November? This threat of an all-summer campaign is terrible to the bosses. The idea is simply appalling to them that the exasperating and infernally successful work done in the summer months of last year by Senator Colby in Essex County, is this year to be extended to Morris and Union and Middlesex and Hudson and other parts of New Jersey. What are clouds of *culex* and *anopheles* compared with the horde of organizers and speakers which the Colby Republican League is preparing to let loose upon the devoted State, to fight it out on that line if it takes all summer?

The Colby movement is admittedly progressing with unexpected rapidity. Wherever its organizers appear, the names of leading Republicans go upon the rolls by the hundred. By "leading Republicans" we mean, of course, not the prominent party workers and office-holders, but the most respectable and influential Republicans in the various localities—the class of men whom the orators are accustomed to point to in proof of the fact that the party embraces the substantial property-owners and the intelligent people of the community. Republicans of this class are going over to the Colby ranks almost in a body. This is conceded by the party hacks. They deplore it, they are angry and bitter about it, yet they cannot deny the fact.

What is its true explanation? At bottom, profound dissatisfaction throughout the Republican party in New Jersey with the methods and personnel of its managers during the past ten years. As soon as Bryan made Democratic New Jersey Republican by 80,000 majority, the Republican machine set out to fasten itself upon the State, and its rule has been mercenary and brainless. It has unblushingly allied itself with unscrupulous corporations, whose pliant tool it was eager to become, and has put the ban upon independence and ability. By its United States Senators ye shall know it. Kean and Dryden! The open way in which those two men, neither of whom would have been thought of but for his wealth and corporation backing, were foisted upon New Jersey Republicans, could not fail to fill the decent members of the party with discontent and disgust. Had the party no honor that was not purse-felt? Had it no men with a voice, that it must select those whose only talking was done by their money? There can be no mistake about this. The delivering of the party over to mere money-bags was felt by reputable Republicans to be an insult and an outrage. It provoked a smouldering revolt which the appearance of a man like Colby was certain to cause to burst into the flame which all men can now see. In its essence, the Colby movement within the Republican party of New Jersey is one of protest against the tyrannical, stupid, and money-grubbing spirit in which the party organization has been conducted. It is a blow full in the face of the Republican bosses.

This fact, indeed, is put in the forefront of the Republican League platform. Its first plank declares for

> "The overthrow of the control of the party organization by corporations through the medium of the bosses, and to that end the nomination of all candidates for public offices by direct primaries without the intervention of delegates or conventions."

That is explicit. It is doubtless to this avowed purpose that so many Republicans of the greatest weight are rallying. Other parts of the programme, though subordinate, are important. One of them is the demand for a "thorough investigation of life-insurance companies." This is aimed at Senator Dryden and the Prudential. The taxation and franchise questions are not so critical as they were before Gov. Stokes and the Legislature capitulated to Senator Colby on those issues last winter. Doubtless much remains to be done to prevent the laws then passed from being ingeniously nullified in execution, and other demands put forward in the name of the Republican League have their interest; but it is undeniable that the movement is gaining the body and impetus which are so troubling the dreams of the Republican bosses, mainly because it is an organized assault upon the old machine, and an appeal for new measures and new men.

Precisely on this score do the innocent Republicans of the organization make their plaint. "They want to destroy our machine in order to build a new one of their own. They want to turn us out of office so as to get in themselves." And then they add that they fear Colby is "ambitious." He wants to be Governor some day. And Mr. Record admits that he should like to be Senator. There you have it—nothing but ambition and office-seeking! Of course, to the Brutuses of the machine, it is a dreadful thing for any one but themselves to have "ambitions." Dryden desires to be reëlected Senator purely in the way of business, we suppose, but for Record to aspire is culpably ambitious. Naturally, Dryden cannot stoop to a joint debate with a man of that sort. Besides, as he remarks in his letter of refusal, he has "other plans" for reaching the people. If the Prudential were ever thoroughly investigated, we might learn something about those plans. Meanwhile, we imagine that the grief of the machine at anybody's actually seeking an office in order to carry out a programme, will merely convince the Colby-

ites that they are on the right track. What the bosses like is a reformer who will emit some fine generalities in May, and then go away, not returning till October to see what the effect is. They do not know what to do with a man who buckles down to a fight all through the hot months, contesting every ward, organizing in every voting division. It is this unprecedented and wholly irregular activity of the Colbyites that is making this summer one of such discontent to the New Jersey Republican bosses, and plunging them into the depths of a divine despair.

DIVORCE TOO DIFFICULT.

The matrimonial infelicities of the head of a great industrial corporation have been freely ventilated in the press. One has been regaled with the future intentions of disagreeing husband and wife, with rumors of the alimony to be arranged and of the names to be "mentioned" or suppressed in the decree. There has been humiliating argument as to the propriety of an unsuccessful husband continuing as the chief of a colossal manufacturing Trust. In short, we have the unedifying spectacle of two people who wish to part, and who are abundantly able to pay the expenses, being subjected to all manner of vexatious delays and invidious publicity. With the divorce laws of forty-odd States to choose from, the farewells of this unfortunate couple still cumber the newspapers and occupy the public sympathy. Could there be a stronger argument against our backward divorce procedure? How long shall we continue to hamper high finance with the matrimonial red tape calculated for an unenterprising bourgeoisie?

We take it that law must in the long run follow the customs of a land. If so, the absurdity of applying the same law to persons whose whole aspect of life—and consequently habits—rests on opposite principles, need not be labored. For your clergyman, mechanic, editor, butcher, baker, and candlestick-maker, the present old-fashioned marriage laws do well enough. These representatives of the plain people seldom look broad-mindedly beyond the stale old words, "until death do us part." Generally speaking, they seldom aspire to more than one living wife at a time. In their unimaginative way, they make the best even of a matrimonial bad bargain, and contentedly pursue the plodding task of domestic compromise and adjustment. Evidently, the most liberal laws could do little for people of this bread-and-butter disposition. Moreover, even were their philosophy the most enlightened, few of these submerged husbands could afford more than one wife. Many find it difficult to maintain a single helpmate in reasonable comfort and dignity. The wives, too, rarely have the habit of the great world. They live too near the pots and pans, vesper services, and the lecture-room to pick up new "affinities" with any ease or grace. In short, they are in no sense "in the movement." Many incorrigibly prefer their own prosaic John to the most sympathetic Algernon that ever was unhappily married to another woman. What could the most liberal law do for those whose means do not permit an alimony account, and whose instincts are fanatically monogamous?

Consider only that divorce remains the sole commodity that great wealth cannot buy quickly and surely. When two persons sincerely desire to part, and are amply able to pay for the damaged sensibilities concerned, why should either be forced to commit constructive desertion, to make unpleasant admissions *in camera*, to establish fictitious residences in remote and dismal parts of the country? Why, in short, should the Constitutional right to the "pursuit of happiness" be clouded and qualified by the scruples of backwoods legislators, not a handful of whom have had any practical experience in the matter? Let Congress provide a quick, quiet, and easy method of changing life partners, applicable, naturally, only to those of approved financial responsibility. The figure we decline to fix, but it fails evidently about where Mr. Roosevelt's "bloated fortunes" begin.

The details of the reform we leave to the associations that exist for that purpose. To many, the Roman law of divorce by mutual consent may seem an admirable model, but it might easily be improved upon, affording as it does no recourse against the rare but possible contingency of a disobligingly attached husband or wife. The essence of the matter is, however, due provision for divorce at the time of marriage. By an amazingly slipshod procedure, unpardonable in any similarly important transaction, the divorcing classes are still guilty of using words which regard the marital vow as perpetual. Here the approved principle of forfeiture should apply. Let the service read, "until death or the courts do us part." Well begun is half done, and a wedding solemnized in this spirit may be said to be already in sight of an easy, equitable, and painless divorce. Good taste would forbid the mention of the hypothetical alimony in the ritual, but a miniature bond of indemnity could be conveyed unobtrusively by the first usher to the bride's counsel at the moment the best man proffers the ring.

We have already admitted the drawback that the reform, though nominally available for all, must practically be in the nature of class legislation. We can, however, conceive of a campaign of education by which divorce might be gradually made available even for the bourgeoisie—whose general incapacity we have been forced to concede. It is obvious that your mere counter-jumper cannot enter into a personal obligation for alimony on his wedding-day that deserves serious consideration. But here is an open field for divorce underwriting. The risk could be ascertained by actuarial calculation. The business might be a profitable side venture for building and loan associations, and bond or indemnity companies. One could imagine a combination life, endowment, accident, sickness, homestead, burial, and divorce policy that might at once rehabilitate a flagging business, and gradually extend the blessings of experimental marriage to the very proletariat.

THE RELIGIOUS QUESTION AND ELEMENTARY EDUCATION IN ENGLAND.

LONDON, June 5, 1906.

Why is it that every attempt to establish a satisfactory system of elementary education for the people of England is hampered by the so-called "religious question"? This inquiry must often puzzle the readers of the *Nation;* it is the more perplexing because a problem which is really nothing else than the difficulty of determining what (if any) form of religion shall be taught in elementary schools supported by the State, has been met more or less satisfactorily not only in many English-speaking colonies, but in Scotland and even in Ireland. My aim, then, in this letter is neither to criticise the educational policy of the Ministry nor to discuss the provisions of the Education Bill now before Parliament, but simply to answer the question which opens this letter.

The existence of the "religious question" has little connection either with the undoubted advance of democracy or with the very doubtful prevalence of skepticism. Democratic government is compatible with either a religious or a secular view of life. Tocqueville was deeply impressed with the influence of religion in the United States; the democrats of modern France can see in the most ordinary emblems of Christianity nothing but the signs of reaction and superstition. There is, again, little reason to suppose that any large body of Englishmen are out-and-out secularists. Convinced Churchmen and orthodox Dissenters possess far greater Parliamentary authority than can be attributed to skeptics or agnostics. The religious difficulty is due not to one but to various complex causes which are so peculiar to England that they do not to any great degree impede the development of popular education in Scotland.

The confusion into which the English educational system has fallen is, as most persons will now admit, due to a blunder committed more than seventy years ago. In 1833 the House of Commons made a grant of not quite £20,000 to promote the education of the people of England. The money was spent on a sort of subscription to two societies supported by voluntary contributions, of which the one represented the Church of England and the other Nonconformists. From this thoughtless, hap-

hazard way of doing something to lessen the gross ignorance of the English people sprang that State-supported, yet to a great extent denominational, scheme of national education which thoughtful men of all parties feel imperatively needs reform. Happy would it have been for the country had the crude but comprehensive scheme proposed by Brougham some fourteen years earlier been adopted. That its adoption was, as things then stood, impossible, every one must admit, but it would have provided a general plan of national education which would easily have admitted of amendment. The blunder, however, of 1833 was natural, not to say inevitable. Its commission was the outward and visible sign of the conditions which have made and still make the education of the English people the field of futile and noxious controversy. These may be summed up under a few heads—the position of the Established Church; the effect produced by the ecclesiastical movement of 1834; the peculiar condition of public opinion with regard to the proper sphere of the State's activity.

The position of the Church of England is a practical paradox: the Established Church both is and is not the Church of the English people. From a Churchman's point of view its national character is obvious. The mere fact that the Church remains established, *i. e.*, that, with the full assent of the majority of the electors, it retains as the national church large revenues and exceptional privileges, is, as things now stand, strong evidence that the Church commands the respect of the English people. The opposition by Nonconformists to a religious census amounts to proof that a majority of the people of England consider themselves to be Churchmen. The legal doctrine that every Englishman is *prima-facie* a member of the Church as by law established, may be a fiction, but it is a fiction based on a considerable foundation of fact. The persons who, were a census taken, would describe themselves as members of the Church of England, have at lowest no wish to join any other religious society. While quiet transitions from Chapel to Church are common, the conversion of Churchmen to any form of Protestant nonconformity is rare, and this is a circumstance of untold significance. Whatever, moreover, be the creed of an English layman, every rector or curate who values a national church acknowledges the right of all parishioners to his services—of every parishioner who wishes to receive them. A Nonconformist minister, however great his zeal or his eloquence, is the minister of a sect whose members are bound together by holding some special form of religious doctrine. A rector is the minister not of Churchmen, but of the parish. No man more completely commanded the reverence of his disciples and the respect of his opponents than James Martineau, but a study of Martineau's life brings home to one the conviction that he never escaped from a sense of the fatal limits placed to the beneficial action of a religious teacher whose congregation consisted of persons having for their bond of union nothing but common belief in some given dogma.

But though, looked at from one point of view, the Church of England can make a claim to a truly national character, no Nonconformist can fail to look at the matter from a different side, and to perceive that the Established Church is nothing like the church of the whole of the English people. English Dissenters form a large and powerful body, and a man whose convictions induce him to stand apart from the religious community which includes most of his countrymen, is likely to be a more zealous believer in his particular form of faith than is the average Churchman. Legislation, moreover, has not only established complete legality for Nonconformity, but has relieved Dissenters from almost every form of political inequality. But this salutary establishment of religious freedom has in some respects increased the division between Church and Chapel. To the grave injury both of the Established Church and of religion itself, theological have become associated with social differences, and Churchmanship has become a mark of gentility. Snobbishness has penetrated into a sphere which ought to be kept sacred to religion. Can any one wonder that, under this state of things, the clergy who have been zealous in erecting denominational schools should look upon national control of public education as a triumph of Nonconformists over the national Church, or that Dissenting opinion should be morbidly alive to the possibility that religion may be so taught in schools supported by the nation as to be the means of inculcating belief in the doctrines of the Established Church?

The High Church movement of 1834 has produced two effects, each of which complicates the educational problem. It has in the first place thrown into the background the Protestant character of the Established Church, which in the earlier part of the nineteenth century was in reality closely allied with orthodox Dissenters by their common Protestantism. Robert Hall,* the eminent Baptist minister, was the most famous preacher of his day. His chapel was attended by Evangelical Churchmen. Alexander Knox, who in some respects anticipated the Oxford Movement of 1834, believed, as early as 1806, that a thorough change was taking place in the sentiment of the great body of Dissenters which would bring them round to a truer Church of England spirit than ever their conformist ancestors were possessed of, and based this belief in part on the character of Robert Hall's writings; while Robert Hall himself taught that the differences which divided Dissenters from their brethren in the Establishment did not touch the essentials of Christianity, and preached on behalf of those national schools which were founded to promote the education of the poor in the principles of the Established Church. This harmony of sentiment, based on common Protestantism, has been destroyed by a movement of which the object was to proclaim the Catholic character of the Anglican Church.

This movement, in the second place, has introduced division among Churchmen. The laymen to whose support the Establishment owes its continued existence, are for the most part Protestants, both in belief and in sentiment. The clergy are Anglicans or Catholics, and their teaching is often regarded with profound distrust by laymen belonging to the Church of England. Hence, a curious misconception as to the real state of religious (or rather theological) belief in England. The country is in appearance divided into Churchmen and Nonconformists, and on all sides one hears expressions used which imply that at the present moment, and at any rate as regards the teaching of religion in State-supported schools, Churchmen are united against Dissenters. But this view of the case does not correspond with patent facts. The true line of division is not between Churchmen and Dissenters, but between a powerful minority consisting of High Churchmen and of Roman Catholics who may fairly and without offence be described as "Catholics," and the vast majority of English laymen, who, whether they worship in Church or in Chapel, or perhaps do not worship in either Church or Chapel with great regularity, may fairly be termed Protestants. The real problem (and it is difficult enough) with which statesmen are called upon to deal, is how to provide elementary education for the people combined with the kind of religious teaching demanded by a Protestant majority with due and careful respect for the rights of what I may venture to call a Catholic minority, whose members demand (and from their own point of view fairly enough) the maintenance of a religious atmosphere—as the expression goes—of a character which cannot be found in any school where no religion is taught except the essential elements of Christianity, common at any rate to Churchmen and orthodox Dissenters.

Difficulties due either to the paradoxical position of the Established Church or to the results of the High Church movement, are complicated by a singular condition of public opinion in regard to the proper action and the moral authority of the State. The old Liberalism which rested upon faith in *laissez-faire* had the closest connection with the belief that the Government should, as a general rule, neither control nor direct public opinion, at any rate in matters of religion. A policy grounded on this belief certainly minimized the risk of conflicts between the commands of the State—or, in other words, the law of the land—and the conscientious scruples of minorities. It also fostered the idea that, in such contests, minorities or individuals were probably in the right, and could hardly with fairness be punished for conscientious disobedience to the law. But this idea or sentiment has survived the creed of which it was the natural or necessary outcome. We all of us, in different ways, demand the extension of the State's authority, which, after all, is nothing else than the diminution of the area of individual freedom or caprice. Hence, of necessity, conflicts between law and the conscience or crotchets of individuals. A Christian scientist who is also a doctor, insists upon his right or his duty to let his patient perish because the physician disbelieves in the use of medicine. An anti-vaccinator demands the privilege of leaving his children unvaccinated. A woman stands a siege rather than pay taxes imposed by a Parliament in which she is unrepresented. A passive-resister refuses to support as a rate-payer a form of religious teaching which he has uncomplainingly supported as a tax-payer; and the

*See Canon Henson's 'Religion in the Schools.'

public, combining the aspirations of Socialism with the sentiment of individualism, wishes that the State should regulate all things, and yet that the conscientious resistance of individuals should be allowed to hamper the action of the State. The very politicians who more or less sympathized with the passive resistance to the existing Education Act of conscientious Nonconformists, must occasionally dread the possibility that the Education Act, 1906, may be more or less nullified by the conscientious (though, to my mind, unjustifiable and ill-advised) passive resistance of conscientious Churchmen.

AN OBSERVER.

JAPAN'S POST-BELLUM POLICY FORESHADOWED.

TOKYO, May 17, 1906.

The working life of Japan's first post-bellum Diet was little more than two months, yet rarely has a national legislature in one session enacted so many laws. Most vital and far-reaching among them, besides the budgetary schemes, are (I.) a law to nationalize most private railways, and (II.) a revised customs-tariff law. The fate of these two laws, like that of the budgetary measures, was decided in committee and in party councils.

(I.) In 1872, the Government began to operate the first railway in Japan. Strangers to the order in which railways are a factor, the people left the enterprise wholly to Government. The Government, with similar tasks of initiative in most branches of industry, lacked capital and trained men. By 1883 the Government was working 150 miles of railway when the first private company took hold. Thereafter Government and private companies built lines in a national system planned by the Government. In March, 1906, there were open to traffic 4,783 miles, of which the Government had 1,532 miles, and 37 private companies had 3,251 miles. The beginning of private railways brought an unsuccessful movement for the State to sell its lines. Later, several attempts were made to nationalize the private lines —the last and strongest in 1900.

Having parried questions in committee concerning rumored plans to nationalize private railways, the ministry brought forward its proposal March 6. The resignation of the Foreign Minister four days earlier had prepared Diet and nation for it. The plan was to buy, within five years, 32 railways (3,160 miles) at a price equal to twenty times average profits for three years, payment to be made with 5 per cent. thirty-year bonds at par, and deliverable within two years after purchase. The bill came from committee March 16, and, after four hours' debate, passed the Lower House by a vote of 243 to 109. The Upper House committee made amendments which eliminated 15 railways (353.5 miles), prolonged the purchase period to ten years, made purchase-bonds in exchange for shares deliverable within five years after purchase, and in certain cases gave right of appeal against prices fixed by the valuation committee. The amended bill passed the Upper House March 26: vote, 205 to 62. On March 31, a few hours before the legal limit to the session, the Lower House committee reported it for passage as amended. Refusal to allow discussion caused a scene of violence, after which—the Opposition declining to vote—the amended bill received 214 affirmative votes.

The law empowers the Government to buy seventeen railways. Their total mileage is 2,806.6 miles, of which 2,538 miles belong to six companies. The estimated cost now is about 425 millions, but further sums spent for improvements and extensions before purchase must be added. Lines may be bought at the discretion of the Government within ten years. The price is in each case to be a sum equal to twenty times average net profits for three years (1902-05). New lines and lines which have not paid dividends will be valued, within cost of construction limits, by a special commission. Against the price so fixed, appeal may be made to the Minister of Communications. Payment is to be made in the form of 5 per cent. thirty-year bonds at face value; such bonds to be delivered to shareholders at the option of the Government within five years from the date of purchase. Between date of purchase and delivery of bonds, shareholders receive, in semi-annual payments, the 5 per cent. interest on bonds due them. Payment for supplies on hand must be made with bonds at their market value. Pending purchase, companies must under penalty make repairs and improvements required by existing law, must carry on their business under Government supervision, and get Government sanction for purchase of supplies or for increasing or diminishing construction costs. They may not amalgamate or buy other lines. A separate and similar law empowers the Government to buy the railways in Korea, the estimated cost being about 34 million yen.

Sums spent on construction and equipment of the seventeen home lines average about 55 per cent. of the face value of bonds receivable in payment, but the extreme range for the several lines is from 34 per cent. to 347 per cent. For the six largest companies, the ratio of cost to face value of bonds receivable is respectively 41.7 per cent., 52.6 per cent., 49.6 per cent., 87.7 per cent., 40.1 per cent., 100 per cent. Eight companies will get bonds whose face value is less than cost of construction and equipment, but only two of them have more than fifty miles of line.

Reasons given by the Government for purchase were: To use a favorable opportunity to realize the "traditional policy" of State ownership of railways; to make railway service uniform, more efficient, cheaper; to promote industries and trade; to get the profits for the State; necessity for military efficiency. Opponents urged that Government railways now charge higher rates, have more costly and less efficient management than private railways, that the Government would raise rates to get profits, and so hinder the growth of industries and trade; that, in the recent war, the Government had practical control of private railways and got efficient services, while it also has by law full power to enforce on private companies needful changes or improvements; that the cost of nationalization would, under existing conditions, have grave effects on national credit, especially abroad; that, having chartered companies for fixed terms, the Government has not the right to buy lines before the end of charter-terms except at a price acceptable to the companies. The last argument—viz., unconstitutionality to force sale at a fixed price—was based on Article XXVII. of the Constitution, which says:

"The right of property of every Japanese subject shall remain inviolate.

"Measures necessary to be taken for the public benefit shall be provided by law."

The Government's answer to this argument was that railway charters were granted by law, and can for the public benefit be changed or ended by law. The inexpediency of enforcing this view, together with solicitude about the costs and the effects on national credit of railway nationalization, had led Mr. Kato, Foreign Minister, to resign.

(II.) The new tariff law—enacted in March, effective October 1—followed no "campaign of education," was marked by no "bitter contests" over schedules. Neither "vested interests" nor burdened consumers were much in evidence. The press and some sections of the people were busy assaulting sinking fund, war-tax continuation, railway nationalization, silk inspection, habutal bleaching, match-monopoly schemes of the Government. The Government's position was strong because its plans were hardly known before they were urged in the Diet. Hence, the Opposition had in a short campaign to distribute its forces over a long line of simultaneous attack. Finally, the heart of opposition was weakened by the feeling that absence of expected indemnity, a huge new debt, and plans to reap large fruits from victory made inevitable unusual fiscal and other measures. So the Government got its tariff law easily, quietly, by merely assenting to some minor changes of rate—mostly protective increases—in the Diet.

The main features of the law are these: (1) The Government may by decree convert ad-valorem into specific duties, using as a basis the average value for a period of six months or more. Tare may be included in fixing specific duties. (2) Valuation for assessment of duties includes original cost, together with costs of packing, transportation, insurance, and other charges to the port of entry. (3) Duties may be wholly or partly refunded when paid on materials which are further manufactured and reëxported, or when paid on materials which are used to make land fertilizer (even for use at home). (4) In the case of countries which have not conventional tariff rights, the Government may by decree impose on their products duties not lower than those fixed in the conventional tariffs. (5) Products of countries which discriminate against Japanese products or ships may be subjected to additional duties up to 100 per cent. of the usual rates on dutiable, 50 per cent. on duty-free goods. (6) Countervailing duties may be used to offset export bounties for imported goods. (7) The law designates 800 kinds of goods, of which 45 are duty-free. Duty-free goods are mostly plants, bristles, shells, bones, potash, ammonia, cotton, mineral ores, manures, various waste products—the rawest exotic materials and fertilizers. Many goods are for the first time dutiable. Most duties on agricultural and manufactured products are increased, even beyond the rates fixed by the war. Typical duties are (approximately equivalent ad-valorem rates): horses 5 per cent., cattle

10 per cent., other animals 25 per cent., cereal grains about 15 per cent., flour, meals, meats, 30-40 per cent; most tinned provisions and those preserved with sugar 40-50 per cent.; coffee, cocoa, chocolate, 45 per cent.; railway and tramway carriages, carts, drays, balances, sewing machines, 20 per cent.; bicycles, clocks, brushes, matches, boots, shoes, harness, hats, firearms, musical instruments, 40 per cent.; carriages, photographic apparatus, toilet articles, games, and accessories, furs, feathers, gold or silver trimmed articles, 50 per cent.; pearls, gold pens, jewelry, perfumery, 60 per cent.; wines and liquors 60-150 per cent.; manufactures of tobacco 250 per cent. In general, crude agricultural products producible at home 15-25 per cent.; coarse manufactures of metals and wood about 20-30 per cent.; those more refined, also ordinary textile, leather, and paper manufactures, 30-40 per cent.; the best grades of these, also of foods and luxuries, 40-50 per cent.; special luxuries and revenue-yielding articles, above 50 per cent. Long-distance transportation costs and low earnings of Japanese make these rates relatively heavier than they would be for Americans or Europeans.

By this law, Japan stocks her commercial armory with the latest tariff weapons, systematizes her duties largely on the basis of the specific principle lately in favor, and takes a long stride in her quick progress towards high protective-tariff duties since in 1898 she left the 5 per cent. treaty-maximum The motives for all this are not solely in the war; neither are they elaboratcly set forth by the Government, which, as usual, prefers results rather than talk. The Government explained that the existing law was defective in some points, hinted that some protection might be good for home industries, and emphasized the necessity of proposed amendments because of change in the "economic situation." Analysis of this rather typical argument, if deemed necessary, would have shown mixed motives. Some increase of ante-bellum tariff rates is needed to offset high internal taxes and avoid handicapping home producers. But, besides the wish for more revenue and still more effective, all-round protection for home producers, it would not be amiss to scale down payments for imports or else make them contribute handsomely towards the large interest balances due abroad—for it must cause concern that, with exports of some 320 million yen, Japan must pay foreigners 90 to 100 million yen yearly interest. In negotiating commercial treaties to replace four years hence those now existing, the new scale of duties—of which further revision then is promised—may be a strong argument in Japan's favor. Finally, to the Japanese mind, there is satisfaction in the thought that the tariff system is scientific, consistent, and in every feature "up to date." The effectiveness of the law for both revenue and protective purposes is limited by existing commercial treaties. Rates fixed by those treaties must continue till 1910-11. They apply to most textile goods, metals other than brass and copper, wines, and some other products. The purpose is not to impose higher duties on products of non-treaty countries.

(III.) Meanwhile, by exhortation, experiment, subsidies, regulation, and every practicable means, the Government tries to raise productive industries to the highest efficiency for supplying home demand and swelling the volume of exports. Thus, questions in committee concerning iron and steel schedules elicited the frank statement that rates on some of them were made specially high because, while capable of production at home, they were still imported; rates on others were made high in the hope that, after the treaties' end, 35 per cent. duties would make it possible to produce them at home. The Government iron and steel factories have been built up by direct appropriations of the Diet, which continue yearly, and on plans which contemplate production of the whole supply of iron and steel products at home. Similarly, it is said that, with a view to improve the quality of silks for export, the Government proposes to buy the best silk-weaving machinery and lend it to silk manufacturers; that, with a view to develop the sugar industry in the Loochoo Islands, the Government has established an office to conduct experiments and model enterprises in cultivating and manufacturing sugar and to teach the best methods. A new law reorganizing with foreign coöperation the Industrial Bank (crédit-mobilier) is intended to open a channel through which cheap foreign capital may flow into needy enterprises, and the Government is advising companies and municipalities how best to profit thereby. Back of almost every promising industry and branch of trade are the guiding, supporting, bounty-giving hand and the directing intelligence of an omnipresent Government. Somewhat along this line were Government proposals to limit all bleaching of habutai to factories designated by Government and to establish Government agencies for the compulsory inspection of all silk intended for export. The latter proposal was rejected, the former emasculated by the Diet. These actions and much sharp criticism seemingly dissuaded the Government from bringing forward plans already matured to grant to a combination organized by Government suggestion the exclusive right to manufacture matches. Fees or profits for the Treasury are a usual feature of such projects, which seem to be parts of a single policy that aims to get revenues and to foster and guide the growth of almost every branch of industry and trade, to realize a *Solidarschutzsystem*. Here is where railway nationalization seems to fit in—an enterprise which Ministers have frequently declared to be the basis of all post-bellum policy.

What will be the outcome? Predilections for or against the efficacy of Government in economic rôles and for or against the wisdom in constitutional government of large sources of income beyond immediate control of Parliament all aside, there are factors here which a Westerner cannot easily judge. Japan does not produce enough food for her people. In 1903 and 1904, both years of big crops, the excess value of rice imports over exports was 47 and 54 million yen respectively. Barley, wheat, and flour together, with almost no exports, show import values for those years of 15 and 11 million yen. The 15 per cent. duty on these staples of food for the masses must be wholly added to the cost of living—for the price of the home product must rise proportionally in the face of regular imports. Again, as compared with Americans and Europeans, Japanese laborers earn less and pay proportionally much heavier taxes. Skilled artisans earn 20 to 40 cents a day. On the basis of a recent Government estimate of national wealth, yearly taxes amount to 2 1-3 per cent. of the whole sum of wealth. Hence the cost of living must rise, and with it wages. But that means higher cost of producing goods for export. Thus a new handicap on the export trade is added to want of sufficiently skilled and experienced workmen in machine industries and want of capital to provide efficient plant and equipment. But ages have accustomed Japanese to heavy taxes and to obedience. They have always looked to Government for initiative. In the new order, the Government built the first railways and factories, supplied capital or guidance for every variety of new enterprise, paid for the education of experts abroad, and had them patiently teach the people how in every field of activity to grow the seeds of the new civilization. It still is doing so. The Meiji Government has thus led the people to unwonted liberty, prosperity, enlightenment, happiness, even glory. Its hold on the people enables it to do what no Western Government would dare try. Perhaps, also, the people have not the bent or training to govern as Western people do.

The feeling grows that Japan must work out her own salvation in her own way. She sees the West struggling with its problems: labor against capital, capital to control government, the United States against Trusts and the railways. Pressed for need of capital, she would yet keep control over it. Hence the seeming paradox that while the West struggles against Trusts, Japan tries to create them. But, in adopting and using the economic forces discovered in the West, Japan would like to force from the West an avowal of her superior use of them, just as she won praise for her use of Western weapons of war! Meanwhile, the war has infused new confidence, new ambitions in the people, a new spirit of daring in the Government. The Government, alert and energetic, would utilize the expansive mood of the people to get far on the chosen way before burdens seem heavy. Daring is an element of statesmanship as of business. Failure alone is called folly, and comes from misjudgment of capacities or conjunctures. If Japan's policy succeeds, her present leaders will go down through history as great empire-builders.

E. H. Vickers.

Correspondence.

THE BLESSED WORD "NATIONAL."

To the Editor of The Nation:

Sir: The opening short editorial and the longer article headed "Ways of 'Regenerating Business,'" in your issue of June 7, raise the old question of the difference between the execution of laws and inspection of conditions by local and by national authorities.

Do not the reports, in Sunday's daily papers, of the intention of Chicago to investigate the conditions [with a whitewash

brush], and so to put a stop to injuries to Chicago's business, show what may be expected of local inspection? Is not the difference between local enforcement of local-option high-license liquor laws in most parts of this country and national enforcement of national license laws a fair indication of the difference to be expected between a "rigid" inspection by Chicago municipal authorities under the shadow of the mighty Trust's wings, and inspection by officials of the National Government?

Does not your argument itself convict your plan of insufficiency? You begin by truly asserting that there is no shortcut substitute for "the old, painful road of repentance and restitution and a sober and godly life." You admit the short-sighted greed of the guilty; and yet you expect their whole attitude to change in a moment, so that they will be far-sighted and wise enough to adopt the highest standards of business conduct.

The people cannot inspect and know for themselves the quality of what they eat, and, so long as the packers can maintain their monopoly in this country, by whatever means, the people are at their mercy. The New York municipal milk inspection has done much to protect New York milk users. Would you transfer this inspection to the officials of the counties where the milk is produced?

If the United States Government has power to require that all food products be submitted to efficient inspection before being admitted to interstate commerce, why then turn over the protection of the consumers of this whole nation to Chicago's notoriously corrupt officials, dominated by the short-sighted greed of the "Beef Trust"? If it were merely a question of punishment of greed, we might leave it to the working of natural laws; but the old adage applies here, "God helps those who help themselves." Chicago will look out for itself, but not for the rest of us. Let our President, whom we elected, by all Constitutional means protect us from filth and poison. CONSUMER.

STAMFORD, CONN., June 12, 1906.

[We are quite willing that our readers should pass upon these interrogatories in their or in our own behalf.—ED. NATION.]

ANOTHER MILWAUKEE PUBLICATION.

TO THE EDITOR OF THE NATION:

SIR: A concern which calls itself the "University Research Extension," E. Milton Jones, secretary, with offices in the Auditorium Building, Chicago, has for some time been exploiting a set of volumes published by the Roberts-Manchester Co., of Milwaukee, entitled "The Ideas That Have Made Civilization." "The University Research Extension," which has very aptly taken as its motto "Your only real property is the capacity to make mental efforts," seems to consist of some enterprising persons who possess this capacity in a remarkable degree, to judge by their methods of exploitation and the pompous phraseology of their letters and circulars, in which they announce this as "the culmination of a world-wide movement in University Circles," and offer the books, along with "membership," "only to people recognized or recommended as careful students and thoughtful readers." Every occasion is taken to proclaim the fact that the editor-in-chief has been "assisted by more than one hundred and twenty-five men, specialists in their own fields, such as the following: A. H. Sayce, Crawford H. Toy, Edward Capps, Walter Miller, H. D. Foster, Henry Rushton Fairclough, Frank Frost Abbott, John Carew Rolfe, Dana C. Monro, Edward G. Bourne, Ferdinand Schwill, Harry Burns Hutchins, William H. Welch, Theodore William Richards, Paul Reinsch, George Goodspeed." Still others are mentioned in the "Editorial Acknowledgment" prefixed to each volume, with the same implication.

We are informed by the editor-in-chief that he did not write the editorial acknowledgment, did not authorize the use of these names, had never been aware that these persons were members of his "staff of associates and coworkers" in connection with this editorial work, and that he has protested vigorously but in vain against the unauthorized and misleading statements made by the promoters of the scheme in this connection.

The undersigned, having made ineffectual efforts to put a stop to the use of their names in connection with this work, take this means of informing the public that they have had no connection whatever, editorially, financially, or advisory, with this publication or its promoters—that they were not upon the "staff" of advisers of the editor nor sustained any editorial or advisory relation to him, and protest emphatically against the dishonest representation made in exploiting it, so far as they are concerned. They are informed, further, that others in the above list, no telling how many, have had as little responsibility for the publication as they.

J. C. ROLFE,
EDWARD CAPPS.

UNIVERSITY OF CHICAGO, June 11, 1906.

THE ASSOCIATED PRESS AND GERMANY.

TO THE EDITOR OF THE NATION:

SIR: Mr. Melville E. Stone of the Associated Press misunderstood me. As far as my very limited understanding goes, the Associated Press collects news through its agents and distributes this daily budget to its various customers. Whether the news be true or untrue is not its business. The only case in which fault could be found with the Associated Press would be if it were guilty of *culpa in eligendo*—for instance, if the association had entrusted a man with the collection of information in a certain district who notoriously and manifestly was unfit to be trusted, and, instead of being a matter-of-fact man, proves to be what Charles Lamb facetiously called a matter-of-lie man. Such mistakes may occur in the best-regulated families.

As to my statement, that of all the news spread broadcast over the world by the Associated Press for many years about German political affairs more than 90 per cent. was absolute falsehoods made up for no other purpose than to stir up distrust and hatred against Germany, I propose a test easy to be made by any man of good will; for the proof of the pudding is in the eating. My humble suggestion therefore is, that Mr. Melville E. Stone or *quivis ex populo* may take up any newspaper published at New York or elsewhere in this country during our last unpleasantness with Spain, and read over the news communicated to that paper by the Associated Press regarding the attitude of the German Government towards our country. After this performance, the kind reader is requested to look over what Mr. Andrew D. White has to say about the same question. I presume that Mr. Melville E. Stone will not deny that Mr. White, who at that time was our ambassador at Berlin, knows what he is talking about, and that he is a competent witness whose testimony would be received as unimpeachable evidence by any court in this or any other country.

The result of this investigation, I trust, will be that the kind reader cannot help coming to the conclusion that either Mr. White or the originator of those Associated Press dispatches, not the Associated Press, has committed an intentional violation of truth. Q. E. D.

Respectfully yours,
E. SCHRADER.

SPOKANE, WASH., June 10, 1906.

Notes.

A work of much prospective interest, 'The Criminal Prosecution and Capital Punishment of Criminals,' by our countryman, Prof. E. P. Evans, long resident in Bavaria, will be shortly issued by William Heinemann, London.

Dr. B. P. Grenfell and Dr. A. S. Hunt are hard at work on their new book (Hiteh Papyri, Part I.), which is to be put out in July by the Egypt Exploration Fund (37 Great Russell Street, London, W. C.). It will represent the publications of two years, since, owing doubtless to lack of funds, no volume was issued last summer by the Græco-Roman branch. It is hoped that early this fall the learned excavators will bring out the fragment of the lost Gospel, the most conspicuous of the finds of their last season. This document, which relates to a visit of Jesus and his disciples to the Temple at Jerusalem, and their meeting with a Pharisee, is declared to be genuine by no less an authority than Prof. D. S. Margoliouth.

One who takes up the 'Statesman's Year-Book' for 1906 (Macmillan) will be struck first by the increased bulk, and next by the numerous interesting maps grouped at the beginning. Surprise (for an American) will set in on finding the United States in the forefront of the nations statistically and politically considered: the British Empire following. He may then turn back to the editorial introduction to learn that, in a spirit of Pan-Anglo-Saxon brotherhood, the two English-speaking empires are hereafter to be in immediate juxtaposition in this Year-Book—the order being properly reversed, however, in the case of the British edition. Furthermore—and this is a very significant and valuable innovation—the United States begins to be treated by States and Territories (like Germany, for example), and no longer simply in the

gross. Each State has prefixed a brief sketch of its history and of its constitutional machinery; then come sections on area and population, justice and charity, finance, production, etc., each closing with a list of books of reference. By this happy thought, the editor of the Year-Book has confirmed its necessity to every American publicist, politician, and journalist, and to every private as well as public library.

There is nothing of the glamour of the prestige of the Clarendon Press about the sturdy, compact, inexpensive little 6x4 series of "The World's Classics," pushed now nearly to the eighty mark (New York: Henry Frowde). Still, it is a boon to have, say, Borrow's 'Bible in Spain' in one volume, and along with it to get Chaucer's Poems (in several), Anne Brontë's 'Tenant of Wildfell Hall,' Thoreau's 'Walden,' and 'Twenty-three Tales by Tolstoy,' competently translated by L. and A. Maude—viz., Tales for Children (1872), Popular Stories, A Fairy Tale, Stories Written to Pictures, Folk-tales Retold (mostly in the eighties), Adaptations from the French (1893, 1897), Stories given to aid the persecuted Jews (1903). This is plain, useful popularization, and we are glad the Press is not above it.

The 'Personal Narrative' of Elias Pym Fordham makes a worthy addition to the series of volumes on 'Early Western Travel' published by the Arthur H. Clark Co. of Cleveland. During the years 1817 and 1818, Mr. Fordham passed through Virginia, Maryland, Pennsylvania, Ohio, Indiana, and Kentucky, and resided for a time in the Territory of Illinois. Late in 1818, while Fordham was still in Illinois, a member of his family in England made a series of selections from his letters to home friends, with a view to immediate publication, but this intention was never carried out. One regrets the wholesale suppression of proper names by this early editor, though the value of Mr. Fordham's letters does not often depend upon the identity of the friends to whom they were addressed. The manuscript fell into the hands of Dr. Hubert de Laserre Spence of Cleveland, a grandson of Mr. Fordham's sister, who accompanied him on his voyage and became the wife of Charles de la Serre, a Frenchman whom she met in the Wabash country. Through Dr. Spence, the present editor, Prof. Frederic Austin Ogg, has been able to establish the authorship of the letters and to add interesting matter concerning Mr. Fordham and his family.

For the same series, Frank H. Hodder of the University of Kansas has edited John W. Audubon's journal of his trip from New York to Texas, and thence through Mexico and Arizona to the California goldfields, in 1849-1850. A biographical memoir of this son of the great naturalist is furnished by his daughter Maria. In its accumulation of misfortunes and its record of ultimate failure, the narrative is an excellent illustration of the average experience of the multitudes who flocked to California in the delirium of the gold fever of 1849. Aside from the failure of the company to realize their expectations in the search for gold, Mr. Audubon's personal hope for valuable material on birds and mammals was frustrated, since his sketches were ultimately lost in the wreck of the steamer *Central America*.

The new volume of Vernon Lee's 'Hauntings' in John Lane's uniform edition of this author's works contains no addition to the four fantastic tales which first appeared in magazine form and were afterwards published together under their present appropriate title. They are subtly devised ghost stories, in which sub-conscious influences or impressions of events and crimes which have happened ages ago, affect and direct the lives of people of other epochs through the chances of heredity or of affinities of taste or choice. They are pure invention, and contain delightful descriptions of imaginary people who become real to the reader through their definite characterization; their surroundings also leave the impression of places we have been in, so that the supernatural tells all the more grewsomely through its realistic setting. Vernon Lee has never given us more accurate and delightful descriptive pages of Italian people and country than in the tale of "Dionea of Montemirto Ligure," or of the simple conditions and bareness of modern Italian life in a provincial town, interwoven with the ancient splendor of antique and mediæval remains, than in "Amour Dure," the most interesting of the four tales. In "Oke of Okehurst" the scene is laid in an old English manor house with essentially English people and traditions; here suggestion leads to a tragic dénoûment. We recommend these tales of mystery and romance to those who are a little weary of the analytical and impressionist method, and who crave for a beginning and an end and some happenings in a story.

The third volume of Mr. Charles Evans's 'American Bibliography,' covering the years 1751 to 1764, has just been issued, though bearing the imprint 1905. It contains titles 6624 to 9890, the first book recorded being: 'An Account of the Robberies Committed by John Morrison and his Accomplices, in and near Philadelphia, 1750,' and the last: 'Zwey wahrhafte neue Zeitungen von gantz besondern Himmels-Zeichen, welches erstere sich bey der Haupt- und Seestadt Riga in Lifland zugetragen,' etc. Both of these books were, by a curious coincidence, printed by Anthony Armbruster, or Armbruester, who at one time was associated in the printing business with Benjamin Franklin—Mr. Evans says from 1754 to 1756, though both Thomas and Hildeburn say that their connection lasted till 1758.

The peculiarities of the Bankside Shakespere editing are too well known to call for comment at this date. The latest issue, volume xxi., "Love's Labour's Lost," gives the quarto of 1598 and the folio of 1623 verbatim. We detect a slip of the types: Quarto 370 and folio 393 both read: "It was fo sir," when the facsimiles read: "It was so sir" (long *s*). We can all admit cheerfully, however, that long *s* was an invention of the Evil One, a mild corrective of surquidry. The Introduction, by Dr. Isaac Hall Platt, touching upon the relation of the play to Shakspere, is readable and scholarly, and in the main sound. Nothing in it militates against the estimate expressed in our review of Furness's variorum editlon of the play. At any rate, Dr. Platt wastes no time over the "Euphuism" of "Love's Labour's Lost," but tries to connect the play with personages and events of the late sixteenth century. His conjectures are worth pondering. The conclusion has a Baconian squint; that, however, was only to be expected, and need not trouble the orthodox.

From G. P. Putnam's Sons comes a book which, except for the imprint, would seem to be privately printed. It is entitled the 'Talbot J. Taylor Collection,' and is what a cataloguer would call a small folio, standing twelve inches high; thin, and numbering only 139 printed pages. It is devoted to giving illustrations of the collection named, with only 9 full-page pictures for the exterior of the house containing it and its grounds. The house shows as a country mansion of fair size, with that strongly English appearance which is got by the semblance of half-timbered construction, and by low walls, broad roofs, and a general overgrowth of vines. It is said to exist at Cedarhurst, L. I. The very brief text deals partly with the arrangement of articles in the house and partly with the objects themselves, namely, furniture, specimens of carved wood, and a few purely decorative objects, statuettes, and the like. The illustrations are entirely in half-tone, and include many valuable specimens worthy of the attention of any student.

Few of our readers, we trust, grumble at their school rates; but a good many suspect shrewdly that the returns are out of all proportion to the money paid in. For explanation of the discrepancy we would refer to a pamphlet: 'Warum kann die amerikanische Volksschule nicht leisten, was die deutsche leistet? Von einem alten Deutsch-Amerikaner.' The pamphlet is Heft 2, Band XV. of the "Sammlung pädagogischer Vorträge," published by Marowsky in Minden, and is to be had for the modest sum of 61 pfennigs. Truly *multum in parvo*. We cannot attempt to condense what is already a model of condensation, but will give one or two general points. The causes are arranged under two main heads: (I) those for which the school authorities are not responsible; (II) those which the school authorities might remove, if they would. Under the first heading are such factors as the mixed nature of the population by reason of immigration; the migratory habits of the American people in general; the composite nature of the English language. Among the more or less remediable evils are: waste of time upon fads; antediluvian methods; sentimentality due to excess of the *Ewig-weiblich;* inadequate training of the teacher. The writer lays down his points with precision and with arithmetical directness. He is no mere fault-finder, but a genuine American, by adoption if not by birth, and his controlling motive is rational patriotism.

'Wer Ist's?' for 1906 (Leipzig: Degener; New York: Lemcke & Buechner) contains the biographies of nearly 16,000 persons, chiefly Germans, but it also embraces prominent representatives of other nations. It has all the usefulness of dictionaries of its class. In addition to the biographies, there are valuable tables of statistics, showing the increase of population, the growth of cities, the development of industrialism and trade; the relative strength of armies and navies, including warships and merchantmen in different countries; the monetary systems of all nations compared with the present standard of coinage in the Ger-

man Empire; libraries, art galleries, museums, universities, and other institutions of learning and nurseries of culture in Germany, Austria, and Switzerland; and, finally, biographies of the rulers and chief executives in all lands, beginning with the Duchy of Anhalt and ending with the United States. There is also a list of about 3,000 pseudonyms of different authors, whose real names are given. We need say no more of this annual.

The thirteenth volume of Meyer's Konversations-Lexikon (Leipzig: Bibliographisches Institut: New York: Lemcke & Buechner) extends from Lyrik to Mitterwurzer. Prominent articles are those on Meteorology, Mineralogy, Milk, Military (in divers attributions), Man, accompanied by proportionately measured-off types of the human figure from many races, Mimicry, with a colored plate illustrative of that in the insect world, Medals, with beautiful examples; Morocco especially; Mexico, with a map, and Painting. Among the maps of Madrid, Magdeburg, Milan, Mainz, Mannheim, Marseilles, etc., Metz excites attention with three (one for the battles round-about in 1870). So does the folding chart of the Mediterranean Sea and adjacent communicating seas; and further, the map of international fleet stations and defences in 1905. What might escape observation is, under *Masse*, a list of terms used in various countries for metric quantities (more differentiated than might have been expected, in adjusting them to the genius of each language), and of non-metric names in vogue before the new system prevailed. Significant is the article on the higher education for girls in Germany, which, in spite of a mediæval reference or two, really began in 1872. Equally commendable is the table, under Maritime Scientific Expeditions, by *ships* (but the greatest of all, the *Beagle*, is wanting). There is a poor, colorless notice of McKinley, with no reference to his part in forcing the Spanish war while pretending to stave it off and in retaining the Philippines, or to his bad faith in suffering the Dingley tariff to be raised after his reëlection on the money issue with the aid of tariff-reform Democrats. His part in engineering his own bill is much exaggerated.

An academic "Studienfahrt" to the classic sites of Italy and Greece, by students of the University of Berlin, will take place during the month of August. The excursion will cover a period of twenty-five days, during which visits will be made under competent direction to Genoa, Rome, Naples, Delphi, Athens, Corinth, Corfù, and Venice. While visiting the leading sites where archæological researches are being made in Greece, Professor Dörpfeld will act as guide and instructor. The number of participants will be large.

It has finally been decided to cease publishing the lecture announcements of the University of Berlin in Latin. All the faculties acted in the matter, and, after securing the consent of the Cultus Minister of Prussia, the Academic Senate resolved, that, beginning with the winter semester of 1906-7, the lecture list should appear only in German, and in three parts: one giving the subjects, the second the names of the docents, the third the hour. The programme will be edited by Prof. Dr. Palzkowski, manager of the Academic Bureau of Information (*Auskunftsstelle*). This puts an end to another specimen of the "Zopf" which the universities of the Fatherland have inherited from past generations.

—The fourth volume of Smyth's admirable edition of Franklin's Writings (Macmillan) covers six years, of which four were passed by Franklin in London. The reader cannot fail to be impressed by the absence of reports and memoranda to his official superiors during his first visit to England, when he was charged with matters of great importance to the Province, and given the use of no little money to effect the purpose of his mission. He expended the money and drew a liberal allowance for his own charges, and his bills were cheerfully paid by the Assembly in spite of some hints of extravagance and even of peculation. Yet nothing can be learned from Franklin's papers of the nature of these negotiations, and the records of the Province are quite as barren. His pamphlet on the 'Interest of Great Britain Considered,' his letters to his wife and Mary Stevenson, and an intention to compose an 'Art of Virtue' were the chief incidents of this stay in England. Strahan almost persuaded him to come into partnership with him, which would have made Franklin the King's Printer! Even his scientific experiments languished, and he rested upon what he had already accomplished. His second visit to England found him a fully developed politician, the agent of the revolt in Pennsylvania against the Proprietary Government, and an active participant in the discussions created by that "Mother of Mischief," the Stamp Act. With his pen he contributed to the newspapers, and his examination in the House of Commons has remained one of the best examples of his wisdom and shrewd foresight. He represented America, not merely Pennsylvania, while the greeting by Hume as the "first philosopher" coming from America marked the position he had attained outside of politics. While Mr. Smyth has not found much that was new in this period, his careful observance of textual accuracy much increases the value of what is printed. An occasional use of the long *s* is confusing, and the word *tous* for *tons* on p. 269 is clearly an error.

—Mr. William B. Weeden's 'War Government, Federal and State, in Massachusetts, New York, Pennsylvania, and Indiana, 1861-1865' (Boston: Houghton, Mifflin & Co.) is a laborious study of the "interplay of the National Union and the State Commonwealths which were principalities in the Civil War, especially in its early stages." A "salient point" in this study, according to the author, lies "in the contention that, if the powers of the people voluntarily thrust upon the Administration in the year following the autumn of 1861 had been energized and fully employed, the tremendous changes in the Constitution and Government of the United States would not have occurred." Incidentally, we have a narrative of the war, and discussions of the parts played in it by Lincoln, Stanton, "war governors" and "Copperheads," with sketches of Andrew, Morton, Horatio Seymour, and other leading men. It seems to us perfectly clear that Mr. Weeden has sustained his side of the "contention," if it be necessary to contend at all; because, if half the period of the war had not been taken up in "energizing and fully employing" the powers of the people, the war would have come to an end two years before it did, and hence possibly without either a draft or the abolition of slavery. But speculation of this kind leads to little or nothing. The body of the book is devoted to a narrative account of the "interplay" of Federal and State authority during the war, ending substantially in the temporary atrophy of the old State system. The narrative, well fortified by references, is marred by a good deal of feeble and confused rhetoric.

—Miss Jane Harrison's 'Mythology and Monuments of Ancient Athens' (1890) has been a useful companion of many students and travellers in Greece, as well as a teacher to many scholars in their libraries. But since the publication of that book much has been learned about early Athens, and, instead of making a vamped edition of the former work, Miss Harrison writes a new and briefer one, 'Primitive Athens' (Macmillan), in which she takes as her text the account given by Thucydides of the ancient city. The earlier book was valued particularly as embodying the latest views of Dr. Dörpfeld, who for a score of years has been the highest authority on Athenian topography, Greek architecture, and the art of archæological excavation. The new book also has had the advantage of his revision. To him it is dedicated, and Miss Harrison is most explicit in her expressions of acknowledgment to him. The favored scholars who not only have read the publications of the German Archæological Institute, but also have heard Dr. Dörpfeld lecture in the presence of the monuments, will recognize his influence on almost every page, and will be glad of this clear presentation of his views, while scholars who have not heard those lectures will welcome the book still more heartily. The main argument is for the location of the early agora, and in particular of the fountain Enneacrunus, in the valley between the Acropolis, the Pnyx, the Areopagus, and the hill of the Muses. That a narrow path led down from the Acropolis directly to the Enneacrunus, is one of the neatest of slight indications. The book discusses also the sanctuaries on the Acropolis in the seventh and sixth centuries B. C. The weight of evidence has been growing in favor of Dörpfeld's views, although these assume the careless formation of a Thucydidean sentence; and many readers, as they lay down the book, will echo the author's hope that the Enneacrunus episode "may be laid to sleep in peace," though we fear that she depreciates the firmness of the opponents of Dr. Dörpfeld's theories.

—In her mythological excursions, Miss Harrison is less likely to secure the ready adherence of her readers, though it was her interest in mythology which first drew her to the study of topography. The principles of the science of mythology are not firmly founded as yet, and many of its theories are tentative. A conservative philologist, for example, would think that Miss Harrison goes beyond her evidence when she argues that Heracles was a foreigner to Greece, an Oriental, from the fact that he presided over the gymnasium of Cynosarges, outside the gates of Athens, which was frequented by youths like Themistocles

who had foreign blood in their veins; that "Aphrodite came to the Greeks from the East, and, like most Semitic divinities, she was not only a duality, but a trinity"; that "Deucalion is a figure manifestly Oriental, a feeble copy of the archetypal Noah"; and that "the worship of Poseidon and Athena came from Libya to Attica from a people geographically remote, but with racial affinities." More convincing and interesting are the arguments to prove the later arrival at Athens of Zeus and Apollo from the fact that neither has any sanctuary on the Acropolis, although both seem to have had shrines assigned to them just outside the old Pelasgic wall. A good bibliography adds to the value of the book.

—'History in Scott's Novels,' by the Hon. A. S. G. Canning (Wessels), is a book which bears an attractive title and is not without some merit. At the same time we have been impressed by a sense that a different type of essay upon the same subject might be made more successful. Mr. Canning takes up fifteen novels in chronological sequence, from 'The Talisman' to 'Redgauntlet,' and runs through such portions of the plot as bring authentic personages into view. His main object apparently is to substantiate the dictum of Macaulay which he selects as the motto of the volume: "Sir Walter Scott has used those fragments of truth which historians have scornfully thrown behind them in a manner which may well excite their envy. He has constructed out of their gleanings works which, even considered as histories, are scarcely less valuable than theirs." Keeping this statement ever in mind, Mr. Canning loses no opportunity to show that Scott is *verbatim et literatim* an exponent of historical truth. When, in 'Ivanhoe,' John proposes that Rebecca be made Queen of Beauty, the comment runs: "This invented scene likely indicates historic truth to some extent, alike showing the unscrupulous nature of John, the helpless state of the English Jews, and the absurd prejudices of Saxons and Normans against them at this excited period of English history." The quality of Scott's genius as an interpreter of former ages and striking types of civilization is less emphasized by far than is his technical accuracy. Mr. Canning himself is not very accurate, and when he tells us that Richard, on his return from the Crusade, was imprisoned by "the Austrian Emperor," he indicates pretty clearly that in some ingenious fashion he has managed to dodge the Hohenstaufen. Some fault may also be found with the style, as illustrated by such a sentence as this: "The singular introduction of the White Lady of Avenel, a fairy adherent or relative of the heroine, Mary Avenel's family, though a pleasing idea, of course adds little if anything to the historic truths or value of this story, which leaves Scotland partly yielding to the Reformed doctrines, Mary Queen of Scots being powerless and, owing to her religion, unpopular, while Murray and Morton, the two Scottish rulers at this time, are allied with England, their country's former historic rival if not foe." A wasted opportunity will be found in what Mr. Canning does *not* say about Charles the Bold in his chapter on 'Anne of Geierstein.' The concluding sentence of the same chapter will likewise help to explain why we cannot speak of this book with any great enthusiasm: "Charles of Burgundy, perhaps the chief historical personage in 'Anne of Geierstein,' may not have been described in a play, or if he has, was not so popular a subject of dramatic attention as his astute rival and nominal Sovereign, Louis the Eleventh, who certainly never seems to have had much authority over so imperious a vassal as Charles the Bold."

—Two articles by M. Eugène d'Eichthal, which appeared originally in Paris periodicals, have just been issued in pamphlet form. The first is a friendly estimate of the late Émile Boutmy, and the second is entitled 'Quelques Notes d'un Voyage aux États-Unis,' based on the author's observations as a delegate to the international railway congress held at Washington in May of last year. M. d'Eichthal, who is a member of the Institute and the son of M. Gustave d'Eichthal, one of the most distinguished of the early Saint-Simonians, is a warm admirer of M. Boutmy, so well known for his studies of the constitution or rather political history of the United States and England. M. d'Eichthal continues: "I have heard the historians of those two countries praise the intelligent grasp which M. Boutmy showed of the fundamental causes, whence, by following different currents, springs the political and social evolution of Great Britain and America. He was neither abstract like Tocqueville, nor did he go into almost excessive detail like Bryce, nor was he oversystematic like so many commentators of English institutions. Perceiving and understanding with precision the real facts, he would pass on them a broad and exact judgment." M. d'Eichthal's account of what he saw, heard, and thinks of the United States is less sympathetic than this study of the scholarly founder of the excellent school in the Rue St. Guillaume, but, on the whole, he is as fair as could be expected under the circumstances. What he says of New York and Chicago seems to be the prevailing note of this *carnet de voyage:* "The two cities give an impression which I have never felt so deeply elsewhere—that of the disproportion of the scale of the physical man to that of the works which spring from him." Of all our public buildings which he visited, only one appears to win his entire praise, and even of this nothing is said of the exterior: "The Library of Congress is, inside, one of the finest and best arranged edifices I ever saw." M. d'Eichthal is a director in one of the great French railway companies, and his pamphlet contains several valuable reflections concerning some of our trunk lines. Touching on a subject which has recently been examined in the *Nation*, he expresses astonishment at the light way in which the American public treats railway accidents, some of which, if they happened in France, "would cause the fall of the Cabinet." The machinery of the Chicago stockyards impressed him, but the unpleasantness of the operations seemed only that inseparable from such bloody business.

—Lillian Dalbiac's 'Dictionary of Quotations (German)'—London: Sonnenschein; New York: Macmillan—raises the old question how far we have to deal in such a work with a simple anthology directed by the personal equation, or a real body of "familiar quotations" gleaned from what is taught in the schools, heard daily from the lips in conversation, or found in a reasonable range of standard literary expression. To take a concrete example, are these sentimental lines from Chamisso "familiar" (p. 126):

> "Du schauest mich an und lächelst dazu,
> Du lieber, lieber Engel du"—

or did the compiler, in making up her Chamisso posey, fail to pluck such nervous and ringing lines as these from his poem entitled "Schiller"?

> "Denn Gottes Rathschluss wird dennoch bestehen.
> Die Frucht der Zeit zu ihrer Zeit geboren,
> Und das, was an der Zeit ist, doch geschehen."

This premised, we pronounce the present collection a useful one. It would have gained by not splitting up poems, like Luther's "Ein feste Burg," for the parts most in favor. Mr. Bartlett's practice is in this respect more commendable. We are not sure, too, that anything would have been lost by omitting the metrical translations sedulously gathered or procured; and certainly where they were not already found in reputable English poetic sources, it would have been better to stick to prose versions. Examples of sad failure are numerous, but we will not cite them. Goethe naturally leads, with "Faust" at the fore, followed by his "Tasso" and "Iphigenie." Schiller is nearly as fully drawn upon (our comparison is indexical)—"Don Carlos" first, "Wallenstein's Tod," "Wilhelm Tell." Heine and Bodenstedt, Lessing, Rückert, Körner, Platen (who forced Carducci into the ranks of the translators), Richter, Geibel—so the line tapers off. In the prose extracts Bismarck is preëminent; even Luther's supply is scanty. There are subject and author indexes, showing occasionally faulty references.

—In 1904 Prof. Georg Jacob of Erlangen began to publish translations of popular Turkish texts, such as *Märchen*, current in Constantinople. Five parts of from 60 to 130 pages have so far appeared, and the collection, under the title of "Türkische Bibliothek," promises to be one of the first interest and value for modern Turkish city life and its ideas, manners, and ways. Part I., besides a valuable introduction on the art of the public story-teller in the East, gives a number of such tales, showing folk-lore origin, but very strongly flavored, too, with broad modern humor. The three parts which follow next contain translations by Dr. Theodor Menzel of Odessa from Mehmed Tevfiq's unfortunately uncompleted 'Year in Constantinople.' The author of that work, an Old Turk of Bohemian life but astounding knowledge of old-fashioned Constantinople and its ways, who died about 1897-8, intended to make it a picture of the modes of entertainment current round the year among the Turks of Constantinople who had remained unaffected by the West. He saw the coming of a new time, and sought to fix the old life as he had known and lived it in his younger years. In this way, though an uncontaminated Oriental, he was really a folklorist, and recognized how quickly popular games, usages, and amusements vanish from the memories of the later generations. Unfortunately, only five *months* appeared, three of which are translated here. Either the author's endurance failed, or the Government, for some mys-

terious reason, interfered. The present translations are not exactly easy reading; they are intended for those already interested in Turkish literature and having some knowledge of Turkish. But if they cannot be read on the run by any one, they will still be quite intelligible to the folklorist, who should greet this genuine comrade and faithful worker, though he probably never heard the word folklore. The fifth part is a translation by Professor Jacob himself of the Turkish *Märchen* and story-book 'Xoros Kardash,' 'Brother Cock,' with a storyological introduction prefixed. He has also just published a third, revised edition of his bibliography of shadow-figures, 'Erwähnungen des Schatten-Theaters in der Welt-Litteratur.' All these with Mayer & Müller, Berlin.

MODERN GERMANY.

Modern Germany: Her Political and Economic Problems. By O. Eltzbacher. London: Smith, Elder & Co.; New York: E. P. Dutton & Co. 1905. Pp. 346.

If any one of King Edward's subjects thinks everything is going wrong in Britain, he will find society in his disgruntled mood in this handsomely printed volume, parts of the contents of which have already appeared in various periodical reviews. The author, apparently an Englishman of German extraction, essays to bring to the consciousness of his insular countrymen some homely truths regarding the way in which their Teutonic neighbors threaten to forge ahead of them, unseat them in their fancied eternal preëminence in the world's commerce, and finally crush them if they remain deaf and blind to the warnings of the times. These lessons he drives home in a sledge-hammer fashion calculated to make the poor Briton tremble for his safety. In his introduction, Mr. Eltzbacher in ringing terms contrasts the splendid results achieved by paternalism and fostering governmental activity in Germany—the subordination of the individual to the State—with what he considers the meagre output of the *laissez-faire* policy and the assertion of individualism as against administrativism in Great Britain:

"If Germany had followed the policy of *laissez-faire*," says the author, "if the German Government had been subordinated to the 'will of the people,' and if it had always waited for the lead of 'The Man in the Street,' the German nation would still be a medley of peasants, university professors, philosophers, and soldiers."

And a little further on he remarks:

"Class government bas proved a failure in England, and party government, as at present carried on, is proving a failure, because the enormous forces of opposition and of obstruction act as an effective check to rapid and even to adequate political and economic progress."

Having delivered himself of his overture, Mr. Eltzbacher launches forth upon a detailed exposition, braced by copious statistics, of the "expansion of Germany." The German Empire contains 60,000,000 inhabitants. Its population has increased by one-half since the war of 1870; the rate of increase is an accelerated one; and, according to the prediction of Hübbe-Schleiden, the babes of 1906 will live to be part of a nation of 150,000,000 souls crowded within the borders of the old Fatherland, While the German people at home is thus growing at a tremendous pace, Germany abroad, Mr. Eltzbacher tries to prove, tends to disappear. According to him, the German cut loose from his moorings is unable to resist absorption by his neighbors. The Germans of Cisleithan Austria, he thinks, are bound to be absorbed very soon by the rising tide of Slavdom about them, and those of Hungary to disappear by Magyarization. In the United States and other parts of the American continent the process of denationalization will ever proceed rapidly. "This spectacle fills many thoughtful Germans with regret and sadness," and with a feeling akin to uneasiness, as our author observes in another place. "Germany is loath to strengthen foreign nations, her present and future competitors, with her emigration, which earlier of later must set in in a powerful stream." Therefore Germany must see to it that she has possessions somewhere beyond the seas into which this great stream may be made to run. "The existing German colonies do not offer an outlet for the emigration of white men. Consequently the resolution has arisen to acquire colonies in a temperate zone whenever and wherever possible." England and the United States stand in the way of Germany's ambition to become a "world Power," and Mr. Eltzbacher sees her preparing for the inevitable conflict, which is to be a death-struggle, with the Anglo-Saxon race. He warns Englishmen that it is high time to rouse themselves to this fact. "Present-day Germany owes her greatness to the sword," and it is with the sword, or rather with an invincible fleet of battle-ships, that she intends to conquer colonies. An interesting array of quotations is presented from the newspaper press and the utterances of distinguished professors to show how intent the Germans are on becoming a world Power at the expense of the Anglo-Saxons, and how dominant is the conviction of the necessity of a great navy.

The author considers it "sufficiently clear that Germany's new fleet has been created for the purpose of fighting Great Britain and the United States, or both nations, in the pursuit of colonies and of commerce." Mr. Eltzbacher has full faith in the ability of Germany to carry out her programme, and he believes further that an alliance between the Empire and France is decidedly in the air. That Germany possesses the means to create as powerful a navy as she chooses, no one will question. So many millions, so many battleships; and world commerce, not to speak of world empire, is worth the investment. But why suppose for a moment that England will stand by and not manage to keep well ahead in the race? Can she not quicken her pace as well as Germany? And, granting that the ultimate potential resources of the one Power are as great as those of the other, will not that one whose very existence depends upon her undisputed maritime predominance forever stretch the limits of exertion and sacrifice far beyond anything that the thirst for expansion can impel the other to strain up to? Germany may as well settle down to the fact that the position of Britain is well nigh impregnable from the sheer force of circumstances. As for an alliance between France and Germany against Great Britain, it is hard to imagine what inducements could tempt the French to take the chances of a defeat at the hands of the British. At first sight, indeed, England would appear to be in a position to outbid Germany altogether in the offer for such an alliance. She has only to say the word, and France can become a great colonial Power, and that without prejudice to British interests. There is Morocco, together with Tripoli, and there are the German possessions in Africa and much besides on that continent, and England could safely allow the extension of French dominion over the whole of Siam, an enlarged French Indo-China being no disadvantage to England in the event of aggressions from a resurrected China. Still, all such visions of territorial expansion are offset by the necessity for France to remain on friendly terms with Germany. The truth is, although she may be loath to admit it, the future of France lies in keeping hands off either Power. It is becoming more and more likely, as years go by, that far-seeing French statesmen, having awakened to the fact that before long, at the present rate of increase, the population of Germany will be twice that of nearly stationary France, and perhaps in the not distant future three times as great, will become convinced that the salvation of France lies in making peace once for all with her neighbor beyond the Vosges, whose military power threatens soon to become invincible. It will yet take time, however, for French patriots who are still dreaming of *revanche* to accommodate themselves to this view. In the meanwhile the one way for Germany to win over France is to offer to restore Alsace-Lorraine, but to this we cannot expect Germans ever to make up their minds.

Mr. Eltzbacher devotes a chapter to the "Expansion of Germany, and the Russian Problem." He is persuaded that the struggle between Slav and Teuton will soon have to be fought out. It will be with Constantinople as her base that Russia will get at her foe, first bursting the Austro-Hungarian realm asunder through her hold upon the Slavic peoples. The author advises Great Britain to watch the coming conflict "with the equanimity of a disinterested spectator. It would be the height of folly if she should unnecessarily join the fray."

The first half of the book before us contains, in addition to the matters which we have been discussing, interesting chapters on the German Emperor, the Armed Forces of Germany, and the Social Democratic Party. The second half is devoted to a consideration of rural industries, means of transportation, the wonderfully developed chemical industries, and the fiscal policy of Germany. There is much here for the Englishman, with his insular horizon, to ponder. In a series of chapters bristling with statistics, Mr. Eltzbacher endeavors to set forth the benefits that have flowed in Germany from the governmental policy of looking out for the economic interests of the people, as embodied in protection, state ownership of railways, the extension of water communications, and the provision of technical education; at the same time he holds up to the English, as a result of their *laissez-faire* policy, the spectacle of their decadent agriculture, the abuses to which they are subjected through the private ownership of railways, the hopeless condition of their artificial waterways, and the evils resulting from the lack of

industrial training. Unless England chooses to profit by the experience of her neighbor, he predicts that she will soon drop behind Germany in the industrial race.

Mr. Eltzbacher, throughout his book, speaks with an air of authority, and with a reiteration that becomes wearisome. His speculations and asseverations would, however, bear more weight if he were less prone to trace results to their causes along the lines that suit his thesis, and if he had less of a slap-dash way of drawing inferences from statistics. It is preposterous, for example, to conclude from the figures of the Austrian census that "the German element in Austria seems likely to disappear almost completely within a few decades." The figures given at page 16 show a barely perceptible decrease in the percentage of Germans in Cisleithania between the years 1890 and 1900 (36.04 and 35.78). But Mr. Eltzbacher would see in this "only the beginning of an enormous shrinkage which has commenced to set in." In making up his inventory of the population of Greater Germany, he estimates the German element in the United States at 11,000,000 souls! When he affirms (p. 43) that between 1857 and 1876 no less than 4,606,000 Germans emigrated to Russia, while only 4,048,000 returned to Germany, he is basing his reckoning on quicksands. What is the use of reminding Englishmen that their birthrate is rapidly falling, and is almost the lowest in Europe, when the population of England and Wales has increased in the last quarter of a century from 26,000,000 to more than 34,000,000? As a matter of fact, owing to improved sanitary conditions, the excess of births over deaths in England has continued to increase steadily in the last decade. If agriculture is sadly declining in England, while it is advancing in Germany, are we bound to agree with Mr. Eltzbacher that it is because everything is wrong in England and the other way in Germany? Granting that extortionate railway tariffs and discriminations prevail in the one, and a well-ordered railway service and cheap water transportation (not to speak of protective duties) in the other, is there nothing else that might tend to make a fundamental difference between the two countries? May not the backward-tending course of agriculture in England, as compared with Germany, be largely the expression of the fact that manufactures and commerce offer a relatively more remunerative field for labor and capital in the one country than in the other? England has not been transformed from an agricultural to an industrial country because agriculture ceased to pay, but because manufacturing paid better, and because the great sources of food supply beyond the seas were brought within easy reach. It may be true, indeed, that agricultural prosperity in Germany has gone hand in hand with an extraordinary development of manufacturing industries, but we must bear in mind that there was room for such an industrial development to take place without any very great disturbance of the rural population. The author himself admits that there has been much more room for agricultural progress in Germany than in England. His own tables, it appears to us, do not altogether bear out his roseate view of this improvement. The statistics of live stock in Germany between 1873 and 1900 (p. 183) indicate on the whole a great diminution per capita of the population. The absolute increase, in itself not large, is not at all to the point. Mr. Eltzbacher contrasts the vast activity expended in Germany on the improvement of waterways, and the resulting low cost of transportation, with the apathy exhibited in Great Britain with regard to rivers and canals. His figures are certainly striking, but he attributes too much importance to the facts brought out in his comparison, overlooking the great difference in underlying conditions in the two countries. Germany is a country of large rivers and great distances. England is relatively a small country, and there is hardly a place in it that is more than sixty miles from the sea. It is natural that railways there should monopolize so much of the traffic. The comparatively short hauls by water, given the artificial channels, would hardly result in such a gain as our author would have us believe.

ATLAY'S VICTORIAN CHANCELLORS.

The Victorian Chancellors. By J. B. Atlay. In two volumes. Vol. I.: Lord Lyndhurst, Lord Brougham, Lord Cottenham, Lord Truro. London: Smith, Elder & Co.; Boston: Little, Brown & Co. 1906.

Mr. Atlay's 'Victorian Chancellors' commences a set of judicial biographies which are full of interest. He cannot, it is true, paint effectively an historical portrait; he does not possess the marvellous insight and the equally marvellous power of expression which enables Bagehot, in a few epigrammatic words, to discover to us the very essence of the character of men so remarkable as Brougham and Lyndhurst. Still, Mr. Atlay, though neither a subtle thinker nor a masterly writer, does provide his readers with a clear, sensible, and, above all, an honest narrative of the career of the men whose lives he undertakes to write. A natural reaction, it is true, against the slanderous malignity of a notorious biographer who could never forgive the contempt for "plain John Campbell" felt and expressed by two men of genius immeasurably his superiors, has led Mr. Atlay to assume in the case of Lyndhurst and Brougham, and especially of Lyndhurst, too much the attitude of an apologist, and to attempt the dreary and thankless task of defending the indefensible. His work, however, is well done. It corrects misrepresentations to which the dignity of a chancellor who pretended to be an historian has given undue weight. Nor can any one regret that the noblest characteristics of public men such as Brougham (who, by the way, has technically no right to be included among "Victorian" Chancellors) and of Lyndhurst, who, whatever his faults, will always remain one of the glories of the English judicial system, should be forced upon the attention of readers who have nearly forgotten the last among English chancellors who could claim to be not only lawyers but statesmen.

The short biographies of Cottenham and Truro are not unworthy either of praise or of notice. Each of these men rose to deserved eminence by pure legal ability. In Lord Cottenham we have a chancellor who, by his unrivalled insight into legal principle, was the creator of law; in Lord Truro we have the rare instance of a man who retained throughout life the spirit of an industrious and acute attorney, yet with universal approval became the occupant of the woolsack. It is amusing to think that one who filled the highest position attainable by any British subject should have been so fond of and immersed in the technicalities of the law that, to use the happy words of Mr. Atlay, "We can almost hear him ejaculating with Uriah Heep, 'Oh, what a writer Mr. Tidd is, Master Copperfield!'" But every intelligent reader of the 'Victorian Chancellors' will assuredly turn away from the merely legal eminence of Cottenham and Truro, and occupy himself with Lyndhurst and Brougham, who are the two heroes of Mr. Atlay's first volume.

Though no two chancellors were more unlike one another, they displayed throughout their careers several common characteristics. They both were statesmen; they both were party leaders; they both, at a revolutionary crisis, commanded the admiration of thousands among their countrymen; they both were endowed with talents so extraordinary as to rise to genius; they both forced themselves to eminence without the aid of patronage, by simple force of character and intellectual capacity; they both belonged in spirit to an age of a lower moral tone than that of the generation of which they were the leaders. The career of each suggests the same problem: Why do the lives of men distinguished beyond all their fellows leave on the mind of every candid critic a sense of failure? Why did the intellectual triumphs of Lyndhurst miss their mark? why did the brilliancy of Brougham's victory over adverse circumstances which made him for a moment the most powerful and the most popular statesman in England, suffer sudden and final eclipse? The question is a curious one, but may easily be answered by any student who weighs the facts collected together by Mr. Atlay, and also recognizes what Mr. Atlay, with a singular want of acumen, fails to do, the decisiveness and the finality of the judgments pronounced by Walter Bagehot. Lyndhurst's career was in one sense, indeed, a perpetual success. His commanding intellect and his social charm secured for him an admiration and an affection which ceased only with his life. To his mental power a tribute has been paid by his severest censor, which makes any other appreciation feeble and useless. It should be read as a whole, though space allows us here to quote but a few words from Bagehot's discriminating eulogy:

> "There was no laxity in his intellect; everything there was braced and knit. . . . Few will recur to Lord Lyndhurst's speeches, but those who do so will find some of the best, if not the very best, specimens in English of the best manner in which a man of great intellect can address and influence the intellects of others. . . . The words seem the simplest, clearest, and most natural that a man could use. It is only the instructed man who knows that he could not himself have used them, and that few men could."

His eminence among lawyers was uncontested. There have been chancellors who have possessed a more profound and complete knowledge of the law of England, but

no man has ever brought to the discharge of judicial functions a more powerful mind, or more absolute intellectual impartiality than did Lyndhurst. Every one who came before him knew that he was in the presence of a great judge. The charm, further, and the urbanity of one of Nature's noblemen told upon every man who enjoyed his society. Lyndhurst was not exactly made for a popular hero; but when he reached old age and denounced the tyranny of Russia, or, after his eyesight had failed him, displayed from memory a mass of legal erudition that was, after all, simply the illustration of the powerful argument which (much to the detriment of the nation) prevented the creation of peers for life, not only the legal profession, but all the educated part of the English people, felt proud of the old man who, when well past eighty years of age, still proved himself a consummate legist, advocate, and orator. Yet, for all this, in Lyndhurst's career there was something lacking. He had the gifts of statesmanship, but he never was in reality the leader of the nation. In spite of his intellectual detachment he played the part without sharing the prejudices of a partisan; and even as a party man he excited distrust. He was generally believed to have been a political renegade.

Mr. Atlay tries to prove that the belief was unfounded. The full evidence for it is not now forthcoming, but Lyndhurst's apologist seems not to perceive how the case really stands. An accuser may not be able to prove that Lyndhurst ever formally deserted deliberately entertained political principles; so be it. The true accusation is, that Lyndhurst never in strictness entertained any political principles whatever. That in early life he entertained democratic sympathies, is in the highest degree probable. What is certain is, that Lyndhurst looked upon politics as a game, and took office under the Tory Government of Lord Liverpool when to join the Tories seemed the only mode of achieving political success. He was not, probably, more unprincipled than many politicians of his youth; he shared the low political morality which belonged to an age that was passing away. In the days of Peel, of Lord John Russell, and of Althorpe he was influenced by the ideas which belonged to the days of Bute and of Wedderburn. Hign intellectual power, moreover, justly exposes its possessor to be judged by a high moral standard. A man who ought to have been the foremost statesman of his day could not without disgrace adopt the moral tone which might not be unbecoming in Rigby or in Creevy.

How little, after all, Lyndhurst could be trusted, may be inferred from the fact that Mr. Atlay himself does not appear fully to believe the word of his hero, even on an occasion when Lyndhurst must be taken to pledge his word as a man of honor. "He played the game of life," writes Bagehot, "for low and selfish objects; and yet, by the intellectual power with which he played it, he redeemed that game from its intrinsic degradation." And this terrible sentence is too lenient. The playing of the political game for low and selfish objects—the treatment, indeed, of politics as a game at all—has been, and always will be, the bane of public life in England; and the wretched game is none the less degrading because the public learn to admire the skill of a player endowed with consummate ability.

Brougham had none of the fineness of Lyndhurst's intellect. He was deficient, one would have supposed, in everything which could be called charm, though, according to Sir James Mackintosh, his "address and insinuation" were so great that nothing but the bad temper which he could not conceal, could hinder him from mastering everybody with whom he came in contact. He conquered the House of Commons, though the members hated while they feared him. The old judge, in truth, who used to style Brougham, when summing up against him, "the Harangue," in an odd way hit the mark. Brougham seemed at times rather a force than a human being. Neither individuals nor the crowd could be insensible to what Bagehot describes as "such an aggressive intellect—so much *knocking* mind." From 1818 to 1832 he became, in the eyes of the English people, the incarnation of power. He was, as Mr. Atlay well points out, at his very best during the Queen's trial; he fought for his client tooth and nail; he crushed hostile witnesses; he bore down opposition; he bullied the House of Lords; he made George shake with fear. The terrible advocate was prepared, if every other resource failed, to show the whole nation the baseness of a royal voluptuary. Brougham was the man to risk revolution rather than lose his cause. Happily for himself, he was retained on the right side. The Queen, whatever her faults, was the victim of gross injustice. The English public sympathized with a woman whom they knew to be wronged. Yet her triumph, such as it was, could hardly have been secured by any man who had not possessed the superhuman energy of Brougham. This success established his power. In 1830 he was for a moment master of the situation.

Of his blunder in accepting the chancellorship, of the still grosser blunder which prevented his ever again being chancellor, the circumstances are known, and they are amply stated, though too favorably for Brougham, in Mr. Atlay's pages. The question before us is not why Brougham blundered, but why were Brougham's errors fatal to his career? Whoever considers this problem must remember that Brougham, whatever his faults, was, by the admission of his opponents, endowed with a genuine public spirit, shown, for example, in his life-long zeal for the promotion of education. He was, moreover, at the height of his power, what Lyndhurst never became, a genuine popular hero; he wielded an influence—for a short time only, it is true—which may well be compared to that of Gladstone in 1880. Yet, for all this, he fell suddenly, and fell to rise no more. Nor are the causes of this calamity in reality hard to find. Brougham's genius itself was closely connected with a certain want of sanity which, combined with the habits of his life, made hostile contemporaries suspect that, on one or two celebrated occasions, he spoke or acted under the influence of drink. He certainly exhibited at several crises of his career a kind of untrustworthiness and even cunning absolutely inconsistent with the possession of a sound judgment. With Brougham no colleague could feel safe. It is pretty clear that he sacrificed the interests of the Queen to the opportunity of display as her advocate, or to the chance of gaining a party triumph for the Whigs. No one trusted him. Those who knew him best trusted him least. Mr. Atlay, with more boldness than discretion, blames Melbourne for excluding Brougham from office. Melbourne was no purist; he was a clever man of the world who knew his own business much better than does Melbourne's critic. He felt, as a man of sense, that Brougham was less dangerous as an open enemy than as a faithless colleague.

Still, the completeness of Brougham's fall, arising as it did, in the main, from the defects of his character, was due also to external circumstances. He had the genius of a revolutionist. From 1815 to 1834, England was passing through a revolutionary crisis. For this stormy end Brougham was better suited than any other Englishman. It suited his vehement, stormy nature. But observers who thought that the passing of the Reform bill was only the first act of a sanguinary drama like that which, not fifty years before, had led to the destruction of the French monarchy, misunderstood the social condition of England and misread the signs of the time. By 1834 the political tempest had abated. What England required was an administration of genius, and the country found what it needed, not in Brougham, but in Peel. It was neither the wisdom nor the caprice of Lord Melbourne, but far rather the natural course of events, which closed Brougham's career. Fortune, too, which was kind to Brougham in his youth, was cruel to him in the later part of his life. He lived too long, and he had not the qualities which gave dignity and grace to the old age of Lyndhurst. There is something, indeed, pathetic in the affection of the two old men for one another; one likes to know that the death of Lyndhurst was a blow from which his former opponent never quite recovered. But Lyndhurst in his last years was far more fortunate than his friend. Brougham was in 1868, in the eyes of J. D. Coleridge, nothing more than "poor old Brougham"; he had survived his powers, he had almost survived his fame. Lyndhurst, on the other hand, retained his intellect and his literary and scientific tastes to the last. Men had forgotten his faults, and still admired his gifts and his grace. He died in the ninety-second year of his age. His last words, uttered in answer to some tender inquiry, were, "Happy? Yes, supremely happy."

ROSE'S DEVELOPMENT OF THE EUROPEAN NATIONS.

The Development of the European Nations, 1870-1900. By J. Holland Rose. 2 vols. Putnams.

This is a useful work, that aims to describe the steps by which the world to-day has arisen out of the conditions which prevailed fifty years ago. By the rapid summary which it supplies, we measure the completeness of the change which a single generation has witnessed. Although Mr. Rose is concerned chiefly with political and diplomatic transactions, the social states from which they spring are easily inferred, and when a war comes, he gives in great detail, with the zest of a military critic, the

progress of the campaign and the story of important battles. We miss, at times, a clear statement of the aims or ideals by which the actors in the drama were moved. Perhaps it is too soon to define the principles which have guided European evolution since 1870; and yet an attempt at such a definition ought to be made. Occasionally, through brief hints, Mr. Rose lets us infer that he has grasped the new synthesis; and then he tantalizes us by plunging again into a mass of details which seem as purposeless as a choppy sea. Nevertheless, some elements of this new synthesis are plain.

Liberty and nationality, the twin ideals which inspired the generation from 1830 to 1870, seem for the moment as obsolete as the rights of man. In 1860, Cavour and Garibaldi incarnated those principles; in 1900 England was struggling to stamp them out in South Africa, the United States in the Philippines, Russia in Finland. In 1860, the world looked with immense hope to the remedial effect of political reforms; it believed that constitutional government, the extension of the franchise, popular education, could be counted on to lift mankind rapidly towards perfection. But after 1870 reaction set in. Those panaceas began to be distrusted, for they failed to produce the desired results as quickly as had been promised; and, after all, they seemed to stop at the political and commercial, which are of the surface, whereas men were already in the toils of the industrial and the social, which are as deep as life itself.

The past thirty years have witnessed the radical changes due to the application of inventions to industry and agriculture. The telegraph, railways, and steamships make all men neighbors. Population has increased at a portentous rate—a fact which lies behind the land hunger and colonial enterprises which have determined most of the recent political action in Europe. Indeed, it is hardly an exaggeration to say that Imperialism, if we use the word in its widest sense, has been the vital characteristic of the period which Mr. Rose reviews. Liberty and nationality led directly to a united Germany and a united Italy, and to the establishment of a certain political equilibrium. Imperialism has transferred to other continents the jealousies and competitions which would earlier have been concentrated in the home nations. Hence it would appear that, while the tendency in Europe itself has been to create combinations which render war improbable, the imperial movement into which England, Russia, Germany, France, and even Italy have been swept, has set up conditions which greatly increase the probability of war. The world has at last become *solidaire*: so that a clash between outposts in the remotest part of Africa or Asia may threaten the peace of Europe.

Mr. Rose begins his work with the unification of Italy and of Germany, giving incidentally a rather minute account of the Franco-Prussian war. He then proceeds to describe the organization of the German Empire and the terrible straits out of which the French Republic emerged with a fighting chance for life. His picture of Thiers is one of the best in the book. The rest of his first volume is taken up with the Balkans, the Eastern Question, and the Russo-Turkish war. Southeastern Europe is, of course, the unfinished part of Europe, and will be as long as the Sultan remains at Constantinople; but since 1870 the process of organizing it has gone on almost without interruption, till to-day Bulgaria and Rumania have an independent existence; so virtually has Herzegovina; Servia looks to Austria and not to the Porte for instructions; Macedonia, though still under the Turk, has grown so restless that its release cannot be long delayed. In a word, the Balkan Peninsula has advanced far towards emancipating itself from the Turk, without becoming a mere Russian dependency, as political prophets until recently predicted it would become.

Mr. Rose devotes much space to these affairs, and he is justified, because it is hard to get a good account of them in English: we regret that at times his own account lacks clearness. It would have helped the general reader to lay more stress on the epochal fact that the Congress of Berlin, in turning Russia away from Constantinople, not only gave a great momentum to the Russianizing of northern and central Asia, but also permitted the reorganization of the Balkan States along non-Russian lines. His chapter on Nihilism and Absolutism in Russia contains much admirable information, but—as if to warn historians against prophesying—the events of the past year have contradicted some of his conclusions. The great strike used as a political weapon last autumn revealed unsuspected qualities in the Russian lower classes.

The only strictly European subject discussed in the second volume is the forming of the Triple and Dual Alliances, and here Mr. Rose is at his best. Then he goes on to narrate the complicated Central Asian and Afghan matters, which drew Russia and England into perilous neighborhood, and have left them in a position where the English, at least, believe war must come, sooner or later. England's control of Egypt, Gordon's quixotic heroism at Khartum, and the reconquest of the Sudan, are three parts of a continued story—a story which for mere strangeness has had few equals in modern days. The partition of Africa and the horrible record of the Congo Free State conclude the account of that continent; for Mr. Rose does not take up the Boer war, which disclosed the amazing incapacity of the English either to fight with white enemies on anything like equal terms, or to make use of modern military tactics and methods. A final chapter, on Russia in the Far East, brings the Russian and the Japanese face to face on the Pacific; but Mr. Rose refrains from entering upon the war itself.

Among many considerations which his survey suggests, we may mention these. First, since 1870, Germany has set up the standard which Europe has, willingly or not, followed, and that standard has been reactionary. Secondly, England, in spite of astonishing incapacity in foreign affairs—there never was a crazier commission, for instance, than that given to Gordon—has got the lion's share in continent carving. Next, the hope cherished in the last generation that democracies would not tolerate war has not been fulfilled, although it may justly be urged that the European governments are not yet true democracies. Fourthly, from 1870 to 1890 Bismarck's influence was paramount. Fifthly, since Bismarck, there has been no statesman of even second rank in Europe: Salisbury's ursine qualities had nothing of greatness about them, and the calamity of the Boer war already hangs like a millstone round his reputation; the German Kaiser plays for limelight effects, but it would be easy to show that the vital progress of Germany during the past fifteen years is due to the momentum which Bismarck created and directed. Finally, this period has lacked ideals. Egotism and Machiavellianism have had a free rein. The white man has assumed his right to kill or exploit black men, brown men, and yellow men, without pretending that in doing so he is obeying Christian precepts. The disintegration of what once passed for Christianity explains much of the white man's action during the past generation. Having learned from science the shibboleth, "survival of the fittest," he brands as "unfit" people inferior to himself in brute force, and proceeds to exterminate them. His favorite philospher is Nietzsche: his pet poet, Kipling of the bloody ballads; his hero, Cecil Rhodes, the glorified land and mine jobber.

Mr. Rose is somewhat uneven in style, perhaps because a large part of the sources of his work comes from newspapers and magazines. He has not put his material together with as much skill as Fyffe displayed in his 'Modern Europe,' and yet the period he deals with is so important and so interesting, and reliable works upon it are so few, that his volumes deserve a warm welcome.

Joseph Jefferson: Reminiscences of a Fellow-Player. By Francis Wilson. Charles Scribner's Sons. 1906.

Mr. Wilson's desire to bear public testimony to his admiration of Mr. Joseph Jefferson as an actor and a man may be accepted as a creditable motive for writing these Reminiscences, but not a sufficient justification for the printing of such a mass of slipshod, trivial, irrelevant, and egotistical detail. In one sense, indeed, this bulky volume may be pronounced entirely superfluous, for it sheds no ray of new light upon its subject, contains no fact of the slightest importance that was not long ago a matter of record, and substitutes for those more weighty qualities which alone can give value to anecdotal biography—such as discreet selection, explanatory comment, or illuminative comparison—a flow of continuous eulogy, always indiscriminate, and often silly. There are, doubtless, plenty of persons of the kind whose appetite for theatrical gossip is insatiable, who will read with avidity Mr. Wilson's rhapsodies over the most trifling action or utterance of the famous comedian, but many a stanch friend of Mr. Jefferson, as he closes the book, will be tempted to exclaim, with feelings akin to indignation, "An enemy hath done this." The old saying, "No man is a hero to his valet," will assume hereafter in their minds a new significance. Yet it would be the grossest injustice to suspect Mr. Wilson for a moment of the least malicious intent. The fervor of his adulation is manifestly sincere. An indifferent actor himself, the exquisite technical proficiency, delicate humor, and natural pathos of Jef-

ferson must have seemed to him almost miraculous. His appreciation of these artistic beauties has been shared by many millions of his grateful fellow-creatures. It is his misfortune, rather than his fault, that he is almost wholly deficient in the qualifications necessary for his purpose. Wise choice of material is as essential to the erection of a permanent monument as constructive skill.

The book is written with a certain amount of verbal fluency, but is chaotic in arrangement, and is stuffed at all points with the foolish chatter of the theatrical press agent. Mr. Wilson is among the most industrious of recent chroniclers of small beer. His intimacy with Mr. Jefferson was comparatively brief, and his recollections limited—good reason why these should not have been padded so egregiously, or repeated so often. If three-fourths of them had been omitted, the remainder would have been three times as valuable, as illustrations of the true Jefferson, who seems, indeed, to have had occasional misgivings as to the discretion of his enthusiastic Boswell. To give examples of the latter's many childish infelicities would occupy more space than can be spared for them. Moreover, further publicity is undesirable. It is better to refer briefly to such passages as are more worthy of Mr. Wilson's subject, and more pertinent to it. These discourse agreeably enough, but with no especial freshness of perception or expert knowledge, of Mr. Jefferson's art and personality; of his untiring industry and sure instinct in perfecting his ideals of Rip Van Winkle and the two or three other characters upon which his fame as an actor depends; of his devotion to painting and fishing; of his shrewdness as a connoisseur of pictures; of his genial and optimistic temperament and his universal popularity. But Mr. Wilson's persistent mood of ecstatic hero-worship adds no weight to his tribute, while wofully exposing his own frailty of judgment. He appears to think that "Rip Van Winkle" was a model of dramatic composition, instead of one of the feeblest, trickiest, and most immoral plays ever written, and is enthusiastic over the wholesale mutilation and unlimited "gagging" which marked the so-called all-star production of "The Rivals." As a full justification of Mr. Jefferson's career, he writes: "He was neither a reformer nor an educationalist. He did not, need not, concern himself with questions of æsthetic public import." This is one of the most pregnant sentences in the book. But did ever eulogy contain a sharper sting? Well might the sufferer exclaim, with old fat Jack, "A plague upon such friendship, say I."

As might be expected, some of Mr. Jefferson's quoted conversations are of more interest than Mr. Wilson's sentiments and opinions. He held that Macbeth was in the beginning a good man; differing on this point from Henry Irving. His argument was that Macbeth uttered some fine philosophical speeches, such as "Life's but a walking shadow," etc. Irving maintained that these were satirical, to which Jefferson replied that Macbeth spoke them when alone, and that a man was not likely to speak satirically to himself. Shakspere, he added, always made his characters reveal their true selves in their soliloquies. Irving said nothing then, but later on remarked that he could not understand how some American students of Macbeth could so misconceive his nature. At another time Jefferson, discussing oratory and acting, said: "The orator must be impressive, the actor impressionable. The orator must speak only; the actor must not only talk, but listen—and an actor who does not know how to listen has half his art to learn—and he must also show what he is feeling as he listens. The orator never has to listen. His art is therefore so much the easier." He forgot, apparently, that an orator must feel the temper of his audience, or risk failure, but there is a truth in his saying which is most imperfectly comprehended by many modern players.

Another acute remark of his was that acting was more a gift than an art. "The great value of art, when applied to the stage, is that it enables the performer to reproduce the gift, and so move his audience night after night, even though he has acted the same character a thousand times." He evidently understood the danger of acting on the impulse of the moment and thus unconsciously modifying the gesture, intonation, or expression, originally determined on as most appropriate to the fictitious character and situation. What most actors call inspiration is simply a surrender to their own private and personal impulses, which are often entirely foreign to the projected impersonation.

We conclude with a characteristic anecdote illustrative of the cheery spirit which lightened the old comedian's life to its close. Not long before his death, he was pointing out the lath supports which he had made for the tomato vines in his beloved garden. "The saddest thing in old age," he said, "is the absence of expectation. You no longer look forward to things. Now a garden is all expectation—and you often get a lot you don't expect. Therefore I have become a gardener. When you are past seventy, don't forget to cultivate a garden. It is all expectation." Herein is a reflection of the humanity and the humor which made the personality of Jefferson so fascinating both on and off the stage. There are few such nuggets in the book, and they can be found only by sifting a vast amount of rubbish.

Rise of the New West, 1819-1829. By Frederick J. Turner. [The American Nation, Vol. XIV.]. Harpers. 1906. Pp. xviii., 366.

Although Professor Turner's volume necessarily deals with a number of topics not directly connected with the rise of the West, its most distinctive contribution is in the field indicated by its title. The editor's choice of a collaborator is as happy as it was inevitable, for no one has studied the early history of the West, in certain aspects of it, more thoroughly, or written about it more instructively, than the accomplished professor of American history in the University of Wisconsin. To those who have been wont to attribute all of our important political happenings to either New England, Washington, or the South, it cannot but be both instructive and refreshing to find the significance of the central West, with its ideas and ideals, judicially and sympathetically appraised. To be sure, only the beginning of the newer Western development in the constitutional period falls to Professor Turner's share, and the exigencies of space have enforced obvious brevity; but what is presented is a welcome addition to the equipment of ordered knowledge in its field.

While the relation of the West to all the main events of the decade 1819-1829 is kept in view throughout the volume, the distinctive characteristics of the section as a whole are particularly dwelt upon in the four chapters entitled respectively "Colonization of the West," "Social and Economic Development of the West," "Western Commerce and Ideals," and "The Far West." The rapid growth of population in the region beyond the Alleghenies, the expanding agriculture and trade, and the steady conquest of new territory, became, after the War of 1812, factors of prime importance in national politics. On two of the main issues during the period, tariff and internal improvements, the demand of the West for recognition exercised a determining influence. The spirit and temper which lay back of and prompted this demand—a spirit little mindful of tradition and form, impatient of authority, ready to ride rough-shod over precedents and proprieties, and, withal, extremely self-conscious and self-contained—was little understood by the generation which saw the awakening of it; yet within scarcely more than a dozen years the West had developed a new democracy, and thenceforward pressed its claims upon the country until, with the election of Jackson, the people came into their own. It is this new Western spirit, little appreciated hitherto by historians, that Professor Turner analyzes with praiseworthy judgment and sympathy.

If any criticism is to be passed on the author's treatment of Western history, it is that strictly political matters are presented in scanty detail. On such topics as population and the settled area, roads and canals, trade and commerce, and the like, the outlines of the picture are tolerably complete. The political history of the States, on the other hand, whether separately or as a whole, is not much dwelt upon. We should like to know more about such matters as the development of State constitutions and governmental forms, especially local government; the legal modifications introduced in the process of borrowing from the older East and South; elections and office-holding, and State taxation and revenue. Doubtless, Professor Turner is right in making the development of Western democracy appear to depend chiefly on economic and national forces; but the outcome of this development in the field of State and local politics merits, we think, more attention than is here given to it.

For the rest, the volume discusses, as accompaniments of this democratic change, though not always an integral part of it, the principal events of the period: the financial crisis of 1819, the Missouri Compromise, the Monroe Doctrine, internal improvements, the tariffs of 1824 and 1828, and the tortuous course of party politics. Three early chapters on New England, the Middle States, and the South, are excellent examples of summary characterization; and the portrait of Adams is sympathetically drawn. For the first time in the volumes of this series relating to the Constitutional period, the subject of slavery holds a prominent place, the cross-play of economic and political influences being especially accent-

ed. The maps are numerous and good; those showing western Indian trading-posts and routes of travel, 1820-1835, and highways and waterways in the United States, 1826-1830, both in colors, being particularly notable. The bibliography lists much unfamiliar literature in addition to the better-known authorities.

Morocco of To-Day. By Eugène Aubin. E. P. Dutton. 1906.

What has become of our ancient friend Raisuli? Can any picture of the topsyturvydom of Morocco be complete without this Offenbachian brigand, who uses the telephone and fleeces his victims with bucket-shop adroitness—but *vi et armis*? In this age of associations for the preservation of ancient monuments, surely a society might be formed for maintaining Morocco in all its delightful incongruity. What could be more queer, more stimulating to the philosophic imagination, than the contrast of His Highness Muley Abdelaziz, Lord of the Believers, dabbling in motor launches, dirigible balloons, and polo, while all around him a political and social system tries to flourish very much as the Old Testament informs us that of the ancient Jews did in Palestine? The hodge-podge is complete. Not only do we have the confusion of races—Moors, Berbers, Jews, negroes, and Arabs—but these last may show us two adjacent tribes, one light-skinned, the other black. The four Arab tribes from the Sahara that dominate Morocco—the Makhzen—have only succeeded in erecting the flimsiest of political fabrics, in which traditions time-honored in Abraham's day still find a conspicuous place. Among them warfare has become as farcical as it was in Italy in the good old days of the Condottieri; and if trophies of victory are required to deck the Bab el-Marucq, at Fez, the heads not of the enemy but of the most handy persons are commandeered to serve the turn. The Sultan himself is the Ishmael among sovereigns. He has four capitals, and constantly wanders from one to the other, to say nothing of occasional excursions to cities of less importance.

But how picturesque, how remote, it all is! There, opposite our Carolinas, stretches a kingdom whose poets still sing their laments for the loss of Granada: "How deeply I mourn for the past that has fled. God! The days of joy and pleasure, the evenings calm and sweet! Homes of Andalusia that we have left behind us, how cruel the parting! Never shall I forget you."

M. Eugène Aubin is a French observer of Morocco, with the gift of precise, delicate, sympathetic appreciation. This he is able to convert into words, and the result is a very good book. It suffers from a certain unevenness, proceeding from the fact that the chapters were each originally contributions to reviews and journals; a little judicious compression and assimilation would have improved it. There are, however, some exceptionally good chapters, notably that on Bu Hamara, in which Moroccan warfare is described with a pleasing lightness of touch, and yet with a precision of detail that convinces the reader that here is the truth of the matter. The author describes many places, institutions, and customs, together with some of the internal incidents of the years 1902-3, but he does not deal with international questions save for a few trade statistics. The translation is fair, and contains few slips.

BOOKS OF THE WEEK.

Vivid character studies of the Clintons, Hamilton, Burr, Van Buren, Seymour, Thurlow Weed, and others dominate "A POLITICAL HISTORY OF THE STATE OF NEW YORK" (1774-1861), by D. S. Alexander, representing the Buffalo district in Congress. This book presents a history of the movements of political parties and traces the interesting causes and history of the prominent factional political divisions in New York politics. 2 vols. 8vo, $5.00 net, carriage extra.

CAROLINA LEE

The Nation.

NEW YORK, THURSDAY, JUNE 28, 1906.

The Week.

The Rate bill is, as we go to press, not yet out of Congress, and the Interstate Commerce Commission has not yet had its powers enlarged, but the effects of the campaign for railroad legislation in Washington are already to be observed in the unusual activity of the various State railroad commissions. June 20 the Kentucky Commission ordered what one railroad man characterized as an "astounding and revolutionary" series of reductions in rates to local points. Some reductions amount to as much as 25 per cent., while the "saving to shippers," which most of the rate commissions take such pride in pointing to, is estimated at $1,800,000. The newly created commission in the State of Washington gave hearings last week on five subjects: the joint rate on wheat, the freight rate on empty grain bags, the terminal rate for Bellingham, the minimum charge on small shipments, and a new station for Pasco. The Wisconsin Commission, having finished an elaborate series of hearings on the 2-cent-a-mile passenger rate, is expected shortly to deliver its decision, the general expectation being that the various roads will be classified according to earning capacity, only those in least prosperous condition being allowed to retain the present 3-cent rate.

The Indiana Commission, also newly created, on June 12 first asserted its right to prescribe freight rates, reducing the rate upon coal in a test proceeding by 40 per cent. The Illinois Commission, one of the oldest in the country, has given but little attention to rate matters since a general revision in 1900; but on June 5 it embodied the result of a long series of hearings in a sweeping horizontal reduction of rates, 10 per cent. on some classes, and 8 on others. The Minnesota Commission, which finished a comprehensive series of hearings in March, has not yet acted on the questions considered. So the news runs throughout the country, these instances being merely typical. President Roosevelt's campaign at Washington has galvanized local authorities into action. Since the Granger movement, it would probably be impossible to find a period of such general State activity in the control of the railroads. The value of it all is anything but uniform.

Senator Lodge spoke words of truth and soberness when he said in the Senate on June 20 that your most successful breeder of Socialists and Anarchists is the cynically law-defying rich man. The latter talks plaintively about the guarantees of property and the foundations of good order, but he himself is the one who does most to break them up by his assumption that the ordinary criminal laws were not intended for millionaires. This is a thesis not unfamiliar to our readers. Another one is that any unfair advantage given one man by the law, at the expense of another, is a direct provocative of social discontent. Men know that they cannot be equal except before the law; and when a law like the Dingley bill creates favored classes, and gives them the power to tax their fellows, it becomes a fruitful mother of Socialism. How does Senator Lodge know that he, by his refusal to lift a finger to remove the unjust burdens of the tariff, is not doing as much to increase the Socialist vote in Haverhill and Lynn as Nelson Morris is in Chicago? When the Massachusetts Senator got round to giving England a *tu-quoque*, he did it in the finest style of the chauvinistic art. The only difference between the English and ourselves, affirmed Senator Lodge, is that we wash our dirty linen on the housetops, and shout to everybody to observe the process, while the English drop theirs quietly into some convenient coal-hole. But that is a slight oratorical exaggeration. No one need assert that human nature is better in England than in this country; sensible Englishmen would be the last to say so. But they do think they have better laws than we against such conscienceless promoters as Whitaker Wright, and that they enforce them better. In Government scandals, too, they are as relentless as we in coming down hard on the guilty, but less sensational. Yet there is no telling how long this superiority in method may continue. The English press is rapidly developing a forty-hysteric power, comparable to our own, and the rest may come any day.

President Roosevelt has resolved to bring sweeping criminal prosecutions against the Standard Oil Company. There has been a vast amount of unofficial evidence against it; the Commissioner of Corporations has officially charged it with violating the statutes of the United States; the Interstate Commerce Commission has drawn out testimony appearing to inculpate it. Now let us have the case tried out. Even the friends of the Standard, like Dr. MacArthur and Chancellor Day, who deplore reckless charges without legal process, must rejoice to see the machinery of the law set in motion. Mr. Moody indicates the legal weapons which the Government will employ. The Standard will be prosecuted under the Anti-Trust act, under the Elkins law against rebates, and under the general conspiracy laws of the United States. It was in the net of these last that Thomas and Taggart were caught in the rebate prosecutions at Kansas City, and sentenced to the penitentiary. The Elkins act against rebates abolished the penalty of imprisonment, but forgot to repeal that statute which makes it a prison offence to conspire to violate any law of the United States. So if it can be shown that Standard Oil officers not only took rebates, but conspired in order to force the railroads to give them, the penitentiary will yawn before them.

President Roosevelt is quite right in pointing out to the appealing Hebrews the difficulty of making any official representations to Russia in the matter of the massacre of Jews. It is a process scarcely known to diplomacy. We should certainly resent it if Russia asked us to put a stop to lynchings; and, distracted though she now is, it is probable that Mr. Roosevelt is right in thinking that she would take any official remonstrances from us very ill, and that he could not "accomplish anything but harm by interference." Unfortunately for his argument, however, he did interfere under similar circumstances in 1903. It is his own fault if Hebrews are now recalling that a Presidential election was then pending.

In his annual message to Congress, President Roosevelt renewed his recommendation that the "regulation" of insurance be undertaken by the Federal Government. It was an interest "clearly national in character"; it had "outgrown the possibility of adequate State supervision"; and it was high time that the United States should "follow the policy of other nations" and undertake "adequate national supervision" of the insurance business. True, there were some who had doubts about the Constitutional power of Congress to legislate in the premises, and hence the President hoped that Congress would "carefully consider" that aspect of the matter. Congress has done so. Some months ago, the Judiciary Committee of the House reported unanimously that there was no warrant in the Constitution for what the President proposed. On Monday the Senate Committee on the Judiciary reported through Senator Spooner their unanimous opinion "that the Congress is without authority under the Constitution to supervise and regulate the business of marine, fire, and life insurance except in the District of Columbia, the

Territories, and the insular possessions of the United States." This seems to leave Senator Dryden of the Prudential as the only one to agree with Mr. Roosevelt's law.

In contrast to the general fusion spirit in Pennsylvania this year, backers of a new labor party in that State announce that they will never combine with the Republicans, Democrats, or Socialists. At the same time that State Treasurer Berry announces his definite withdrawal from the race for the Democratic nomination for Governor, leaving the way clear, barring accidents, for that party's endorsement of Emery, the choice of the "Lincoln Republicans," the laborites are to tread a lonely path. "Nobody looks out for the interests of labor," say the textile workers of the State who are most active in promoting the labor ticket. They cite the defeat of the fifty-five-hours-a-week bill in the last Legislature as proof. So far as they have gone, these new party agitators seem to have avoided the hysteria usually associated with such movements. They disclaim any other intention than to put men of their class, who know their needs, into the State Legislature. According to their plan, "labor leaders" and union officials will be kept out of the convention, and will not be nominated for office. How this desirable result is to be obtained is not explained, nor is it clearly shown how the new organization means to keep distinct from the Socialist party.

The committee authorized by the Massachusetts Legislature this year, and appointed by Gov. Guild, to study the insurance laws of the State and recommend modifications, has made its report. It was instructed especially to find out how Massachusetts might be benefited by the adoption or rejection of any of the provisions of the Armstrong report in New York, or of the measures recommended by the Chicago conference of governors, attorney-generals, and insurance commissioners. A number of changes in the State law are suggested, including a general act to govern the formation of new companies; the Wisconsin provision for requiring a yearly gain and loss exhibit; the prohibition of officers and directors from being pecuniarily interested in a company's financial transactions; the appointment by the Governor of two State directors on the board of mutual companies, with a definite prohibition of deferred dividends. In a general way, the committee followed the New York committee's findings. It was consistent in recommending that all salaries above $5,000 a year be authorized by the boards of directors only, and that pensions and political assessments be cut off.

Where the Massachusetts committee failed to agree with the Armstrong report was in these recommendations: that no limitation of the amount of new business be imposed; that no restriction upon investments by the companies be enforced, except that no more than 10 per cent. of the capital of a company shall be invested in the stocks of any one corporation; and that no limitation of expenses be required, nor any restriction of expenses within the "loadings." It is proposed that punishment for rebating shall not be extended to the receiver of the rebate, that bonuses for new business be disallowed, and that the accounting be made uniform and be subjected to periodical examination by publicly licensed accountants. Favorable comment on the committee's report is general; the only regret seems to be that no way was found effectively to reduce the cost of life insurance. Meanwhile, the investigations of Canada's Insurance Commission are proceeding, as the Toronto *Sun* notes, without any special vigor or earnestness. Even at Ottawa, however, enough has been revealed to show the necessity for "a system of inspection that will inspect, and certain provision for the jailing of directors and presidents who falsify returns or use for personal ends funds committed to them in trust."

The lawyers of the Eighth Judicial District have set the rest of the State an example in the way of taking nominations for the bench out of politics. At Buffalo on Friday five hundred representatives of the various bar associations of the district met to choose the four men best fitted for the vacancies in the Supreme Court. The chairman made an admirable statement of the object of the gathering: "We are not here," he said, "to pull wires. We want the full expression of the majority of the bar on the best fitness of men for these offices. Freedom of the bench from all entanglements, political or otherwise, is what we desire." The result of the ballot was the choice of three Republicans and one Democrat. The managers of the two party machines will hardly dare to put up candidates against this ticket of the lawyers, for voters are now independent enough in New York State both to defeat the partisan and to punish the politicians who put him forward. It is too much to expect that before the election in November the lawyers in every judicial district will be able to throw off professional inertia, overcome the opposition of the bosses, and force non-partisan nominations. The thing should, however, be done in New York and Brooklyn, where the bar is strong and well organized.

Minnesota seizes the opportunity to remind California that in one respect, at least, the Pacific Coast State is behind the times. With the destruction of San Francisco's City Hall, were destroyed all records of titles in the city, and now owners are dependent upon the more or less incomplete records of the title-guarantee companies. The municipality itself will be at the mercy of these companies when a reduplication of the burned books is attempted. But it is pointed out in Minnesota that the Torrens registration system would have minimized the damage. As it works in the Northwest, a title becomes unassailable six months after the entry of the decree of title; after that a claimant must proceed against the State, which has guaranteed the title, rather than against the individual holder. Again, in case the official record is destroyed, a certified copy in the owner's possession is taken as conclusive proof of the matter contained in the original. California had a Torrens law, but it had been ignored; what seems to be needed now is what is urged in Minnesota—that registration be made compulsory rather than voluntary. As a first step, it has been suggested that all estates passing through the probate courts shall be registered under the law.

Houston now adds her testimony to that of Galveston to show that the so-called "Texas plan" of municipal government is worth careful study. What the five commissioners, in whose hands the conduct of the city's business was placed after the flood, have done in the Gulf city, a similar body is doing in Houston. The *Post* of that city notes enthusiastically some of the things accomplished since the old spoils system was abandoned: After a year in office, the commission paid off an old and annoying floating debt of $400,000 without issuing bonds; ample school facilities have been provided, for the first time in years; systematic street cleaning has been undertaken; "graft" in the purchase of city supplies has been cut off, and a worker who gets a dollar from the city earns it; it has been voted to purchase the waterworks for the city; a vigorous and systematic paving policy has been adopted; provision has been made for a gradual retirement of outstanding city bonds; and, with all these achievements, the tax rate has been reduced from $2 on a hundred to $1.90 on a hundred. Though the experiment is too new to justify all that optimistic Texans claim for it, it is hoped that in efficiency and honesty these governing commissions, already at work or provided for in Galveston, Houston, and Dallas, will not fall below the present high standard.

Even a boss of the old school has his moments of virtuous expansion. When San Francisco faced the problem of adjusting its material affairs after the fire,

it was judged necessary to convene the State Legislature in special session and secure an extension of the statute of limitations and certain other urgent measures. Accompanying the San Francisco delegation to Sacramento was Abe Ruef, the undisputed boss of the California metropolis and the power behind Mayor Schmitz. Here, it would seem, was the "grafter's" opportunity, for the Legislature was in the mood to grant whatever the city's representatives asked for. But, according to the Sacramento *Bee*, Ruef "used his pull with the Legislature in the interest of economy and dispatch." This was merely an extension of the boss's effective work as a member of the Citizens' Relief Committee of San Francisco, where his Mayor proved to be a man of liberal ideas and balanced energy. In speaking of the need for the extra session, Ruef took occasion to dispel some of the illusions that have grown up about him. Of course, he denied being in politics for profit; more credible was his explanation that he took up Schmitz "in the first instance, not for his sake, but because I wanted to beat somebody else. And," he added significantly, "I still have enemies to punish and friends to aid." It was a definite notice to the world that, while a boss can drop his club and labor for the community in a crisis, his life-work is not of such a philanthropic nature.

M. Clemenceau's address of June 19 in the Chamber puts him on record as an opportunist Republican of the late Waldeck-Rousseau's sort. His explicit condemnation of collectivism, made in rejoinder to M. Jaurès's plea for pure Socialism, shows that the Ministry no longer depends upon Socialistic support. It will welcome, but does not need it. No recent Government has been able to maintain so independent an attitude. The practical outcome of the Clemenceau policy, which must be regarded as that of the Cabinet, is not easy to forecast. It is one thing to profess friendliness to all manner of paternalistic legislation, and quite another to pass the requisite laws. Previous governments have been well content to let their most radical measures drag along from Parliament to Parliament, or even die between sessions. In almost every case the budgetary consideration stands in the way of the proposed reform. It seems probable, then, that the ruling Radicalism will pursue a Fabian course, and confine its law-making to the old-age pension bill, already promised, and to such measures as do not draw directly upon the Treasury. M. Doumer's bill for limiting Government contracts to firms that adopt the profit-sharing idea, is a sample of the more inexpensive avenues towards M. Clemenceau's vision of reconciled labor and capital.

It is evident that the Duma has no constitutional right to demand the resignation of the Ministry, but it is also clear that nothing worth while can be done in Russia without an understanding between Parliament and the Czar. By voting want of confidence in the Ministry, the representatives of the people have shown that Premier Goremykin is not the proper man to bring about the necessary *entente*. Meantime, the old power and the new are drifting further apart, and any remaining bond of loyalty is being strained to the breaking-point. At such a moment it is foolish to stand on punctilio. If only in the hope of stooping to conquer, Nicholas II. could well afford to dismiss the present Prime Minister and call one from the Constitutional Democrats, who constitute the Parliamentary majority. Some such striking demonstration of good will would go far towards insuring real co-operation between the Czar and the National Assembly he has called into being.

As bearing on the dearth of great leaders in Russia, Frédéric Loliée writes, in the *Revue Bleue*, of the weakness of the Russian press. In the year 1900 there were in the entire Empire only eighty-nine daily papers. Of these, twenty were published in St. Petersburg and Moscow. In forty-two departments no newspapers were printed. At the time when Alexander III. pursued his extreme policy of suppression, and banished many editors and university professors, Russia was deprived of certain organs of opinion, and of certain public men who might have been powerful in directing the revolution. By the law of October 17, 1905, the Russian press was temporarily emancipated, but the liberty was only momentary. Even after the assassination of Aiexander II., when the press was obliged to exercise great prudence, political opinions were more freely expressed, affirms M. Loliée, than is now the case. While admiration of the Czar was required, and while the doubtful virtues of the Grand Dukes had to be celebrated, editors were left comparatively free to discuss matters of general political interest and of foreign diplomacy. The liberty of the press, so long as it is dependent on the will of the Minister of Interior, can scarcely be a reality. The hope of the progressive Russians is in the Duma. But freedom of speech and of action is of little value unless there be efficient leaders. The episode of Father Gapon's brief and tragic career has had a sinister effect. The revolutionary press needs not only freedom, but men.

With the crowning of the new King of Norway on Friday, there existed, for the first time in more than 500 years, three distinct Scandinavian monarchies. It might seem, then, as if the dream of a single strong Power as successor to three petty kingdoms had vanished. But those who know most about the peculiar relationship between the three kindred peoples are inclined to believe that the placing of Norway in complete equality with Sweden and Denmark really marks a step toward the union which has long been hoped for by the most foresighted men in the Scandinavian countries. The ill-feeling between Norwegians and Swedes has sometimes been said to be rooted in irreconcilable temperamental differences, but the men on either side of the Kölen Mountains know how to appreciate and befriend each other. The principal cause of the animosity between them in the past was the false position held by Norway up to the final severance of her ties with Sweden. By the total separation of Norway, a balance of power has been established that may breed trust and understanding where suspicion had held unreasoning sway. From now on, the outside forces tending to compel a federation of the Scandinavian countries should gradually increase their pressure, while the resistance to that idea from within may be expected to decrease steadily. And if, as some optimistic spirits hope, the inclusion of a liberated Finland ever becomes a possibility, then the establishment of a federation may certainly be looked for. The failure of King Oscar to send a representative to the crowning implies no ill-feeling on the part of Sweden, and can have caused no resentment in Norway. It is well understood on both sides of the Kölen that it would be impossible for the aged monarch to go further than he has gone in showing forbearance towards the nation that so brusquely took away one of his crowns. But his good wishes are known to be with the Norwegians and their new King, and friendly relations may be strengthened between the two peoples.

Port Arthur is not the only ice-free harbor which the Russians covet. There is another, Narvik, in Norway, the world's northernmost open harbor of considerable size, at which they have long cast envious glances. There are Swedes who fear that Norway, having become an independent kingdom, would be unable to repel an attempt on the part of Russia to conquer it by way of Narvik, and that Russia, having once gained a foothold on the peninsula, might bag Sweden, too. According, however, to Hugo Ganz, who recently visited this region, such fears are futile. The mountain roads from this harbor are, he declares, impregnable, being cut largely out of the sides of the precipitous rocks and only just wide enough for two wagons to pass; a single regiment, with a few guns, could defend such a pass for months.

VALEDICTION.

June 28, 1906.

The need of a prolonged rest after forty-one years of unrelaxed application in the service of the *Nation* constrains me, from the present date, to relinquish the editorial direction of this journal. With extreme reluctance, and with far profounder feelings, I take a grateful leave of my readers and of all my cherished and indispensable associates.

WENDELL PHILLIPS GARRISON.

LLEWELLYN PARK, ORANGE, N. J.

REMAINING CANAL DIFFICULTIES.

Thursday's unexpected action by the Senate in voting down the sea-level plan of canal at Panama clears away certain difficulties. The President will not now have to face the threatened awkwardness of having the two houses of Congress give him contradictory directions. He may exercise unhampered whatever powers he has under the Spooner act of 1902. His own announced preference being emphatically for a lock canal, it is probable that the sea-level project will now be put aside indefinitely. So far as Congress is concerned, it seems to have been disposed of by the speeches of Representative Burton in the House and Mr. Knox in the Senate. The strongest argument against it is on the score of navigation. Very strangely, in view of the fact that the canal was designed for shipping, almost no expert navigators have ever had anything to do with the various Commissions. The canal has been regarded as exclusively an engineering problem. So it is, in the matter of construction; but when the thing is done, the main question is how it will subserve the passing of vessels; and that consideration, in turn, ought powerfully to mould the plans of the engineers.

Of course, to the man in the street, who is perfectly ready to be the man in the canal and to settle all questions offhand, the idea of an uninterrupted passage through the Isthmus makes strong appeal. He pictures the stately ships gliding easily from ocean to ocean. Why hamper them by locks? In a burst of enthusiasm, our engaging friend Bunau-Varilla has put forth the notion of the "Straits of Panama," a sort of smaller English Channel where the big steamers might come and go with no lock to make them afraid. Such a strait might perhaps be made for a billion or two of dollars, but no one has seriously urged that. The favored sea-level canal has been a narrow cut from 150 to 300 feet wide, and with at least one tidal lock on the Pacific side. But one of the merits of Mr. Burton's effective speech was his conclusive argument against this plan. Leaving out entirely the questions of cost and time, which surely make for the lock canal, the case against the sea-level type might be rested wholly on reasoning drawn from the navigation of ships. It can be demonstrated that large steamers can be taken across the Isthmus with more speed, as well as more safety, through a lock canal, with its incidental lakes, than through a narrow cut at sea level. The cause lies in the danger of navigating a ship of great displacement in a constricted channel. Experience at Suez is ample and instructive on this point. And Mr. Burton drew also a strong argument from the records of shipping disasters in the St. Mary's River below the locks. He said:

> "Where have the accidents happened? In channels 300 feet wide or more, below the locks in St. Mary's River, where the current is not 2.64 miles, but 1 1-3 miles per hour, and at the St. Clair Flats Canal, where the current is 1¼ miles. In these channels, more than twice as wide as the prevailing width in the proposed sea-level canal, with maximum currents half the maximum there, there have been during the fifty years mentioned a long list of disasters arising from collisions, from grounding, and, perhaps worst of all, as the result of boats being driven athwart the channel. By these accidents shipping has been delayed many days, with the result that the damage to boats upon the Great Lakes has assumed very large proportions. If these boats, which until recently averaged less than 400 feet in length, may meet with such accidents in channels of greater width and in currents not so swift, what would be the probabilities in a canal where the specifications require provision for boats 800 feet long and of very much larger size? Thus, when we take into account the danger that has arisen from locks, they are far outweighed by the danger arising from the narrowness of the proposed sea-level channel, and the current that might be created in it."

President Roosevelt seems to believe that the practical determination of the type of canal removes the last obstacle. He gives the order "Cut loose" to Chairman Shonts. This is a substitute for the "Make the dirt fly" of 1904, which the charitable are expected to forget. The President will find, however, that difficulties remain. It is pretty clear, for example, that further legislation will be necessary. Mr. Roosevelt himself has expressed doubt whether the Act of 1902 yields him all the discretion required. It certainly does not in the matter of money. Section 5 authorized him to make contracts for constructing the canal, but the aggregate was "not to exceed $135,000,000." The lowest estimate is now $139,000,000, not including sanitation and terminals. Plainly, much more money will have to be voted, especially with the direction given the President to buy no supplies abroad. Furthermore, the Spooner Act prescribed that the locks should be large enough "for vessels of the largest tonnage and greatest draft now in use, and such as may be reasonably anticipated." That direction would not be carried out if the present plans for three locks in flight at Gatun is adhered to. Ships 800 feet long are already projected; the 900 or 1,000 foot steamer is expected in due time; and those locks would be too small for them.

Another aspect of the projected Gatun locks will be apt to make trouble. The feasibility of that structure is sharply challenged by many eminent engineers. Some of them maintain that the locks cannot be built at all, as planned; others contend that, even if possible, they would be exceedingly dangerous and very costly. These authorities may be wrong; but what contractors would be willing to risk millions in the face of such adverse expert opinion? Yet doing the work by contract is an essential part of the Administration's plan. We imagine it will find bids slow to appear, and that it will be compelled to sit down with the engineers, again and again (as did the French, of whose course we are giving a fine imitation), and revise the plans. Even the magic words "Cut loose" will not split the Isthmus as by a cataclysm.

THE YEAR OF FOOD LAWS.

That the packing-house disclosures and the new meat-inspection law should have come just when Congress had got to the point of passing the Pure-Food bill after a delay of seventeen years, was a mere accident, yet these two measures combine to give the year 1906 a distinction which may be even more lasting than that which it gains from railway regulation. The great result accomplished is that, from this time forward, some eighty millions of people will sit down to the table with considerably less disquietude. Methods in food production being what they are, there could be few changes more revolutionary than the requirement that things to be eaten by human beings—cattle foods have been safeguarded for a long time past—shall be sold for what they actually are.

"If we read instead of 'lying tongue,'" says Ruskin (referring to the phrase in Proverbs about "getting of treasures by a lying tongue"), "'lying label, title, pretence, or advertisement,' we shall more clearly perceive the bearing of the words on modern business. . . . Poisoning people of large estates was one [way of growing rich] employed largely in the Middle Ages; adulteration of food of people of small estates is one employed largely now." One of the incidents mentioned on Thursday last by Congressman Mann in his interesting speech on the pure-food problem illustrated admirably the ingenuity and resource, as well as the entire unscrupulousness, of the manufacturers of sophisticated food. A brand of flavored glucose was put on the market as pure honey, and in each bottle was placed a dead bee to give verisimilitude. To the mind of many a purchaser, no doubt, this industrious insect had toiled to fill the bottle, and, returning with the last load of sweetness, had succumbed on the rim of the bottle and been embalmed within its contents. This, by its ludicrousness and simplicity, makes more of an impression than the

equally dishonest work of the skilled chemists who have worked out all the manifold devices for making the counterfeit of something expensive out of something cheap. But the talk of outright "poisoning" finds small confirmation. Most adulterations are merely frauds, and the greater part of them are concerned with the odds and ends of the larder. In fact, in the vegetable portion of our national dietary much the same situation exists that has been revealed regarding the animal. It is not the meat sold over the butcher's block that is under just suspicion at present, but the sausage and canned "delicacies"; just so it is not our flour or sugar or other staples that are seriously tampered with, but canned goods, jam, catsup, and the like.

Both Congress and the food manufacturers have undergone more than one change of heart since this agitation began. Open opposition was never much of a factor. The "right" to use deceptive labels is not one for which impassioned oratory can be readily invoked. But the underground obstructive tactics of the makers of doctored whiskey, the promoters of the inhuman substitutions in the drug trade, the compounders of nostrums, as well as the food adulterators themselves, have been succeeded by a little greater degree of frankness. Faced as they now are with the necessity of selling goods at least approximately on their merits, they have made the beginning of a campaign of education. A maple-syrup manufacturer, testifying before the House committee, declared that actual sap "would not, in my judgment, supply more than 5 per cent. of the demand for syrup in the United States." It will soon be for the manufacturers to create a market for the other 95 per cent., which is wholesome enough and appetizingly flavored; but it will not be done at genuine maple-syrup prices. Some of the States, it may be added, have done excellent work under their own food laws, though they have been greatly hindered by the freedom with which goods from lax States could be shipped over their borders. Any one who has glanced over an ordinary grocer's stock knows that a considerable portion of it already bears labels which state the fact that glucose or preservatives have been used.

The feelings of Congress have unquestionably been hurt while this matter was pending. The Pure-Food bill was rarely regarded anywhere as a measure of the first importance until within the past year or so. Its repeated failures brought out but little general comment. But when its history began to be printed as a capital illustration of the Senate's treasons, stratagems, and spoils, that body began to take notice. It passed the Pure-Food bill this year with promptness and in a stringent form that nobody expected. Then the House dawdled over the bill until militant constituents began to send telegrams and name names. The Chicago scandals gave another stimulus. Thus, not only should the bill pass in an effective form as regards foods, drugs, and beverages, but the House has even been nerved to defiance of the proprietary medicine interests. It delivers a "deathblow" in the shape of a clause compelling the nostrum-makers to tell what harmful ingredients are in their wares, and shows its determination by preferring the more rather than the less stringent phraseology for this clause.

OFFSETTING CANADA'S LURES.

From Minnesota to Washington, the States on Canada's frontier have begun to discuss plans for nullifying the effects of the siren voices of Manitoba, Alberta, and Saskatchewan. The Republicans of Minnesota have nominated for Governor a man who has pledged himself to head a campaign of State developing and advertising. Newspaper advertising of the sort that California has used and Colorado is now essaying, is being recommended all along the border. Irrigation projects in the Northwest are graphically pictured and written about as if they were exactly what is required to forestall another famine in Egypt. Agricultural experiment stations are urged to explain that Minnesota wheat is the most profitable in the world, and that North Dakota live stock pays better than ranching near Calgary. "Seed-gospel" trains are made up by the railroads and the State universities, to show the farmers how to increase their yields. Everything that can be suggested to keep a man satisfied in his own country is being attempted. Still, Canada goes on calling Americans over the border, and the case is regarded as desperate.

Albert L. Cole, who is expected to lead the Republicans of Minnesota to victory this year on a "State-development" issue, points out what he conceives to be proof of the need of doing something at once. He says:

> "Unfortunately, we have fewer farmers in the State to-day than we had twelve months ago. The last census shows that there are fewer people, outside of the villages and cities, than there were ten years ago. In one of the northern counties of the State, fifty carloads of emigrant movables left the State this spring from a single station. From another small station fifteen families have gone, and from every county in the State save one, where I have made inquiries (and I have made the inquiry quite general), there is more rural population gone by far than has come. . . . Farmers worth $100,000, who have earned a life of ease, are now compelled to toil from morn till night, in order that their property shall operate as an asset instead of a liability. It is next to impossible to get desirable tenants or employ farm help at other than ruinous prices."

Mr. Cole regards it as lack of enterprise to permit a Canadian immigration bureau to exist in St. Paul while the State makes no effort to stop and hold the stream of people bound from Nebraska, Iowa, Wisconsin, and Illinois, as well as from Minnesota itself. He declares that if the State authorities took the matter up, and if the Legislature made liberal appropriations for the work, many of the settlers in the Canadian West could be tolled back.

"Where," asks a writer in *Collier's Weekly*, after showing what an immense population the Yakima Valley in Washington can support, "are our Departments of the Interior and Agriculture, and the voice of our boasted American press, that a hundred thousand of our countrymen have accepted less desirable lands under a foreign flag?" The inference apparently is that we should supplement our irrigation service with a Government press bureau to offset the public appropriations made by the Dominion Government for attracting settlers to Alberta and Saskatchewan. When a single letter of inquiry will bring a paid agent of the Canadian Government to a farmer's door, with tales of fortunes to be quickly won across the border, what chance has the humble land agent in the United States to secure buyers and add to the glory of the republic and his own bank account?

This is a somewhat new ground of complaint. Not long ago we were plainly told that the good lands in the American West were rapidly passing into private ownership. "There are only a few choice farms left," ran the announcements, "and one who fails to take advantage of this splendid opportunity to obtain a Dakota (or Minnesota, or Montana, or Idaho, or Washington, or Oregon) farm will regret it all his life." This was all a mistake, it seems. In reality, "there is more good land lying open in the United States than can be made fruitful to the highest point in half a dozen centuries. The eonian silence of the desert has only been broken by a whisper." One explanation of the change of tune is that the American railroads have succeeded in disposing of practically all of their grants of land, while the Canadian roads are just getting theirs on the market. The smaller owners in this country cannot afford the advertising that was formerly done by the railroads.

"Twenty-five years ago," Mr. Cole of Minnesota recalls, "the Canadian Northwest had the same land laws it has to-day. Much of the land was as near the railroad stations as it is to-day, and prices were a great deal lower. But no settlers were going there." Of course now that the tide is flowing steadily into the provinces, it is alleged that "advertising has done it." But advertising does not suffice to hold settlers in an undesirable country. There must be something besides statistics and colored fold-

ers to keep a wide-awake Iowa farmer contented in Manitoba. This something, it may be inferred from reports that come across the border, includes vigorous, business-like provincial government, a low rate of taxation, a good school system, and, on the remoter borders, excellent protection for life and property. It was only a few weeks ago that the first successful train robbery was committed on Canadian soil. The contrast between American frontier conditions and Dominion administration is sharpest, of course, in Alaska. There, the miner who digs in Canadian soil is protected in his rights; the laws are definite, rigid, and are strictly enforced. The chaos that has prevailed on the American side in regard to mining laws has been a matter of scandal for years.

It is to be hoped that Mr. Cole will keep up his agitation for a greater and more populous Minnesota; that the Yakima will draw its four million settlers, and that Canadian enterprise will be imitated on this side. The homeseeker may not stop to consider, as he should, the value of American citizenship, but he will be really gratified to know that the great West can provide for him for centuries. We might suggest that the best advertisement of a State would be an exhibit of what the taxpaying citizen gets in return for his assessment.

THE LAND QUESTION IN RUSSIA.

From the first, the agrarian question has been one of the most formidable to come before the Duma; and the election last week of a grand commission of 99 members to study and report thereon, shows an intention to grapple with it. "Land and Liberty" has been the steady cry of the peasant Deputies. Amnesty was well in its place; the abrogation of class prerogatives, with the emancipation and making politically equal of all citizens and races, had the approval of the peasant members of the Duma; they were naturally, too, for universal suffrage; but what the 200 representatives of the muzhiks have been constantly asking is, how they could go home without carrying back word that something had been done to help settle the land question. About that, granting that the Duma is not dissolved and that the country is not plunged into the red fury of the Seine, the most competent observers agree that the greatest legislative battle will be fought.

Russia is still the most purely agricultural country in the world. Despite the somewhat forced introduction of manufacturing industries, farming remains the chief occupation, and the peasants constitute the enormous majority of the population. Rural depopulation is not yet a Russian problem. There has been no appeal, "Back to the land"; it has been, rather, in the peasants' mouths, "The land back to us." Their extreme demand to-day is that all the land be taken from the great landlords, the nobles, and apportioned among the muzhiks.

On this proposal, Paul Leroy-Beaulieu writes with authority in the *Journal des Débats*. He shows, in the first place, how backward is Russian agriculture, as a whole. The peasants in particular, whether as small proprietors or tillers of lots assigned to them by the Mir, are not awake to modern methods of farming; their system being routine and their production far smaller than the capacity of the land. This was precisely one of the questions studied by M. Witte's commission, before the war with Japan. Its report was published in 1902, and dwelt with especial emphasis upon the agricultural evils growing out of the communal holding of land. The uncertainty of tenure, the separation of fields, the lack of implements, the failure to plan crops for the future—these and other causes inherent in the system of the primitive Mir were offered in explanation of the miserable condition of the peasants. That commission recommended the abolition of the village-community holding of lands. M. Beaulieu adds his endorsement. Otherwise, he argues, there can be no real improvement of Russian agriculture; and he declares: "In placing all the soil, or nearly all of it, under exclusive peasant proprietorship, Russia would be doing the most retrogressive and anti-economic thing imaginable. She would be fixing the feebleness of her agricultural production and of her rural population."

Theorizing about results aside, there are immense practical difficulties in the way of any such repartition of the land. The St. Petersburg correspondent of the *Temps* takes up the question in a statistical way. If one were to admit the asserted "right to land," what would be the basis of division? Some say, vaguely, as much as each peasant needs. Others, as much as he can satisfactorily work. But in either case we have to discover what the ratio is between Russia's available farm-lands and the figures of population. Says the *Temps* correspondent: "Russian land is too prolific in men, and Russian agriculture too far behind the times, to permit the apparent productivity of the soil to equal the demands of the peasants." He goes on to show that if all the land owned by the Government were divided among the muzhiks, each one would have a holding smaller than the minimum described as necessary at the time of the emancipation of the serfs. Of course, the agrarians propose to go much further and take over the lands of the nobles, with or without remuneration.

One element in the Duma does, in fact, contend for forced expropriation. Another party admits that, if the land is taken away from its present owners, compensation should be made by the State. Various sums are mentioned as necessary. The estimate of Dr. Rappoport in the *Fortnightly* is $2,500,000,000. Where could Russia find anybody to lend her any such sum? The security proposed is a land tax; but it would almost seem, *ex hypothesi*, that the land could not endure such a tax. And it would surely diminish other revenues and sources of national wealth. Russian agricultural exports would pretty surely fall off, if the muzhiks became owners of all the soil. They could not hope for years to come to equal the results obtained by the great landlords, educated in modern agricultural methods.

With such apparently insurmountable obstacles in the way of any solution of the agrarian question that would be satisfactory to the peasants, and yet with the latter, as Professor Vinogradoff admits, determined on expropriation of all Russian land now privately owned, it is not strange that pessimism reigns in regard to the outcome. Excellent and sober authorities agree that it would take twenty years to settle the land question in Russia, even if the work were at once undertaken. But will the muzhik have patience?

A MONUMENT TO DUMAS FILS.

On June 13 literary Paris unveiled its statue of Dumas *fils*. It stands in the Place Malesherbes, where Dumas *père* already presides in bronze, and some day Gen. Dumas, of Revolutionary fame, will be installed to perpetuate a most remarkable family reunion. Even for a Parisian inauguration, the supply of oratory was profuse. Victorien Sardou, the president of the committee, and in a sense the inheritor of the younger Dumas's popularity, was followed by Paul Bourget and Paul Hervieu, residuary legatees in the novel and drama of the social criticism of the master. No such occasion would have been complete without Jules Claretie to speak for the "House of Molière." All these orators, and the prefects and ministers, whose names we spare the reader, agreed that the younger Dumas was primarily a militant moralist who had chosen to become a great dramatist.

There is nothing particularly novel in the notion of the author of the 'Lady of the Camelias' as a preacher. It was the iconoclastic nature of his moral pleading that gave his plays a kind of continued forensic success in France, and made them unquestionably the most-discussed and influential plays of an intellectual sort that our century has seen. That Dumas *fils* conceived himself to be a prophet of righteousness appears in certain personal reminiscences which Paul Bourget contributes to *Figaro*, wherein the great dramatist accepts the calling in

all simplicity. The dramatist who hasn't his public with him is wrong, he told Bourget, evidently with a scorn of the homilist who preaches to empty pews. The sturdiness of his thought appears in his judgments upon conscious artists. Of Flaubert he said: "He was a giant, who laid a forest low to make a box; the box is perfect, but surely has cost too dear." To that restless analyst, Bourget, he used to say: "You seem to me like a man who, when I ask the time, draws his watch and smashes it before me, to show me how the mainspring works." Maupassant, he believed, had been hopelessly perverted by Flaubert, and he often said: "Oh, if I had only had charge of that young man; he was worth so much"—*une pareille valeur!* The thought and the phrase were worthy of the creator of "the useful drama."

It is a commonplace of criticism that the rugged morality of our author was a natural reaction against the colossal bohemianism of Dumas *père*. It has possibly not been so clearly seen that the dry, logical, propagandist theatre of the younger Dumas is the true reaction to the vague Romanticism that immediately preceded it; the 'Lady of the Camelias' was written the year that Châteaubriand's 'Mémoires d'outre-tombe' was published. It is seldom that a literary demarcation is so palpable. One must insist that the counterpoise to romantic exuberance was primarily Dumas *fils*, if only to realize that Zola's experimental novel is, properly speaking, the culmination not of a literary movement, but of a personal aberration. The art of the younger Dumas—to use a word he would probably have repudiated—was eminently sane, trenchant, and analytical. A play was an argument against a social evil; a dramatic climax was an appeal to the jury of the universal conscience. There never was a literature less literary than his, more exasperatingly insistent in its attack upon the mind and heart. "One rages against the rascal," Sarcey once said, "but he captures you and masters you, and, whatever you say, you give in."

It is unfortunate that the non-Gallic world knows him chiefly through a single play, and that chiefly in an operatic and grossly sentimentalized version. The fault is probably in part his own, for the lesson of "Camille" seems infallibly to present itself in the guise of a rather sickly social compassion, just as the heroine herself has been the forerunner of the Zazas and the whole tribe of glorified demi-mondaines. Nothing could be farther from the temper of the man than the maunderings of his imitators; and the general failure to perceive his arraignment of a social order is a striking indication of popular incapacity for general ideas of any sort. It was the feeling that he addressed, if not deaf ears, at least misunderstanding heads, that shed profound melancholy about his leonine old age.

By a curious but characteristically Parisian denaturalization of a simple theme, the sculptor Saint-Marceaux has represented Dumas *fils* as a father-confessor to the frailer sort of women. He sits proudly on, not in, his confessional, while the fair figures of the frail ones float up to gain his ear. One is not surprised that the idea emanates from Sardou. To such shifts are driven those who would poetize the downright and insistent moralist for whom women's hearts were chiefly so many documents in the great indictment against an unjust social order.

It is precisely this denunciatory quality of the man that makes the non-French reader rebel a little at the work and doubt its permanent value. Scornful of the minor perfections of French style, the younger Dumas stands aside also from its great tradition. A generation from now there will be, we judge, few to read him for his manner; few, in fact, have ever done so. And it is probable that his matter will seem a little old-fashioned. Indeed, already the problems of the plays are those of a class of men about town, discredited if not obsolete. It is to be more than suspected that, with all its technical ability, his theatre belongs, at bottom, to the class of literature of which 'Uncle Tom's Cabin' is the consummate type. We do well to erect monuments to such writers, if only that posterity may not forget the great services of those whose literary works hardly live after them. But a hundred years from now one can hardly doubt that the three statues in the Place Malesherbes will seem to stand there by grace of that "prodigal father" who cared little enough about improving mankind, but a great deal about amusing them and himself.

CATALAN SOLIDARITY.

BARCELONA, SPAIN, May 26, 1906.

There has just taken place here a civic demonstration called the Homage of Catalan Solidarity, which the outside world may have lost sight of in the whirl of the wedding festivities at Madrid, but which none the less is of great significance for Spain's future development, possibly quite as great as the English marriage. It represents the culmination of a stage in the century-old conflict between the centralizing forces at Madrid and the individual instincts of the various nationalities bound together in the sheaf of races called the Spanish nation. It is the struggle of the Magyars in Austria-Hungary, of the Poles in Russia, and so its general import is easily understood; but to know the reason of this particular display of national spirit we must go back to its immediate causes in recent history.

Last November, the Catalanist and Republican parties, which, though a minority in the Cortes, divide between them nearly all the votes of the province of Barcelona, were fighting like cats and dogs. The Catalanists had gained a few seats in the city council of Barcelona, and, on the night of November 18, held a banquet to celebrate their victory. The diners left the table after midnight, and went through the streets singing "Els Segadors"; a few hotheads came to blows with some Republicans, and heads were broken on both sides. The matter might have ended there if a question of treason had not entered into it. It was reported, perhaps with truth, that shouts of "Hurrah for free Catalonia!" and "Down with Spain!" were uttered by some of the banqueters in the mêlée. That sufficed to bring the affair before the Cortes, and a hot debate resulted, in which the Castilian politicians exaggerated the facts and accused Catalonia of wishing to secede from Spain. On November 25, a body of army officers, very likely under secret pressure from the Government, entered and sacked the offices of two prominent Catalanist newspapers in Barcelona. The public safety was declared endangered by the prevailing unrest, and the Liberal ministry of Montero Rios had barely time to vote the "suspension of constitutional guarantees" in the province of Barcelona (Nov. 30) before it fell. The suspension of guarantees introduces a sort of half-military law; the police are permitted to enter houses without a search-warrant, public meetings cannot be held without the consent of the civil governor, etc.

In short, the episode was one of the kind which appear in American dailies as a two-line item: "Anarchy in Barcelona; Military Rule Proclaimed," and which we have come to regard as regularly recurrent in the history of Catalonia. But its consequences were far-reaching. Moret, the next premier, also of the Liberal party, turned his attention first of all to the "Catalan problem," and refused to revoke the suspension until be procured a law called the "law of jurisdictions," which provided that "crimes against the country and against the army" should be tried before military, not civil tribunals. This project, a step backward in the march of civilization, was made applicable to all Spain, but really it was special legislation aimed at Catalonia. It passed by a party vote after most strenuous opposition from all the Radical minorities, and after the Republican and Catalanist deputies had withdrawn in protest from the Chamber. The guarantees were restored in Barcelona the same day that the law was gazetted.

The contest over this bill had the effect of bringing together the parties previously at war in Catalonia. The Catalanists conceived the idea of paying an imposing tribute of thanks to the Senators and Deputies who had fought the measure in the Cortes. The idea was received with enthusiasm by the people and the other parties, and was carried into effect with entire success. Every one of the twenty-eight men invited expressed sympathy with the movement of regional liberty, though not all were able to attend in person. Geographically, they represented (besides Catalonia) Navarre, Léon, Asturias, the Basque Provinces, and Valencia; politically, almost every possible belief outside the centralists, from Russiñol, the hot young Catalanist, and Salmeron, the veteran leader of

the Republicans and ex-president of the short-lived republic of '73, to Vázquez Meila, the Carlist leader, and Nocedal, the ultramontane. The Government by its repressions has succeeded only in leaguing its opponents, and instead of dampening the national ardor of the Catalans, has raised it to an unknown pitch. The money for the celebration was raised partly by the sale of commemorative medals and stamps, but also by a truly popular subscription. The names and amounts were all published, and the majority of the items were of this nature: "A good Catalan stirred up over the jurisdictions business, 2 cents; a Castilian Catalanist, 2 cents; one who loves his mother, 2 cents; one who weeps for his oppressed mother, 2 cents; I, 1 cent, she, 1 cent, the boy, 1 cent, the girl, 1 cent, the baby, 1 cent; a girl who wants autonomy, 2 cents"—and so on, some serious, some facetious, but all in sympathy.

The festival of the Homage was held on Sunday, May 20, and was an imposing demonstration, gorgeous, yet restrained, "of truly Catalan serenity and dignity," as a daily paper put it. Some called it the most brilliant spectacle ever seen in Barcelona. The balconies all over the city were hung with gay cloths in the orthodox Spanish fashion, the electric cars were decorated with flags, everywhere the four red stripes on a yellow ground of Catalonia were in evidence and nowhere the national emblem of Spain. The magnificent boulevards of this city permitted, with very little interruption of traffic, the formation of a parade over a mile long and containing 150,000 men. Four hundred towns and cities were represented in the line, and two thousand banners, many of them miracles of embroidery, marked the places of as many societies—political, patriotic, choral—and of the trades.

The promoters had issued orders that no shouts of any kind should be given, lest an opportunity be offered mischief-makers to foment conflicts; and in impressive silence the immense throng of meridional men, federal republicans, unionist republicans, monarchists, Carlists, Catholics, and free-thinkers, marched together under the Arch of Triumph in the Salón de San Juán, and filed before the statesmen who received their homage. There were no speeches. The day passed without any unfortunate incident, and Catalonia claims with reason that a people which can give proof of such unanimity and self-restraint, is quite capable of governing itself.

Just what does "Catalan Solidarity" mean? Evidently it may mean different things to the different parties concerned; but the common feeling which brought together so many divergent opinions was love for Catalonia the nationality; the feeling that a distinct race, with its own language, traditions, and literature, should not be held in bondage to a highly centralized government. In immediate practice, it means that the Catalanists and Republicans, so recently at swords' points, have agreed to forget party differences for the moment, and aid each other at the polls whenever there is danger that a Government candidate may be elected; but in a larger sense it means that all Catalans, whatever their religious or political beliefs, will unite in an effort to restore to their country her autonomy.

The awakening of the national Catalan consciousness since its forced submergence in the larger entity of Spain has been slow. The idea has never really vanished since Catalonia became united by marriage with Castile; but since the disaster of 1714, when the *fueros* were abolished and Castilian officialdom invaded the land, the fact that Catalonia was once a separate nation, with its own traditions, its own rulers, and its own laws, had dropped slowly into the background. In 1859 the revival of the Floral Games gave an impulse to the cultivation of the native language, but the movement was confined entirely to literary folk. In the seventies a few students discussed the advantages of "provincialism"; in 1885 the term "regionalism" or "Catalanism" began to be used, and within the last ten years "nationalism" has been adopted as the most adequate word. The present attitude of mind toward Spain (or, better, toward Castile) is shown in this phrase from a 'History of Catalonia' ('Historia de Catalunya'), by N. Font y Sagué, intended as a text-book of national spirit: ". . . the shameful decadence into which we fell when Quixotism invaded us, and, usurping our government, imposed itself upon the common sense and practical spirit of the Catalans." And the last words of the book, in small capitals, incite its readers "to strive that all Catalans may know and love their only country, the Catalan Nationality."* The land inhabited by the Catalans is to return as nearly as possible to the political freedom which it had previous to its union with Castile in the palmy days of Jaume the Conqueror, of Pere the Great, and Pere of the Dagger, when the united kingdom of Aragon and Catalonia claimed sovereignty over Sardinia, Sicily, Calabria, and Athens.

Does this people aim, then, at actual secession from Spain? Madrid, to suit its purposes, has often affirmed it, but unjustly. One must admit that some of the Catalanists' acts and words have lent themselves to an unfavorable interpretation. Undoubtedly some over-excited persons have shouted "Muyra Espanya!" in public, and the famous national song "Els Segadors" (The Reapers) is not exactly conciliatory toward the central Government. No account of Catalanism would be complete without mention of that song, a real stirring folk-tune, with its minor cadences, abrupt changes of time, and telling refrains. It dates from 1640, when the Catalans rose against the impositions of Philip IV. In June of that year a great crowd of reapers were in Barcelona and began the rebellion; hence the name. The original words related the events of the ensuing war, which lasted twelve years, and ended in the conservation of the jealously guarded privileges; the modern words are adapted to present exigencies. Thus, the second verse runs:

"Reapers, now the hour is come,
Now's the hour to stand alert;
So, against another June,
Let us whet full well our blades.
(Refrain):
A good sickle-stroke, defenders of the soil,
A good sickle-stroke."

This "bon cop de fals," to which the music imparts a vicious swing, certainly does not speak of love for Spain. There have been, and possibly still are, some real separatists, but they are a hopeless minority. Practically, all Catalanists realize that, although they have as good an ethnological right to separate existence as Portugal, the ties with the rest of Spain have now existed too long to permit of rupture. As Vázquez Meila puts it, "The greatest, perhaps the only, real separatist in Spain is the central Government." When the repressive measures cease, when Catalonia obtains the right to work out her own destiny within her regional limits, the Catalan will shout "Visca Espanya!" with the best.

For that matter, no one has a right to be ignorant of the professed aims of Catalanism. In 1892 an Assembly of the Unió Catalanista formulated the famous *Bases de Manresa*, to embody the ideal which was to be the goal of their efforts. Their desires were not a bit modest. Under the proposed autonomy, the central Government would have control only of international relations, of the army and navy, of the customs, of interregional affairs, including railroads, mails, telegraphs, and ports of general interest; the national budget would be raised, aside from customs revenue, on the fixed contribution system, each region to raise its quota by the method it deemed best. The region would have its own internal laws, its own Cortes, its own tribunals beyond which there could be no appeal—in short, complete control of its own affairs, including post-office and railways. All (even Government) employees should be Catalans; the *quinta*, or forced military service, would be replaced by volunteering, the region would coin its own money, and Catalan would be the official language even in communications to and from the central Government. In short, Catalonia desires independence of action greater than that possessed by any State of our Union.

Subsequent Assemblies of the Unió Catalanista have repeatedly affirmed that it would not abate a jot from the pretensions exposed in the *Bases de Manresa*. Nevertheless, from what I hear, I am inclined to think that many would be satisfied to recognize Castilian as the official language of Spain and to drop the coinage clause. The last Assembly (1904) seems to recognize the necessity of modifications when it declares that "the temporary Bases of these Assemblies are only the necessary transition from the present régime to the new one, while autonomous Catalonia is organizing itself; the concretion of the national thought, which the present movement cannot pretend to define, must be left to Catalonia when her own mistress." The language of these Assemblies, I may add, has always breathed a wholly admirable spirit of dignity, serenity, and consciousness of right.

Madrid has answered the frank statement of Catalonia's aspirations with a short-sighted policy of calumny, suspensions of guarantees and proclamations of military law. Probably the repugnance of the ministers to reform does not depend so much on real disbelief in its desirability as on purely political reasons, namely, the need of keeping in the good graces of the dynasty, and the prospective loss of 70,000

* The word *nacionalist* is used by the Catalan writers in the strict sense of a race of people bound together by common language, customs, and ideals, in contradistinction to a *nació*, which is a political state. *Nacionalism* means the cult of *nacionalitat*.

Government offices which it now fills with appointees. An amusing incident in the Cortes last November exposed them neatly. A Catalan Deputy read from a newspaper paragraphs praising the municipal freedom of London, and declariug tbat peoples which arrive at full consciousness of their ability to govern themselves will not admit external tutelage. "Separatism!" shouted the Government benches, and protested vociferously. The orator turned on them: "Do you protest? Then protest against your own leader and premier, for what I have just read is an extract from a speech of Montero Rios, delivered a year ago." So wide is the gap between theory and practice.

Iu 1893, the Catalanists decided to enter party politics with their own candidates, whose success has gradually increased with the prosecution of a vigorous campaign of education. The loss of Spain's colonies helped the cause, because it seriously affected Catalonia's commerce and furnished final proof of the ineptitude of the Government. At present they have eight Deputies in the Cortes, barely enough to form an official minority. Tbe movement of Catalan Solidarity has, however, so fired the spirits of the people that, with tbe aid of the Republicans and Carlists, the Catalanist leaders promise themselves at the next general election to make a big gap in the ranks of tbe old party Deputies from Catalonia. But it will be an uphill task; caciquism is deeply entrenched in the country districts, and, besides, there are serious dissensions, especially with the unionist Republicans, which threaten the new harmony consecrated on May 20. Yet all admit tbat a new Cortes in June, which now seems likely, would mean a loss of Government seats from this region.

An American cannot but sympathize with Catalonia. She is, with the Basque Provinces, the most energetic and enlightened part of the peninsula, and it irks her to be held back by the dead weight of illiterate Spain, as it would a skilled workman to be placed under an ignorant and malevolent boss. Her burdens are so intolerable that the wonder is she has not lost all spirit under them. Her judges, enforcing an alien code, do not know the language of the people; testimony must be given in Castilian, an immense handicap to the peasant; the civil governors of tbe provinces, even the mayor of Barcelona, are Castilians, always more or less bostile; half the city police of Barcelona are sent from Madrid, and many amusing stories are told of their attempts to find a criminal without knowing Catalan. And all this in a country whose native laws and instincts are absolutely opposed to centralization and uniformity, giving, on the contrary, the utmost latitude to towns and municipalities, and basing suffrage on a classification by heads of families and guilds.

The Catalan has been called an egotist, and in a way he is. So he obtains his autonomy, he cares very little whether the central government is a republic or a monarchy, Catholic or agnostic. Neither does he bother his head much about the other regions of Spain, whose condition is similar to his own. If he is glad to join hands with the Basque and Aragonese in a figbt for the old *fueros*, it is to strengthen his own cause, not out of sympathy for theirs; if their racial conditions are such as to justify autonomy, let them struggle for it and he will help them, but they must first show as good reason for it as he has. Tbis is the weak point in his scheme. Although the Basque Provinces are the only section of the peninsula wbose case is really parallel to that of Catalonia (and they already possess fiscal autonomy), such a radical change as he desires to bring about leads logically to general regionalism or decentralization of Spain, and autonomy after the desire of the Catalanist could hardly be granted in one region without a movement all over Spain in that direction. It would undoubtedly be wiser for him to make bis campaign more general, since success in it can come only from widespread education of the country, such as the Republican party is undertaking.

The Homage of Catalan Solidarity marked the highest point yet reached in tbe regional spirit, as it marked also a triumph of reason and moral right. There is no cause to doubt that Catalanism is destined to grow with every year, and that is why this Festival may well be more important than Alfonso's marriage. It remains to be seen whether the latter will liberalize the national policy. If it does not, the wedding represents merely a brief truce in the futile political warfare which will break out anew more fiercely than ever, before the tapestries are fairly removed from the balconies of Madrid; while the Homage at Barcelona represents an idea which will not down, and which may easily cause, not soon, but some time, a complete reconstruction of Spain's constitution.

S. Griswold Morley.

A VISIT TO ASSISI WITH PROFESSOR VENTURI.

Rome, May 24, 1906.

The Managing Committee of the American School of Classical Studies at Rome made a new departure at the beginning of the present academic year by admitting Italian Art of the Middle Ages and Renaissance to full standing as an independent discipline henceforth to be taught in the School. Their first act in this direction was the appointment of a Fellow in Mediæval and Renaissance Art, and later in the year it was announced that, beginning about the middle of February, Commendatore Adolfo Venturi, Professor of the History of Art in the University of Rome, would deliver a course of lectures, three times a week, on Italian painting in the fourteenth century. The experiment has proved a great success. It was found that about ten members of the School knew enough Italian to enable them to follow the course with profit, and their opinion may be sufficiently summed up in the assertion made to me by a well-known American classical scholar, that he had never listened to finer academic discourses. Venturi has not only an artistic insight at once critical and sympathetic, and a wide and accurate knowledge of tbe monuments of mediæval and modern art, but also, being thoroughly versed in hagiology and folk-lore, literature and history, has an intimate appreciation of the spiritual content of those ages in which the greatness of Italian art was consummated. As many readers of the *Nation* are aware, he is now engaged in writing his monumental 'Storia dell' Arte Italiana' (published by Ulrico Hoepli, Milan), of which the fourth large volume brings him only through the sculpture of the fourteenth century. His instruction, therefore, has all the force and freshness that belong to a teacher who is himself always learning.

For example, Commendatore Venturi has always maintained the theory (first advanced, I believe, by Crowe and Cavalcaselle) that Niccola Pisano was not a Pisan at all, but an Apulian. The contract for tbe pulpit of Siena, dated May 11, 1266, and still preserved in the *Archivio* of tbat city, gives his name in Latin as "Nicolaus Petri de Apulia." Milanesi, Symonds, and others, wbo still argued that he was a Tuscan, were obliged to explain the phrase *de Apulia* as referring not to him, but to his father, Pietro. However, the evidence from bis works in favor of his Apulian origin was at least as strong as that from the document, since they show a remarkable affinity to relics of classical sculpture abounding in Apulia and the South, but of which tbere was practically nothing in Tuscany. Finally, when our studies were interrupted by Carnival Week, Venturi went to Siena, and, searching the archives, found a document of the same year as the abovementioned contract, in which the sculptor is merely called "Nicolaus de Apulia."

Although most of Professor Venturi's lectures in the American School were on Giotto and his immediate followers, the other artists of tbat period, such as Cimabue, Arnolfo di Cambio, Pietro Cavallini, the Cosmati, and Duccio di Buoninsegna, did not fail to receive the notice due to their respective magnitudes. Without attempting anything like a detailed summary, I pause long enough to mention a few of our teacher's original departures. He is convinced that Giotto spent some of the years of his apprenticeship at Rome, because, in the decorative architectural details to be seen in his undoubtedly authentic works, the Cosmatesque style is frequently employed, being rendered with exceeding accuracy and skill. This intimate acquaintance with Cosmatesque he could have obtained at that time only in Rome; and since we have documentary evidence that Cimabue was called thither in the year 1272, it would be probable enough in itself that he took his promising pupil with him.

Venturi also had many things new and interesting to tell us about Arnolfo di Cambio. He assigns to this master the famous and much venerated image of St. Peter in tbe Vatican Basilica, which he considers a free copy in bronze of the marble statue of the same saint, formerly placed in the vestibule of the old Basilica, and now preserved in the Vatican crypt. In addition to the evidence from style, he points out that there is no mention of the bronze statue earlier than tbe fourteenth century, and also that the cross engraved on the key held in his uplifted hand is a detail never found until the end of the thirteenth century. He likewise gives to Arnolfo two figures of propbets in the spandrels of the arch at the entrance to the *Confessio* of the Sistine Chapel in Santa Maria Maggiore, and also the fragments of a *Presepio*, figures of St. Joseph and three Magi, now pre-

served in the ambulatory of the aforesaid *Confessio*. And whoever shall confront these pieces with the sculptures on Arnolfo's two *cibori* in San Paolo fuori le Mura and in Santa Cecilia at Rome will, I believe, be convinced that this attribution is correct. The two prophets in the spandrels of the arch of the Sistine Chapel are identical in conception, pose, and treatment with the figures similarly placed in the *ciborio* of Santa Cecilia; while the small statues of the ambulatory reveal the same power and dignity, together with an imperfect mastery of the upright human figure, as do the statues on the *ciborio* of San Paolo fuori le Mura.*

These lectures, in themselves so instructive and inspiring, had a consummation as delightful as could be imagined when Professor Venturi invited his American pupils to go with him and his class at the University on a visit to Assisi, there to study the frescoes of Giotto from life, as it were, since life is the element he had taught us to look for in the works of the mighty Florentine, *il sommo maestro*, as he is fond of calling him. Five of us were able to accept, making in all a party of about twenty-five, of which a goodly proportion were ladies. I take this opportunity of publicly acknowledging, on behalf of the American contingent, the courtesy of our Italian fellow-students, who with thoughtful kindness, though without appearance of effort, made us strangers feel that we were a part of themselves.

Professor Venturi's fifth volume, containing his chapters on Giotto, will soon be given to the public. But in the meantime, with his kind permission and assistance, I am enabled to give the readers of the *Nation* a foretaste of the rich feast therein to be provided. In the Lower Church, Venturi attributes the frescoes and decorations of the nave to a poor local master, whose work is the earliest of all. In regard to the paintings by Giotto and his school, both in the Upper and Lower Churches, he has conclusions to offer which, although they will not, of course, find universal acceptance, will certainly be received as the most authoritative utterances on this difficult and much-mooted subject, because they are based on scientific historical research, and on the most careful and penetrating investigation that has yet been given to the monuments of early Italian art. As he himself has remarked, the same thing has befallen the study of Giotto that we experience in a first visit to a strange country; at first all its inhabitants look alike, as if cast in the same mould. It is only by residence in the country and familiarity with the people that we begin to distinguish differences in physiognomy. Thus, many of the works of his pupils have been confused with those of the master himself. It is Professor Venturi's life-long knowledge of this beautiful land of Italian art that has enabled him to identify its personages with such convincing accuracy.

I first take up the allegorical pictures in the crossing over the high altar in the Lower Church, representing the marriage of St. Francis with Poverty, Chastity, Obedience, and St. Francis in Glory, and also the frescoes of the right transept, representing scenes from the life of Christ and three miracles of St. Francis. In all of these, which have been variously attributed to Giotto himself, to Giovanni di Milano, Taddeo Gaddi, Maso di Stefano, and to an unknown pupil of Giotto, Venturi sees the workmanship of two of Giotto's best and closest followers, but never the hand of the master himself, and there are certain outward and visible signs by which each of these pupils may be recognized.* The one is remarkable for his long figures, long and narrow heads, and for the clear tints in which he paints his faces. The nose he makes thin and somewhat aquiline, the eyes almond-shaped, with bright pupils, lips slightly closed and chins pointed. His hands have not the mobility and expressiveness that mark the authentic works of Giotto. As regards his inner quality, he is, as distinguished from his master, labored, hieratic and conventional. Although similar in style to Bernardo Daddi, he is not to be confused with him, and since he cannot be given a name, he may be denominated the *maestro oblungo*. The other pupil, who collaborated with the *maestro oblungo* in the Lower Church, painted the whole of the Chapel of St. Nicholas, and also worked with Giotto at Padua, was nearer his master by virtue of his direct expression and dramatic power. His outward distinguishing marks are his sombre tints, which he employs in a peculiar manner. That is, he generally uses a dark line to separate hair from forehead and beard from chin. His eyes shine out from dark sockets, and his lights and shadows are somewhat crudely rendered, with too little graduation and shading. This artist being likewise nameless, Venturi calls him the *maestro nerastro*.

Taking up first the frescoes of the right transept and applying these tests, we find that the first miracle of St. Francis, the resurrection of the child who had fallen from a window, is entirely the work of the *maestro oblungo*. The other two miracles, also dealing with the death and resurrection of a child, are by the two in collaboration. The fine crucifixion, on the other hand, is chiefly the work of the powerful and dramatic *nerastro;* only the figures of the Jews and soldiers, and also that of the last kneeling friar, bear the marks of the *maestro oblungo*. The scenes from the life of Christ in the barrel vaulting of the transept show unmistakably the same signs of the combined labor of these two worthy followers of Giotto—for there is good proof that they are not by Giotto himself. As compared and contrasted with the life of Christ as depicted by him in the Arena Chapel at Padua, they are imitations, and, in a sense, developments of the same theme. In the Nativity of Assisi the angels that descend in the act of devotion are measurably increased in number, as are also the followers of the kings in the Adoration of the Magi. Backgrounds are enlarged, houses, temples, and towers become more numerous and more magnificent. But with all this there is a distinct weakening in dramatic power. The veracious and direct genius of the master had rejected the superfluous and stale conventionalities of Byzantine art, going straight to nature for his forms. His pupils at Assisi, while borrowing his ideas and imitating his composition, both feared his simplicity and naturalism, and failed to apprehend his higher intellectual and ideal quality. In addition, therefore, to obscuring their themes with superfluous architectural details, they reintroduced Byzantine formalism of attitude, vesture, and expression, including such absurdities as the two infants in the Nativity, one held by the Virgin and the other by the midwives, and the palm tree that bows before Mary in the Flight into Egypt.

When we reach the four allegorical scenes over the high altar, the note of the cruder but more forceful *nerastro* almost entirely disappears. These celebrated paintings unquestionably reveal a fine perception on the part of their author of the mystical phase of the legend of St. Francis. But, as compared with Giotto's authentic works, they are cold, hieratic, and formal. Nevertheless, they are authentically Giottesque in their inspiration. In the four compartments of the vault in the Bardi Chapel in Santa Croce, the master had painted, simply and greatly according to his use, four solitary figures of Poverty, Chastity, Obedience, and St. Francis in Glory. The *maestro oblungo*, as he had done before, borrowed the themes, externally amplified their treatment, and diluted their spiritual content.

The Cappella della Maddalena was traditionally ascribed to Buffalmacco, but modern criticism has always shown a decided tendency to give it to Giotto himself. Following this inclination, but leading it from vagueness into almost certainty, Venturi has reasserted Giotto's claim to this marvellous shrine, and believes, moreover, that it belongs to his greatest period—that is, to the end of the third decade of the fourteenth century. 'Some parts of it, to be sure, are obviously by a much inferior hand—for example, the whole of the Journey to Marseilles, and a considerable portion of the apparition of Jesus to the Magdalen. But let him who has eyes to see diligently consider the Raising of Lazarus. Agonized supplication in the kneeling women, emanation of divine power from the figure of Jesus, the answer of the startled human spirit to his call, the religious dread of the lookers-on—all will come home to him with the force of direct communication; direct communication from a sublime intelligence which was not unworthy to share with Dante the glory of that wonderful age.

I now take leave of the Lower Church with merely the remark in passing that, according to Venturi, Simone Martini's assistant in the Cappello di San Martino was not his brother-in-law Lippo Memmi, as generally stated, but his own brother Donato. In the Upper Church, Venturi does not depart from the usual opinion of critics that the sadly faded frescoes of both transepts and of the apse are in large part by Cimabue. But in the scenes of the upper nave from Old Testament history he sees no hint of Cimabue's school, but rather the grandiose Roman style of Pietro Cavallini. The four beautiful medallions in the ceiling, representing Christ, the Madonna, St. John the Baptist, and St. Francis, he gives to Jacopo Torriti, with how much justice any one will see who shall compare them with this master's mosaics in the apse of Santa Maria Maggiore. He

*For a full treatment of these and the other works of Arnolfo, see Venturi's 'Storia dell' Arte Italiana,' vol. iv., pp. 72 ff.

*See Venturi's article, "Le 'Vele' d'Assisi," in his journal, *L'Arte*, Fasc. I., 1906, pp. 19-34.

attributes to a pupil of Torriti the scenes from the life of Christ in the upper nave, and to a pupil of Cavallini the four Doctors of the Church in the triangular spaces of the groined ceiling.

The Giottesque frescoes representing the legend of St. Francis have long been the debating ground of critics. Their opinions have varied from that of the Baron von Rumohr, who holds that the only two scenes from Giotto's own hand are the Miracle of the Water and the Sermon to the Birds, to that of Mr. Berenson, who regards as genuine the first nineteen in order from St. Francis Honored by a Simpleton down to and including St. Francis Receiving the Stigmata, but ascribes the remaining nine to a pupil.* The first impression of a competent observer will, I believe, always be that of a general unity in conception and design pervading the entire series; and Venturi, in recognition of this impress of Giotto's manner, thinks that there is no one of the pictures that was not executed under his guidance and supervision. But he sees in only six of them the true form and pressure of the master's supreme and solitary greatness. These are the first of the series, St. Francis Honored by the Simpleton; the nineteenth, St. Francis Receiving the Stigmata, and the next four in succession, The Death of St. Francis, The Apparitions of St. Francis, The Incredulous Knight of Assisi, and The Mourning Nuns of San Damiano. The incommunicable quality possessed by this elect number can be felt only by the beholder who stands in their presence. Words are powerless, as Lessing has long since taught us, to express the qualities that properly belong to the provinces of painting and sculpture. I asked Professor Venturi if he could suggest any expressions by which I might convey to my readers some guiding principle that would enable them, either from recollection of the frescoes or while studying them in the future, to appreciate the justness of his attributions. His reply was a gesture of despair. Then, seizing pen and paper, he wrote: "The master who reaches depth, both in thought and perspective; the master who is dramatic; the master who rejects traditional formalism; the master of whom the final test is that he renders life and character—this master is always Giotto."

H. EDMISTON.

*Mr. Berenson, in his 'Florentine Painters of the Renaissance' (2d ed., p. 119), most strangely asserts that these frescoes are "entirely repainted." Venturi declares flatly that they are not repainted at all; moreover, that there is no repainting in the whole Basilica, with the exception of a very little in the Lower Church.

Notes.

From Mr. John P. Kennedy, State Librarian of Virginia, we have a bulky 'Calendar of Transcripts, including the Annual Report of the Department of Archives and History.' It covers the entire collection of MSS. in the State Library in bound form, and fills 100 pages with a calendar of the Journals of the Council of Virginia (1692-1850), House of Burgesses (1619-1776), Senate (1839-1861), House of Delegates (1776-1813), the Executive (1832-1901), Civil Establishment (1775-1862), Military, Naval, and County Records, etc., etc. Then follows in ample measure a check-list of the transcripts made from the original papers in the British Record Office, London, relating to Virginian colonial affairs—Sainsbury, Winder, De Jarnette, etc. The whole concludes with a check-list of Virginiana in other departments of the State and National Government, and with an index. It would be superfluous to dwell on the great utility of this key to the sources of Virginia's history. The laborious research reflects great credit on Mr. Edward Steptoe Evans, Assistant Librarian and Acting Chief of the Department of Archives and History.

The fires of scientific controversy are still burning hotly about the facts and theories of heredity and evolution; and, as usually happens in such cases, a large part of the material of the controversy has already been wholly consumed by the conflagration. The residue which has survived the ordeal necessarily rests upon so intensely technical a foundation that it would seem almost impossible to formulate a statement of the general principles of this department of biology and the basal facts upon which these principles rest, that would be of value to any but the thoroughly informed specialist. The preparation of a manual of theoretical biology for the general scientific public is really a far more difficult enterprise than in the days of Herbert Spencer's 'Principles of Biology,' when protoplasm could be regarded as a simple, homogeneous fluid. Prof. T. H. Montgomery, in his 'Analysis of Racial Descent in Animals' (Henry Holt & Co.), has attained a large measure of success in presenting the general problems of evolution as they appear to-day, with the necessary technicalities succinctly and, on the whole, clearly presented. The relations of animals to their environment, their differentiation, modes of reproduction and variation, the physical basis of heredity, the transmutation of species, and phylogeny are broadly treated, and in some cases, as in the discussion of the old problem of the inheritance of acquired characters, the essential points of both sides of the controversy are brought into harmonious adjustment.

Prof. W. J. Sollas of Oxford University has brought together, under the title of 'The Age of the Earth' (E. P. Dutton & Co.), ten short articles which, even if they do not all deal directly with the main question, serve to show that the earth is very old to have permitted the transformation of salt-water animals into fresh-water ones, and to have allowed the many geographical changes enumerated by the author. There is an interesting account of the attempt to prove by boring that the Funafuti coral reef was formed in accordance with Darwin's theory. Professor Sollas is content with a minimum estimate of the age of the habitable earth, but admits that the discovery of radioactive energy leaves the problem of the earth's real age practically in the hands of the geologist, to be worked out independently, or at least without undue attention to the maternal chiding of the solar physicist. The chapter on the figure of the earth is perhaps the most interesting in the book. That on the history of geology is naturally a rehearsal of the esteemed labors of British geologists. A key to terrestrial history is the old story of the use of fossils made more interesting in the light of modern studies of the migrations of past faunas. The work closes with an essay on geologies and deluges; in connection with the latter subject, the well-known hypothesis of Suess is retold.

The range of authors included in Frederick Lawton's little 'Anthology of French Poetry,' from Froissart to the twentieth century (London: Sonnenschein; New York: Macmillan) is the best thing about the collection. The compiler acknowledges the limitation of length in his choice, but does not hint at retrenchment (not always indicated), which has been visited with a heavy and a chaste hand on "Le Roi d'Yvetot." Two is the ordinary allowance for each author; Béranger's other piece is "Les Marionettes." It would have been a service to reprint the little gem "Glycère," first brought to light by the future Mme. Guizot just a hundred years ago, and afterwards embalmed in a footnote by Sainte-Beuve in his first "Portrait" of the poet; not to be found, we think, in the larger collections. The schoolmasterly rap given Sainte-Beuve by De Musset in a short stanza reprobating his having let his prose lapse into a rhythmical couplet, would have usefully replaced either of the two rather monotonous selections from Musset here given. It would have had the historic and the human interest such as appertains to the three funereal poems in honor of Théophile Gautier grouped here at the end as representing Coppée, Prud'homme, and Heredia, Musset's *bite*, by the way, might have been exemplified by his "Sur une Morte." So far as we have observed, the French is very accurately printed.

Chili's former consul at Havre, now consul-general at New York, Sr. Adolfo Ortúzar, has renewed with a second volume his 'Le Chili de Nos Jours: Son Commerce, sa Production et ses Ressources,' which now, under Government subvention, will become an annual, vastly useful for those having trade or industrial relations with that country. It forms a large, generously-printed royal octavo of more than 600 pages, concluding with a map showing Chili's mineral resources. From Sr. Ortúzar's *coup d'œil* we select the items that the nitrate deposits till within a year supposed to exist in only one province, have been found in several others, thus guaranteeing the world's supply of this fertilizer for three centuries. Part of the revenue from nitrate exportation the President of the Republic proposes to use to create a fund for building workingmen's homes on easy payments to patrons of the savings-banks. The great Trans-Andean Railway is being vigorously pushed, and already the journey from Santiago to Buenos Ayres has been reduced to thirty-six hours. Another mountain railway, that to Antuco, will use electric propulsion for the first time in Chili, with the aid of river water-power. Finally, the Republic is committed to making its own iron and steel, again being the pioneer in South America. Great plants have been contracted for.

Thirteen years ago Valdés Vergara gave the nitrate deposits a lease of life for forty years at most, and this instability of the chief source of national revenue is contrasted to Chili's disadvantage by MM. A. B. Martinez and M. Lewandow-

ski in their well-wrought economic picture of 'L'Argentine au XXe Siècle' (Paris: Armand Colin). They have procured a retrospective introduction from ex-President Pellegrini, who prophesies Argentina's rise in 2000 A. D. to the present strength and prosperity of the United States. "Oh, fifty years will be enough, I am sure," was President Roosevelt's amiable concession on having this said to him by the same writer. The authors remark on France's holding aloof from investment in Argentina, being still, as they conjecture, under the spell of romantic ideas about savage conditions, such as the reading of Châteaubriand might engender for the North American continent—and probably does. This modest duodecimo work is a solid performance, perfectly objective, and under no obligations to the Government. Tables are sparsely used, and one may read with enjoyment the orderly chapters on Argentina viewed economically and from the point of agriculture, of commerce and industry, of finance. Maps of the railroad system and of the country as a whole are appended.

In 'Vita Moderna degli Italiani: Saggi di Angelo Mosso' (Milan: Fratelli Treves), the eminent physiologist of Turin discusses modern Italian life chiefly from an economic and industrial point of view. He devotes considerable space to the question of emigration, especially to the United States, and differs from most of his countrymen in his exceedingly optimistic conclusions concerning the effect of these movements upon the progress and prosperity of his native land. The author has studied this problem in both Italy and North America, and should, therefore, be well qualified to judge it. The number of Italians migrating to foreign countries has greatly increased during the last ten years, and now amounts to half a million annually, and this enormous outflow of population would be generally regarded as an immense economic loss. It must be remembered, however, that while the German emigrant severs his connection with his fatherland permanently and identifies himself wholly with his adopted country, thus contributing in no small degree to its industrial and intellectual development, the Italian, as a rule, remains in close relationship with his birthplace, to which he sends the surplus of his earnings either for investment or to aid his kinsmen. In most cases, if successful, he returns, often in middle life, bringing with him whatever wealth he possesses as well as the business capacities acquired in accumulating it. Thus, as our author maintains, the emigration of Italians contributes vastly more to the material welfare of Italy than to that of the countries to which they migrate, and should therefore be encouraged rather than restricted.

'Die Weltwirthschaft' is the title of a new year-book of commerce, edited by Dr. Ernst von Halle, of which the first volume, an international survey, has just been published by Teubner of Leipzig (New York: Lemcke & Buechner). The second volume will be devoted to Germany only, the third to all other countries. The whole work will comprise nearly 1,000 large octavo closely printed pages of encyclopædic information on the most recent happenings in the realm of trade, commerce, manufactures, banking, industrial legislation, and the like. It is made up of monographs by various experts and specialists, who describe briefly the salient events and features of the year 1905 in such matters as commercial law, railroads and telegraphs, insurance, finance, and the money market, agriculture, technical progress, tariffs, poor laws, and other related topics. The variety of subjects touched upon may be inferred from the mention of such items as the dirigible balloon, the submarine boat, our new International copyright law of March 3, 1905, modern art furniture, steam turbines, etc., etc.

Forty years' continuance of a college periodical conducted by undergraduates is a fact out of the common, but this has just been commemorated by the *Harvard Advocate* at a banquet, and the story of this journal is capably reviewed in the *Harvard Graduates' Magazine* for June. The editorial boards have turned out a remarkable number of belles-lettres men, especially verse-writers, to say nothing of scholars and critics. In proof of this, by the way, there is published every ten years a collection of 'Verses from the *Harvard Advocate*,' and we have actually before us the third series (Cambridge: The Advocate). For the rest the Medical School is the prominent feature of the present number of the *Magazine*, and its imposing new palaces are photographically shown in connection with the descriptive and retrospective text. The new methods of admission already announced in our columns are the subject of another noteworthy article; and for finis one has the Sanskrit of Professor Lanman's poem on finishing Whitney's translation of the Atharva-Veda Samhita—the English preceding on the recto of the same leaf.

Goode's formula: "An efficient educational museum may be described as a collection of descriptive labels, each illustrated by a well-selected specimen," is the subject of critical comment by two writers in the April number of *Museumskunde*. Mr. Benjamin Ives Gilman of the Museum of Fine Arts in Boston objects to its being used at all in connection with art museums, on the ground that these do not exhibit *specimens*, but *unica*. Mr. E. Ernest Lowe of the Museum and Art Gallery of Plymouth, England, in an article entitled "The Inductive Method of Installation," opposes Dr. Goode's dictum on the broader ground "that, after all, *specimens* are the primary object in a museum, and not labels." Dr. Goode's formula comes, of course, very near being paradoxical; it should be remembered that he meant by this statement to express the thoughts that "the people's museum should be much more than a house full of specimens in glass cases. It should be a house full of ideas, arranged with the strictest attention to system." So understood, with due remembrance, also, of the fact that he speaks of *educational* museums, it would seem to contain a very important truth which might well be borne in mind even in art museums. Mr. Lowe's article has its independent interest, aside from the above-mentioned criticism, in describing his method of installation and labelling, resulting in "the exhibition of carefully selected and carefully labelled specimens, followed by a summary label in which a general conclusion is drawn from the information which has preceded it." The series may not be complete, but to this the author sees no objection, as long as nothing but what is actually shown is mentioned in the labels; if the whole is planned according to a carefully-considered scheme, the gaps will in time be filled out.

The latest issue (No. 57) of the Harvard University Bibliographical Contributions deserves wide advertisement and circulation. It is a catalogue of the Molière Collection in the University Library, chiefly derived from that of the late Prof. Ferdinand Bôcher, and has been prepared with infinite pains by Thomas Franklin Currier and Ernest Lewis Gay. From this appears the wide influence of Molière upon the world's dramatic boards, and a remarkable appendix records the English imitations and translations of his plays. Another deals with Molière's portraits. Another is a most serviceable key to the collective editions, by the aid of which any play may be instantly traced to the volume which contains it. The most striking analytic service is rendered in connection with the ten volumes of *Le Moliériste*, whose contents are alphabetically listed.

The rainfall of the monsoon region of Asia is the subject of the leading article in the *Annales de Géographie* for May, the object being mainly to show the effect, not of the *amount* of precipitation, but of its duration, upon the physical and economic life of a country. The whole region, accordingly, is divided into four zones, the first being that in which the rain falls during more than eight months of the year, the others from five to eight, four, and three and less. The similarity of the vegetable life of these zones is shown by the fact that tea is cultivated in southern China, Japan, Annam, and Ceylon—four countries where the annual precipitation, though differing greatly in amount, is spread over the whole year. Prof. Cvijić of the University of Belgrade shows how the struggle for supremacy in Macedonia between the different Balkan nationalities renders the various ethnographic maps and statistics absolutely unreliable. As an illustration of his point he gives a table of statistics by different writers. The Servian says that there are 2,048,320 Serbs and 57,600 Bulgarians; the Bulgarian claims 1,184,036 Bulgarians and 700 Serbs; while a Greek gives 454,700 as the total number of both peoples.

The rainfall of Africa is the principal subject of Petermann's *Mitteilungen*, number four. To a summary of the observations in different parts of the continent is added a colored map and a list of 368 stations with their average annual precipitation. The largest amount noted, over 10,000 mm., is on the Kamerun coast. The schedule of courses of lectures on geography to be given during the summer semester in thirty-eight German, Austrian, and Swiss universities is suggestive. The geography of the commerce of the world is naturally the leading subject at Leipzig, while at Danzig there is a course upon the German colonies as compared with those of other European countries, some phase of this subject being treated by many of the universities. Among the minor contents of this number are articles on recent volcanic

eruptions in Samoa and the geology of Sumatra.

Misled by similarity of binding as well as of contents, we last week classed among the Arthur H. Clark Co.'s "Early Western Travels" the inedited works, 'Fordham's Personal Narrative' and 'Audubon's Journal.' They are not reprints; but this really was made apparent in our notice.

—With the publication of Part 8, the Second Catalogue of the Library of the Peabody Institute (Baltimore, 1896-1905) stands completed. These volumes not only register the accessions made to the Library since the appearance of the previous parts, but include many references to older books which it was not possible to include in the earlier catalogue. The thirteen volumes constituting the whole work contain some 658,000 entries, and form a complete index or dictionary of the 168,000 books and pamphlets in the Library. This disproportionate ratio of entries per volume is due to a very extensive system of analytical references to parts of volumes, and it is this which constitutes the distinctive feature of the work and raises it from the level of a mere library catalogue to the rank of a valuable bibliographical tool. Distributed under their appropriate author and subject-headings are to be found thousands of entries for articles in periodicals, publications of American and foreign learned societies, Government publications, collections like those of the Abbé Migne and Muratori, the "Monumenta Germaniæ Historica," the various collections of French historical memoirs, and even entries for single chapters of important works of lesser extent.

—The Second Catalogue exhibits the distinctive features of the first, with improvements in typography and arrangement. Much greater attention has been paid to indexing scientific works, these having been to a great extent intentionally passed over in the earlier catalogue. There is, indeed, some question as to the wisdom of continuing the subject analysis of the English and American periodicals, considering that this work has now been done most comprehensively by so firmly established and so well-known a publication as 'Poole's Index,' and its continuations. On the other hand, the author-entries for articles in these same periodicals are useful, and are not contained in 'Poole.' The inclusion of references to articles in various foreign periodicals is especially welcome. A notable feature of the new catalogue consists in the long tables of contents of the works of famous Americans, as Washington (66 columns), Jefferson (65 columns), and Jay (16 columns). The alphabetical arrangement of the separate items of these tables makes them convenient to consult as indexes, and the distribution of the same items throughout the catalogue under the proper subject-headings cannot but be useful. The long arrays of entries under many of the headings will often be of value. Especial mention should be made of the author and title-index of plays under the word *Drama* (83 columns), containing references to the complete works of the dramatists and to well-known collections of plays, as "Bell's British Theatre." Also worthy of notice are the sections devoted to England, English, and Great Britain (in all nearly 300 columns), France and French (153 columns), United States (363 columns), and other countries. We remark further the seventeen columns devoted to Charles I. of England, containing a catalogue of a noteworthy pamphlet collection. One defect in the arrangement of the catalogue is the division into two or more parts of the alphabetical table of contents for such publications as the Reports of the U. S. Bureau of Ethnology. This is due to the practice of splitting up such series of reports into periods and entering each under the director of the Bureau for the period concerned, rather than placing all together under the name of the Bureau as heading. Considered as a library catalogue, the work well fulfils its acknowledged aim of answering the three questions: "What books are in the library? Does it contain a certain book? What books does it contain relating to a particular subject?"

—That students of comparative literature do not necessarily devote themselves to forgotten and insignificant texts is sufficiently shown by the writings of Prof. Arturo Farinelli of Innsbruck, who is perhaps the most eminent living investigator in that field. His two articles on the relations of Voltaire to Dante, published during the present year in the *Studien zur Vergleichenden Literaturgeschichte* at Berlin, may be taken as a model for the scholarly treatment of an important and interesting subject. These articles will ultimately form a part of a comprehensive work on Dante in France—a general subject of which various phases have already been treated by Farinelli himself, and by Oelsner, Dejob, Bouvy, Counson, and other writers. With abundant detail, Farinelli makes plain that the unfavorable opinion which Voltaire is known to have held of Dante was no whim, but a conviction founded on principles of literary criticism which were generally accepted in the eighteenth century. Voltaire explored all branches of human knowledge, but any investigation requiring time and patience was apt to discourage him, so that he rarely studied any subject deeply. Although he prided himself on his knowledge of Italian, and read Ariosto with ease, he found so many difficulties in the 'Divine Comedy' that he confined his attention to the "Inferno," and scarcely penetrated below the surface of that. Even his conscientious efforts to translate or summarize certain passages resulted in little better than a caricature. Moreover, far from revolutionary in his literary criticism, he rarely went against accepted judgments. Not only was Dante unknown in France, except by name, but all tradition was against studying works of the Middle Ages, or indeed any works which failed to conform to the classical rules of good taste. To pass from the eighteenth century to the fourteenth seemed like passing from light to darkness. Even in Italy, Dante was little understood. Thus, Voltaire's attitude is not in the least surprising, and he deserves credit for having devoted any attention at all to Dante. Certain episodes, particularly those of Francesca and Ugolino, he sincerely admired; and if the obscurity of many parts of the poem repelled him, at any rate he drew attention to Dante in France and in England, and thus paved the way for more intelligent study later.

—Even with the rise of Romanticism there came into France no profound appreciation of Dante. To be sure, the very qualities of the 'Divine Comedy' which had repelled the eighteenth century, aroused the enthusiasm of the Romantic writers; but Dante's influence, still exercised through separate episodes in the poem, was chiefly in the matter of poetic style and picturesque description. As a sequel to Farinelli's articles on Voltaire, one may turn with interest and profit to an article by A. Counson, "Dante et les Romantiques Français," which appeared in 1905 in the *Revue d'Histoire Littéraire de la France*, and to the same author's 'Dante en France,' announced for the present year. Counson treats in detail Dante's influence in France in the first half of the nineteenth century, and concludes that he was read and imitated rather with *grande amore* than with *lungo studio*.

—Two things will prevent Gerhart Hauptmann's latest play, "Und Pippa tanzt!" (Berlin: S. Fischer), from soon becoming very popular: the symbolic character of the story with its atmosphere of deep mysticism; and the dense Silesian dialect, besprinkled with Italian patois. The first, a periodical outburst of Hauptmann's dual nature, recalls his "Versunkene Glocke" and the weird world of elves; the second, from Hauptmann's early environment at Obersalzbrunn and his naturalistic tendencies, reminds us of "De Waber" and "Fuhrmann Henschell." And yet it is possible that in this new play, so carefully worked out in the smallest details, so vivid in its personalities, so free from repulsive content, so chaste, if not lofty, in poetic prose diction, and so stageable—as was shown in its delightful début at the Lessing Theater in Berlin—we have the best of Hauptmann's work since "The Sunken Bell." A glance at the action will show its dramatic strength. The manager of a glass-works in Silesia, a matter-of-fact business man, comes home on a stormy winter's night to find, not the gay revellers of aristocratic society, as in "Michael Kramer," but a company of glass-blowers, woodsmen and others, such as Hauptmann well knows how to describe, drinking and playing cards in the local tavern. Among them is Tagliazoni, an Italian glassmaking expert, who has a beautiful daughter Pippa, a dancing sunbeam from Venice, a ray from the glass-oven and the world of idealism, a fairy-like being, symbolic of all that is fair and enticing. Her father keeps her imprisoned until it suits his pleasure or greed to bring her out Old Huhn, a former glass-blower and a rough specimen of the raw and brutal mingled with the good, strolls in, and his lusty companions call for a dance by him and Pippa. The suggestion inflames the manager, who offers Tagliazoni ten, twenty, fifty, and finally one hundred lire to produce the girl; and at the bid of "cento!" Tagliazoni calls Pippa downstairs. At midnight another guest arrives — young Michel Hellriegel, a typical, self-confident German *Handwerksbursche*, who, half frozen and starved, awakens the sympathy of the Italian maiden. Huhn, with his gorilla-arm, beckons the girl to dance; she disdains him, but yields to the clamors of the company and the notes of an okarina. Clumsy Huhn tries to follow her fantastic

footsteps. A fierce quarrel breaks out among the glass-blowers and Tagliazoni, whom they accuse of cheating at cards; he draws a knife, is chased out into the snow and killed. All save Huhn and Pippa follow the assassins; Huhn sees his chance and carries off the fainting girl to a storm-invaded hovel, and there he collects for her rags, wine, and crusts, and even brings in a goat to be milked.

—A stranger's voice, half challenge and half appeal, draws Huhn away; Hellriegel appears but fails to see Pippa, unconscious, in a corner. He pulls out the okarina which he bought at the tavern, and begins to play; Pippa rises to dance, thinking her father calls. Hellriegel, astounded, recognizes her but slowly as flesh and blood; she begs him to fly and save her, but he replies with astonishing indifference that he has magic with which to scale mountains and fly over valleys, and that with a toothpick, like a sword, he can slay Huhn or even dragons! Pippa learns from Hellriegel of her father's death, and realizes that in future she has no one to depend upon but Michel; and at the end of the second act they wander forth, arm in arm, to climb the mountain together in the cold night. The third act shows the glass-works manager in the snow-bound hut of Wann, a mountain seer or German savant of mediæval tendencies, to whom he confesses that he is seeking for Pippa. Wann claps three times and Pippa staggers in, crying that Hellriegel is dying of cold in the snow; and Wann and the manager, preceded by Pippa, hurry to the rescue. In the meantime Huhn finds his way to the hut, steps inside and hides behind the stove. Wann conducts his guests to rest, when Huhn struts forward defiantly; Wann peers at him wonderingly under his hand and then gives way to righteous wrath; the giants wrestle and Huhn falls. Pippa and Hellriegel reappear; the writhing glass-blower is held down, but humanely ministered to, and Wann absents himself, warning Pippa not to dance. Old Huhn's mind wanders and he begs the girl to dance; her heart is touched, and Hellriegel, fingering his okarina, advises her to yield; she dances and falls dead in Wann's arms! A moment later Huhn expires. Hellriegel plays on. Wann joins him in wedlock to Pippa, or rather the "shadow of Pippa"; and Hellriegel, blind, sets forth, not knowing that Pippa is dead, but thinking that she marches at his side. Of all who wish to possess and control the dancing sunbeam, the German Michel alone secures her, albeit in death!

THE HISTORIC PERSONALITY OF STUBBS.

Lectures on Early English History. By William Stubbs, D.D., formerly Bishop of Oxford, and Regius Professor of Modern History in the University of Oxford. Edited by Arthur Hassall, M.A. Longmans, Green & Co. 1906.

We are now much better able to understand Stubbs's attitude towards the study and writing of history than we were at the time of his death, five years ago. For nearly a generation, every one who spoke of him at all lauded him as a paragon of impartiality, and few writers, if judged by their leading works, have better merited such praise. But we can now see also that his mind had a strong native warp which, save for compensating qualities, might have made him an historical pamphleteer. The additional information is contained in three volumes—the 'Letters' (edited last year by Mr. Hutton), the 'Lectures on European History,' and the 'Lectures on Early English History' which Mr. Hassall has just published. On a former occasion we discussed the 'Letters' in so far as they follow the development of Stubbs's career and illustrate the nature of his ecclesiastical predilections. But we found it impossible in a single article to touch upon these subjects and likewise upon the Bishop's character as a historian. To the latter theme we at length return, finding an excuse in the volume before us.

"The 'Lectures' are hardly less important than the 'Letters' for the assistance they give one in estimating the strength of Stubbs's primary impulses. If we judged from the 'Constitutional History' alone, we should conclude that his mind had a strongly judicial and objective cast, that he wrote his paragraphs slowly, and that, possessed though he might be of great learning, his personality would prove somewhat colorless. It cannot be asserted that every reader would derive these impressions from a perusal of Stubbs's masterpiece; but one who did, could furnish a plausible set of reasons for his belief. The facts, however, are utterly at variance with such a diagnosis. Stubbs was an avowed and vigorous Tory, he wrote very fast, and in point of character he was so pronounced as to scandalize weaker brethren among the clergy of his diocese, whether at Chester or Oxford.

The 'Letters' and the 'Lectures,' then, show a much freer sweep of expression than the 'Constitutional History,' and are an indispensable complement to it. Even if we are unwilling to style Stubbs, in the language of Mr. Hutton, "the greatest English historian since Gibbon," common consent places him high enough to justify a detailed study of everything he wrote. Confining attention for the moment to his Lectures, a contrast may be indicated between those which were published during his lifetime and the two volumes which have appeared posthumously. The Oxford lectures published by Stubbs himself are less restrained in style than the 'Constitutional History' and the introductions he wrote for the Rolls Series. They show at times his tone of banter, and, if carefully read, might modify to a considerable extent the impression left by his more formal works. But, having been put forth in a tone of apology, they received less attention than they deserved, and at the best do not reveal the method of teaching which he adopted during his tenure of the History chair. Some of the discourses published by Mr. Hassall would hardly have left Stubbs's own hand for the press in their present unrevised condition, but, as revealing his more spontaneous habits of thought, it is well to have them in their present form.

The 'Lectures on Early English History' were written before the days of Vinogradoff, Maitland, and Round. Occasional inaccuracies also crop up in their allusions to German, French, and Spanish history, as where Lothar of Supplinburg is set down for a mere weakling, and a mistaken view is accepted regarding the relation of the Visigothic conquerors of Spain towards the native population. It would be ridiculous to dwell upon slips which hardly do more than measure the advance of historical knowledge. At most points, even where not an original investigator, Stubbs was well abreast of contemporary information, and seldom made a really important statement without being able to tell where his facts came from. The list of *corrigenda* for these lectures does not concern us here, nor shall we outline the contents. The subjects are all drawn from the constitutional history of England during the Middle Ages; the method followed is broadly comparative. With this preface let us glance at the personal element which enters the volume in the train of pure erudition.

A few passages may first be cited for those who still see in Stubbs the ideal of a scientific, emasculated historian. Take, for instance, the concluding chapter entitled "The Beginnings of the Foreign Policy of England." The whole motive of the tract (we can hardly use any other name) is that England was essentially right in her long contest with France, while France was essentially wrong. As a rider to the foregoing proposition, much is made of the Anglo-German *entente* which existed for long periods together during the Middle Ages. As for France: "It may be true that, up to the time of the French Revolution, there can hardly be said to have been a French people; but such as that people has shown itself since it struggled into actual existence, such was the spirit of its rulers and leaders from time immemorial —aggressive, unscrupulous, false." As for the natural alliance of England and Germany: "We know how cheerfully our fathers endured the taxation by which the English and German races were enabled to destroy the fabric of power raised by the first Napoleon. Still, as of old, England and Germany, whether represented by Prussia or Austria, were found fighting the battles of freedom, and still successful. God send that we never see another such war; but if we do, may we find still the old allies on the same side, with the same good cause, and we need never fear for the same result." As for the main tradition of English foreign policy: "I have not proved that England has always been on the right side in all her foreign wars, but I have put before you facts into which, if you will search for yourselves, you will find, I think, that for the most part it has been so. I am sure you will find that in every European perturbation our country has been on the side of order and freedom." What need to break the moral law by exclaiming, "Our country right or wrong," when "in every European perturbation our country has been on the side of order and freedom"!

Were it necessary to cite further passages from the same lecture, we might place alongside of the foregoing quotations such a dictum as this: "The German and English alike are non-aggressive nations." But the whole discourse illustrates to perfection one side of Stubbs's mind and character. The French he disliked because they were revolutionists in both politics and

thought. France for him was the antipodes of the land he loved, the land

> "Where Freedom broadens slowly down
> From precedent to precedent."

He loathed the principles of Constituent Assembly and National Convention. He tried forcibly to prevent J. R. Green from reading Renan's 'Vie de Jésus.' Apropos of the Magenta campaign, he writes in one of his letters: "I cannot bear the French and their detestable Emperor, or the wretched Italians, either. I like the Austrians as Germans, and go in for Maria Theresa. As for the imperial family, their despotic and bigoted character comes in quite as much from the French house of Lorraine as from the Hapsburgs." But radicalism in forms far less pronounced than the French type excited his extreme antagonism. "I do not believe," he writes to Freeman, "that a Dissenter could write a History of England"; and to the same correspondent he observes: "I was in hope that experience of Swiss imposture would have opened your eyes to the evil of republican institutions." For most of the national movements which abounded in his generation he had no sympathy. "Do you go in for those horrid Poles?" he asked in 1863. "I think not, so I will not abuse them." And at the time of Garibaldi's celebrated visit to England (1864), his comment upon the incident runs: "I am not quite sure whether the sight of the creature has not rather damped the ardor of some of his admirers. His demeanor is described as theatrical and affected to the last degree; this may partly have been owing to his being tired to death. Great crowds of the working (*i. e.*, drunk and disorderly) classes attended him everywhere."

Many of the clergy could not understand Stubbs's love of chaff, and took everything he said *au grand sérieux*. In quoting forcible utterances from his letters, we must not forget that a letter is a privileged communication, or that a good deal of persiflage is mingled with his dogmatism. A lecture, however, is a more studied piece of composition than a letter, and the bits of dogmatism which it contains must be taken to represent the author's sober convictions. We could make up from the present volume and the 'Lectures on European History' a long list of pronouncements upon important and representative subjects which, while moderate in tone of statement, are not the utterances of a "scientific" historian. "Modern civilization is the work of Christianity, and has inherited nothing from ancient civilization except what Christianity has gathered up into itself and preserved." The last part of this statement is so extreme that we find difficulty in guessing why it should have been made. Brunetière spoke picturesquely when he termed the French Revolution the work of Plutarch, but surely the whole contact between the orators of 1792 and the classical past stands outside the range of Christian influence. A host of other examples from all fields of intellectual culture will occur to every reader who takes a comprehensive view of modern life.

It was one great merit of Stubbs as a historian that in his principal works he avoided the expression of what he must have felt to be mere personal opinion; or, rather, if he disclosed the nature of his opinions, he did so without endeavoring to convey the idea that they were irrefragable truth. A large proportion of those who write about the past think they are neglectful of their duty if they do not inveigh against the characters and institutions they dislike—conveying their disapprobation under the most oracular form. The same didactic tendency is even more often encountered under the guise of generalization. Here Stubbs was equally on his guard against temptation. No one believed more implicitly than he in Divine Providence, but God, according to his judgment, works through secondary agencies, the chief of which is the will of men. But, leaving theology aside, he felt that the differences disclosed by historical phenomena are far more profound than the resemblances, or, as he himself has said:

> "It is certain that greater and more minute knowledge reveals endless differences—leads to an impression rather of infinite diversity than of elemental unity; that although the eye of genius can descry the one in nature and the other in history, the admission must be made with two serious drawbacks: first, that it is not every student of history or one in a thousand who possesses the eye of genius; while generalization is a most tempting process to all minds, and thence in nine cases out of ten a generalization is founded rather on ignorance of the points in which the particulars differ than on any strong grasp of the one in which they agree. The more you know of any two persons or events, the less alike they seem; perfect knowledge is independent of, and even inconsistent with, any generalization at all."

This utterance enables us to see why Stubbs used in the 'Constitutional History' those marvellously careful phrases which, save for its learning, are the most striking feature of the work. How far impulse led him in the other direction we have shown by the quotation of downright sentences from his 'Lectures' and 'Letters.' Like other Yorkshiremen, he could be a hard hitter and loved such sport for itself. But any warp of mind which he possessed was corrected by an equally native sanity and breadth of spirit. He used to say that he became a historian because his father set him to decipher and translate charters when he was a boy at Ripon. Step by step throughout the long distance he travelled he never lost touch with the concrete. His favorite pastime, apart from the correction of proof-sheets, was genealogy. In the common-room of Exeter College a question was once asked him at random about the value of a mark in a particular reign, and he delighted the dons by giving the whole history of the coin, with side references to Germany. He amazed a fellow-traveller by reciting the biography of John Cattryck, Bishop of Exeter, when stumbling upon the name 'Catryk" in the floor of Santa Croce. Nor were his technical acquirements less remarkable in the eyes of Freeman and Liebermann. This fact has a distinct bearing upon what we have said regarding the freedom with which he expressed himself in his letters and minor writings. Two things, indeed, stand out from any minute study of Stubbs's works. Despite a marked fondness for antiquarian detail, his largeness of spirit kept him from becoming a pedant; despite the strength of his prepossessions, his reverence for fact prevented him from becoming a pamphleteer.

THE BEGINNINGS OF THE THIRD FRENCH REPUBLIC.

Contemporary France. By Gabriel Hanotaux. Translated from the French. With Portraits. Vol. II. London: Archibald Constable & Co.; New York: G. P. Putnam's Sons. 1905.

This new volume of M. Hanotaux's carries on for just one year the story of that singular provisional period which lasted from the fall of the Second Empire till the establishment of the Third Republic—a year full of events so interesting in themselves and so important in their consequences that the fulness with which the period is described seems in no wise excessive. This year exactly covers the Ministry of the Duke de Broglie, formed after the fall of Thiers in May, 1873, and overthrown by a hostile vote of the legislative Chamber in May, 1874. It was a year of ceaseless negotiation and intrigue—negotiation to effect a fusion between the Legitimist and Orleanist parties; intrigue to keep the three or four monarchical parties together against the Republicans. The Assembly, elected to make peace and elected also under the impulse of a reaction against Bonapartism, was monarchist, though there was in it a very strong Republican minority. The majority, besides the broad division which cut it into three groups, Legitimists, Orleanists, and Bonapartists, was further weakened by the division of the large Legitimist group into several sections, some more, some less extreme. To keep these groups and sections united against the common Republican enemy was no easy task. But a still harder one was to make the only possible monarch consent to receive the crown of France upon the only conditions which could enable the majority of the Assembly to tender it to him.

These persistent efforts, first to persuade enough members of the Assembly to choose the Count de Chambord, "Henry the Fifth," as his partisans called him, to be King, and, secondly, to persuade the Count de Chambord to consent to reign with a constitution, *i. e.*, under a parliamentary system of two Chambers, one of which at least should be elective, fill the greater part of the present volume. The story is intensely interesting, and deserves to be perused even by those within whose personal recollection the events of 1873 lie. It is true that no one of the actors is a man of firstrate intellectual power. It is also true that the central figure, "Henry the Fifth" himself, is in a certain sense a fool, a man of narrow, fixed ideas, unable to see the world around him as it is, and ready to throw away not only his own chances of the throne, but all the results which the devoted loyalty of his adherents had secured, rather than relax the rigid attitude of vindictive antagonism to everything connected with the Revolution. Still, the conflict of moral principles, the triumph of a sense of duty, however perverted and unreasonable, over the strongest promptings of personal ambition, always produces a dramatic situation. Henry the Fifth making the great renunciation has a poetical value. He might, indeed, have been made the hero of a semi-tragic poem,

based (like the "Philoctetes" of Sophocles) on a moral struggle, had he been the least bit more of a heroic figure.

Alas, he was not a hero! He had not even that superficially chivalric air which made Charles Edward Stuart seem for some few months a sort of hero to his followers. After superhuman exertions, the monarchists of all shades had been brought to unite. The representative of the Orleanist line had made his submission to the legitimate head of the elder branch of the Bourbons. Thiers had been defeated, and Marshal MacMahon, a convinced and loyal Legitimist, installed as provisional head of the executive power. Envoys were dispatched to Frohsdorf, where the Count de Chambord mostly lived, to ascertain how far he would go to adapt himself to modern ideas and something that might be called constitutional government. At last, since his utterances were so vague and guarded that further enlightenment became necessary, an eminently respectable member of the Legitimist party, a bourgeois who had gained some reputation as a fluent speaker and more as a pious and honorable man, M. Chesnelong, proceeded, at the bidding of the Monarchist Committee of Nine, to visit the Count at Salzburg. "Henry the Fifth" consented to accept some kind of constitution, condescendingly declaring that he had never considered pure despotism to be the only alternative to a revolutionary republic. But he would not accept the tricolor flag. To him it was the symbol of the Revolution, associated with anarchy, impiety, and bloodshed, the flag that had waved round the scaffold on which Louis the Sixteenth perished. The most that M. Chesnelong could obtain from the Count was an ambiguous undertaking that he would settle the question of the flag with the Assembly when he returned to France as King. The perplexed and anxious envoy persuaded himself that this utterance left a door of escape, and gave the Committee and his other friends in France, when he returned, a somewhat more favorable version of the Count's declarations than the facts warranted. Then the Monarchists prepared their great *coup*. With infinite difficulty they secured, or believed themselves to have secured, a majority, small, indeed, but sufficient, for inviting "Henry the Fifth" to return to the throne of his ancestors. Then, just before the vote was to be taken, there appeared a letter from Henry the Fifth himself, addressed and sent to M. Chesnelong, but published simultaneously in the *Union* newspaper, the organ of the extreme Legitimists. It was drawn from him by the reports which, assiduously circulated in France by his friends, and sarcastically commented on by his enemies, represented him as having abandoned the lofty principles to which he had hitherto clung. To remove once for all these misconceptions, he declared in this letter that he would not accept any flag but the white flag of Henry the Fourth, "the flag of Arques and Ivry." The letter proceeded:

"My person is nothing, my principle is everything. When France is willing to understand this, she will see the end of her tribulations. I am the necessary pilot, the only one capable of bringing the ship into harbor, because I hold a mission and authority for that purpose. . . . France cannot perish, for Christ still loves His Franks, and when God has determined to save a people, He sees to it that the sceptre of justice may be entrusted only to those hands which are strong enough to bear it" (p. 257).

This letter was a bombshell. It scattered and routed the Legitimist party. As events have proved, it destroyed, possibly for ever, the chances of a monarchical restoration in France. All the monarchical groups, except the extreme high-Catholic Legitimists, refused to part with the tricolor. The army would have refused, Marshal MacMahon did refuse. Henry the Fourth won Paris by abjuring his Protestantism. Henry the Fifth lost a throne by insisting that a piece of cotton should have a certain color. Pius the Ninth was reported to have said, "And all this for a napkin."

However, Henry the Fifth did not fully know that he was, to use a phrase current at the time, "throwing a crown out of the window." He seems to have believed that the magic of his name, supported perhaps by the direct interposition of Providence, would still enable him to save France by becoming her King. Shortly after the fatal blow he had given his party, he went secretly to Versailles, where the Chamber was sitting, endeavored to see MacMahon, who would not grant an interview, tried to induce a few of his most devoted friends to make one more effort in his behalf. Recognizing that any such effort was foredoomed to failure, they refused. The chance never recurred; but if it had recurred, there is little reason to think that this obstinate will, supported by a mixture of duty and vanity, would have shown itself any more accommodating.

All this is told with unflagging spirit by M. Hanotaux. He has taken great pains to get at contemporary memoirs, letters, reminiscences, many of them still unpublished. He presents a vivid picture, a narrative full of life, of movement, of color. Especial diligence has been bestowed on the portraits of the leading figures, and some of these are executed with great skill and with a minutely elaborate care in which art has not been always sufficiently careful to conceal itself. Here is a character of the Duke de Broglie, who played so fateful a part in the evolution of the Republic, creating, *malgré lui*, after the attempt to reëstablish monarchy had failed, a system which he disliked and had sought to avert:

"Inheriting as he did the blood of the Neckars and of Madame de Staël, he was a born publicist, a Christian publicist. The practical direction of minds, the politics of religion, education, the moral tendencies and aspirations of peoples in themselves or between one another—such were the subjects that attracted him; he was neither a psychologist nor a philosopher, nor a sower of ideas; he was an inquirer into the inner forces of collectivities, a calculator of the emotions which shake the masses and determine the movements of souls. There was in him much conscientious correctness and knowledge, along with a sober imagination, limited and cool, which could neither give itself a free rein nor become gracious. . . . This dread of geniality rendered the demeanor of this 'honest man' icy" (p. 37).

Not less elaborately studied, down to the smallest refinements of phrase, are the portraits of Marshal MacMahon, of the Count de Chambord, of Léon Gambetta, the most interesting of all the prominent actors of that generation, and the one who came nearest to becoming a figure in European history:

"He was a powerful, broad, abounding personality, such as overflows spontaneously, and fertilizes by overflowing. He possessed in the highest degree the social and political aptitudes which come from the heart, the indescribable human sympathy to which nothing human is ever a stranger, the insinuating grace which means to please, convince, and dominate, in the end, by that sense of conscious authority which in itself is imposing and compels obedience. . . . Always in love with words, he recited [at the Café Procope] the Olynthiacs in Greek, the Catilinarians in Latin, or passages of Rabelais. His inexhaustible memory, his bottomless fund of spirits, his bewildering eloquence, might fatigue his audience, but never himself. . . . His real religion was the cult of the Fatherland, of the city" (p. 58).

M. Hanotaux, like a man of his time, like a reader and admirer of H. Taine, desires to connect political history with the history of letters, of art, of thought. He devotes the last two hundred pages of this volume to a survey of the economic condition of France after the war of 1870-71, and of the causes which enabled her to recover from that terrible blow. He then proceeds to describe the literature of the years 1870-1880, touching briefly on the more eminent names. He traces the movements of thought, not without reference to art and to science. To accomplish such a task adequately needs great philosophic penetration and a wide outlook over the contemporary world of all Europe, as well as a skilful and vivacious pen. M. Hanotaux, however, shines more by his pen than by his philosophy. We do not feel that he has got to the bottom of the questions he discusses. Even his characterizations of the writers of the time have more glitter of phrase than grasp of essentials. Sometimes he seems to be the victim of his own phrases, which are so ingeniously contrived to express *nuances* of view, or epigrammatic summarizations of opposite qualities, as to become almost meaningless. Not to every one is it given to be Tacitean, or to combine the terse force of the ancients with the decadent over-subtlety of the modern. Nevertheless, the book is most interesting—as interesting a piece of contemporary history as has appeared for many a year. It well deserves to find readers on this side of the water.

The Jews of South Carolina. By Barnett A. Elzass, M.D., LL.D., etc., Rabbi of K. K. Beth Elohim, Charleston. Philadelphia: Lippincott. 1905. 8vo, pp. 352.

The author has since 1894 been the minister of the Beth Elohim, the oldest and only important Jewish congregation in Charleston. He was born in 1867 at Eydtkuhnen in East Prussia, pursued his rabbinical studies at London, and came to America in 1888. He availed himself of the public records at Charleston and Columbia, such as the Deed Books (or, as they call them there, "Records of Mesne Conveyances"); he has for colonial times scanned the news items and advertisements of the Charleston *Gazette*, and other newspaper files for later times, whichever of them contained names of Jewish sound; also, the Charleston directories away back to their earliest publication; and last, not least, the minute and account books of his congregation. His book is of the same order

as hundreds of local and genealogical histories written about "towns" and old families of New England, but appeals perhaps to a larger public, namely, to all the Jews of the United States, as Charleston, next to New York, has the most interesting Jewish antiquity.

The author has, in the columns of the *American Hebrew* of New York, had some sharp disputes with his townsman, Dr. Hühner, mainly as to ages and dates of arrival of some of his eighteenth-century heroes. South Carolina was the first colony in which the Jews were not only tolerated (in that respect Maryland, New York, and Rhode Island preceded), but in which, under the charter, they were, under the general head of "Protestants," *i. e.*, non-Papists, from the very beginning admitted to full citizenship; indeed, they were chosen, out of all proportion to their small number, to offices of trust and honor, both in the colony and in the State. The earliest mention of a Jew (unnamed) is for the year 1695; he was employed to translate a Spanish letter. The Jews then in America were all of the Sephardic or Spanish-Portuguese branch, coming over from Amsterdam, London, or the West Indies. In a footnote to page 27, the author, referring to Isaac de Paz, a "Charles Town" merchant in 1738, says: "There are many [of his] descendants in South Carolina. They are no longer identified with the Jewish faith." The same may be said of many of the other old families, not only in Charleston, but also in New York, Philadelphia, and Richmond. In short, his sons or grandsons, daughters or granddaughters, married Christian wives and husbands; thus the later descendants were swallowed up in the Gentile population. The causes are not far to seek. The Sephardic Jews were too few to find fit spouses among themselves; being in manners, education, and wealth equal to their Christian neighbors, they met among these no repugnance to intermarriage. Again, while, after 1750, many German and Polish families came into the colony, who willingly adopted the Sephardic ritual, the Spanish Jews treated them as equals only in the synagogue, not in social intercourse, because of their lower level of culture; when entering into wedlock, they would rather step out of their race and faith than down from their social level.

In 1800, our author says, Charleston, with one hundred families and five hundred souls, held the largest Jewish community in the United States, the whole Jewish population of the country hardly exceeding 2,500. Among the arrivals during the eighteenth century, perhaps the most interesting is Francis Salvador, a rich young man, whose grandfather had already obtained his armorial bearings from the two kings-at-arms of England, and who came over in 1773, bought a plantation in District Ninety-six, was in 1774 and again in 1775 chosen a deputy to the Revolutionary Provincial Congress, took part in the latter in framing a State Constitution, and on the second of August was killed at Oconee Creek in a battle between the South Carolina militia in which he bore command, and a force of Tories and Indians. Among later names of prominence we find that of Major M. M. Noah, who, when still a young man, removed to New York, where he became a well-known journalist, conspicuous for his plan to found a Jewish farming colony near Niagara Falls; Solomon Heydenfeldt, who went off to California and reached great prominence on the bench of its Supreme Court; and Uriah Levy, whose kinship to the well-known naval officer Uriah P. Levy is not set forth. Philip Phillips, for many years the busiest man at the Supreme Court bar; Lewis C. Levin, the Philadelphia Congressman at the head of the "Native American" party, and Dr. David C. De Leon, first Surgeon-General of the Confederate army, were also born and bred as Jews in Charleston.

The Jews of Charleston were the first in America, and, after Hamburg and Berlin, the first anywhere, to introduce striking reforms in public worship. In 1824, a part of the Beth Elohim congregation, being outvoted on a proposition to modernize the services, set themselves up as a body of "Reformed Israelites." For a while the body grew in numbers, but it collapsed in 1832, partly because they took the radical step of worshipping with bare heads, but mainly because they had no preacher, without whom a modern service is dead. They returned to the old synagogue, but in 1836 a new minister, Gustav Poznanski from Storchnest, Province of Posen, caused another split by insisting on organ music. This time the reformers prevailed; the conservatives formed a new congregation, Shcarith Israel, which later on received new accessions, when Poznanski proposed and carried the abolition of the "second days of festival of the exile," which custom has added to the Scriptural days. The seceders unwisely sued for possession of the church property, taking the ground that the party in possession was violating the charter which bound the congregation Beth Elohim down to the "Sephardic ritual." The Supreme Court held that doctrines and rituals naturally change in the course of ages, and that courts of justice cannot step in to stop this development. The two congregations were at war for many years—a war which embittered all social relations between reformers and conservatives, and lasted till 1866, when the common poverty of both parties compelled peace, and all returned into the old "Beth Elohim" synagogue on a common platform. What this platform was, and how far the ritual was then or has since been reformed, the author fails to tell his readers.

The author touches briefly on the smaller communities at Georgetown, Camden, and Columbia, the first-named quite an early offshoot of Charleston; while the congregation at the State capital is rather modern. In referring to old customs, he is somewhat shamefaced. Thus, he refers to an item of outlay in an old account book for painting a Mikwah, and of wages paid to a Goy; but he only defines the former as something now almost obsolete, and the latter as something almost unintelligible to the present generation.

Falckner's Accurate Narrative of Pennsylvania. Translation and Introduction by Julius Friedrich Sachse, Litt.D. Philadelphia. 1905.

This volume, originally issued for the Pennsylvania German Society, is a reprint of a set of questions propounded in 1702 to Daniel Falckner by Pastor Augustus Hermann Francke, the head of the Pietist movement in Germany. Falckner had but recently returned from a stay of three years in Pennsylvania, and Francke desired to make use of the young man's intimate knowledge of the new land to assist in bringing about a general Pietist movement toward Penn's colony. In themselves, and considered apart from their historical surroundings, neither questions nor answers are of great social or historical interest. Falckner saw and reported nothing concerning the new land that others had not seen or reported before him. He is sufficiently enthusiastic to be sure of awakening interest in the scheme; sufficiently plain and direct to commend himself to the reason of people of very moderate culture; and sufficiently truthful to arouse no false hopes of easy golden gain. He indicates means of transport, dangers of transit from war, from thieves, and from drunken sailors; lists the necessary baggage, enumerates varieties of supplies; suggests schemes of investment and methods of development for those investments, and carefully pictures the natural and social features of the new colony. These details undoubtedly formed a trustworthy guide for some thousands of early Palatines, but they can lay claim to reveal little if anything that we have not learned from other sources.

And yet the volume has a potentiality out of all proportion to its matter. In a certain sense it made Pennsylvania, for its influence really began the German movement of the eighteenth century that in twenty years added 40,000 to the population of the colony. Of all the colonies Pennsylvania was, without doubt, the most widely advertised. From its inception, Penn and Furly had made diligent use of printer's ink. In 1681 the 'Account of the Province of Pennsylvania' was translated into German and Dutch by Furly, and this was soon followed by other and similar tracts, all of which were generously distributed throughout the Rhine valley, while Penn was making his first voyage in the *Welcome*. Six months before the settlement at Philadelphia, Jacob Telner and Dirck Sipman of Crefeld in Lower Palatinate had made a purchase of 15,000 acres covering the site of Germantown, and, a year after Penn's coming, the first band of Germans, from Krisheim and Crefeld, arrived under the guidance of Francis Daniel Prætorius. For nearly twenty years from this date, however, the tide of immigration was slow. There was needed a compelling influence on the other Continent.

That impulse came from the Revocation of the Edict of Nantes in 1685. Thousands of fugitives from France crowded over into the Rhine country, and economic conditions, hardly yet recovered from the stunting effect of the Thirty Years' War, rapidly became unbearable. The growth of the Pietist movement, too, was making deep lines of demarcation within the State Church, and intolerance was no less accentuated between factions than it had been in the days of the great church struggle between Catholic and Protestant. To this let us add the miseries brought on by the slow progress of the war that attempted to determine what grandson should sit on the throne of Spain, and we have gathered together at least three of the forces un-

der whose impulse the famous migration commenced.

In the meantime a few Germans were drifting into the colony. Of these, one group that accompanied Magister Kelpius to settle on the Wissahickon, in 1694, contained a young man, Daniel Falckner, then twenty-eight years of age. Three years later he returned to the Fatherland to report the condition of the Pietist movement in America, and on this occasion it was that Francke propounded his 73 questions. These, amplified to 103 in a second edition, were diligently circulated among the German principalities, and almost immediately the new *Völkerauswanderung* was begun. To Francke this migration meant the development of a Pietist colony in America. In the outcome it became a veritable stampede of people of all sorts. Pietism in the New World found itself as intolerant and as quarrelsome as it had been in Europe, and lines of separation were sharply drawn. Dunkard, Mennonite, Seventh Day Baptist, broke away from each other to found exclusive communities. But meanwhile the steady influx of those whose sole hope lay in finding a new home, surrounded all these exclusive communities with an inchoate multitude whose increasing inertia rapidly made the growth of the Pietist movement a mere notion. Many of the early Germans had been cultured men, and most of them had been inspired by ideals that would undoubtedly, if it had been possible to realize them, have made Pennsylvania one of the most progressive of all the colonies. But the great mass of the later comers were ignorant of everything save the willingness to do the hardest kind of work in solitude. They had no ideals, and they desired to know no community. To escape social organism, they attempted to bury themselves in the solitude of widely separated farms in the wilderness. They grew up to look out for themselves as though there were no community of interest beyond the farm and the village. Beneath this flood, that which Pietism might have done for the colony was submerged; and yet to-day we wonder how Pennsylvania can suffer so quietly under the tyranny of bossism. From the time of Franklin to that of Quay, the State has never known, or perhaps never wanted to know, anything but the lash.

The volume is handsomely made up, and it contains valuable reprints and portraits that must prove useful and necessary to the historian. Much praise cannot be given to the work of the translator, whose version is at times rugged and literal to the point of comicality. It is labors of love such as this, however, that blaze the way for the historian.

Courts and Procedure in England and in New Jersey. By Charles H. Hartshorne. Newark, N. J.: Soney & Sage. 1905.

As a rule, we look upon "New Jersey law" as good. Its judges have a secure tenure, its bar is well-trained, and its reported decisions have a high standing. Notwithstanding all this, it is the object of this little volume of Mr. Hartshorne's to show that its procedure is antiquated, cumbrous and expensive, and that by comparison with the reformed procedure of England under the Judicature Act of 1873, it does not conform to the demands of a civilized State. A great deal of what he says would apply to New York and many other American States, the inhabitants of which live in blissful ignorance that, since the code reforms of fifty years ago, American communities have fallen more and more behindhand in developing the true principles of a simple and inexpensive "adjective" law.

The principles of the English procedure of to-day are, first, the unification of jurisdiction, so that (excepting county and local courts) every judge and every division has the full powers of all the others; second, the unification of procedure (a single form of action); third, judicial control over procedure, as distinguished from statutory control; fourth, the complete settlement of the whole controversy in one proceeding; fifth, the right to bring in parties whenever necessary; sixth, the right to join, or disjoin, causes of action, as occasion may require. Of these the one which lies at the root of all the others is that of judicial control; the unification of procedure and of jurisdiction has been attempted in this country, but the ultimate control of the whole business has always been left with the Legislature. The consequence is that a code of procedure, like that of New York, once adopted, the Legislature is occupied year after year in adding to and changing it—many of the changes being little procedure "jobs" got up to serve the ends of particular litigants—till at the end of fifty years the litigation over procedure has swollen to such proportions as to threaten to swamp the whole administration of justice. The constant cry is now, "Give us more judges—the present courts cannot keep up with their business"—the fact being that the business is being steadily inflated by the multiplication of statutes, every word of which requires, or gives the opportunity for, litigation to determine its meaning. In New Jersey, where this evil is probably far less than in New York, there are 937 sections of acts dealing with procedure.

In New Jersey there are no less than nine courts having different jurisdictions, so that a mistake made by a suitor in selecting the court in which to sue may be, and often is, fatal (Mr. Hartshorne estimates at about 5 per cent. the number of failures or delays of justice from this or connected causes in chancery); there are many different kinds of action, and for the suitor who cannot discriminate correctly between them there is usually no salvation; there is a very limited judicial control over procedure, the whole system being at the mercy of the Legislature. Now this cumbrous system works, no doubt, better than from this statement would seem likely; but there are statistics as to the judicial machinery of New Jersey as compared with England which give startling point to Mr. Hartshorne's criticism. Assuming that the work is equally well done in the two jurisdictions—system for system—it takes forty-nine judges (local courts being excluded) to administer justice to 1,833,669 people in New Jersey, while in England justice is administered (local courts being again excluded) to 32,091,907 people by ninety-two judges. Under one system a single judge answers for 348,828 persons, under the other for 40,949. These facts might not be conclusive in themselves, but they certainly reinforce the argument derived from natural reason. We certainly speak within bounds when we say that much the same condition of things will be found, on examination, to exist within most other American States.

Mr. Hartshorne's volume is exceedingly valuable because it is an unsparing exposition of the essential difference between what is really our antiquated and still unreformed American procedure and a thoroughly good system, perfectly adapted to our courts and legal habits, and now in operation for a generation. We hear a great deal of the "Law's Delay," and for good reason. What any one can see from Mr. Hartshorne's pages is that the cure lies not in the multiplication of courts and judges, but in the adoption of the fundamental principles which have guided the English reform.

The History of Concord, Massachusetts. Vol. I.: Colonial Concord. By Alfred Sereno Hudson. Concord: The Erudite Press.

This work has been put forth in good faith by a man of simple parts who is immersed in his subject, and desirous of taking his readers into full confidence. The stout volume contains over five hundred pages, including a facsimile of a map of eastern Massachusetts, dated 1634, an intelligently contrived but not elaborate index, a synoptical list of chapters, and numerous and agreeable illustrations which relate in no way whatsoever to the immediate text, but are almost wholly concerned with the portraiture and topography of literary Concord of the past eighty years. There are many illiteracies and misspellings, the blame for which should fall less upon the author than upon his printing-office, which, by some unexplained irony, is called the "Erudite Press."

Faithful to the promise of the title-page, the text is closely confined to the colonial period; but the mode of presentation is extraordinary indeed to those accustomed to the prosaic methods of town and village historians. Mr. Hudson has tried to transport his readers and himself back two hundred years or more, as in a vision. In imagination we sit before the humble firesides of the first settlers; hear and join in their gossip, superstitions, and communings, social and religious; inspect their farm lands and homesteads, and mark well and remember their boundaries and their family histories. At the same moment we are supposed to be living in the present, and viewing these days through the customary haze of retrospect. It is asking a good deal of any one to fancy himself in two centuries at the same time, but Mr. Hudson's humor is insistent on this point, and he keeps up the illusion, which is, unfortunately, no illusion whatever, through half the volume, and then finds himself on the safe road of steady and progressive narrative.

Mr. Lowell, in his famous essay on "Witchcraft," pays a tribute to Mr. Upham's attempt to revivify the life of ancient Salem: "We are made partners in parish and village feuds, we share in the chimney-corner gossip. . . . To know the kind of life these people led, the kind of place they dwelt in, and the tenor of their thought, makes much real to us that was conjectural before." Something of this

sort Mr. Hudson, with an almost pathetic earnestness, has attempted; but the poor reader, not so familiar as the author with riding on Fancy's steed, is jolted from past to present, and back again, until he is fain to slip from the saddle. Not everybody can listen to quotations from Whittier, Lowell, and Wordsworth, cited in the first half of the seventeenth century in Concord village, without getting what in boyish slang is called a "jar." If Nature makes no jump, Mr. Hudson certainly does when he breaks his narrative short off on page 63, and, without a word of explanation, takes it up again on page 79.

Notwithstanding these violent requisitions on the imaginative faculty, there are gradually disclosed throughout this disordered pattern of phantasy many curious old customs and phrases, used with such entire familiarity that, were it not for the suspicions excited by various typographical inaccuracies, we might be persuaded of their fidelity to facts. Our learning does not permit us to challenge such words as "nokake," "quidonies," "typocias," "lossets," "twifflers," and "Luthern" windows; but we cannot think that even the earliest of settlers advisedly said "one pence," or that "grooming cake" was used at the festivities following a childbirth, when the rest of the English-speaking world was eating groaning-cake. It is not the actual errors which prove most disturbing, but the sense of uncertainty created by such assertions as that "William Evarts" was Secretary of State in Grant's Cabinet. If incidents that have occurred within thirty years are wrongly stated, how shall we feel secure concerning the happenings of more than two centuries ago?

It would have been well for Mr. Hudson had he placed his store of information—and it is a large one—in the hands of some one competent in the joinery of books, who might have brought orderliness out of the inchoate, and fashioned a work more to the comprehension of ordinary men.

The Life of John Wesley. By Prof. C. T. Winchester. Macmillan Co. 1906.

So fair, calm, and lucid a biography as this can be read with full sympathy. It is the story of the founder of Methodism by a loyal disciple, and no less a portrayal of the man in his lights and shadows, his largeness and his limitations—all within 300 pages. "He was not a perfect man, and his followers then and since have perhaps often idealized him." He made mistakes, notably as to the American war. "On historical and scientific questions he was liable to be the prey of the last plausibly reasoned book he had read," "his deduction was much better than his induction." His credulity is here enlarged upon (pp. 279-281). He "had very little gift of humor," and that little was extremely dry and mostly satiric. He shared the sentimentalism of his age (pp. 284-5). "He was not raised up to write books," and most of his "are doubtless destined to oblivion," though the Journal "is immortal"; he "had not that union of imagination and passion and that special gift of phrase which make writing literature." (Mr. Winchester makes less than others of Wesley's poetic talent, and calls his translations "sometimes bald"; the word "Hymns" is not a caption in the Index). "Something of his early asceticism survived all his days." At Oxford and in Savannah, though "certainly a Christian, and of a noble sort" (pp. 33, 53), he was an "uneasy, self-questioning mystic," his dominant motive the desire for assurance of his own salvation; but this ceased in 1738 with his "conversion," which is here (p. 58) regarded, with Professor James, as a "shifting of character to higher levels." In strange contrast with his usual knowledge (and command) of human nature were his ill-judged and ill-starred relations with Sophy Hopkey, 1737, and Grace Murray, 1748-9, and later his purely prudential marriage. Earlier accounts differ somewhat from Mr. Winchester's as to the two heart-affairs, and say much more about their painful effect on the lover's feelings and reputation.

Thus, in one of his finest hymns, indited on the voyage back to England:

"Is there a thing beneath the sun
That strives with Thee my heart to share?
Ah, tear it thence, and reign alone,
The Lord of every motion there."

The "thing," it is believed, was the girl in Georgia. The entanglement with Mrs. Murray not only drove him likewise to the muse for solace, but caused a scandal which threatened his influence, though soon forgotten and not mentioned in this volume.

Wesley's love of letters and logic, his "exaggerated passion for reasoning," his refinement and courtesy—above all, his conservative temper, "by native disposition the friend of order rather than of freedom"—seem doubtful tools for his peculiar task; but most of his traits marked him for it. "He was the most self-possessed of men. He had no moods, no unregulated impulses. He never let himself go. He was not the man to fling his inkstand at the devil. He never hurried, never worried; his life was a pattern of order and precision." Once he realized his mission, his iron will, his mastery of men, and his splendid organizing and executive ability, backed by his fearlessness and his immense power of labor and endurance, became the servants of an altruistic devotion that was an efficient substitute for fanaticism; for fanatic he was not. "Ambition, in any bad sense, he had none. It was not power he wanted, but influence and opportunity"; and to this end he sacrificed his tastes and inclinations as a gentleman, a scholar, and a churchman. A great work had to be done; nobody else could do it; so he became "Pope John," "absolute commander of the army." To push and maintain the cause, he used, not such means as he preferred, but such as facts permitted or required. He did things which his brother and chief helper abhorred: deploring separatism, he started the greatest schism of his time. Yet the lengths to which the reformer went are hardly more notable than the moderation of the man. He did not respect "the amorous style of praying and the luscious style of preaching" (p. 121). He little valued controversy, and left it mainly to his friends. Probably his sharpest reply to his foes is from his preface to the 'Arminian Magazine' (not cited by this biographer): "They have defended their dear Decrees with logic worthy of Bedlam and language worthy of Billingsgate"—which was quite true. The mild Charles Wesley, in his hymns, dealt the fiercest blows at hypercalvinism. John was in his way a liberal (for this see pp. 209-212). "The distinguishing marks of a Methodist," he wrote in 1742, "are not his opinions of any sort." If he put vital religion, as he understood it, above everything else, the secular mind may honor his visible and practical results, and the qualities in him which made these possible. Matthew Arnold's academic disregard for him as a second-class man will hardly stand: inferior men do not reform the morals of a nation. Professor Winchester finely says: "It is not the Wesleyan system, but Wesley, that calls for our admiration." When he asks, of all the great men of that age, "Whose motives were so pure, whose life was so unselfish, whose character was so spotless?" one may be content merely to substitute the comparative for the superlative. This writer has given us, in brief space, probably the clearest view of his hero.

Poetry and the Individual: An Analysis of the Imaginative Life in Relation to the Creative Spirit in Man and Nature. By Hartley Burr Alexander. G. P. Putnam's Sons. 1906.

We have in Mr. Alexander's volume the courageous attempt of an idealist not merely to refute those matter-of-fact critics who cannot see that poetry has anything of importance to offer to an age which wants realities rather than the unsubstantial fictions of the imagination, but to carry the war right into the camp of the enemy, and show that it is the poet after all, and not the scientist, who holds the key to the fundamental realities of life. It would hardly take the "Ph.D. (Columbia)" of the title-page to identify in much of the author's thought the fruitage of the idealistic seed which Professor Woodberry has been scattering at Columbia during recent years. Indeed, Mr. Alexander hardly retains a sufficient degree of self-control when occasion comes to use the *ipsissima verba* of his oracle. "To quote from the 'New Defence of Poetry' partakes somewhat of the desecrative boldness that transplants a rare exotic or plucks the wild rose from its native prairie." But we must not do him an injustice. He writes as no slavish follower of any master, and the thoughts that have influenced him, from whatever source, have been fused in the crucible of his own intellectual processes.

The "psychical matrix" of poetry is *mood*, a mental attitude neither strictly intellectual nor emotional, but partaking of both, and adding to the combination a subtle tone and quality having its origin in the predispositions of the individual soul. This peculiar mood is a kind of *insight*, leading the poet not along the straight and well-paved paths of colorless intellectual truth, nor yet into the mire of mere personal bias, born of the emotions, but conducting him rather to a point of view from which are revealed the deep-lying secrets of character. It follows, then, that the expression of this mood, true poetry, represents an insight into our spiritual diatheses, into the nature of that which is most native and enduring in us, into reality more fundamental and inevitable than any other. Of course, the world at large will not drop the market reports for the anthologies on the strength of Mr. Alexander's argument for

this position. "After I've sent you to Hades for your trickery," cried Heglo to Tyndarus, in "The Captives," "I don't care what people call it. Just so you do actually die, they may say you're *alive*, for all I care." And if the man of mercantile mind gets the dollars, it does not worry him to be told that they are mere empty baubles, and that his poetic neighbor, with no bank account, has the only enduring fortune, after all.

The poetic insight in its most clarified state, our author holds, is essentially optimistic. The pessimistic poets, like Poe, are men of restricted creation, uttering but a partial message, however true it may be so far as it goes. And yet the widespread questioning of the worth of life cannot be disregarded. We must seek an explanation of it, and we find this in the reflection of an advanced state of culture upon the continually thwarted struggle, not for existence, but for an *ideal* existence. It is on Fifth Avenue, not on the lower East Side, that the worth of life is denied because it will not yield the things that are desired. And Nature, by injecting a suicidal element into this hypersensitive, pessimistic mood, eliminates it as it is evolved, and thus protects the race against the menace of its contagion. The massses do regard existence as worth while, and the man of culture, too, must be persuaded that it is worth while.

The conclusion is inevitable: the soul must occupy itself in this life with the quest for some ideal good, and this good must be attainable in sufficient degree to convince the seeker that his search has not been in vain. This good cannot be mere knowledge. All human experience testifies to the bitterness of the dregs beneath the deceitful surface of that cup. There remain three other types of possible good, the emotional, the religious, and the æsthetic, somewhat interwoven but essentially separable, none the less. The first is evanescent, without the objective orientation which alone could give it worth, forcing the searcher ever to fix his attention upon agencies which of themselves defeat the desired fruition, and thus ending in restlessness and dissatisfaction. As to religious good, the value of it, our author thinks, must lie in what it has to offer in the life here given. "It must be a terrestrially attainable worth; even religious faith itself, if that is supreme, must be valued for what it now is, not for what it promises." As for the more idealistic side of the moral and religious life, that can be separated and carried over into the third type, the *æsthetic* good, giving us in the apprehension of beauty, and especially through the poetic insight, a conception which is comprehensive enough to "supplement all insufficiencies, and gather into itself what elements of final adequacy have been attained" from any and all sources. But, after all, man's divining power has its limits. He feels his way out into the vast like some solitary sun trying to pierce a boundless gloom which no reach of its rays can ever fully sound; and if his mind surrenders to the conception of its comparative powerlessness, a hopeless pessimism is the result. The true attitude of the poetic soul, however, is that of unquenchable aspiration, not of cowardly surrender. It may be necessary to pass to spiritual beauty over a path of pain, but the eye must be kept upon the goal, not upon the infelicities of the route.

Such, in substance, are some of the conclusions to which Mr. Alexander's argument leads. Doubtless many will question the validity of his logical process at various points, and a still larger number will find it extremely difficult to read his pages with confident grasp of his meaning, for it is not the habit of the day to carry such discussions quite as far beneath the surface as he has presumed to go. We agree with him, however, in the conviction that "criticism, whether of art or of life, suffers less from the rigor of metaphysical searchings than from need of them." His book is plainly not for the multitude, but thoughtful students of the higher forms of literature and art in their relation to the inner life will do well to give it serious attention.

Historic Styles in Furniture. By Virginia Robie. Chicago: Herbert S. Stone; New York: Fox, Duffield & Co. 1905.

This small, square book, bound in boards, contains 190 pages of text, and nearly every page has an illustration, generally a half-tone. These are selected with considerable judgment, as representing the different styles discussed, and are drawn from very many sources, not commonly mentioned. The text undertakes to traverse a long historical sequence. It is divided into fourteen chapters, and the record begins with the earlier Middle Ages and ends with "Colonial Furniture," viz., of the colonies of America. It is evident that such a book, unless disfigured by very great misstatements, must be of use to persons beginning to interest themselves in this branch of decorative art. Mistakes, however, are discoverable, and some of them seem as if caused by a lack of knowledge of the actual pieces—by the drawing of all information about them from printed authorities which were, perhaps, not perfectly understood. The most surprising of these misstatements is in connection with that same Boulle work concerning which the author of the big and costly Windsor Castle book was found to have been so careful. The new treatise explains the patterns of tortoise-shell and metal as if the brass were pinned on, outside of the shell, or the shell outside of the brass—one or the other. The fact of its being an inlay with one uniform and perfectly polished surface does not seem to have occurred to the writer. A somewhat less serious mistake is that made in connection with the supposed origin of Vernis-Martin. It is explained that "panels of Chinese woodwork were inserted in French furniture," and that this combination could not long be tolerated—hence the origin of "a preparation which had the properties of lacquer" invented by a Dutch cabinet-maker named Huygens. But nothing is more striking in the furniture of the seventeenth and the first half of the eighteenth centuries than the eagerness of the Dutch artists to imitate, not so much Chinese as Japanese lacquer-work. Whenever they could get a panel of the real Oriental thing, they used it; and that it was used with eager satisfaction is shown by the splendid mounts in which both French and Dutch set up the pieces of Eastern decoration. But such pieces were not common—they had to be brought by slow-sailing ships of small burden; when they gave out, the Dutch and the Flemish and even the French artist enjoyed very much making the quasi-Oriental designs of which he found himself capable, and the decorated cabinets and clock cases, with varnish-painted designs upon them, which we used to mistake fifty years ago for the real Oriental thing. Even vases of Delft ware were taken in hand, and their cool blue-and-white picked out and thrown into relief by partial surface-adornment in lacquer. Under the name of *Vernis de Chine* and the like, brilliant and translucent varnishes were imported from eastern Asia, and when the four brothers Martin began to be famous as cabinet-makers, about the year 1750, it was chiefly because of the magnificent lustre of their varnished pieces, which were assumed to be Chinese Fashion, or Japanese Fashion, even when they had that which the Oriental pieces seldom had, a brilliant gold ground, and the paintings on it in something very like relief, so strong and bold were they.

But we have no right to ask a small handbook to go into these minutiæ, and, again, it is with great difficulty that a compilation of this sort can be saved from very serious error.

Seashore Life: The Invertebrates of the New York Coast and the Adjacent Coast Region. By Alfred Goldsborough Mayer. (New York Aquarium Series, No. 1.) A. S. Barnes & Co. 1906. 8vo, pp. 181. Illustrated.

This book is the first of a proposed series designed to illustrate the common animals of the coast for the purposes of nature study, and in a general way to serve as a guide to persons visiting the seashore or the exhibit of the New York Aquarium. The forms treated of are very largely those which may be seen alive at the Aquarium from time to time, and many of the illustrations are from photographs taken by the author from living specimens in the tanks of that institution. Dr. Mayer is well known as a student of invertebrates, lately the Director of the Museum of the Brooklyn Institute, and now of the marine laboratory of the Carnegie Institution at the Dry Tortugas. His reputation is a sufficient guarantee of the accuracy of the work from a scientific standpoint, though it is intended to be of a thoroughly popular character. He has made a gift of the book to the New York Zoölogical Society, which is responsible for the conduct of the Aquarium, and the proceeds of its sale will be devoted to the improvement of that establishment.

The book attempts to present in untechnical language a description, with illustrations, of the larger and more conspicuous marine invertebrates of the coast of New York; but in order to increase its general usefulness, there have been included references to the habits of a few creatures from other regions. It is not intended to be a textbook of systematic zoölogy, but rather to increase the popular interest in the life and habits of our marine animals and to illustrate their characteristics. It is hoped that the book will serve to render the collections in the Aquarium and mu-

seums of New York more intelligible to the visitor, and to aid in the educational work which is their most important function. The different groups are briefly but sufficiently described, and are illustrated by a series of 119 half-tones of exceptionally good quality, nearly all of which are from photographs taken from the animals themselves. Half-tones are so frequently obscure and unsatisfactory that we feel disposed to emphasize the success attained in this instance. A perusal of the text leads to the conclusion that it combines interest with accuracy in an exemplary degree, and is well qualified to meet the requirements of the intelligent reader who may yet be without technical training in zoölogy. The author and the Society alike seem entitled to congratulations on the success with which their purpose has been carried out. If the series is continued by works of a similar quality, it will be very sure to meet with popular appreciation and be widely useful.

The "How" of Immortality

Dr. C. T. Stockwell, the author of the awakening hook, "New Modes of Thought," and previously of "The Evolution of Immortality" (three editions of which have been exhausted), writes unsolicited to the publishers as follows:

"I have been immensely interested in the new book, 'Beside the New-Made Grave,' especially in that part of it which treats the 'How' of an unending life. Here the thought runs along lines that fit in very closely to my own conceptions of the past twenty years or so. And having said this, I hardly need to add that, as I turned these thrilling pages, no word of dissent rose in my mind to disturb the vision. This is indeed the scripture, the holy scripture, of Nature. And I fail to see wherein it, in the least manner, is inconsistent with the latest revelations of modern science, especially in the world of physics. In fact, these revelations, to my mind, suggest and warrant the deductions so forcefully and logically drawn in this hook. With myself it is conviction rather more than a faith. The ground taken in my 'Immortality' and also in 'New Modes of Thought' leads directly to this. There is much in common hetween these three books. It might be said that 'The Evolution of Immortality' leads up to the 'How' of the present hook in a rather significant manner. In the 'Immortality,' you will remember, I did not venture upon the 'How.' I contented myself then with a suggestion merely of the possibility. Twenty years ago the data were not at hand, at least in any scientific sense. Now they are abundant, and the present book uses them in a very skillful and telling way. The volume seems to me priceless."

BESIDE THE NEW-MADE GRAVE. A Correspondence on Immortality. By F. H. Turner. Cloth, $1.00 net. Boston: James H. West Co.

$1.00 For Summer Reading $1.00

What better use can you make of ONE DOLLAR than to send it for a THREE MONTHS' TRIAL SUBSCRIPTION to THE LIVING AGE?

For that sum, you can receive EACH WEEK FOR THIRTEEN WEEKS Sixty-Four Pages of the best possible contemporary reading, comprising articles carefully selected and reprinted without abridgment from more than thirty of the leading English periodicals. The subscription price of these periodicals is more than $175.00 a year. But you may have the best of their contents for three months,—more than 800 pages—for the small sum named. You may begin the subscription with any number, and the magazine will follow you every week to your summer address.

With the whole range of English periodical literature to choose from, THE LIVING AGE is able to present A MORE BRILLIANT ARRAY OF CONTRIBUTIONS representing A MORE DISTINGUISHED LIST OF WRITERS than is possible to any other single magazine, English or American. THE LIVING AGE ignores no subject of contemporary human interest. Readers who want discussions of the weightiest subjects, and readers who want bright social and literary essays or the cleverest things from Punch, will find what they want in The Living Age. The magazine gives special attention to international affairs and CURRENT EVENTS AND DISCUSSION, and its weekly publication enables it to present contributions on these subjects while they are still fresh in the public mind. The Living Age looks back over a long past of SIXTY TWO YEARS, during which it has not missed a single weekly issue: but its chief business is WITH THE PRESENT AND THE FUTURE. With all its other attractions it prints the best SERIAL AND SHORT STORIES and THE BEST VERSE. Specimen copies will be sent free on application. The regular subscription price is SIX DOLLARS A YEAR,—52 numbers and more than 3,300 pages.

Harkness, Kirtland & Williams's Cicero. Six Orations.

$1.00

In this volume are given the four orations against Catiline, Archias, and the Manilian Law. The introduction gives an outline of the life of Cicero, of the history of Roman oratory, and of the public life of the Romans, with an account of the magistrates, senate, popular assemblies, and courts of justice. The notes are in keeping with modern methods of teaching, and have been prepared with a view to meeting the needs of both student and teacher. The illustrations are unusually choice.
